## Narrative: 1

We started out vectored off our arrival by ZZZ Center to the southwest with several step down altitudes. 30 miles from the airport we found ourselves at 20,000 MSL which is about 10,000 feet higher than usual for a normal descent. ATC, specifically ZZZ Center, was overloaded with aircraft going into south State X. The Controller brought us around and eventually around 10,000 MSL he told us to go direct to the ZZZ airport. At that time, we were about 15-18 miles away at just under 10,000 MSL. A few minutes later the Controller asked if we had the field in sight to which we replied that we did, but we needed a vector because we were too high to safely attempt the visual approach. We were given a left 360 degree turn and cleared down to 3,000 MSL also while given direct to the ZZZ airport. Upon leveling off at 3,000 MSL we were in a cloud layer and couldn't see the field. We requested lower and were given 1,500 MSL. Once we reach that altitude, we could see the field and was cleared the visual approach to Runway X and to switch to Tower. On final, after fully configuring the aircraft, Tower told us to turn right to a heading of 180. Very confused, we asked him to repeat the instructions at which point we executed a missed approach for a disabled aircraft on the runway. Tower never actually told us to go-around. We were given heading 180 and a climb to 4,000 MSL. Following the level off we were instructed to hold present position however the aircraft will not hold present position on HDG mode. It can only PPOS HOLD while on and active FMS leg with less than .25 NM cross track. Knowing this, we told the Controller we needed a fix to hold and we were given the ZZZ2 NDB which doesn't exist in the database. We instead requested the missed approach fix for the RNAV X approach. We weren't sure or told how long the runway was going to be shut down so the crew started to discuss diverting options which ZZZ1 was the only real viable option. The FMS indicated it would take about 3,500 lbs of fuel and we had about 2,300lbs of reserve fuel on board. From my quick calculation, I had to make a decision fairly soon considering the following: we had about 5,700lbs on fuel on board, unknown runway closure, time, FMS calculation of 3,500 lbs of fuel required to ZZZ1, high volume of ZZZ Center traffic and high controller work load. I sent a message to Dispatch informing them we would attempt one more approach and if unable to make it in we would divert to ZZZ1. We notified ZZZ Center Controller we needed to attempt another approach or we would soon have need to divert. We were given vectors around and cleared for the visual to Runway X once again. As the pilot flying, I opted to proceed direct to the FAF of the RNAV X and continue the visual approach. At about the base leg portion I turned off the autopilot and turned towards the runway. I believe that a slight turn inside of the FAF did not sequence the approach nor the glide path information which led to a position above the glide path. I flew down to correct the glide path all while in and out of 1,000 FPM VVI. I acknowledged the momentary deviations of descent and quickly corrected as I was now on the visual indications from the PAPI's. On short final, a thermal briefly interrupted our descent and with a quick correction back to glide path I corrected the path for a safe landing. I believe the accumulation of all factors above could have led to a critically low fuel situation much quicker than expected. I believe the saturation of airspace on a very busy travel day could have been underestimated in the current climate of understaffed controllers. ZZZ Center controllers were so saturated with aircraft that any chance to hand an aircraft off to a visual approach whether it was really safe to do so or not was attempted. Unsure about divert fuel and runway state created a high-importance, high stress moment of deciding when a divert should occur without having proper data supporting it. Lastly, in a heightened sense of urgency with a tight turn inbound to the runway and sub-sequence 'Cutting the corner' led to the aircraft being in a position higher

than the glide path. I would suggest the following for operations into ZZZ Captain only approach and landing. I believe most captains take it upon themselves to make the approach and landing due to the short runway as it is. There should be more "hip pocket" information whether in the form of a bulletin or some other format that provides rough numbers of divert options, fuel required, routing, etc when a formal alternate is not filed. I also suggest fuel planning take into account busy travel days and add as much fuel as practical for contingencies even on days with VMC conditions that does not preclude landing due to being over max landing weight. I also believe during all forms of training (initial, recurrent, etc) special authorization airports and airports such as ZZZ are discussed. It is my suggestion that ZZZ be a mandatory training event. I can tell you everything you need to know about flying to ZZZ2 yet we don't actually go there in the aircraft. However, airports such as ZZZ are rarely mentioned when we fly there every week. I suggest more 'hangar flying" where scenarios are discussed (such as this one) in a classroom/training environment to get captains to start thinking about scenarios such as these. I'd also like to recommend that one or two approaches from ZZZ3 be included in our Jeppesen charts or company pages. Should ZZZ be shut down for any reason and there is not enough divert fuel to safely make it back to the mainland there will be a 10,000 foot runway available; especially in IMC conditions. Lastly, I suggest that pilots refrain from attempting to cut corners while approaching the runway from greater than 90 degrees. Instead, they should fly the published approach in its entirety including glide slopes or glide paths so that they maintain a safe, stable approach to the runway.

## Synopsis

Air carrier Captain reported a disabled aircraft on intended landing runway resulted in their flight being vectored away from their approach path. The additional vectoring caused them to be concerned with their fuel state and made a request to be cleared as soon as possible. The crew was cleared for another approach and landing and reported being unstable/high before safely landing the aircraft.

## Narrative: 1

45 minutes into the flight we received a Dispatch message that Passenger X in seat X5 has tested positive for COVID. Passenger X was traveling with 3 others which all were in row X. I contacted medlink and was disconnected. I asked my entire crew if they had any experience with this which none of them had and I hadn't either. I asked Dispatch for the name of the passenger and protocol to follow. I retried medlink and followed their instructions to minimize contact with Passenger X and get row X off before all others. We asked for priority handling. Dispatch informed us the station will meet us at the gate. Before getting to the gate we asked all passengers to stay seated with seat belts on at gate arrival for a medical situation. I opened the cockpit door to make sure everyone was complying and only Passenger Y wasn't. I said "Please everyone stay seated" and he sat back down. Later he made a rude comment deplaning and complained to Customer Service. We deplaned row X only and met them and Customer Service in the jet way to assess Passenger X. Passenger X was a young woman that had COVID a few months ago and was 100% healthy. Customer Service followed them to baggage claim for another test. Customer Service cleared us to deplane so I made a PA explaining the situation. Customer Service informed me many people that have had COVID in the past test a false positive.

## Narrative: 2

Received Dispatch message indicating passenger in [seat] X5 received an airport COVID test that came back positive. We were located about 1 hour from ZZZ. Continued towards ZZZ, declared a medical issue on board indicating positive COVID passenger. ATC turned us into a priority handling. Coordination through medlink provided some guidance and we were met at the gate by appropriate personnel to evaluate the passenger. Passengers were informed of the medical issue and told of the possible positive test at the gate. ZZZ supervisors cleared us to continue our trip.

## Synopsis

Air carrier flight crew reported a passenger who had tested positive for COVID-19 was on the flight.

## Narrative: 1

I departed Aircraft X for takeoff. Once approved separation was anticipated I cleared Aircraft Y for takeoff. Once airborne I noticed the departures in a closer proximity than anticipated but I was providing visual separation. I verified that I had appropriate separation on the radar display. In my judgment speed and spacing was adequate and I switched both aircraft [to] departure. Not long after I was called by the Departure Controller that they needed more space between departures because I had less than three miles between Aircraft X and Aircraft Y. This is not typical of my best practices to ensure separation. A possible factor could be aircraft performance. I wasn't anticipating the trailing aircraft to be so much faster or the lead aircraft to under perform like it did. Both aircraft were similar types. Another factor could be that I had been medically decertified due to a COVID-19 exposure at the facility. I was not sick but I was only notified the day before this incident that my medical had been reinstated and that I was to report to work the next day. [It] was quite a surprise to me and didn't give me any time to mentally prepare to conduct air traffic duties after [several] weeks away from work. The only recommendation would be a more advanced notification of a return to air traffic duties after a long time off. It allows controllers to be more mentally prepared to preform safety related duties.

## Synopsis

Tower Controller reported a loss of separation between two departures and cited aircraft performance differences as a possible contributing factor.

## Narrative: 1

I was working everything in the Tower combined. Aircraft Y checked in on a GPS Runway XX approach and I cleared him for the option. A few minutes later Aircraft X called for taxi and I gave him the normal taxi instructions with a crossing at Runway XX, forgetting that I had cleared an aircraft for that runway. While I was making an amendment to a flight plan I hear Aircraft Y ask why there is an aircraft on his runway. He had come to a complete stop on the runway while Aircraft X was crossing. I told him to hold position and once it was clear I cleared him for takeoff from present position. We're reduced staffing due to COVID-19, and having to train forces us to combine positions to accomplish the numbers that management is pushing for.

## Synopsis

Tower Controller reported a ground conflict and cited reduced staffing due to COVID-19 and training at combined positions as contributing factors.

## Narrative: 1

I have been working for a Part XXX operator this year. At the beginning of the season, when I was hired, I noted aggressive corrosion in multiple areas of the aircraft. I also noted that some components were missing documentation from the logbooks, and other components were "time expired." When I made mention of these items to the certificate holder, I was told that the aircraft is "public use" and that the airworthiness requirements do not apply. I was also told that if I don't like the way they operate, I can find a different

job. Well, I left a good job to come to this operation and it is too difficult to find decent jobs with the COVID employment downturn in general aviation, so I was stuck. I still refused to sign off an annual inspection so the operator had a different Inspector Authority (IA) sign it off. The other IA never inspected the aircraft...just signed the logbooks. The aircraft operated all season in this condition. Now that the season is over, I was again told to do an annual inspection, so that it is ready for next season. Instead, I turned in my notice. I don't feel the aircraft is necessarily a danger to the public, however I also don't feel the aircraft is necessarily "legal." Maybe all this is acceptable in the Part XXX world.

## Synopsis

Maintenance Inspector reported concerns with company signing off of annual inspections of aircraft with several known maintenance issues and discrepancies.

Narrative: 1

While working Aircraft X ZZZ-ZZZ1, I became concerned for the health and well-being of my flying partner. She displayed numerous symptoms of severe illness including: persistent coughing, sneezing, shortness of breath, weakness, and sweating profusely. Prior to starting the service, I witnessed [flying partner] remove her tote bag from the galley cart and take several pills. [Flying partner] then had difficulty pushing and pulling the beverage cart with assistance. It strained her and seemed very difficult for her to speak with customers, so I had prepared a sign in blue marker that read, "What do you want to drink?" and listed beverages. After picking up trash, [flying partner] repeatedly placed her used gloves on top of the galley counter. Upon descent into ZZZ1, I noticed the orange strap at door 2R was not attached and reminded her to affix it. At that time, she was coughing and was no longer wearing a mask at all. I expressed genuine concern for her well-being and was uncomfortable flying with someone who appeared so unwell.

## Synopsis

Flight Attendant reported another Flight Attendant was ill during the flight and not able to wear the face mask at all times, especially when coughing.

## Narrative: 1

Departing Runway XXR ZZZ we were filed ZZZ1 Departure ZZZ transition then ZZZZ [fix]. Upon receipt of CPDLC clearance there was a route modification that was obtained that had us routed via the ZZZZA3 ZZZZ. I loaded the flight plan per the CDU prompt and accepted the clearance and printed it out. There was plenty of time as loading was delayed. When I reviewed the loaded clearance it came up ZZZZA3 ZZZZA ZZZZ. I then went back to the DEP/ARR page and checked the runway and SID which I had previously selected to ensure it was still in the FMC. I did notice that the routing had us now going south to ZZZZ and thought the ZZZZA ZZZZ was a short cut ATC wanted due to light traffic and time of day. I also looked at the printout and didn't see the period between ZZZZA3 and ZZZZ as in ZZZZA3 DZZZZZ verses ZZZZA3.ZZZZZ meaning that ZZZZZ was the transition. Once we were airborne ATC cleared us directly to 12,000 which we were initially given 7,000 in the clearance. ATC then came back and said maintain 12,000 unrestricted which in my mind validated the shortcut because usually you get the phraseology "Climb via the SID except maintain XXX". ATC then informed us our deviate and asked us if we were on the SID. I said affirmative except from ZZZZA we were direct to ZZZZZ which was incorrect according to the clearance. After getting to cruise the Captain and I discussed the situation looking at both the clearance, the FOM and the loaded routing from the CPDLC. We realized that two errors were made. When I loaded the SID I did not reselect the runway and SID with the ZZZZZ transition because when I checked it was in the box and because we both missed the period in the printout and ZZZZZ was on the regular routing I thought ATC wanted us to cut that part of the SID off because of low traffic volume. It was pilot error and it's a difficult lesson. I am fully aware that a period means a transition but I missed it on the printout and assumed ATC wanted a shorter routing which has become the norm is so many ATC environments with COVID. I also realize that I will always double check every period on the CDU against the printout copy as it's easier to see. In addition I will ensure that every modification in the future requires an input of both the runway and SID even when uploading clearances from CPDLC

which I'm aware to do but I didn't see the period on the printout. I take full responsibility for this mistake and I feel really bad I missed such a small but signification part of the clearance. I know better so there's no excuses for this missed detail.

## Narrative: 2

First leg (and only leg) with FO, blocked XX mins late for loading, so not rushed. Filed FP was ZZZ1 ZZZ transition, ZZZ [VOR], ZZZZZ, RXXX ...CPDLC had "route change" (I was doing exterior prefect when it came): cleared ZZZZA3 ZZZZZ, RXXX ... climb via SID except maintain 7,000 feet. The actual printout was "ZZZZA3. ZZZZZ", which means the ZZZZZ transition with the "dot" in between. We missed that dot. We both assumed the clearance was direct from ZZZZA to ZZZZZ. The ZZZ1 does not have ZZZZZ as a transition, yet it was on our filed flight plan. To add some justification for our assumption, the ZZZ1 goes way north and west before heading west. The ZZZZA SID went south of ZZZ [airport] and more direct west on course. Add that is was [early] in the morning (very light traffic plus Covid19 low traffic) we assumed we were cleared a more direct routing south of ZZZ [airport]. And the Controller gave us climb unrestricted to 12,000 which also made sense for the Direct ZZZZZ we had in the FMC. And then climb to FL340 but then stopped us at 15,000. But we were wrong. He questioned us and we discovered the actual clearance was the entire transition out to ZZZZZ. At that point he cleared us to ZZZZZ and to climb to FL340 again. No TCAS or other traffic was in the area. This was a crew error. We both were very disappointed with the mistake. We reviewed the FOM and saw our mistake. We have both done this correctly many times but the "ZZZZZ" on the filed route threw us off. No other excuse. And as the Captain I take responsibility.

## Synopsis

Air carrier flight crew reported a track deviation occurred due to misreading a changed departure clearance.

## Narrative: 1

I was reassigned from a deadhead to ZZZ to flying a turn to ZZZ1 because the copilot called in sick with suspected symptoms of COVID-19. Reportedly he had lost his sense of smell and had a severe headache. He had already flown with Captain X that morning potentially exposing Captain to the virus. Now I am assigned to fly with Captain X potentially exposing me to the virus. I called the flight operations management, explained my concerns, he explained CDC guidelines, I told him I was uncomfortable with the situation, he told he would call me back. I got no such call. We are flooded with cautious bulletins, emails and other communications from our company about COVID-19 yet when faced with getting a flight out it would seem that's all thrown out the window. Regardless of CDC guidelines, it would seem prudent to remove anyone who is knowingly exposed to the virus from duty until verified negative or positive. Please note, I was not trying to get out of the trip, I was trying to get out of being needlessly exposed to COVID-19. I'm exceptionally disappointed with how this was handled.

## Synopsis

Air carrier First Officer reported being assigned to fly with a Captain whose previous First Officer co-pilot called in sick with COVID-19 symptoms. Reporter described concerns with management's handling of the situation stating it goes against all the guidelines delineated by the company.

## Narrative: 1

On Aircraft X from ZZZ to ZZZ1 while boarding passenger seated in seat XX4 came on that aircraft with his mask below his nose and between his lips. I told that passenger his mask must come over his nose and mouth. He responded "He will try." I then offered him a company approved surgical mask that were provided by the company. He responded "No thanks." That was the first time of me asking him to put his mask on properly. During my compliant check before doing the safety demo, the mask was down again. I told him once again about the mask. That was the second time. During cabin service the mask was down again and I had to remind him once more. Once cabin service was over and passengers were given time to eat and drink, I then went around to collect trash and he was asleep with his mask down. I called out to him and he opened his eyes and I told him for the third time about his mask. Once we got to the final descent his mask was down and I reminded him once again for the fourth time. Once I told him this time he just looked at me and shook his head. This passenger and his wife, were both sick. They were both coughing without covering their cough. The couple kept coughing during takeoff, throughout the flight and landing. The coughing drew the attention of other passengers to look. People are very scared and when they hear coughing and other passengers not wearing mask properly they worry. Many verbal warnings were given.

## Synopsis

Flight attendant reported two passengers were coughing throughout the flight and not adhering to face mask policy.

## Narrative: 1

I don't know what to make of the most recent bulletin about pilot mask usage and COVID-19. To date there is no concrete directive about mask usage in the cockpit. My own policy as Captain is to direct mask usage at all times possible while in the cockpit other than while eating or drinking or obviously in an emergency while using oxygen. I believe this to be congruent with CDC guidance for when someone needs to be in close contact with

someone else who does not live with that person. This procedure is not perfect but the best I can come up with outside of pre-departure rapid COVID testing. As pilots we usually fly with new coworkers on every new trip and to date there is no way to determine that the person you are flying with is not an asymptomatic carrier of the virus. This whole situation is a failure of: The pilot group as a whole: We should do better than this Union: Our pilots are more at risk from death or injury from COVID than any other operational threat Airline: The safety protocol enforced outside the cockpit should extend inside as well, no exceptions FAA: If none of the above will take action the FAA needs to step in My First Officer on the flight associated with this report agreed in the briefing phase to comply with my directives for mask usage. During the flight I detected a problem though. I generally try to be friendly and conversational not only to pass the time in pleasant way but also to provide a comfortable environment to empower my First Officer to be a helpful partner in the flight. This wasn't to be on that flight and it culminated in my FO intentionally removing his mask on descent into ZZZ. Stating when asked about it that "It is interfering with my duties." The interference he was referring to was that I didn't hear the altitude ATC assigned and I asked him to ask ATC to confirm. I don't know how his mask interfered with ATC transmissions. I honestly think he was looking for an opportunity to remove his mask in defiance. I asked him to replace his mask and offered to work the radios if it's a problem. Later at the hotel I restated my objection to flying with someone who refuses to wear a mask and asked if that would be a problem in tomorrow's flight. He stated it would not. There were no mask issues on that flight, however it was not the most pleasant environment, quite sterile. Mask-less cockpits are dangerous. Unfortunately this is not my first time experiencing the mask resistance in the cockpit. The current guidance on this is weak and shows a lack of leadership on all involved. My experience is that a surgical type mask does not interfere with my duties, is easily and quickly removed if necessary, and by medical consensus prevents contagious droplets from dispersing to a great extent. Please enforce mask usage and prevent the sickness or death of our brothers or sisters in the cockpit.

## Synopsis

Air carrier Captain expressed a need for a concrete directive about face mask usage in the cockpit.

## Narrative: 1

There was moderate turbulence all altitudes. I asked the prior controller to let me know when turbulence had lessened at higher altitudes so I could climb as I was at FL280. The next Controller cleared me to Flight Level 400. I confirmed the climb to 400. At about 36,600 feet I was asked by that Controller on frequency XYY.Z whether I wanted FL400 or FL360 or similar words. I remarked back that I was already cleared to FL400. He didn't respond. This Controller was very busy because everyone was asking for a different altitude. I confirmed the altitude assignment and before he even cleared me there he asked if I wanted that altitude. It was the only smooth altitude at that time. I think the best way to correct this is for the Government to get back to work and live with COVID. They were short staffed.

## Synopsis

High Performance Aircraft Single pilot reported receiving confusing instructions from the Controller and believes COVID-19 ATC staffing issues were a factor.

## Narrative: 1

Due to the COVID pandemic, I have not been able to fly as much but had ample time in full motion jet simulators within the preceding month. That day I was working at the airport when I was contacted to help move planes around in the area for a business because their main pilot did not show up. I was told I was to be flown to an airport and to pick up a plane from a local airport and to fly to another airport. I got to the airplane and was able to fly the airplane to ZZZ. Upon arrival at the airport, the person I was following then asked for a ride back to the origin airport on the plane I was in. I accepted and flew without incident to the airport and made a safe landing. Upon landing, I realized that I had not been passenger current for single-engine aircraft. I would not say there was a lack of proficiency, just a lack of currency. I have been in and out of simulators for jets and had no worries that I could not fly and land the aircraft safely. I was just not able to fly as often as I'd like. I think some of the main causes of this was the fact that this was sprung on me with little warning and no clear plan and I had not flown with this group of people before. It was a major complacency incident on my part and lack of proper flight planning.

## Synopsis

GA pilot reported flying with a passenger while not being passenger current for single-engine aircraft.

## Narrative: 1

There was a family in exit row. They were not compliant with mask policy. We asked for a Supervisor to come on board to talk with them because it is an X hour flight. We were close to push when the Sup came on. I forgot to brief the exit row. I realized it when we

were going up in the air. The Captain dinged us at 10,000 [feet]. I made sure it was safe and A made her announcement. I got up and briefed the exit row.

## Synopsis

Flight Attendant reported that they forgot to brief the exit row because the passengers were not compliant with face mask policy and a Supervisor had to speak to them.

### Narrative: 1

Typical peak afternoon departure. Estimated 1hr late with 2 MELs, one unfamiliar. Flap system inoperative. About 25 minutes after show time finally got notice and it showed aircraft nearly fully loaded with 1 can to go. Went to aircraft and still pushed late. After engine start got ECAM flaps extended. Since flaps should have been fixed in the closed position I believed it was a problem. Maintenance believed it was an expected spurious ECAM due to the MEL. It took over 40 minutes to taxi to maintenance area, make calls to duty officer, and attempt calls to 2 tech pilots to finally have Maintenance on ground visually confirm that the notch flap on the left wing was not retracted and the ECAM warning was real. Returned to gate, tail swapped and blocked out in just under 2 hours. Nice job by everyone involved. Flight to ZZZ was uneventful until approach control informed us the Tower was closed due to COVID. We flew a box pattern while simultaneously looking at ZZZ1 as alternate (we could get there with 10,000 pounds of fuel due to Captain added fuel) and FO working ACARS to get non-Tower approval. We briefed the details and flew an instrument approach in VFR conditions to an uneventful

landing and block in at destination airport. After block in I studied the events and our crew response and believed we did an excellent job under the conditions but noted the newest FOM revision required an alternate to operate to a non-towered airport, which we did not have. The following morning, further study showed that the normally 24 hour Tower may have been closed due to COVID, but there was indeed a NOTAM for the closure which both I and the Dispatcher missed. The confusing MEL language refers to "appropriate AFM performance restrictions are applied" led to longer than necessary hunt for those in the AFM when the only restrictions I could find are in the QRH. The time I spent trying to make sure I didn't miss any restrictions could have been better spent studying the NOTAMs. The closure NOTAM was found using the iPad app. which sorted the airport closure first, while company's provided NOTAMs sorted the closure near the end next to the airport inop lighting. The requirement for the alternate seems to be a change in this **week's FOM. The missing NOTAM closure is high workload human error sorting through** pages of NOTAMs. Lowering the workload by changing the MEL to point to the restrictions rather than creating a lengthy search would have helped. Company NOTAMs should be sorted more like the iPad app.

### Narrative: 2

Flight was scheduled out and conducted a return to gate. An aircraft swap ensued and then departed. I took the flight over from Dispatcher #1 at shift change. I am unsure if the crew was given any NON-TOWER OPS info before departure. The following NOTAM came into play upon arrival: Air Traffic Control and Air Traffic Control Procedures -----  
----- ZZZ APT ZZZ SVC TWR CLOSED CTC CTAF XXY.Z  
DLY ZZZ APT ZZZ SVC TWR CLOSED CLASS D SERVICE NOT AVBL CTC ZZZ3 ARTCC .4  
PRACTICE INSTR APCH NOT AVBL DLY Did not know if the crew or the releasing Dispatcher #1 saw the NOTAM for the Tower closure due to the aircraft swap and delay that occurred. Which delayed the flight where the NOTAM became an issue. Double check NOTAM closures when flights are delayed for an extended period of time. Checked NOTAMs to verify Tower was closed. ACARSED the crew a non-tower operations worksheet and informed the crew to contact ZZZ Center for arrival procedures.

### Narrative: 3

Requested the RNAV approach to Runway XX at ZZZ. ATC cleared us for the approach and instructed us to switch to advisory frequency due to the Tower being closed (we asked and were informed it was closed due to COVID). We were not expecting this and it set in motion a need to assure we were legal to land before doing so. We discontinued the approach and requested radar vectors while working the scenario together as a crew and bringing Dispatcher in to the loop to coordinate a non tower operations approval. I worked with Dispatcher on ACARS while the Captain flew the aircraft and evaluated our fuel status, options, and game plan with me. It was a thing of beauty to be a part of as it came together quickly as we were able to print our ACARS generated non tower ops exemption worksheet that Dispatcher sent us. We asked Dispatcher if everything was in order to be legal to land. Dispatcher did a great job triple checking we had covered all our bases and assuring we got everything needed to legally land in this situation with the Tower closed. Once Dispatcher covered all bases, he informed us he had done so and we as the crew felt we had all items to be legal to land at ZZZ in this situation. Landed on Runway XX and cancelled IFR with ATC on the ground, ZZZ. Debriefed the event and felt we covered all bases to be able to deliver the freight safely and legally. Of note: We had an alternate plan in mind of ZZZ1 just in case ZZZ did not work out. Captain had flown to ZZZ recently and immediately recognized the tower being closed was an issue (normally open 24 hours) that needed to be handled before landing. First officer suggested getting radar vectors while we worked everything out together. Crew working well together lead to excellent

team work and communication to get the job done safely and legally. During the debrief in the aircraft we felt we had covered all bases. However, upon independent further study later at the hotel we both became aware and further debriefed together that we and the Dispatcher missed the NOTAM indicating the tower would be closing. Having seen it, we would have most likely discussed it with the Dispatcher and mutually decided to add an alternate to the release. We also discovered there is a recent change [in the] FOM that requires a destination alternate by clarifying that "a destination alternate is required for operations to a non-operational Control Tower airport. We had to be loaded due to a block turn back at the origin and ended up departing the station later than scheduled, which happened to push our ZZZ arrival in to the later time frame (tower closure). The aircraft swap was a CRM warmup for us working together for the next event in ZZZ at the end of the day. It was impressive how the entire team reacted to a downed aircraft and re-loaded for launch in a relatively short time. It appears we should have added an alternate to complete the "full package" of legality. Even though we had an alternate in our hip pocket and the gas to do it (thanks to crew discussion and Captain adding fuel) it appears we should have had the alternate on paper. Human factors seems to be the cause of this event. Two excellent CRM exercises in one day. Both with positive outcomes. All flights always including lessons learned and what could be done better. Regarding the non-tower ops event, the lesson learned for me is to always check the "ATC" NOTAMs just as closely as the others and it would be a great idea to update NOTAMs before departure, or enroute, or query Dispatch / Flight Ops...if significant departure delays are experienced. These times we are living and dealing with COVID certainly causes some unexpected ATC closures even including Centers. An extra vigilance for these potential closings is in order. Suggestion: possibly generate a frequently updated list (of all our destinations) to Dispatch and on news for crews, of expected ATC closures would be helpful? Bottom line: I will be continually reviewing NOTAMs in search of that one crucial piece of information that might save the day and be something others somehow missed due to Human Factors experienced in high workload and departure delayed environments.

## Synopsis

Air carrier flight crew and Dispatcher reported missing a NOTAM alerting that the destination ATC Tower was closed due to COVID-19.

## Narrative: 1

The scanner radio room is located in a busy hallway at [location] on the X-Concourse. During peak times, many employees are accessing the scanner radio room for equipment needed for their shift. Recently a temperature check station was installed near the scanner radio room in an already busy hallway where many employees are accessing for various areas. The added temperature check station is creating congestion where six feet of spacing for COVID is not able to happen. As much, many lead kits taken from the scanner radio room are being taken off the counter and coming close to hitting people in the hallway when congestion is high during peak times.

## Synopsis

Ground employee reported that the addition of a temperature check station nearby an equipment room creates congestion, making it difficult to social distance during busy times when many people are in the hallway.

## Narrative: 1

Every day for at least the last 2 months there has been a huge lack/deficiency of staffing Customer Service Representatives in the Lobby. Even when staffing looks good at the beginning of a shift, Lobby agents will be moved by to gates, Customer Service Counters, Baggage, etc. Management operates the lobby everyday below number of agents and moving agents to other areas just compounds this huge safety debacle! Management continues to open Kiosks for check in and also keeps all kiosks open which does not allow for the CDC recommended 6 foot distancing as these kiosks are not 6 feet apart!!! As our Customers check-in with their families and fellow travelers there are groups of people standing too close to each other! Lack of agents has many times created safety issues as passengers/groups checking in line up in bunches too close to the passenger currently using a kiosk. Also due to the continuing lack of staffing passengers are touching, grabbing and pulling agents to the kiosk they are at and need help checking in.

## Synopsis

Customer Service employee reported there is a lack of proper staffing in the lobby, which makes it difficult to follow CDC social distancing recommendations as passengers bunch up in groups while waiting in line.

## Narrative: 1

I was the Relief Pilot on Aircraft X and during the briefing, I requested that masks be worn while I was in the flight deck because my wife has a condition that will require surgery and

I am trying to protect her and my family. I explained that I was okay with masks being off if we were eating and drinking. The Captain's response was that "It is too long of a flight and that I should have not come to work." This set the tone. He then stated I should remove myself from the trip. I attempted to contact company but was unable to reach anyone. I then called the flight operations management and requested to be removed from the trip. I was removed from the trip with a significant reduction in pay. Safety was never mentioned as a concern just the inconvenience of wearing a mask for a long period of time.

## Synopsis

Air carrier Relief Pilot reported removing himself from a flight due to a disagreement with the Captain about wearing masks in the flight deck.

## Narrative: 1

Captain had been off for 6 months. Flying First Officer new on aircraft 3 months. I was Relief Pilot #1 in corner seat. Initial clearance to climb to 3,000 feet. Then cleared to climb higher. Around 4,000 feet after flaps up, plane was in a descent and ATC asked if we were going to climb? FO put on autopilot, plane was still not climbing. Power was nowhere near full power. The other Relief Pilot #2 talked FO into moving power up by hand (manually). After quite some time we realized plane was in ALTITUDE hold. Altitude knob pushed, plane entered VNAV climb mode.

## Synopsis

Air carrier Relief Pilot reported the Captain and flying First Officer were not climbing as instructed by ATC due to inadvertently being in altitude hold during departure.

#### Narrative: 1

Two back to back flights had people scheduled to work type X Aircraft gates with no (zero) type X Aircraft experience. The flight out of [Gate] XX1 at ZZZ had several maintenance items at the gate. Two or three mechanics wasted their time and our time due to lack of type X Aircraft experience. A fourth mechanic got us out of town after someone tracked him down at a different gate. Another flight took a half hour delay because no one on the ramp had ever worked a type X Aircraft. 30 extra minutes to load bags after someone that had worked a type X Aircraft showed up to help. Worse yet, no delay information was available without the cockpit being proactive. Zero communication via the gate screen in front of the aircraft (at one point it changed to the next flight on that gate), nothing in the companies message updates, no updated flight service form, no call from Local Control. Each posted delay (and there were several) was initiated by the pilot contacts. The Local Control seemed to be the last to know and blamed the delay on the baggage system. The tug driver told us it was that the employees scheduled to work that gate had no experience on the type X Aircraft. With all of the cutbacks and furloughs, we need to make sure that each gate is staffed with people that know the type of aircraft that will be parked there.

#### Synopsis

Air Carrier Captain reported maintenance and ground personnel with no experience on specific aircraft types are being utilized due to staffing cutbacks.

## Narrative: 1

I am concerned about having to wear a mask at cruise altitude while a Flight Attendant is on the Flight Deck. I feel we are putting Flight Attendant mask concerns over safety of flight concerns. If we experience a Rapid Decompression at FL 390, time of useful consciousness is measured in single digit seconds. A Rapid Decompression would be stressful, disconcerting and confusing. Now we would also have to waste a precious second or two to remove the cloth mask. If it is OK for the pilots to be mask-less in the cockpit when no Flight Attendant is present, why put the safety of the flight at risk solely for the comfort of flight attendants?

## Synopsis

Air Carrier Captain reported the requirement of wearing a face mask with a Flight Attendant on the Flight Deck is a safety concern, especially if there is an event such as a rapid decompression.

## Narrative: 1

We were descending via the ZZZZX arrival with the Autopilot off - on profile and speed. FO decided to hand fly the remainder of the approach and landing and disconnected both the Autopilot and Autothrust near ZZZZ1 intersection. A minute later I looked away and when I looked again, I noticed the FO was high on profile and I mentioned that we needed to cross ZZZZ1 level at 6,000 feet. The FO increased the rate of descent and crossed ZZZZ1 level at 6,000 but then continued to descend to approximately 5,900 feet and around 250 knots - with accelerating trend. I verbalized both altitude and speed, and the FO quickly recovered both. We were soon level at 6,000 feet - 240 knots...and soon to slow to 210 knots by ZZZZ2. There was very light traffic in the terminal area and ATC made no mention of conflicts of any kind. We then proceeded to land uneventfully on Runway XX. The main contributing factor was the FO being new as well as not having flown much for the last several months. We fully debriefed everything, including what to improve on, once at the gate when duties permitted.

## Synopsis

Air carrier Captain reported an altitude and airspeed deviation during arrival. Captain cited the First Officer's lack of flying time in the last several months as a contributing factor.

## Narrative: 1

On the arrival into ZZZ on the ZZZZZ1X arrival, we were told to maintain 250 knots to ZZZZZ, cleared the approach, ILS DME X rwy XXR. We had LNAV and VNAV engaged, I recommended the FAF altitude of 1300 feet be set in the MCP altitude window, the PF, F/O agreed and I set it. The controller told us to slow to 190 knots followed by a slow now call, the F/O (first flight from a long break, several months) was a little hesitant to get it done, so I told him he could hand fly bringing the nose up to slow aside from the speed brakes that he was using, or he could use vertical speed and decrease the descent rate VNAV was currently giving him. He opted to use the vertical speed. I got a call to switch to the Tower, as I did, I got distracted from resetting the MCP altitude of 2000 feet for the mandatory fix altitude at ZZZZZ1. We crossed ZZZZZ1 at approximately 1700 feet. Recognizing this, I had him climb back up to 2000 feet until we intercepted the glide path. We were visual with the runway the entire time and the aircraft in front of us, that is perhaps the reason I wasn't giving due diligence to my approach plate.

## Synopsis

Air Carrier Captain reported an altitude deviation.

## Narrative: 1

Prior to top of descent we briefed the NNCEE 1 RNAV Arrival into IAH. The arrival says to plan on flying the RWY 8R transition. So we briefed the ILS RWY 8R approach. Houston Approach Control then told us to fly the RNAV (RNP) Y RWY 9 approach. The CA was the PM and told the FO he would change the approach in the FMC. After selecting the new approach the CA told the FO that there was a discontinuity at HOWLN. By selecting the HOWLN transition two separate HOWLN fixes were created separated by a discontinuity. The discontinuity appeared at the top of page two in the legs page of the FMC. So the CA brought up the second HOWLN fix and entered it into the discontinuity boxes and assumed that this action closed the discontinuity. But he never went back to page one to verify that the discontinuity was closed and he did not ask the FO to verify it as the FO was busy managing the descent. The MCP displayed LNAV and VNAV were engaged and so did the FMAs. Approach Control then said at HOWLN you are cleared the RNAV (RNP) Y RWY 9 approach. So the CA set FAF altitude of 2,000 in the MCP. The FO went through LAVSFT and at HOWLN (IAF) had me set TDZE of 100. Then we both said why isn't the airplane turning? Tower immediately cancelled our approach clearance and vectored us for the ILS RWY 9 approach. The CA was on a larger scale than the FO and noticed that the magenta line showed both the RF leg turn inbound but also extended beyond HOWLN as well and said I think I did not clean up the discontinuity correctly. The contributing factors were both pilots did not verify the legs page after the Captain cleaned up the discontinuity and the high workload environment in IMC. Additionally it was the FO's first trip in over a month.

## Narrative: 2

I briefed the ILS 8R per listed as the runway for flying the NNCEE1 Arrival. During our descent when checking in with Houston approach we were given a new runway RNAV Y runway 9. The captain put the new runway into the FMS and Verbalized he was cleaning it for the RF. **I was reviewing the approach plate and didn't verify his FMS inputs. The CA** noticed right away that the plane should be starting to turn for the RF, which ATC cancelled our approach and told to fly a heading.

## Synopsis

Air carrier flight crew reported a track deviation on the mid-approach segment due to a high workload environment coupled with the First Officer's extended period of time off.

## Narrative: 1

As we were pushing back from the gate in ZZZ, the flight attendants informed me there was a passenger vomiting uncontrollably in the lavatory. The flight attendants also

informed me that another passenger witnessed the presumably ill passenger "throwing up in a trash can outside the airport in front of the airline drop off area approximately one hour before the flight." We made the decision to call Ops and return to the gate. When we got back to the gate the paramedics were standing by to meet the passenger. The Station Manager came into the cockpit and said, "Medical" says she is fine and wants to get her back on the airplane." Given the current environment that we are living in with COVID, we didn't feel that was the right thing to do so we left her at the gate. I told the Station Manager if she felt better in an hour and a half she could take the next flight. The flight attendants and passengers were grateful we didn't allow a sick passenger on the airplane.

## Synopsis

Air Carrier Captain reported returning to the gate to remove an ill passenger from the flight.

## Narrative: 1

While executing the published missed approach for the Practice VOR approach at TUS Runway 11 left, Aircraft Y departed on Runway 11 flew under the Aircraft X and continued a climb to their departure altitude. The Aircraft X encountered wake turbulence from the departing Aircraft Y at approximately the VOR location, recovered, and continued with the missed approach procedure. Extenuating circumstances were that the Tower at TUS was closed due to staffing issues, and the TRACON was handling IFR and VFR traffic into and departing from TUS. We had no direct radio contact with the departing air carrier before, or after their departure. If the Tower had been open instructions to us or to the air carrier would have prevented this close encounter.

## Synopsis

Small aircraft flight Instructor reported encountering wake turbulence from a departing air carrier that passed below them as they were executing a practice missed approach. Reporter stated Tower was closed at the time because of staffing issues.

## Narrative: 1

My duty day started in ZZZZ. I was part of a 2-man crew, scheduled to operate ZZZZ-ZZZZ1-ZZZZ. At the time I left ZZZZ, the TAF for ZZZZ had a small period of low visibility in the forecast, which was to occur while I was on the ground in ZZZZ1, and the weather was forecasted to improve to be above CAT I minimums prior to my arrival back into ZZZZ. While on the ground in ZZZZ1, I was checking the ZZZZ weather and found out that the ceilings were WELL below CAT I minimums. I called Flight Operations for a briefing and was told the same thing. I decided to delay the flight for an hour to watch the ZZZZ weather and to "time" my arrival into ZZZZ to coincide with the forecasted lifting of the weather. Flight Operations then called me back and asked for me to delay another 30 minutes so we would arrive 30 minutes after the period of low weather in ZZZZ - I agreed, as it was a good idea. I also knew that I was currently at an outstation where I really have zero options for adequate rest if we got stuck there since we can't deplane the aircraft without mandatory COVID tests and quarantine until test results come back negative. So, in reality, flying to ZZZZ1 is really a gamble in the first place but, for sure, I knew that staying there wasn't even an option. I eventually departed ZZZZ1 at the newly determined departure time and flew towards ZZZZ. Through the use of ACARS ATIS updates as well as messages to/from the company - it was determined that the weather in ZZZZ had not cooperated with the forecast. Visibility was 125 meters to 225 meters - well below CAT I minimums. I talked with my First Officer and we decided to enter high altitude holding and set a "bingo" fuel number for us to know when it was time to have to go to the alternate airport, ZZZZ2. We burned through our holding fuel and were forced to divert to our published alternate airport. That's where the real fun began. This is the point where we found out that an alternate that looks good on paper doesn't always work in actual practice. We landed, parked in spot XX, and sat, and waited, and sat, and waited some more. It took almost an hour just to get a set of stairs brought to the aircraft - and took an equally long amount of time to get a GPU and wheel chocked so I could release the parking brake. At this point, I became doubtful that we would have the duty time to allow us to continue to ZZZZ1 - and that feeling was mirrored back to me by Flight Operations on my first phone call to them. A plan for crew hotels was then started, as well as the continued effort to contact our "handler" there in ZZZZ2. Next came the biggest issue...Customs. The handler first started telling me that we can't stay there because we can't clear customs "in their country". I reminded him that we were scheduled to land in ZZZZ, which is the same country - but he didn't care. Clearly, the thought of a crew having to get rest at this published alternate airport hasn't been approached before? Finally, after 4 hours on the ground, the handler comes to the aircraft, asks me to shut it down so he can take us to a hotel close to the airport. I complied, and as soon as I carried my personal items downstairs, I was told by that same handler that it would be another hour before customs can clear us and to please wait on the aircraft - which was now shut down. I opened the aircraft again and that's where we waited for almost 2 more hours before the handler came back to tell us that there is 100% no way we were gonna clear customs there at that airport. At this point, we had absolutely no choice but to stay on the aircraft. After talking it over with my crew, we decided that the only option would be to depart ZZZZ2 as soon as we were legally able to do so - even though sitting on the aircraft isn't actually "rest" - we had no other options. I talked with Flight Operations and they told me that we could depart at XA:00Z, which was another 3 hours from then. Out of lack of better ideas, we agreed, got the plane ready, and blocked out at XA:01Z for ZZZZ. The real point in this report is to illustrate that so many of our flight plans might look OK on paper, but when it comes time to actually put contingencies into practice, the plan immediately dissolves - leaving crews stranded without the ability to legally continue

operating, and without the ability to obtain legal rest. Vetting of our "approved alternates" certainly needs to take place. Not properly vetting filed, "approved," alternate airports to facilitate crew egress between aircraft and legal rest facilities. Worked tirelessly with the ZZZZ2 handler to try to secure rest facilities for my crew. When that failed, I worked with my crew and with Flight Operations to determine when we could "legally" leave. Time and manpower needs to be put forth in this company to actually find out what processes would need to take place at alternate airports or at intermediate stops to allow crew members a place to get safe, legal rest when needed.

## Synopsis

Air Carrier Captain reported a delay due to weather at an international location resulted in crew rest issues. The Captain also stated they decided to not deplane the aircraft during the delay due to the requirement of having to take a COVID-19 test if they left the aircraft.

## Narrative: 1

We began our duty day at XA30 Z on date in ZZZZ, for a flight to ZZZZ1, continuing to ZZZ. Upon arriving in ZZZZ1 the ground handlers removed existing pallets and started loading the outbound cargo, before fueling started. Approximately 30 - 45 minutes later we had about a 16 ton imbalance with all of the fuel in the left wing tanks and center tank, and fuel was venting overboard, after the fuel spill clean up the fueling process resumed and again stopped due to the mechanic onboard the flight was not experienced on the aircraft type, and could not figure out how to operate the valves and transfer fuel to the right wing tanks. With us as the flight crew not allowed to exit the aircraft in foreign country, had no other option but calling [company], and keep them in the loop. At this time we are approaching our duty limit for the day in order to reach ZZZ, and we all agree to extend our day by X hours to get the job done, as described in the FARs. Numerous calls are being made to Dispatch, Maintenance Control in order to find help for the Mechanic who is outside supervising the fueling. Again we are approaching our duty limit, and calls are being made to Director of Operations Control, who hung up the phone on the Captain and to the Duty Officer who hung up the phone twice. What we were trying to accomplish was if the company had a contingency plan, or a plan B for us. As we had discussed this earlier, and rather sleeping on the aircraft, we were thinking more like proceeding to either ZZZZ2 or fly back to ZZZZ to rest, which was denied by the Duty Officer. We ended up spending the night on the aircraft, and after the curfew was lifted in ZZZZ1 we were able to get the required paperwork and fuel for departure. Finally arrived in ZZZ with no issues almost XX hours after the duty day had originally started. Would like to add that ALL phone conversations to operations control, maintenance control, Director of operations control and Duty Officer were made using speaker phone and was heard by the entire crew on the aircraft. [Caused by] inexperienced Mechanic operating and supervising the fueling process. The company needs to have a contingency plan, and plan B. By changing the scheduling procedures, have a dedicated crew fly between ZZZZ - ZZZZ, and use heavy crews for the rest, and provide better training for maintenance personnel in order to understand the aircraft type refueling process.

## Synopsis

Air carrier First Officer reported that a ground delay caused by fueling imbalance resulted in the crew approaching duty time limits. Due to the foreign country's COVID-19 restrictions and company procedures, the crew had to remain on the aircraft for required rest.

## Narrative: 1

Prior to entering the ZZZ Center airspace, during cruise at FL330, I had just returned back to my seat as "as pilot monitoring" after using the rest room. As a matter of practice, I read aloud the FMA parameters (which all appeared normal), upon taking my seat and assuming the role as "pilot monitoring." Immediately after that, the Captain had also returned back to his seat as "pilot flying" from his rest break, and exchanged his position with the IRO who had been occupying the captain's seat as the "pilot flying" during the captain's break. At that time the Captain noticed that the aircraft had momentarily climbed to and leveled off at an indicated altitude of 33,500. The Captain immediately commenced a descent and returned the aircraft back to its original altitude of FL330, without any further consequence. We had become aware of the altitude when the Captain brought it to our attention in the cockpit. However, it was on the following day in ZZZ1 during my deadhead trip, that the captain recollected the event details and informed me that we had a deviation that may warrant the filing of a report. I believe that the aircraft may have climbed 500 feet and leveled off by the inadvertent touching of the altitude selector knob, either by the handling of the clipboard or by using disinfectant wipes in close proximity to the FCP, by one of the crew members, while getting in and out of the seats. None of the crew members is sure of what caused the movement of the altitude selector knob and the gain in altitude. The Captain immediately commenced a descent and returned the aircraft back to its original altitude of FL330, without any further consequence. As crew members, we were all equally surprised by the inadvertent deviation in altitude. Exercising greater level of situational awareness by all crew members, increased monitoring of the FMA, especially during the exchange of pilot seats and exchange of pilot roles while commencing and ending of crew rest periods. Exercising extreme care during handling of clipboard and using disinfectant wipes in vicinity of FCP during flight.

## Narrative: 2

Aircraft wandered off of assigned altitude in excess of 300 feet in cruise flight. [It was identified] when the Captain pointed it out. Mountain waves and or FO accidentally bumping the VSI or altitude pre-select while cleaning/sanitizing the FCP [may have caused it]. I confirmed that the altitude was off the assigned, and needed to be corrected immediately. Advise all flight crews to use extreme caution when moving things around or cleaning the FCP inflight.

## Synopsis

Air carrier flight crew reported an altitude deviation after the altitude selector knob was inadvertently moved. The flight crew stated the use of disinfectant wipes on the control panel may have been a contributing factor.

## Narrative: 1

In ZZZZ loading was taking too long so I stopped our duty day because at our arrival point we would be over our legal XX hours. I asked the company for hotel rooms for the crew. The Handler informed us we would need to stay in a government designated hotel and undergo COVID-19 testing or stay on the airplane. We chose the hotel. The handler and a [company representative] informed us the immigration service of foreign country denied our crew entry into the country and we were not permitted to leave the airplane. I asked the Directors of Operations, Safety, and Standards, and the Chief Pilots if this would be legal Rest for our upcoming Part 121 assignment and got no response from any of them prior to our new (after minimum rest time) departure time, so I asked my crew if they felt safe to fly and they all said yes, we departed. We were in a foreign country subject to our Handler's communication with local immigration officials and them informing us what we could or could not do. We were even warned not to leave the aircraft by the handler to walk over to our other company airplane on the ramp as it could subject us to serious consequences if we were detected by Immigration. When we realized we had no alternate other than to obtain our Rest on board the aircraft A lack of planning on company Operations part in terms of how the Crew would be provided with normal hotel rest facilities should they get stuck in this location as we did. Even if you book a hotel if Immigration won't let you leave to go to it it is of no use. I kept my crew 100 percent in the loop as to all communications and any of them were free to decline the 121 assignment after we obtained Rest on the airplane. All of them told me they felt safe and were ready to fly. Plan for more than adequate time to load an airplane at this location. X.X hours were allocated obviously that was not nearly enough.

## Narrative: 2

Though we were as a flight crew rested, alert and fully capable of conducting the flight safely, local authorities had denied our entry into the country. We were forced to obtain rest prior this leg in the aircraft. Again, to restate; we had no choice other than to stay in the aircraft during our rest period. Our choice was originally to be tested for COVID-19 and risk quarantine to obtain **adequate rest in the hotel. I personally witnessed company's** efforts to get us into a suitable hotel. Those efforts were denied by local officials as relayed through emails from our handler. We were aware prior to the flight that it would be necessary to depart after resting in the aircraft. 1) Mechanical delay departing ZZZZ on previous leg. 2) Failure of our handler to obtain rights to enter the country to ensure proper rest facility. All attempts were made to complete the flight within the originally scheduled duty day. We even suggested a shorter flight time to a different destination for a crew change. All efforts made by the crew were denied by the handler. Explain to the customer / handler that it will be necessary to obtain permission for the crew to stop enroute for a crew change if the loading is delayed. Please note here that the load being

stopped and the crew departing within the appropriate duty day was an option given to the handler. The choice was made to continue with the full loading of the aircraft.

## Synopsis

Air carrier flight crew reported that they had to get their required rest on the aircraft instead of at a hotel. The flight crew stated that although they had agreed to take a COVID-19 test to stay at the hotel, the foreign country's immigration service did not allow them to leave the aircraft.

Narrative: 1

The aircraft had been sitting for a great length of time so it was decided the aircraft should be test flown prior to its first revenue flight. During the initial checks, the radar system failed the test cycles, so the discrepancy was noted in the logbook and maintenance was performed (approximately one hour). All other checks were satisfactory. Taxi normal. Initial takeoff normal 80-kt call normal. At approximately 110 kts I noticed my airspeed indication had blanked. Taxi was indicated in the window. I glanced to the right the FO (First Officer) indications appeared to be normal. We were rapidly approaching V1/Vr 135 kts so I elected to continue. V1/Vr was called and I rotated at a normal rate after the nose wheel left the ground my airspeed tape reappeared; however, the indication was approximately 90-100 kts with visual stall indications. No shaker. Positive rate was called and the gear was raised. At about 100 feet. I transferred control to the pilot monitoring. I had IAS comparator in the PFD and multiple levels one and two alerts. SEL Manual Feel Sel Fadec ALTN (3). A combination of those alerts drives the user to "Refer to Emergency Non-Alert procedure- AIRSPEED UNRELIABLE." I called to the pilot in the OBS seat to get the QRH out. I was also handling multiple radio calls. Notified ATC that we had issues with airspeed indications and erratic altimetry issues and to keep us within 20 NM of ZZZ and that we would be returning to ZZZ. The FCP was blanking on numerous occasions we were cleared to 10,000 ft however the altitude window would blank on occasion. Between 6,000-7,000 feet we were trying to ascertain what readouts were accurate as the right-side airspeed was giving erroneous indications altitude readouts seemed erroneous as well. Captain side was reading 90 kts FO side 270 knots standby 230 kts. I asked for a ground speed readout from ATC 380 kts was the response. Then as we leveled at 10,000 feet my airspeed and altitude indications returned to normal as did the FOs. We returned to ZZZ with no other issues. Blocking in Maintenance noted two ADC failures generated by the CFDS below 300 feet.

## Synopsis

MD11 Captain reported that at approximately 110 knots a loss occurred of both ADC computer/inputs below 300 feet.

## Narrative: 1

While I did perform a visual inspection of the flight deck in accordance with FOM requirements on all flights departing the US to Country X, I never received or completed a search form. I realized this about halfway to our destination. I called the flight attendants and asked them if they'd performed a visual inspection during their pre-flight, to which they responded in the affirmative. I also called ground handlers in ZZZ when I got to ZZZZ. The gentleman confirmed with me something along the lines of, "the cleaners perform the search of the cabin while they're cleaning and disinfecting the aircraft." This was a "turn around" with maintenance items that needed addressing and [aircraft] disinfection that needed accomplishing, so some task saturation. Furthermore, my normal routine is typically to trade the Gate Agent's paperwork with my completed security sheet. With the auto passenger count closeout, that moment is no longer consistently there. I think we could benefit a lot from some more standardization (pilots, flight attendants, and Customer Service) regarding the completion of the security sheet. With the new below wing ground handling and the new procedures in ZZZ, there are changes in the way aircraft are turned and the people I interact with. I will most likely remind myself and my crew about the security sheet during my Pre-flight Briefing when I mention passports. This way, verifying the paperwork is received and goes out the door can be a collaborative effort.

## Narrative: 2

When airborne on our flight to ZZZZ the Captain realized that he didn't receive, fill out, and return the paperwork saying that he did the security sweep of the aircraft. He did perform the sweep when we first arrived at the aircraft and asked the Flight Attendants to see if they did their sweep as well. They also performed the sweep. When we landed in ZZZZ my Captain called the ground handlers and explained the situation and confirmed that he did the sweep. Our plane arrived late into ZZZ. We had to do a quick turn and wait for cleaning to [sanitize] the aircraft before our crew and passengers could get on the plane. Maintenance had to be performed on the aircraft. A lot had to be done in a short time. On the quick turns everyone needs to slow down and make sure they are doing

**things correctly even if it means we won't get out on time. If the Gate Agent, Flight Attendants or Pilots took time to remember the security sheet then it would have been filled out and given back to be filed.**

## Synopsis

Air Carrier flight crew reported failing to complete the security sheet due to pre-flight work overload that now includes the added task of ensuring the aircraft was sanitized.

## Narrative: 1

During boarding procedures a passenger was advised of the mask wearing requirements, nose/face. Flight Attendant (FA) advised passenger nose exposure to FA B who also had to re-advise passenger. Passenger appeared disgruntled about requiring nose coverage and Gate Agent advised she also had words with passenger with same response. FA B advised **Captain of passenger's position against compliance. Prior to door closure the Gate Agent was present in case passenger removal was necessary.** An announcement was then made saying "non-compliance passengers were noticed and removal option would be used for non-compliance." Passengers were advised they had an agreement at ticket purchase this had been clear this was not an optional requirement for flight. Using this method passenger realized this wasn't a joke and removal would occur. Captain advised FA B to do walk through for compliance and removal before door closer option. This passenger had been advised over 3 times by 3 different individuals with non-compliance results and now aware airlines was serious about compliance. Entire plane was compliant during walking through and continued flight. During entire flight passenger continued to pull mask off nose and appeared disgruntled. Passengers around passenger kept saying "FA caught you again each time" so passenger then laughed like it was a game. We are to "inform" at this point, which continued at every walk through, "not enforce ." This was a constant occurrence during flight. After arriving and during departure this non-compliant passenger stopped and made rude remarks to FA A. FA B went to Gate Agent during cleaning to **advise of this passenger's attitude and non-compliance** so Gate Agent could make a note for future travel. This passenger felt he was not going to wear mask as required. FA B advised gate agent row and seat area and agent opened up the location and verified **passenger's information. Due to constant resistance FA felt safer not to confront** passenger directly. During 3 points this party was given clear instructions on mask covering requirements and possible travel denial. They continued during every stage with 4 different advisory points pre-board at gate, boarding (flight attendants), flight introduction (Captain's announcement) and inflight (flight attendants). With actions [during] deplaning this passenger let FA A know that they were above this rule.

## Synopsis

Flight Attendant reported a passenger would not comply with face mask policy throughout flight.

#### Narrative: 1

Normal (very early) departure. We taxied out, ran checklists, lined up for takeoff, when I added power, we got the takeoff configuration warning horn. We both saw immediately the flaps were not set. I notified tower we needed to exit the runway. Exited the runway at the first taxiway. I don't think our ground speed got above 25-40 (?) knots. Set the flaps, re-ran the before takeoff checklist, notified the Tower ready, and completed the flight normally. Haven't been flying as much as normal. First flight, very early morning. Possible distraction(s). This is a humbling event. I don't think I've done it in X0 years of flying. There was nothing specific that I remember, but something interfered with our regular routine or "flow". I did the "after start" checklist and missed it, and we both did the "before takeoff" checklist aloud and missed it. I thought I was checking the position and the indicators carefully, but obviously I need to be more stringent, and will be in the future.

#### Narrative: 2

When cleared for takeoff, and starting to line up and advancing throttles, a configuration aural warning activated because the flaps were in the up position. Neither of us realized the flaps in the incorrect position before taking the runway and I immediately took control of the aircraft and returned the thrust levers to the idle position, disconnected the auto throttle and cleared the runway, never exceeding 10-12 knots (still at taxi speed). Once clear of the runway, I commanded the flap lever to 1 and first officer moved lever to 1 and we got the green light. Ran the entire before takeoff checklist again and was cleared back onto runway for an uneventful takeoff and climbout. I had completed a 3 day trip late the previous night and this was an early XA30 departure time with minimum required rest. I stayed at the hotel and was interrupted in my sleep routine at around midnight by a noisy neighbor conducting a phone call in the room next to mine. Maybe I wasn't fully rested and still a little groggy. My expectation was that the flap lever was placed to 1 after engine start and I was used to that routine so I didn't register that the flaps were not in the correct position. This was the first time this has occurred for me. Only suggestion is to double and triple check all items, especially configuration items, and to use the crew concept better.

#### Synopsis

Air carrier flight crew reported not setting the flaps resulting in a takeoff configuration warning on takeoff roll.

## Narrative: 1

During the crew brief we discussed the departure procedure and I selected LNAV on and confirmed it was armed via the PFD. After a maintenance issue at the gate and a rushed before takeoff checklist during a short taxi we took off. Shortly after takeoff, ZZZ tower asked why we didn't turn. Confused I looked at the PFD and LNAV was not operating. I told the Captain to turn in the correct direction and moved the heading bug to the correct heading. We don't know how or why LNAV disengaged after we both confirmed it was armed in the brief. Rushing the before takeoff checklist caused us not to verify everything in the MCP/ND check so we don't know if LNAV was still armed at takeoff. Other than training in the aircraft type simulator, I have not flown since early November. The Captain only has X00 hours in the aircraft. Suggestion - Don't rush the before takeoff checklist.

## Synopsis

First Officer reported LNAV was not engaged during departure resulting in a track heading deviation.

## Narrative: 1

We were at 4,000 feet on a vector to final about 15 southeast of ZZZ when a TA came up on TCAS on the nose co-altitude. Right after it came up we were given one more turn to join final for [Runway] XXL. In the turn the TA became a descending RA and we complied per the maneuver's section in the QRH. We descended about 800 feet and finished the turn at which time we were Clear of Conflict. As we leveled the wings we saw the traffic go by our right wing a little high as they were still at 4,000 feet, appearing to be no more than a half mile away. It appeared to be a smaller GA aircraft but went by quickly. We told ATC we descended for an RA, at which time he said to just maintain 3,000 feet. He seemed unconcerned and asked no questions nor gave us any information. We never received a Traffic Advisory call prior to the initial TA. The Controller was busy, but did not seem to be swamped. Maybe staffing as a result of COVID-19 is a factor.

## Synopsis

Air carrier Captain reported a TA/RA on initial approach and believes ATC staffing may have contributed to the event.

## Narrative: 1

ZZZ TRACON planned to surrender their ZZZ1, ZZZ2, and ZZZ3 sectors to ZZZ ARTCC initially around XA:00 pm local due to facility cleaning of a COVID-19 positive. Area X (controllers and management) objected to the proposed time frame and was able to push the event back to around XD:00 pm local. Shortly before the XD:00 pm acquisition of airspace from ZZZ TRACON, we learned that there would be no radar service to any of the City satellite airports. We were given the following stipulations: No IFR service to ZZZ4, ZZZ5, ZZZ6, ZZZ7, etc. No VFR Flight Following will be provided in ZZZ TRACON's airspace. Any IFR aircraft not willing to cancel IFR and proceed to their satellite destination VFR without any radar service from ATC will be kept out of ZZZ TRACON's and offered an alternate airport for landing in ZZZ Centers airspace. At XI:04z, ZZZ2 ARTCC called ZZZ ARTCC Sector XY to coordinate a possible emergency situation with Aircraft X. The aircraft (a type) was originally off of ZZZ8 to, as ZZZ1 ARTCC stated, "Somewhere in the midwest" but changed his destination to ZZZ4 because a service center was located there. The issue affecting the flight was with a fuel pump trying to incorrectly pump fuel to a wing (or tank) that it wasn't supposed to. This was not an emergency at the time but serious enough to change the destination and have the aircraft inspected by maintenance. At XI:07z, the aircraft checked on with ZZZ ARTCC sector XY. As the situation developed, it was discovered through management that if the pilot declared an emergency, it would have no impact on the reduced level of service he would receive from ZZZ TRACON enroute to ZZZ4. Shortly after this time, I relieved CPC [Name] at [Sector] XY and began working the sector. Upon realizing the possible developing situation and the corner that I was being put in, I declared to continue under Article 65 of the 2016 FAA/NATCA CBA. My experience painted a picture of a night time, single-engine and (possibly single pilot), IFR flight being operated in IMC, with a fuel pump issue that likely could become an emergency situation, wanting to land at an airport that would have no radar service for the last 45 miles of flight; IFR or VFR. At some point Management requested the pilot provide an alternate airport. In a brief discussion with the pilot on the frequency, I suggested ZZZ because in my mind, it's the only airport that would have any kind of radar service. As the pilot reluctantly continued on to ZZZ4, he was forced to descend to find VFR conditions. It wasn't until he broke out of the clouds below 4,000 feet that he announced he could continue VFR. This now meant that this aircraft had to fly the last 45 miles to ZZZ4 at 3,000 feet. Any level of safety that altitude provides to an aircraft (in distress or otherwise) was forcibly sacrificed. Additionally, to remain clear of the Class Bravo, the flight was vectored to the east of side of the city toward the ZZZZZ way point and then northbound. The pilot mentioned his plan was to fly north from there and then turn west toward ZZZ4 and call the tower when he got 10 miles out. This added additional miles and flight time to the situation. Again: Single-engine (possibly single-pilot), night, IMC, with a mechanical issue and no radar service. At XI:33z, the pilot informed me that he could proceed VFR to ZZZ4, and radar service was terminated by ZZZ ARTCC. Other factors during this ZZZ TRACON COVID cleaning period: VFR aircraft off of ZZZ4 enroute to ZZZ9 could not maintain VFR and needed a short range IFR clearance with an RNAV approach clearance. Volunteer (call sign unknown) aircraft inbound to ZZZ9 requested and received radar vectors to the ILS [runway] X approach. Finally, at the end of the cleaning period, ZZZ TRACON suggested that ZZZ ARTCC just keep the airspace for the rest of the night which was agreed to by ZZZ ARTCC. Consider the impacts of Covid-19 cleaning, not to just the affected facilities but also the flying community.

## Synopsis

Center Controller reported underlying TRACON went ATC Zero for COVID cleaning, and described the problems associated with getting an aircraft to a diversionary airport without TRACON services.

## Narrative: 1

I was the D-Side for approximately 1-1.5hrs when ZZZ Approach went ATC Limited with Tower only open from 1800-2000 local time for COVID cleaning. It was clear from before ZZZ went limited that the contingency plan was lacking, and controllers were brainstorming on the fly how we would handle the situation. In the period of 2 hours, I would estimate we had 15 arrivals into ZZZ1/ZZZ2/ZZZ3. It seemed like an abnormally busy time. I do not believe there were any losses, however there seemed to be a complete failure of planning/explanation/preparation provided to us controllers on how to best handle the situation and what we could expect. Many aircraft experience lengthy delays with several getting low on fuel. I would recommend for better contingency plans and better preparation for controllers when such an event is to occur.

## Synopsis

Center Developmental Controller reported a Tower went ATC Limited and the confusion that ensued with determining how to handle the situation. Controller cited lack of planning, explanation and preparation as contributing factors.

## Narrative: 1

The aircraft listed entered my airspace without coordination. I previously reported dozens of airspace violations directly to management. Management has recently changed its stance, and they now view a violation of my airspace as a performance issue on my part. It is their stance I am to watch all surrounding sectors and prevent other controllers from failing to do their job. I will now be reporting these airspace violations here instead to preserve my career. Also worth noting, the Controller that violated my airspace was working their first session after XX days off of COVID leave, and was working a higher volume of traffic than they could handle with the rust of being off so long. Controller did not have a D-side or any other support. The supervisor was apparently unaware of the traffic volume, and I walked over to ask him to monitor Controller. Bring back the safety and reporting culture. A controller should not have to choose between complying with a mandatory reporting requirement or losing their job, especially when it isn't that controller failed to comply with regulations.

## Synopsis

Center Controller reported multiple airspace violations resulting from hand-off issues with adjacent sector controllers.

## Narrative: 1

Our facility has been back on a normal schedule for around 2 months now but we are operating extremely short staffed due to the amount of people out due to the pandemic. This is forcing those of us that still come to work to work harder. I was working GC and LC combined since this is now the "new normal." I commented to the CIC who was also working FD (pre-pandemic we would have had a Supervisor a GC, a FD, and a LC). "Why did the TMC switch flows when we have a 7 knot tailwind?" He agreed that it was an early call but this happens a lot and I believe it happens because ZZZ TRACON is still on 5 days on and 5 days off and they don't have the staffing to open positions which is causing ZZZ to operate in a way that I believe introduces more risk. On the west side we normally have three runways but one is closed due to a construction project, and numerous taxiways are closed as well. In a north flow we are forced to land on Runway XXR when we would normally not do this and the East side keeps all the departures. This causes the situation that happened to me. Aircraft X goes around and I issue the standard 340 and climb to 3,000, he went around due to the tailwind. I then issue instructions on GC to alleviate a conflict there. I then notice a suppressed data tag of a west bound departure off of the west side (Aircraft Y), and issue Aircraft X a further turn to 270 and coordinated with the departure controller. The suppressed data tag was a huge factor in me not seeing the east side departure heading west, and the conflict on GC was another distraction. ZZZ TRACON needs to return to a normal schedule so they can staff their final monitor positions. ZZZ does not need to be departing west bound departures off of the east side when ZZZ1 TRACON is landing XXR, especially when the weather is marginal like it is today. Additionally, ZZZ TRACON does not need to be landing XXR at all, because that forces us to depart XYL which involves multiple crossing on Runway XXR (more risk). ZZZ TRACON needs to land the normal arrival runways and if they can't do this due to their staffing then they need to return to a regular schedule. Most of us here are fed up with what is being asked of us and the safety of the system is quickly eroding to appease the users demands and ZZZ's TRACON staffing.

## Synopsis

Controller working Ground and Local combined reported a conflict resulting in an aircraft having to go-around. Reporter stated Tower does not need to be departing westbound aircraft off the east side of the airport.

## Narrative: 1

Well, fatigue did play a role. It slowed us down. Earlier the hotel we were at started with construction outside at XA:00 am. This flight was already an hour late, and it was XO:30 pm at night before we could even taxi. I might also need to use the tools the Ipad has to draw a taxi route when I am not super familiar with the airport. Yes this is a hub for us, but the deice pad was in a place I [had] never been to. The First Officer was also overly concerned about cleaning the aircraft flight deck due to the COVID virus, as we changed planes from an earlier flight. I was having a slight reaction to the spray as I breathe it in, which gave me an allergy response. I had to step out of the flight deck for a few minutes. So my pre-flight taxi brief was lacking and I should of and will going forward instruct my future First Officer's that I need the extra set of eyes outside. On top of that, I will send an email of my concern for the proper use of this spray. We don't have much guidance on it. After being de-iced on the X taxi pad area, we were given taxi instructions to cross Runway XXR-XXL at Taxiway F, but the instruction to get there was a little vague because we started on Taxiway H. Because the ground being covered by snow, the taxi signs became the primary way to identify the taxiways, the painted tarmac signs were covered by snow. I believed I passed Taxiway F because the sign was further away and I was distracted because the First Officer was having difficulty with the de-ice checklist and holdover times. I then (most likely) made a left turn on Taxiway Bravo and right turn down Taxiway V. While on Taxiway V and approaching the intersection of Taxiway Y & V, I made an all stop as I was confused and approaching two runway intersections. I saw I went past Taxiway F and then had to get my bearings where I was. I declared to the First officer that I was lost and needed help. Once I figured out where I was, ground control gave me a new set of taxi instructions. The ground controller did not seem to be too concerned about the taxi deviation. However, at the time the confusion was real and I did not want to cross a runway without figuring out where I exactly was. After this I brought CRM back into the game and had a frank discussion with the First Officer. I told her that I can't taxi the plane and look up deice holdover data at the same time, and that the current issue is that we don't have much time to mess around with since we only used type 1 fluid (15 min). I then asked her that it looked like it stopped snowing anyways, so would she agree or disagree to that assessment? She did so we proceeded to taxi to takeoff.

## Synopsis

Air carrier Captain reported a taxiway incursion and cited fatigue, weather and signage issues as contributing factors.

## Narrative: 1

Just clearing the bridge prior to Taxiway 1 we were cleared for takeoff Runway ZZR at approximately XA00z for an on-time departure. After brake release and prior to 80 knots our takeoff clearance was canceled. We aborted departed [Taxiway] 1X and were instructed to hold short of [Taxiway] 1Y for 45 minutes both engines running (vaccine on board) and wait for departure control to resume duty (allegedly COVID cleaning). Tower and ATC need to coordinate their operations. We shouldn't be getting a takeoff clearance cancellation after brake release. Over 80 knots we may have had to press anyway as opposed to a high-speed abort putting everyone in a precarious position. Since company is the only significant operation during the AM push in ZZZ there isn't any legitimate reason ATC isn't aware and able to accommodate our operations.

## Synopsis

Air carrier Captain reported performing an aborted takeoff after getting takeoff clearance cancelled during the initial roll.

## Narrative: 1

While boarding for our ZZZ-ZZZ1 flight, the Fwd FA came into the flight deck to tell us about a rude passenger. Passenger boarded the plane without wearing a mask and took a seat in X1. The Fwd FA approached and reminded passenger about the required mask policy. Passenger reluctantly complied and as the FA turned to walk away, the passenger called her an "[expletive]". After the FA informed us about this, I first asked the FA if passenger is being disruptive. The FA stated that passenger was not. I then asked if she would like me to go speak to the passenger. The FA stated that was not necessary. Finally, I asked if she would like me to request a customer service representative. The FA again said no, the situation is under control and she would let us know if the problem continues. I messaged my Dispatcher to keep them in the loop of what was said. We pushed, de-iced, and while taxiing to our assigned runway, I asked the FO to call and make sure there were no further issues in the back. The FA stated that the passenger had fallen asleep, so we elected to continue. About mid-way through the flight, the Fwd FA called up and stated that the passenger had woken up and was starting to cause some disturbances. The FO was already the PF and I asked him to take radios as well. The passenger asked for a cup of water so passenger didn't have to wear the mask because she was "drinking". The FAs let this go on for about "30 minutes" (quoting them) and the passenger had not drank any of the water. Passenger again was non-compliant with the mask and both FAs asked passenger three times to wear the mask. At this point, I sent another message asking for a customer service representative to meet us at the gate in ZZZ1 and explained to the Dispatcher everything the FAs had told me. About 5 minutes after that, the Fwd FA called up again. Again, I told the FO his controls, his radios. The FA then explained that the passenger was now starting to "scream" on the plane and yelled very loudly, "#@%^! I'm not from [foreign country]!" While doing this, proceeded to flip off both FAs. I again messaged our Dispatcher with this information and now requested Security along with the customer service representative. The FAs and I talked back forth regarding passenger danger level. The passenger was remaining in the seat and making no other threatening gestures, so we did not see the need to declare an Emergency. We continued the flight to ZZZ1 with no further incidences. After landing, I had the FO call Ops just to make sure a customer service representative and security were waiting for us at the gate. Upon arrival into the gate, a customer service representative and security officer where indeed right there. The customer service representative immediately came onto the plane and removed the passenger. The FAs did not make any indication and no one told me they suspected the passenger was drunk. Seems as if passenger was just a genuinely disturbed person. We probably should have gotten security or customer service involved at ZZZ because of the name calling. Because the passenger had put on the mask and was making no further threatening behavior, we decided to make a note of it and continue. We all agreed though, that if passenger made one more derogatory comment, we would most likely be removing passenger from the flight. We had no further problems until mid-flight.

## Synopsis

Air carrier Captain reported a passenger was not compliant with mask policy and being disruptive. Captain reported multiple interruptions during the flight in order to communicate with company about the situation.

## Narrative: 1

Flight Attendant was preparing for door closure checking bins and seat belts. Upon reaching Passenger X in XX2 noticed young man mid twenties wearing mask below his nose. She asked him to pull his mask up and got no response. She motioned to him to get his attention and repeated herself, but he just stared straight ahead in defiance. She had to repeat herself and asked if he understood English. He made an eye roll and told her, "You can leave now," dismissing her instructions. The Flight Attendant approached the cockpit and told me the situation. We were now past departure time and I stepped back to reiterate the mask policy verbally. When I approached his seat, he was staring straight ahead with the mask just barely over his nose. I explained Airline has a mask policy for everyone on the airplane except when actively eating or drinking, and that he was not being singled out and needed to follow the instructions of the flight attendants. His response in a raised voice was, "I'm wearing the [expletive] mask!" and "You're making me angry." I asked him why he was angry and then what he thought he would do when he got angry. He just tried to stare me down and I decided there was no point in continuing this conversation with him. I made the decision to have Customer Service remove him from the full flight to prevent anymore altercations once airborne.

## Synopsis

Air carrier Captain reported having a passenger removed from a flight due to non-compliance with face mask policy and passenger misconduct.

## Narrative: 1

On arrival into ZZZ from the south, we were vectored off of the ZZZZZ procedure and held high due to traffic. We had been previously queried as to our RVR requirements for [Runway] XXR. We were set up and briefed for CATIII approach to XXR. Just prior to ZZZZZ waypoint, we heard traffic ahead cleared to descend via ZZZZZ arrival landing north. We were then given clearance to descend via the arrival landing north and were unable to meet the new crossing restrictions. Due to 71 knot crosswinds our heading was 320. The vector we were given for descent was 340. This was assumed to be a 360 for descent. As we turned through a heading of 260 ish we were told to make an immediate right turn for restricted airspace. We complied. We continued on the arrival and had an uneventful hand off to approach. I believe that the ATC is currently overworked due to COVID cutbacks. Many communications are being missed in the last months because ATC are covering too many sectors. Our lack of fore warnings regarding the changes to airport configuration left us with inadequate situational awareness. We followed the vectors given to us with incorrect assumptions. I'm grateful that this situation was resolved without incident. My recommendation is that we begin to re-staff ATC to normal pre-COVID operation.

## Narrative: 2

Flight was left high on the ZZZZZ Arrival. ATIS had us landing on [Runway] XXR. We were cleared for the ZZZZZX but never informed by ATC that ATIS X special was issued at XA22z we only learned that there was a runway change due from listing to arrival aircraft in front of us. We were now high for landing [Runway] YYL by 6,000 feet at the same time we were instructed to slow to 190 kts. We can slow down but not go down at the same time. We were instructed to fly heading 340 as we descended the controller once again said turn left 340 which we were on and we assumed he wanted us to do a 360 which is common to loose altitude and rejoin the arrival. He was busy with several other aircraft left high the weather was poor in mild turbulence. The next call was for us to turn I believe 040 because he said we are going to hit a restricted area. I was heads down retrieving the new ATIS as well and programming the FMS for a different runway. This was a combination of change of runways, poor weather, and aircraft being left high by two controllers and high winds with an approach to mins. This was a series of events that lead to an aircraft being out of position. When the weather is poor we cannot skimp on air traffic controllers they need to be tentative to aircraft and where they are going. If the aircraft is out of position. It should be quickly realize especially when a runway change has been posted and an aircraft may not have received the special ATIS.

## Synopsis

Air carrier flight crew reported airspace, heading, and altitude deviations during approach. The Captain stated a late runway change and Controller workload were contributing factors.

## Narrative: 1

Aircraft X, ZZZZ-ZZZ1 was the continuation of a planned [refueling stop] for ZZZ-ZZZ1. Thus the passengers remained on the plane while there was a crew change and fueling. The crew inbound from ZZZ reported that the APU failed multiple start attempts after landing. ZZZZ Maintenance was working to fix the APU and was in and out of the cockpit and the lower E&E bay. Upon boarding the aircraft my FO requested that external air be connected to the aircraft. After some time we were told that air conditioned air was not available, as the airport had "switched" over to heat. Wanting to get some (any) airflow on the aircraft we requested that it be connected. Again after some time we were informed that no external air was available at the particular gate. At that point we requested a start-cart unit be connected so that we could use it to run the packs. Eventually this was accomplished, but only after the passengers had been onboard without any cabin airflow for an extended time, perhaps 90 minutes. Early upon arriving in the cockpit, I called dispatch to inform her of the problem and to let her know that we'd keep her in the loop as maintenance worked the problem. During our initial time in the cockpit the two mechanics were coming and going and I multiple times, offered to get out of the cockpit to allow them access to the displays as they worked the problem. Eventually, I left as they were paying no attention to social distancing, often reaching over us to access the FMC keypad. Though they were wearing masks, they were often pulling them down to talk on the radio or the phone. Multiple times I had to ask them to replace their masks over their mouth and nose. I felt they were too focused on their work and forgetting the COVID precautions. After some time, my concern changed from maintenance getting the APU fixed, to them not being able to get it fixed. Normally, I'd have little to no issue operating a flight without an APU, however with the on-going pandemic there are additional considerations. I thus called the dispatcher and let her know of my concerns and asked if she would reach out to the Operations Center OM for what airline plans are for an inop APU in today's environment and to get more information / guidance to aide in our decision making. Eventually, I was informed that the Operations Center OM had simply said that "We had to get the passengers to ZZZZ1." This was not information, guidance nor helpful. My responsibilities are to do that safely and given the pandemic we needed more information to help us assess and understand the passenger safety implications. I was VERY disappointed with the lack of understanding, information and support from the Operations Center. Our dispatcher, and her relief, did a FANTASTIC job! I also attempted to find the information related to running the APU during the pandemic. Unfortunately, given the format, there is no way to read the titles without opening each one. It was too time consuming at that time, thus I was unable to access the needed information. The display really needs to be made user-friendly. The Dispatcher was able to coordinate with ZZZZ1 and we were told from the dispatcher that ZZZZ1 had external air and a start cart and could support a no APU operation. I asked that they be informed that we would plan on keeping an engine running until both external electric AND air were connected so as to maintain cabin airflow. We eventually agreed to accept the flight with the APU deferred

believing that we had a viable operational plan, no thanks to the Operations Center. Upon arrival in ZZZZ1 there was much confusion, likely due to language barriers. It took some time to understand that there were local rules that prohibited them from connecting external air or a start-cart while an engine was running. Once we shut down the left engine it was +10 minutes before external air was connected to the aircraft. Given the on-going pandemic the key is airflow. Yet it appears there has been no planning or consideration of what to do in the event of an inop APU. I feel that on this flight we completely blew our promise to passengers and employees with regards to airflow and air filtration. I've continued to assess how I could have made better decisions, but can find no guidance or related plans. I'm not sure but perhaps refusing the aircraft and deplaning the passengers would have been safer from a COVID standpoint than leaving them on an aircraft without any airflow for such an extended period. I believe that we need to come up with some clear plans, guidance and actions to support a flight if we are going to operate with an inop APU. Perhaps we need to even ask if given the pandemic and Airline's associated messaging if we should even operate with an inop APU. I'm not sure why ZZZZ was unable to fix the APU, as the ZZZZ1 mechanics were able to identify and fix the problem in less than 30 minutes from block-in!

## Synopsis

Air carrier Captain reported the APU was inoperative and attempted to have maintenance repair it.

## Narrative: 1

Family of four delayed flight due to their 2 year and two month old and 5 year old not wearing masks. Mother told Agent, Supervisor and flight attendants [the] children would be fed for entire flight to avoid wearing masks. After I was briefed on the situation we had the Supervisor repeat the mask requirements which they agreed to follow. During the flight the father was asked to put on his mask and he pointed at his cup of soda and cookie, but would not speak. By pointing at the soda/cookie he was indicating he did not have to wear his mask. This went on for a long period of time during our 3 plus hour flight. Our flight was close to capacity. I also informed Dispatch and asked for a Supervisor to meet the flight as the family was supposed to connect on another flight.

## Synopsis

Air carrier Captain reported a family ate and drank during the entire flight to avoid having to wear face masks.

## Narrative: 1

Following issuance of a first class medical under special issuance for sleep apnea, conducted a flight for a flight review with a qualified flight instructor. This flight was conducted a few weeks after the first possible dose of an investigational vaccine for COVID-19. The vaccine was unapproved for general use, and the trial the pilot is participating in phase 3 at the time of the flight and currently. The pilot has subsequently taken a second possible dose, but was unaware of any potential FAA interpretation that

participation in a vaccine trial was potentially medically disqualifying, he treated the situation as with any vaccination and self certified himself as fit to fly having no adverse symptoms. This may have been incorrect for the moment, but was done in good faith at the time.

## Synopsis

Pilot reported taking the COVID vaccine and was unaware that it was unapproved for general use and a possible FAR violation.

Narrative: 1

I am reporting my misinterpretation of the COVID relief provided by SFAR 118-1, which resulted in my acting as PIC beyond by required flight review date. My last flight review was in Month X 2018, so normally I would need another one by Month X 2020. But I saw a headline online (maybe from [organization] or another similar site) that the end dates had been extended due to COVID relief, so I didn't worry about the expiration too much - **many official agencies have been extending deadlines for things like driver's license renewals etc.**, and I assumed FAA had done the same. So I flew once in Month Y and once in Month Z; the last flight being to take my plane to a maintenance shop for its annual. I then started thinking about getting a flight review, so I decided to read SFAR 118-1 to determine exactly what relief the FAA had provided and whether it would last until my plane was ready. To my surprise, there were requirements about recent experience, type of operation, the need to take Wings courses, etc. - it was much more complicated than just an extension of time. But I determined that I did meet the requirements, provided I took the required Wings courses; I decided that both getting my plane back from an annual when it was finished, and traveling to a flight review were operations required by the FAR's and were thus permitted. The annual took longer than expected, but I saw headlines that the relief had been extended with SFAR 118-2. When the plane was ready to be picked up on Month C day 2, I took the required Wings courses and flew my aircraft back from the maintenance base; thinking that I had until Month C day 31 to complete a BFR. Then on Month C day 14 while preparing for my flight review later that day, I carefully read SFAR 118-2 so I could explain to the CFI how I had adhered to it. At that point I realized that while its relief should have applied to the end of my plane's annual, the delay in the annual's completion plus the fact that the FAA's further extensions did not apply to me meant that I had exceeded the relief allowed by SFAR 118. To summarize, the SFAR is new and complicated and I mis-interpreted it despite a good-faith effort to comply. I think the substance of the SFAR is reasonable now that I understand it, and although it's vague in places, I understand that it's an emergency regulation, so it doesn't seem too bad. I think what would have helped me is a requirement that, in order to use the relief offered by SFAR 118, one of the required Wings courses should have been a tutorial on SFAR 118 itself. My flights past the Flight Review deadline were uneventful and I am of course no longer flying until my next Flight Review is complete (I started it on Month C day 14 as stated but the flight portion was delayed due to weather). I doubt that SFAR 118 will be relevant much longer, but I think adding a Wings course the next time some complicated new SFAR comes out would go a long way towards increasing compliance and understanding.

## Narrative: 1

Upon boarding [Passenger X] was noted to have a valve connected to his mask board. As Flight Attendant A was able to ask the valve be covered with one of the on board masks or swapped at his discretion due to the company not permitting direct exhaust valves. He indicated his mask had filters on the interior and was disappointed he could not use his

preferred mask. After discussing with crew we agreed the valve at least needed to be covered or swapped out. Mask was swapped prior to departure. Advised I had asked for a Supervisor to ensure we were on the same page regarding masks and valves noting it was not my intent to single him out or pick on him, but wanted to ensure we were on the same page for policy. The passenger thanked me and we departed for ZZZ1. Enforce policy at gate.

## Synopsis

Flight Attendant reported a passenger that had a valve on their mask was asked to replace the mask or cover the valve.

## Narrative: 1

We noticed when we were doing the in-flight service that passing out the bottle of water/snack bag first, meant that all the passengers had their masks off as we were serving them from the bar cart. It would be safer for passengers and crew to serve the beverages first, then the snack bags as the amount of time the masks were off would be

shorter. This would also limit our exposure time while passengers have their face masks off.

## Synopsis

Flight Attendant reported there should be a change to the in-flight beverage/snack service to limit exposure time to Flight Attendants while passengers have their masks off.

Narrative: 1

While in cruise flight Flight Attendant (FA) A called the flight deck. The First Officer answered the call. He told me the FA had a non-compliant passenger with the mask. He reported that she was tapping him trying to waken the passenger and he pushed her arm away. We transferred control and I called her back and asked if everything was OK and to repeat what happened. We ACARS Dispatch to have a Supervisor at gate. We were in range when we received the call and elected to continue to ZZZ. The passenger was mask non-compliant. He was told to cover his nose with the mask. He was sleeping when mask slid down. FA woke passenger with a tap, it may have startled him, but he pushed her hand away and swore. I believe the company has to make sure the passengers are aware of the seriousness of non-compliance.

## Synopsis

Air Carrier Captain reported a passenger was not complying with face mask policy during flight while sleeping.

## Narrative: 1

Aircraft being pushed back from gate XX in ZZZ. Just prior to our pushback, another company had started to tow a type X aircraft from gate XX1 to XX2 (I didn't see which gate specifically as I was the wing-walker). The crew towing the type X aircraft cut across the ramp when they had plenty of room to maneuver around our flight and in the process give us plenty of room. The other company tow team's action forced me to motion to our pushback driver to stop the push ASAP. We stopped our push and the other company continued to their gate. Our crew then continued our push back and dispatched the flight normally. The X gates are being used for RON aircraft due to ongoing COVID-19 flight reductions.

## Synopsis

Ground wing-walker reported ramp safety concerns because of the unusual aircraft parking areas needed during the COVID-19 reductions.

## Narrative: 1

During pushback a Flight Attendant called and informed me that a passenger was refusing to wear their face mask. I asked if she wished to have the passenger removed for non-compliance to which she responded in the affirmative. I had the push crew pull us backed to the gate and requested a Supervisor from operations. Arriving at the gate, the Flight Attendant informed me that she made four attempts to have the customer replace his mask over his nose to which he refused or was otherwise non-compliant. The Gate Agent boarded the plane and was unable to get the customer to wear the mask appropriately so he was removed.

## Synopsis

Air Carrier Captain reported a passenger would not comply with face mask policy and was removed from the flight.

## Narrative: 1

After takeoff Runway X on the ZZZZZ3 departure ZZZZZ transition, the Pilot Flying called for clean wing configuration, Climb Power and VNAV. Pilot Monitoring failed to properly select and verify the selected vertical command. PF flying did not receive the correct level off climb guidance. Human error focused on initially to cross ZZZZZ1 above 7,000 feet NOT at or below 7,000 feet. ATC immediately instructed aircraft to "STOP CLIMB" and level off in which we complied with. Contributing factors: Pandemic and lack of flying time in last 6 months. Unfamiliar airport operations.

## Narrative: 2

At departure called for clean wing, CLB, VNAV. PM cleaned wing and selected VNAV,CLB. I as PF failed to verify new VCLB mode on PFD. Contributing factor: - on initial brief i misread SID as cross ZZZZZ above 7,000 feet. The SID requires a cross ZZZZZ below 7,000 feet. - last flight was July 2020.

## Synopsis

Corporate flight crew reported an altitude deviation during departure and cited lack of flying as a contributing factor.

## Narrative: 1

I came to my gate early to work my next flight. A flight was still there and boarding. I watched as passenger after passenger scanned their boarding pass or mobile device across the gate reader. I even watched as one gentleman sneezed with his boarding pass in hand. The reader was never wiped down with sanitizer between scans. I believe we should be wiping down gate readers before and after each flight.

## Synopsis

Gate Agent reported the electronic boarding pass readers at the gate need to be sanitized after each flight.

Narrative: 1

During boarding Family A was sent down to aircraft not wearing face covering. Passengers were asked the age of the child at the entry door and stated 3 years old. Passenger stated at the doorway she had the child's mask in her purse and would put it on at their seat location, I apologized and stated the mask would need to be on the child before boarding the aircraft. Family A then stepped out on the Jetway, pulled the mask out and said it would be difficult getting the child to wear and keep the mask on. I wanted to have the passengers go back up and speak with customer service, but thought they would comply. As other passengers were boarding, Family A followed behind, I did not notice they had not put the mask on the child. After we completed the safety briefing and doing the walk through, Family A were sitting with the child, had not placed the mask on the child, mother had placed the mask back in her purse. I apologized again and stated she would need to put the mask on child. Captain had signaled for takeoff. I also mentioned to the parents the Captain wanted to go back to the gate and I told them I did not want to go back to the gate. The mother tried to put the mask on the child, the father tried, then stated he wanted to give her some medicine that would make her go to sleep. I informed the Captain what was going on and of our progress, Captain made the call to go back to the gate. Several managers met the aircraft. Family A was asked to deplane.

## Synopsis

Air Carrier Flight Attendant reported a family was removed from the flight because their 3 year old child would not wear a face mask.

## Narrative: 1

There was a break before the next flight to ZZZ. Flight attendants left the aircraft. First Officer (FO) left the aircraft. Captain left the aircraft as one of the FAs came back to the aircraft. Captain came back to the aircraft. Both FAs and FO were on board. Also a Ramp Agent (RA) was on board sitting in the back of the plane resting. One of the flight Attendants told the Captain she was concerned that the RA did not complete the security search. From her perspective it seemed as if the security check was not complete. Captain went back and asked the RA if he had completed the security search. He said yes. Captain asked what was involved with the search and he described that it was a visual search and where he looked. Captain told the Flight Attendant that the Ramp Agent said he did it. Flight Attendant was not sure because the RA hadn't lifted up the seat cushions and looked behind them or put the tray tables down as the FA had seen done in previous security searches. Captain asked the RA if he could do the security check again and that there was a concern that it was not complete. The RA started doing another security check lifting up the seat cushions in the first couple rows. Captain went to the flight deck to prepare for the flight. Captain assumed that the security check got completed the second round and all was good to go. Flight departs for ZZZ, Captain and FO review the security section of Flight Ops Manual (FOM). After arrival in ZZZ, the Captain goes to review the security section with FAs. It is then that he hears that the Ramp Agent did not go completely through the cabin on the second time and check seat cushions and tray tables at ZZZ1. The RA talked with another RA and then told the Flight Attendants that the search had happened and it was complete. The Captain called the Duty Officer and had a discussion about the situation and the wording in the FOM. Duty Officer told the Captain that he would call back after a few minutes while he made a call to find out what the Ramp manual says to do. After the Duty officer called back to the Captain he referenced the Services Manual about aircraft search to and from ZZZZ, wording was not the same as what is in the FOM. The Duty officer agreed that there is room for some confusion between the wording in the two manuals. Captain decided to stop the operation and have ZZZ ramp agents do a Full Search before continuing on to ZZZ2. A Big thank you to ZZZ RAs in knocking out a Full Search. My thoughts (Captain) there is some confusion in how the FOM describes a cabin search and what a visual inspection actually is on the security form. Pay closer attention to details. Don't assume anything, make sure everyone is on the same page in understanding of what's happening. Ask questions, try and understand the full picture. It's been awhile since our airplanes have made ZZZZ trips and it was the first time for our crew the other day since prior to COVID-19. We need to show each other respect, and give grace in this super stressful time. After talking with the Duty Officer, I more fully aware of the staffing issues with ramp, COVID-19 cases and just under staffing in different areas which has been extremely difficult. I also see a value in debriefing the crew at the end of the trip or after abnormal situations as a learning time for all as we grow as professionals.

## Synopsis

Air carrier Captain reported the aircraft security check may have been improperly conducted and cited confusion between the wording in two manuals as a contributing factor.

## Narrative: 1

During a Flight Attendant crew change and passenger boarding, our Flight Attendant B advised Flight Attendant A and myself, Captain, that she received a call from her personal

Physician that she had a positive result for COVID-19 test resulting from a pre-surgery screening. A Flight Attendant immediately advised B Flight Attendant to contact Crew Scheduling and request to be removed and replaced for the flight. The Captain immediately advised Operations Agent to discontinue boarding and have passengers in jet-bridge return to boarding area in terminal building, while B Flight Attendant gathered her belongings and removed herself from the aircraft. I then requested the Operations Agent to call Flight Attendant crew lounge to see if a Reserve Flight Attendant was available to assume vacant position. The Flight was originally advised of a 30 minute delay for inbound Flight Attendant from another flight. After approximately 10 minutes, we were advised that a Reserve Flight Attendant was enroute from the crew lounge to cover flight. The Flight took a 17 minute delay due to the Flight Attendant exchange.

## Synopsis

Air Carrier Captain reported during passenger boarding one of the flight attendants received a call from a physician reporting a positive COVID-19 test result.

## Narrative: 1

During Takeoff a strong odor of chemical/burning plastic filled the cabin and all-call was made to confirm everyone else also smelled the same odor. It lasted for about 15 minutes. Pilots also confirmed the smell, along with some passengers and non-rev crew members. During descent and approach the same smell came back through to landing, 15 minutes, the chemical burning odor. The Flight Attendants felt symptoms (coughing, watery eyes, sore throat, lightheaded, headache) from this odor and had Medical meet us at the gate.

The First Officer also had Medical check him as well. We did not feel well enough to continue on for our next segment of our trip. Due to the pandemic of COVID-19 and the short time frame of a fume event needed for bloodwork, the risk to go to a hospital is too high for both ourselves and others.

## Synopsis

Flight Attendant reported a cabin fumes event during departure and again during descent resulting in health issues. Flight Attendant described the odor as "chemical/burning plastic."

## Narrative: 1

I went into the cockpit for a bathroom break at XA: 30pm. Neither pilot was wearing a mask. I asked, "please put on a mask," and pointed to mine as I entered and saw they weren't wearing masks. The First Officer reached for his mask and put it on as I paused upon entering and pointed to my mask. I again asked the Captain to put his mask on, once again pointing to my mask with both hands this time. The Captain just turned and looked forward out the window in front of him. He would not verbally reply nor put on a mask. He refused to follow company policy. We did not speak the entire time I was up

there for their break - he looked out the window, I stood silently by the door. I had to stand there in the cockpit and potentially be exposed to COVID-19 and the serious consequences that could ensue. It is my understanding that COVID policies apply to everyone! When the First Officer swapped out, I said something to him about the captain refusing to comply with policies and procedures and being disrespectful. The First Officer chose not to comment on the Captain's inconsiderate and dangerous behavior, although the First Officer was wearing a mask at that time and he kept it on while I was in the cockpit. I chose not to go up again, so a colleague said he'd help with the meals in 20 minutes. At the time the colleague handed the meals up, the person taking them from him didn't have a mask on. The Captain did not wear a mask when others went into the cockpit to help. Several crew members chose not to go up there at all, several were offended and uncomfortable but chose not to say anything, and one said they didn't care that much. Fortunately, we only flew one leg with the Captain. The Captain's behavior was inappropriate, disrespectful, non-compliant with company policy, and potentially quite dangerous. His behavior was unsafe and unacceptable on all fronts.

## Synopsis

Flight Attendant reported that the Captain did not wear a face mask while flight attendants were in the cockpit and was non-compliant with face mask policy.

## Narrative: 1

Upon doing cockpit pre-flight to ferry Aircraft X out of long-term storage from ZZZ to ZZZ1, I noticed the aircraft was fueled improperly. The wing tanks were not full and were imbalanced, there was no fuel in the center tank and there was fuel in the ACT (auxiliary) fuel tanks. This is not the proper configuration for fueling the aircraft. The wing tanks must be full before there can be any fuel in the center tank and certainly there cannot be fuel in the ACT tanks in this scenario. We notified the mechanics onboard who were assisting us to make sure everything was good prior to departure. What ensued was a three-hour debacle trying to figure out how to drain the fuel from the ACT tanks and ensure the only fuel was in the wing tanks. Planned release fuel was 25k, which in this scenario should result in fuel only in the wing tanks. After the fueling issue was finally resolved, we received two separate ECAMS after engine start. Shut down the engines and called the mechanics back to fix the new issues. SMOKE DET Fault and ANTI ICE STBY L STAT. MX fixed those two issues and we finally departed over four hours late. Someone in ZZZ is not making sure [aircraft company] aircraft coming out of storage are fueled properly. This is the second time I have caught a problem. Someone less vigilant may miss the problem. This is the second fueling issue I have had with an aircraft coming out of storage from ZZZ in the past two weeks.

## Synopsis

Air carrier Captain reported having an aircraft that was fueled incorrectly for a ferry flight.

## Narrative: 1

While flying the ZZZZZ RNAV departure this morning, ATC asked us if we were assigned a heading from the last Controller. The PM replied stating we were direct ZZZZZ1, with ZZZZZ behind us on the FMS legs page. This made us look closely at our legs page and moving map on our iPads, which showed us off course. ATC replied with "roger." Shortly following that, we were handed off to the next controller. When we checked in we mentioned our box input error and he said, "No problem, proceed direct ZZZ1. How's that?" No further discussion with ATC. I immediately knew what happened and why. The FMS would not download our flight plan (not uncommon) so I built in manually. As I looked at the clearance I noticed the departure and selected it, but failed to assign the ZZZZZ1 transition. ZZZZZ1 appeared on our route packet as a different fix, not part of the departure and I fell for it. I had a lot of fixes and airways to type in so I focused on getting them correct and failed to notice how I had loaded the departure, without the transition. Ultimately we were missing 4 fixes in the legs page. I checked the first 5 fixes in the legs page to confirm the altitude restrictions since we were cleared to climb Via. Normally I check all the fixes but the other contributing factors today were no coffee or breakfast at this point. I wanted to get setup and ready so I could get coffee. Due to COVID, food and coffee was not available at the hotel so we catered it for our morning departure. Additionally, the pax showed up XX minutes early which squashed my plans to eat before we took off. Additionally, the lead pax birth date was incorrect on our brief so we were further distracted. Human error. I caused this event during the FMS setup. The pre-flight distractions becoming more and more common place with passenger related issues of catering and name details, today it got me. Another potential cause could be how the flight plan route is displayed on our packets. I'm used to seeing something like "ZZZZZ.ZZZZZ1 ZZZ2, etc.," as the FMS shows, but the filed route on our flight plan shows "ZZZZZ ZZZZZ1 ZZZ2, etc." Seeing it with the period would have drawn my attention to the ZZZZZ1 transition. Suggestions - For me, all things being the same again, if the filed route on our flight plan packet showed "ZZZZZ.ZZZZZ1" this deviation wouldn't have happened today. Regardless of this and the distractions, I need to be more careful.

## Narrative: 2

Clearance was ZZZZZ departure ZZZZZ1 transition, data link would not download flight plan. Flight plan was manually entered by PF loaded ZZZZZ departure to ZZZZZ then direct ZZZZZ1. When verifying flight plan off filed route page neither of us caught this manual entry error. When asked if on heading by ATC we started wondering why so checked departure and GPS position and found our error. Asked ATC if we needed to correct error and they said no and cleared us farther down line on clearance. Possible contributing factor were passengers showed XX minutes early, the way ARINC flight plan

filed route shows on first page. Things could do to correct this issue on future. Verify and check each fix on the departure and also check mark each fix on lat long pages in flight plan compared to what is in the box. The way filed route showed on ARINC page, not loading transition properly when manually entering flight plan. Cross check each leg of the departure versus the plate. Also check mark each way point matches the lag/long pages in the ARINC flight plan. Any time having to manually enter information verify everything a couple times.

## Synopsis

Corporate flight crew reported a track heading deviation due to loading an incorrect transition fix in the FMS.

Narrative: 1

Alerted to passenger with continuous cough throughout flight. Passenger in [seat] X3 had spent the last year in [foreign country] and reported that she had the cough for a week and had been taking medicine for 2 days. Flight Attendant witnessed her taking cough medicine during flight. No other COVID symptoms reported. Dispatch and Medlink consulted. Passenger was relocated to aft of aircraft to isolate, per recommendation of Medlink doctor. She was also given an N95 mask. Paramedics met aircraft. Passenger's temperature was taken by EMS and was normal. She refused to answer any further questions and treatment. All 3 flight attendants [were] exposed to this passenger.

## Synopsis

Air carrier Captain reported having a passenger who was coughing throughout the flight.

## Narrative: 1

Prior to block-out of Aircraft X, ZZZ airport Tower and Approach Control closed due to a COVID cleaning. Dispatch informed the flight crew to remain in the gate and not block until a new flight release could be sent with an alternate. Additionally, a non-tower operation worksheet was needed which includes approval from the manager and flight operations duty officer. Once the crew signed the new release and had a copy of the approved non-tower ops worksheet, the aircraft blocked out and operated to ZZZ. Later that night, the captain called the Flight Operations Duty Officer around XA: 15pm to inform the Duty Officer that when he landed the aircraft in ZZZ, the airport lighting was not operational. However, the flight crew was able to safely land the aircraft in ZZZ because the moonlight was bright. There were no NOTAMs indicating the airport lighting was INOP. Additionally, Dispatch was never notified by the crew that the lighting was INOP. Dispatch was only notified by the Duty Officer four hours after the aircraft blocked in at ZZZ. I called the airport Tower after it reopened, and the controller stated he wasn't aware of any lighting issues and the lighting was operating normal. Even though this was a short flight, communication from the flight crew to dispatch was poor. They're several things Dispatch could have helped with prior to the outcome, including calling airport operations to inquire about the lighting issues and suggesting diverting to the alternate airport.

## Narrative: 2

Just before we were ready to pushback ground ops messaged us to let us know that ZZZ was going to non-towered ops for COVID cleaning. After we reviewed the FOM to ensure that we collected all the required documents and procedures. We had all the required items per the FOM. With that we departed 1 hour and 8 minutes late. We knew that Tower and Approach would be closed upon arrival. We were being vectored in by ZZZ Center. We requested to come in between ZZZZZ and ZZZZZ1. We requested the visual into Runway XX at ZZZ the weather was VMC. On the base leg I has a visual on the PAPI and the captain intercepted final around 8 miles out and was flying the glideslope towards the runway. We were cleared the visual and switched to CTAF frequency. We made multiple calls on final reporting our position. We also tried to activate the lights on the field 3 times with no success (there was nothing on the approach plate indicating it would be pilot controlled. But we hoped that it being listed as the CTAF would give us control). Around ZZZZZ the runway was clearly coming into view. By 1,000 feet we could clearly see the runway and all the markings. The Captain then proceeded to land and we taxied into

parking. The landing occurred at XA15z which was in the twilight hours. At no point did we feel that we were in danger or unsafe. We mistakenly used the takeoff lighting requirements. After landing we looked everything up in the FOM to double check ourselves. We do feel it would have been dangerous to go around in a CFIT moderate environment with minimal coverage from Center. This was my second flight in ZZZ with the Captain this week. We were comfortable with the approach leading into Runway XX. The event was caused by ZZZ Tower not leaving the lights on when they closed and us as a crew using the takeoff lighting requirements vs landing requirements for CATI table. We could have delayed longer out of ZZZ1 to arrive when ZZZ was definitely going to be open. We could also call the Tower before departure to ensure that they leave the lights on. We could also plan to shoot the ILS all the way from the initial approach fix.

### Narrative: 3

Our flight blocked out due to late sort as well as a last minute change to our normal ZZZ1 [to] ZZZ flight to a non-tower ops flight per ground ops. Once notified of the change due to a COVID cleaning at the ZZZ ATC facility. We then researched the FOM for the details of the procedure. ZZZ is not normally a non-tower ops airport. We communicated with ground ops several times as to required paperwork needed for the flight. They provided us an ATS non-tower ops form, and we reviewed the form while staying in contact with ground ops to ensure compliance. We then pushed and departed. Weather at ZZZ was clear and 10 with light winds. The forecast was P6sm FEW250 and winds 21008. My line in December was the ZZZ out back line, and the previous week I flew this trip four times and this was my third this week. Mostly we had been landing Runway XX during solid VFR WX. We typically had been doing visuals utilizing LNAV/VNAV and ILS guidance in conjunction with the PAPI. Our plan on this flight was to do the same thing. ZZZ Center was our final Controller arriving into the terminal area due to the ZZZ ATC facility being closed. We stated our intentions to do the visual Runway XX. We began trying to obtain runway lights upon entering the terminal area utilizing the CTAF frequency provide by ground ops. We initially got no response and continued our approach and on base began to pick up the PAPI. As we rounded base to final we were locked in on the LOC/GS, LNAV/VNAV and the PAPI. Landing was at XA15 local which put us in the astronomical twilight hours. We continued to try and access the lights with no success but fortunately as we continued the visual, we gained solid visual sight of the runway with all of its markings while staying on the desired path. We were confused by the light issue but were more than content with our visual picture. We elected to land due to having the runway and all of its markings in sight vs going around at a CFIT airport with minimal ATC control. Unfortunately, I mistakenly applied the night takeoff lighting requirements to our landing. Again, myself and my FO discussed and agreed we were solidly established on the visual and had plenty more than enough visibility to safely land. Once on the ground, upon researching the FOM, I realized I had committed unintentional non-adherence to company policy by confusing the runway lighting criteria takeoff vs landing. The confusion created by the late change to non-tower ops was not our ally, and if I could do it all over again I might have requested to delay the flight to have us arrive after the ATC facility reopened , or discontinued the approach and either divert or hold to again allow them time to open back up. The landing was smooth and on speed in the touchdown zone. It was a stressful learning experience, but also a good one. Much was learned by the crew. Cause - As described above, it seemed to be a combination of events that put us in the situation. We could have taken a further delay in ZZZ1 to further research the situation and all the nuances. We could have held or diverted to allow the facility to reopen.

### Synopsis

Dispatcher and flight crew reported a night landing without runway lighting.

Narrative: 1

About 2 hours into the flight, I received a call from A Flight Attendant that a passenger was told on 5 occasions to properly wear face mask and would not comply. The situation never escalated to heated verbal exchanges or threats. I informed the flight attendant to pass on to the passenger that the Captain will have law enforcement meet the aircraft upon gate arrival if he does not comply with policy on wearing of a face mask. The passenger complied for the duration of the flight which had approximately 1 hour remaining. I called ahead to have a Customer Service Agent meet the aircraft at gate arrival and talk with the passenger, which was done. Some passengers believe that certain policies regarding flying do not pertain to them. Keep backing up the flight crew when passenger disregard airline and FAA policy when on board an aircraft.

## Synopsis

Air carrier Captain reported a passenger was not compliant with face mask policy.

## Narrative: 1

During taxi out for takeoff at ZZZ we received an ACARS message stating that "the load close out was invalid" and that we must wait for a valid load close. I got distracted and forgot about getting a valid load closeout and we departed and flew uneventfully to ZZZ1. The Captain and I had had a successful trip. We worked well together. This was our last leg home on our last day. We had confidence in each other and perhaps that led to

complacency. We had just been delayed at the gate for a COVID concern. I think we had a runway change and I got distracted. Perhaps, in the future, I will Scribble "void" over the invalid load close out so that we do not mistakenly use it.

## Synopsis

Air carrier First Officer reported becoming distracted and not getting a valid load close out.

## Narrative: 1

From Captain X - "When I approached the gate for my flight the boarding agent was talking on the phone. As a courtesy I waited until he was off the phone to identify myself

(as working crew). I overheard his side of the conversation and clearly heard him state that he was (now) aware that the first four rows of coach class could not be occupied due to weight and balance and that he would re-seat the passengers that were booked in those seats. During my FA briefing I said nothing about those seats because there was no mention in my flight release that the first four rows of coach should not be occupied. During pre-flight in the cockpit I called my Dispatcher to ask for additional fuel and an alternate and during this conversation nothing was said about the first four rows of coach not being occupied. We pushed at XA: 15Z and got airborne eight minutes later. The closeout had a note about the first four rows not being occupied, but since I recalled the agent saying that he would re-seat the passengers in those rows I did not pursue it any further. After climbing out of ten thousand I called the #1 FA and told him to make sure that no passenger changed their seats to the first 4 rows of coach during the flight and was then told that there were 3 passengers sitting in the first 4 rows of coach. I called my Dispatcher to make sure we were restricted and was told we were. I asked Dispatch to find out why those seats were assigned by the gate agent after I heard the agent acknowledge over the phone that those seats were restricted due to weight and balance and should not be used. I also asked my FA to re-seat the 3 passengers and make sure the first four rows of coach remained unoccupied for the duration of the flight. I don't know why the agent who said he was going to re-seat the passengers didn't do it. The passenger manifest clearly showed that at least one of those 3 passengers was assigned a seat in the first 4 rows of coach by the agent during our boarding process." To tag along with what Captain X said, the TPS did not have any weight and balance information about seat restrictions. The closeout did, but since Captain X knew that the gate agent knew about it already, we figured no one would be assigned those seats. For some reason, those passengers got assigned those seats, I assume because they were non revs and the gate agent was under pressure to get the flight out so they probably forgot about the restriction. Time pressure, gate agents are under a lot of pressure, and seem understaffed during COVID. Due to this, they should be commended for doing the work that they are. They should be thanked for making sure non revs make it on. The intense amount of pressure agents work under day in and day out, adds up and a mistake is bound to happen. This mistake, although a procedural mistake, was not one of extreme error. The margin of error built into weight and balance is wide. If weight and balance is truly as tight as 3 passengers, the FAA would make sure we weighed every single bag individually and get true cargo weights instead of averaging bag weights. We would also weigh passengers instead of simply assuming there are average summer and winter weights per passenger. The flight was completed successfully, transporting XX or so people across the country. Don't work gate agents so hard. Give them the tools they need to succeed and ease up on micromanaging. Let agents make real decisions and they will feel empowered to complete their tasks, like making sure 4 rows are empty on a flight. I could place the blame on the agent and make a bunch of suggestions and punishments up, but I'm tired of the culture of pitting work group against work group here. This is the only airline I've worked for where this practice is known and visible. We are all working toward the same goal of trying to save the airline industry. Let the agent know of the mistake and move on. We need to work together now more than ever.

## Synopsis

Air carrier First Officer reported that the first four rows of the aircraft were to be left unoccupied for weight and balance reasons, but found out when airborne some of the seats were occupied.

### Narrative: 1

We taxied out single engine. There was some distraction/discussion on taxi out regarding a large brush fire burning to the east of the airport. Upon turning north to Runway XXL we noticed Aircraft Y holding short of the runway. There was some discussion of the aircraft as we had a similar setup the day prior in ZZZ and it changed up the departure sequence and we had to maneuver around that aircraft. As we neared the runway the Tower then cleared as for departure without delay as there was another aircraft on final. We lined up on the runway and as I added power I noted the asymmetrical thrust. I rejected the takeoff and advised Tower. After clearing the runway we started the second engine and completed the takeoff without incident. In my opinion we developed some expectation coupled with distraction that it may be a bit before we departed. This must have pulled my mind from the task at hand (starting the second engine). With the Tower then expediting our departed we switched into a rushed sequence that resulted in the error of not starting the second engine. The other aircraft and the aircraft on final also pulled my eyes and attention outside the aircraft more than usual. In hindsight and trying to examine why this happened I have also had some personal distractions that could have been a casual factor in contributing to my lack of focus. This was my first trip after recovery from a moderate case of COVID as well as an [another personal issue.] While I can say these weren't outwardly conveyed or discussed they were heavy on my mind.

### Narrative: 2

We taxied out to XXL from the gate single engine. On the way we noticed a big smoke plume and also saw a fire truck spraying water on field which was unrelated. When we turned on bravo away from view of the smoke we noticed Aircraft Y awaiting takeoff similar to yesterday at what appeared to be the end of the runway. We couldn't tell they were at the intersection prior until we were upon them. I was looking at them when Tower cleared us onto the runway. I read the line up and wait back and instinctively started my before takeoff flows. Notifying the flight attendants, transponder and to config. As I read that checklist ATC interrupted and said cleared for takeoff. I read that back then restarted the checklist and finished it. The captain added power and immediately rejected. We notified ATC and exited the runway. We then started the engine and ran the checklists from there and resumed the flight.

## Synopsis

Air carrier pilot reported asymmetrical thrust on start of takeoff roll resulting in a rejected takeoff.

## Narrative: 1

There was some confusion going into work as I was notified at XA:00 pm for my XA:30 shift and told not to report to work until XD:45 due to Level 3 cleaning that was taking place. When we arrived at work the control floor was empty and ZAU ARTCC resumed operations at XD:55am with no briefings at all. I was working the MID configuration which includes the following sectors (sector numbers removed) along with the following approach controls (ZZZ1/ZZZ2/ZZZ3/ZZZ4/ZZZ5). During my stint which started at XF:00 am and ending at XI:00 am around XX:50 ZULU I spoke with Aircraft X looking for the ILS to Runway X at ZZZ2. I asked the pilot if he had the current weather at the field along with the NOTAMs and the pilot responded with a yes to the weather and that he had read the NOTAMs yesterday. I then read what I thought was all the pertinent NOTAMs to the aircraft. I vectored Aircraft X for the ILS at ZZZ2 and cleared the aircraft in for the approach. I switched the aircraft to advisories and requested a timely cancellation due to a second aircraft being vectored for the same approach. Aircraft X soon cancelled his IFR and reported a down time along with the condition of the runway and that the ramp area was in a much worse condition. I inadvertently missed the snow removal NOTAM and was later on informed by management that Aircraft X had landed on a runway with snow removal equipment on it. Any usage of the active runway should require call to either the facility or on frequency to prevent any confusion on what is going on at the airport. Any and all NOTAMs that directly effect the runways should be better identified. ZZZ2 had over 15 NOTAMs listed at the airfield which all look identical, if the ones like snow removal were BOLD or even a different color it may help the next person avoid the same mistake I made.

## Narrative: 2

I was notified today upon arrival to work that Aircraft X had landed on a runway occupied by snow removal equipment at the time. I was unaware that this had happened. I was working the assist position when the aircraft was cleared for the visual approach. The Radar Controller had issued the weather and read the NOTAMs to the aircraft and neither of us were aware that snow removal was taking place at the airport. The aircraft canceled IFR prior to landing. I was not made aware of the hazardous situation until the following work shift. This is the third report that I have written on this type of event at this airport! Several years ago, I myself had an aircraft execute a missed approach due to snow removal equipment on the same runway. I of course submitted a report detailing the situation and offered recommendations to prevent the situation from occurring again. I received no feedback. I told my Operations Manager, who was aware of the incident, and

was dismissed. I then took it to the local safety council who actually looked into it. However, after some time I was informed that the current procedures would remain in effect. No definite reason was given. If a runway is possibly occupied by snow removal equipment, an aircraft should not be cleared for an approach. Having an aircraft switch frequencies to contact the snow removal crew themselves to land obviously has many drawbacks. The snow removal crew should simply notify the control facility prior to entering the runway. ATC could then close the runway until notified that the snow removal crew has exited the runway. This could be done by radio or phone, thus preventing the situations that have previously occurred.

## Synopsis

Center Controllers reported an aircraft landed on a closed runway due to snow removal equipment and not being able to identify the correct NOTAM for the runway closure..

## Narrative: 1

Passenger X (seated in X1) boarded the aircraft with a small cup of coffee and a bag of cheez-it. He took an excessive amount of time sipping the coffee and eating the snack, keeping his mask off for most of the flight. Whenever I passed through the cabin I would notice his mask off and when I approached him he would take a sip of coffee. He had his mask off this way from the safety demo to the initial descent. When we started our initial descent I walked through the cabin to collect trash and he appeared to be asleep with his eyes closed and his mask off. I woke him up and instructed him to wear his mask over his

nose and mouth. He seemed to be doing everything he could to circumvent wearing his mask properly the entire flight.

## Synopsis

Flight Attendant reported a passenger circumvented having to wear a mask by eating and drinking throughout the entire flight.

## Narrative: 1

Please thank the Customer Service helpers for arriving immediately. 10 minutes prior to departure, the lead Flight Attendant (FA) informed us there was a female passenger who was dizzy and had vomited. The FA was concerned about the passenger's fitness to fly and requested we call for the Customer Service helpers. They arrived and immediately

removed the passenger. I suggested to the Gate Agents that they consider calling for Medical Assistance. I discussed the situation with the lead FA and First Officer. The lead FA said the passenger had described a history of kidney illness. We all agreed we had not received any information that would cause us to suspect COVID-19 illness. We departed on time. I described the event to our Dispatcher via ACARS. After arrival, I called the Duty Officer and the Chief Pilot on Duty and reported the event to them.

## Synopsis

Air Carrier Captain reported a ill passenger was removed from the flight before departure.

## Narrative: 1

ZZZ based Flight Attendant (FA) A was coughing during pre-flight and during the flight commenting about a sinus/cold issues. She accomplished her boarding / pre-departure

duties. FA E advised that FA A was feeling ill due to cold, sinus, headache and now running a fever. (unverified) and that the FA A had taken a cabin seat and was attempting to rest. Dispatcher was notified via SATCOM and advised that FA A was feeling ill, running fever and that I was requesting a Manager meet the flight. I inquired if COVID (rapid) testing was available (due to current world events) for FA A upon arrival at ZZZ. Dispatcher respond that ZZZ did not have rapid testing and Customer Service Manager (CSR) would meet the flight. Upon arrival, the flight was met by 2 CSRs and they were briefed. I also spoke with the ZZZ Chief Pilot on the phone, post flight.

## Synopsis

Air Carrier Captain reported a Flight Attendant on the crew became ill and there was concern regarding exposure to COVID-19.

## Narrative: 1

Need more space to accommodate 6 feet apart. On this day, [it] was very chaotic during the international check-in. We are really short of manpower to accommodate document checking. Violating the safety standards for us the employees and the customers. Please review cameras to see the amount of people in the same area.

## Narrative: 2

I was scheduled to work lobby for international flights to help them to check in and check their requirement COVID-19 for every single customer. At the kiosk I realized that it was around 200 people and only 2 agents were scheduled to work that area. I was very concerned about safety and health of myself and others because there was no social distancing and not following CDC guidelines. I talked with Supervisor and asked to please call a union representative. To see the unsafe conditions that the company is operating. I hope you will be able to see the cameras in order to understand the horrible situation. I think all the authorities including health department will be concerned about this very important issue.

## Synopsis

Customer Service employees reported social distancing concerns at the airport lobby due to it being overcrowded.

## Narrative: 1

Many of our fellow pilots have said to me that many pilots and others have been affected by COVID in one way or another; either necessitating quarantine or even hospitalization. Further, and in particularly our fleet, there is a disruption to the training schedules due to a lack of instructors, hence little, if any continuity. Have the Union and the Company considered shutting down for another month as the surge upon surge rages? There's no need to rush training if pilots will go non-current without the additional flying. Plus an additional month might get us to the beginning of a vaccination. I don't know if I have missed communications or not from the Union or the Company, but what is the plan for vaccinating pilots or other front line employees? Is there a timetable? Where do we stand in the national "Phase 1" rollout? Has an update to the memorandum on pay during COVID sick leave been considered? Specifically, what happens to the pilot who receives round 1 or 2 of the vaccination and has to call in sick due to side effects. What happens to a pilot who has adverse side effects which lead to LTD? Could this pilot apply for the new LTD

benefits and not wait until month X? Is a pilot required to take the vaccination? If yes, what happens if he declines? Where will pilots get the vaccination? Does a pilot have to wait until the Company procures the vaccine? What has FAA medical said about any of this?

## Synopsis

Air Carrier Captain reported concerns regarding company COVID-19 related plans pertaining to sick leave, vaccinations, training schedules, etc.

## Narrative: 1

After landing when I requested that I be able to keep the same squawk for convenience as I was dropping two people off and continuing on VFR, the Tower Controller ask if I heard him calling us. I said no, due to Approach Controller keeping us on their frequency. As we are a helicopter and we are given clearances like "landing at the ramp is at own risk" it can be confusing as to a clearance to land. I thought I was given a clearance to land. I'm not sure if it is due to COVID and staffing issues but it seems like I hear more ATC frequencies managed by one person, so this could have led to confusion during frequency changes.

## Synopsis

Helicopter pilot reported a communication issue with ATC resulted in a landing without a clearance. Pilot stated the Tower Controller was working multiple frequencies, which may have contributed to the event.

## Narrative: 1

Three passengers boarded with their masks down. I asked them to pull them up. When collecting trash, before door closure, I noticed passenger in XX4 mask down again. I asked her again to pull up mask and advised of policy, she laughed at me, then mocked what I had said. I asked again if she would pull up mask. Then advised the Captain of the interaction since I had to speak to her twice while on ground. Passenger in YY3 had mask down for second time in cruise when I collected trash after service. He claimed he was forgetful. XX4 passenger played the peek aboo game where she had mask down but each time I approached, before I reached her, would pulled it up. ZZ4 passenger asked me how many times I was going to ask him to pull up his mask. When deplaning, had mask down.

## Synopsis

Flight Attendant reported three passengers would not comply with face mask policy.

## Narrative: 1

Passengers bag was too large to fit in overhead bin, I advised bag needed to be checked. I noticed the face mask was down and asked her to cover her nose and mouth. She said that her mask just fell down when she sat in her seat. I advised her that her mask had been down since she tried to stow the bag. She started yelling at me and ask if I was the mask police? I said no, but if your mask doesn't fit, I can provide you another mask, she declined. I told the Captain and forward Flight Attendant because the passenger would not comply. Forward Flight Attendant asked passenger if she needed another mask, she complied wearing her own mask. I had to ask the passenger to pull up her mask a second time. When deplaning, passenger had mask down again.

Narrative: 1

Passenger started complaining that he was extremely hot and was grabbing at the collar of his shirt. The vents were open and the aircraft was chilly not warm. I could see that he was sweating and he asked if he could have some water. I went to the back galley to get him water and some iced cloth folds to put on his neck. When I turned around to head out with his items, [his condition had deteriorated]. I immediately called the pilots and we paged for medical assistance. We had a few nurses onboard that assisted us with the passenger. He stated he needed to get to the restroom. I helped the nurse get the passenger to his feet and the passenger went into the lav. He was vomiting for several minutes. I spoke with the Supervisors the next day and advised them of my concerns regarding the fact that this passenger seemed to be exhibiting COVID symptoms. I was advised there was nothing that could be done regarding the possible exposure and that I should just self monitor while continuing to fly. I feel that more precautions should be taken when a passenger shows symptoms of COVID mid flight. I think we should carry a thermometer onboard and when a passenger shows COVID symptoms especially when it results in a call to medical. More precautions should be taken to protect crew members proactively instead of retroactively.

## Synopsis

Flight Attendant reported possible COVID-19 exposure from an ill passenger and expressed concern the company did not have a plan for the exposed working crew.

### Narrative: 1

The "Before Takeoff" Checklist was not performed. The Captain did not call for the Checklist and I did not catch the error. The Aircraft was properly configured and the Takeoff occurred normally without incident. We were both focused on properly performing the ZZZ Noise Abatement procedure. We pushed back from Gate X (very close to the departure end of Runway XXR). During the pre-departure takeoff briefing neither of us discussed the Threat of the very short Taxi to the Runway. We did discuss that ZZZ was a bit of a "Ghost Town," with minimal activity compared to the times we'd previously been to the airport (for both of us it was during the "Pre-COVID" era). Within a short period of time after Departure, I mentioned we'd forgotten to perform the Before Takeoff Checklist. We both discussed our expectation that there would have been wait during Taxi, which is part of the "Normal" routine. In this case, we did perform the Runway/Performance Change items after push-back with the Parking Brake set - we were then cleared to Taxi, instructed to switch to Tower, and then Cleared for Takeoff. The delay we were anticipating never occurred. The Captain called the Cabin after we were out of the sterile flight deck period and learned that the Aft Flight Attendant (FA) was seated, the Forward FA stated he was standing in the Galley during Takeoff. Both FA's indicated that all passengers were seated. Suggestions - 1. Brief the Flight Attendants that the Taxi Time is ZZZ is very short, and to be seated prior the call for "Cabin Secure". 2. At ZZZ, include the short Taxi time, close proximity of the Gates and Runways as a Threat during the takeoff briefing. 3. Perform both the Runway/Performance Change items and Before Takeoff checklists prior to beginning Taxi for Takeoff.

### Synopsis

Air carrier First Officer reported they did not perform the Before Takeoff Checklist.

## Narrative: 1

I went into the control room to relieve the RX2 Controller at XA00Z. I received a position relief briefing and there was nothing out of the ordinary that was given to me. There were a couple of frequency notes given to me with ZZZ1 [Center], but other than that there was nothing different from normal. All during this time apparently ZZZ2 [Center] was ATC-0 and we in Area X were never told about this going on. When I came in that evening there was no notice, and no one was told that a Zero event was going to be taking place. The Controller on RX2 that I relieved was never briefed about ZZZ2 [Center] being ATC-0. When I took control of the position I had Aircraft X on frequency and he was turning towards ZZZ [VOR]. ZZZ [Airport]. This is the routing that per the LOA we give to ZZZ2 [Center]. The aircraft was level at FL340. After a few minutes I gave the aircraft a crossing restriction to cross ZZZ [VOR] at 100, what we give these aircraft again per the LOA. His route of flight was going to clip Airspace X if the aircraft stayed up high before meeting the restriction. I placed a PVD [Plan View Display] on Airspace Y that auto-directed to Airspace Z as normal for that time of night. When the aircraft started to descend the point out had still not been accepted, so I called to the sector and got no answer. I tried a few times to no avail. I then tried to call ZZZ2 [Center] Airspace X and got no answer from anyone. The Controller on the low side RX1 said the Shout Lines with ZZZ [Approach] were down, maybe the ZZZ2 [Center] lines were down as well. By this time I had hollered for the FLM to come down and explain if they knew what was going on, and it was then I was told that ZZZ2 [Center] was ATC-0. At this time the aircraft had already entered ZZZ2 [Center] airspace without approval, and my main focus was to handle the aircraft towards ZZZ [Airport] approach. We pulled up the approach plate at ZZZ [Airport] and I told Aircraft X to maintain 110 to not enter approach's airspace and gave the aircraft I think XYZ.AB to switch over. Not two minutes later, ZZZ2 [Center] comes back up and helps me with necessitating the hand-off. Not at any time was anyone working traffic aware of this issue with ZZZ2 [Center]. After this aircraft handling was done, I called Area B controllers and asked if they knew about the ZZZ2 [Center] Zero event and they said no that they had not heard anything. Area B also is adjacent to ZZZ2 [Center] airspace. Later the FLM came back down to let us know the ZZZ [Approach] lines were back up and running. This makes this Zero event even more frustrating to us in Area A since the routing and altitude that we give ZZZ2 [Center] aircraft going to ZZZ1 Approach requires us to call ZZZ Approach for a Point out. So during this Zero event, we had no clue that we were actually in it, and then if we did know we would have had to do extra work just to get the procedure to work with ZZZ Approach. Another part of this is that the controller on RX1 never knew about this event as well because he had a ZZZ [Airport] departure at FL230 during this time as well, and according to the ATC-0 procedures we are to Radar Identify the aircraft when they come over to us. I cannot be sure that this was done. This aircraft... I don't recall the numbers or where he was headed. Communication is a big deal in what we do. It is highly irresponsible to not be told about something as important as an ATC-0 event in the facility. All I needed was to know who and when and we could have handled this situation the correct way. We have routing for this exact situation, we have the procedures posted in the area, but if no one tells me what is happening then this type of event will continue to happen.

## Synopsis

Center Controller reported an ATC Zero event at another Center facility resulted in communication issues and an airspace violation.

## Narrative: 1

The no touch exemption for headsets, microphones and O2 masks was directed towards relief for recurrent or CQ lessons only. It apparently did not cover the other Training/Qualification Lessons. As this seems illogical (a virus cannot tell the difference). I applied the no touch exemption to all lessons.

## Synopsis

Air Carrier flight instructor reported the "no touch exemption" as written for O2 masks, headsets, etc., does not cover all types of training and checking periods.

## Narrative: 1

I was the PNF and the First Officer on this flight to ZZZ. On our approach into ZZZ we were slightly high on vectors and then cleared for the visual approach. The Captain PF was at a speed of 230 knots indicated airspeed (KIAS) and was trying to descend and slow to land. He was unable to slow to 200 KIAS as we were entering the Class C airspace and we determined the approach was unstable and executed a go-around. We entered the traffic pattern and landed successfully. I believe the cause is a decrease in proficiency due to reduced flying during the pandemic. We were doing 220-230 KIAS while entering the Class C airspace.

## Synopsis

Corporate First Officer reported an unstable approach occurred and cited lack of flying as a contributing factor.

## Narrative: 1

Due to the lack of proper transportation support, employees are either packing themselves into crowded buses or rushing from home to catch one of the improperly scheduled buses that will get them to work on time. The company has reduced the frequency of the buses and now each of us is either leaving our homes earlier to get to the lot or leaving the terminal late because the schedules are not aligned with employee's hours. There are two things occurring here. Theft of employee time and endangerment of exposure to COVID-19.

## Synopsis

Maintenance Technician reported reduced bus schedules are causing overcrowded buses and increasing the possibility of catching COVID-19.

## Narrative: 1

While doing my countdown/brief down, there was a passenger in [seat] XX1 complaining about the passengers in [seat] YY3 and [seat] YY4 that were not being compliant about

the mask being over their nose and mouth. I immediately told the passengers in YY3 and YY4 to place their mask over their nose and mouth, which they complied. While I was waiting for the pilots to finish up the last of the paperwork, so I can close the main cabin door, the passenger from XX1 came up to me to complain about the passengers again in YY3 and YY4 that were not being compliant about wearing their masks. The passenger from XX1 proceeded to ask me what the consequences were for people who don't comply with wearing their masks so I told him that I would speak to the Captain. I told the Captain to make an announcement about wearing the masks over their nose and mouth for the duration of the flight and in the next few seconds the Captain made the announcement and everyone was in compliance. It was then time to close the main cabin door and begin the safety announcement. I started the beginning of the safety announcement and the passenger from XX1 walked right up to me to complain yet again about the passengers in YY3 and YY4. I told the passenger that I am doing the safety announcement and I have to do my Flight Attendant duties but I will come to address the issue. The passenger was not pleased with my response because he wanted me to address the issue right at that moment, but I only have a finite amount of time to do the safety announcement and do the last of my Flight Attendant duties before takeoff. After the safety announcement was complete, I went to the passengers in YY3 and YY4 and told them to keep their masks over their nose and mouth. One of the passengers said that he was drinking his beverage so he forgot to put the mask back on. I reminded both passengers to keep their masks on and comply with the policy in order to avoid any issues in the future. Both passengers made some remarks and was upset that the passenger from XX1 was complaining about them so much. I even offered to give them additional masks because the face covering that they had on was sliding off their faces. The passengers refused to receive the additional masks and said that they would comply. In the end, both passengers from YY3 and YY4 complied so that we could depart safely. While inflight, I made several announcements about all passengers keeping their masks on for the duration of the flight and that everyone had to comply with this policy. The passenger from XX1 did not come to me to complain at all during flight or after taxi. I assumed that he was satisfied with the results of what happened and the passengers in YY3 and YY4 remained compliant with the mask policy.

## Synopsis

Flight Attendant reported two passengers would not initially comply with face mask policy. Both passengers complied after another passenger began complaining about them.

## Narrative: 1

Passenger A had to be told several times to please wear his mask. The last time I asked him, he was playing with his cell phone, was NOT chewing anything and shook an empty chip bag at me, telling me twice that he was eating. Well, he was not. I learned later he had connected that day from ZZZ, a hot zone. I guess Passenger A felt that he was exempt from wearing a mask on board.

## Narrative: 1

Upon deplaning a gentleman complained to the Purser and I, regarding another gentleman passenger. He said the man sitting near him was coughing and sneezing the whole flight and that he was not wearing a mask. He pointed his finger at us and sternly said you two did nothing about it. The Purser responded to the gentleman about the situation. My work position was in the First Class galley. There was no complaint brought to my attention during the entire flight. At no time did I observe any of this behavior.

## Narrative: 1

I take full responsibility for this altitude deviation. We were in the chocks at ZZZ and there was a slight reroute to ZZZZ. The FO X said it would not load in the FMC, but FO loaded manually. FO said the same thing happened on the last flight also into ZZZZ. I had flown down to ZZZ1 in Month X and had the same reroute. The FO had over 40 hours total time with XX landings. I have not flown in over 60 days. So in the chocks the Departure Briefing I briefed CA designates PF PM states concerns and threats PF states concerns and threats taxi, takeoff/reject departure. The FO said low time and I said my over 60 days off. FO is rock solid, what an excellent stick. You know when you meet someone for the first time, it's going to be a fun flight. Every time I see FO X's name on the crew list, it will be a fun flight. For over 40 hours and XX landings FO flew real well. Talking to ZZZ Center of frequencies XYZ.Z and XYA.B and we're climbing to FL230 and they ask Aircraft X we just want to confirm the route. FO asks this is a reroute you want me to put on the autopilot? If I had said yes, I would not be writing the report. The fault is all mine. My thinking was this is the same reroute we got in the chocks easy-peasy. And it was the same route but took three or four minutes to get everything done. ZZZ Center then cleared us ZZZZZ JXXX ZZZ1 as filed. I spelt ZZZZZ wrong and it was not accepted in the FMC. Right then the Altitude Deviation warning came on. ZZZ Center told us switch over to XYZ.Z and I reported FL240 we were at FL238 and our clearance was FL230. Center than cleared me to climb to FL400. Lots of areas to hit on. Even though I haven't flown in over 60 days do Company work on most days, I read all the changes, FD Pro X, Airline Pilots, WSI Pilotbrief, and Outlook. On any day to read all this it takes 45 minutes to and hour and a half. For this ZZZZ flight, I checked it three days in a row. What was the routing, did it go over ZZZZ1 Country, and the weather? FO is an excellent pilot. Low time like FO is the autopilot should have been on. The mistake is on me, no excuse, I messed up. It pains me to have made this mistake, I can't remember my last report.

## Narrative: 2

New on the aircraft, I had briefed the Captain I wanted to hand fly the aircraft, which he agreed was a good idea. We departed ZZZ on XXL and was cleared on the ZZZZZ1 4 RNAV SID. In our turn towards ZZZZZ1 we received clearance to ZZZZZ2 on frequency XYA.B. When we checked in to XYZ.Z we received a clearance to FL230 and to fly direct to ZZZZZ. ZZZZZ is not on the SID or depicted anywhere on the SID. The Captain was unfamiliar but I was because I flew the same Flight the day before and we received the same clearance. I believe I spelt the fix out to the Captain and asked if I should I put the Autopilot on, which he responded 'no it's okay'. Just as he was typing it in and he executed it we heard the altitude alert caution and we were at 23,580 feet. I quickly reacted and proceeded back towards FL230 at the same time the Captain called ATC and stated 'Aircraft X at FL240'. ATC then cleared us to FL310 or FL330. The deviation occurred at XA:22Z. I should not have asked the Captain if I should put the autopilot on, I should have just done it. We were obviously both needed to navigate. I should have put the autopilot on while the Captain was trying to figure out and insert a fix that was not on the SID. Having the autopilot on would have prevented us from flying through our assigned altitude while we were navigating the new clearance.

## Narrative: 1

I have been on more than one flight scheduled to DH to ZZZZ. Of the X # of DH FA crewmembers NOT ONE of them was aware of the required Country X medical tracking system to come and help the FA crew get the system installed and the form completed. On the other flights, [the FA department] failed to respond to our request. As a result, the other pilots and I had to take time to instruct the flight attendants on the process. The time we took to do this took away from the time we had to do our flight duties and

resulted in a flight departure delay. The set up and function of this program does not allow it to be downloaded and permission for entry obtained while in-flight. I have heard everything from "I don't think we need that," "I will just do it inflight," and the best "I don't read the email messages." (This from the FA who was detained). In any case it is not the job of the flight deck crew to instruct the FA group something of this nature. If a crewmember is caught without this tracking system, it exposes the whole crew to medical detention. The in-flight group needs to take responsibility for ensuring the FA group has the proper tools and is following the proper guidelines. I believe for the immediate future a station manager needs to meet each departing crew and ensure that they have the tracking system on a device and it has been properly filled out. They also need to ensure the FA group is aware of the requirement of a daily health submission. Those who fail to comply with this Country's government procedure jeopardizes our right to operate in this Country. The hotel hands out a form which in part states that if you are caught outside your allowed radius of operation, your airline may lose its right to fly to this Country. The same rule applies to not having the tracking system on arrive or not submitting a daily health check. Cause - Lack of oversight and education from the inflight group. Lack of following procedures from FA group. I have to wonder if this important item is missed, what else are they missing? Each DH crew should be met at the gate by an in-flight Supervisor who ensures that the app is installed and a health check complete. Failure to comply should result in being sent home without pay. Individual FA who do not read company Email messages should be put on a monitor system to ensure the start reading messages and complying with company procedures. I would like a response, other than the usual thanks for the report, it has been accepted we are looking into it.

## Narrative: 1

I have been called as shop steward by agents to report unsafe COVID work environment, and I noticed due to short staffing and limited area of check in point also the volume of travelers there is no social distancing and no shields to protect agents from possible exposure to COVID. Most of international travelers are subject to document check and most are not familiar with kiosk checking, also each passenger is accompanied with several family members which makes it more difficult to deal with the crises. There were only 2 agents assigned for all the passengers and all the crowds with was out of control. All has been reported and requested for more manpower and full service to avoid direct and close contact with passengers. The issue of lack of manpower and enforcing passengers and agents to use the kiosk when there is no protection is serious safety issue during [the] COVID pandemic. I hope this report brings all the safety issues to your attention.

## Narrative: 1

Again, while going home on the elevator in ZZZ more than X people were on the elevator. It is the same few people each time. They push the button to make the doors open and come on in the elevator. They do not care that there are already four people inside. They still have no concern about my safety or those in the elevator. COVID-19 is on the rise nationwide. They may not care if they die. I am not ready to catch this disease or die. It is to the point I am mocked. The one guy tells people "Come on in, we can fit lots more."

## Synopsis

Ground employee reported concerns with the number of people getting on an elevator.

## Narrative: 1

I am writing this report due to the potential this type of incident has to distract aircrew, particularly the pilots. I believe Purser X, was attempting to implement her own personal mask policy with respect to eating and drinking. Even though I complied with her excessive demands after our first encounter, she immediately escalated the issue and contacted the flight crew (because I asked her name), thereby creating a potential distraction to the flight crew. Summary of events follows: A couple of minutes after being served a drink, I was actively drinking and had my mask down. Purser X, came by only a few minutes later and said I had to put my mask up. I told her I was actively drinking and I had actually just set the cup down. She said my mask had to be replaced between each

sip. I identified myself as an employee and told her I disagreed with her interpretation of the policy. Of note, I have never had a Flight Attendant make such an assertion before. I told her I was actively drinking and she said, that what I was doing was not allowed and reiterated, I had to put my mask up between sips. She also immediately threatened to "Go to the pilots" when I challenged her interpretation. I complied with her dictate, though I believed it to be errant, and put my mask up; dropping it only between sips of my drink thereafter. Of note, the Flight Attendant deadheading adjacent to me left his mask down for long periods of time while eating and drinking, so it appears he had the same opinion as I did. Afterwards, when she passed back by, I asked her if she would give me her name as I felt I needed to report this incident, since she threatened to go to the pilots and I considered her interpretation of the policy to be errant. She refused to give me her name and said she was " Going to the pilots" now, because I asked her name. If Airline X intended her rule to be the standard, then I'm certain Airline X would specifically state that mask must be replaced between sips and bites as opposed to actively drinking or eating. I reread the policy and I still believe her interpretation is errant. I also checked with the ZZZ Chief Pilot office and they also believe there is nothing to support her interpretation of the mask policy. In summary, I believe her actions, specifically developing her own policy and her abrasive engagement has the high potential of creating additional conflicts with passengers and unnecessary distractions to the cockpit.

## Narrative: 1

Our alternate was ZZZ2 exactly because ZZZ3, ZZZ4, ZZZ5, and ZZZ6 were not suitable weather-wise. The original flight plan had fuel to fly ZZZ-ZZZ1, go-around and fly to our alternate of ZZZ2 landing with a fairly standard REMF, as I recall; certainly not enough fuel to shoot a second approach in ZZZ1 and comfortably divert to ZZZ2. This was our third and final leg of the day, following a ZZZ-ZZZ7 turn. It was our second day of a three-day trip and we felt reasonably alert. If we had to divert to ZZZ2, I suspect we would have been close to timing out in our block time; from a passenger standpoint, ZZZ2 made a lot of sense with the ability to re-crew in a base. By the time we blocked in ZZZ1 we had completed 7:30 actual flight time. I know I was tired at the end of the day. Time compression in ZZZ between second and third leg. 1. The flight plan for our final leg was not yet available for downloading and consideration before top of descent ZZZ7-ZZZ (leg #2). Flight planning on the ground felt very time compressed. 2. We were switching aircraft in ZZZ. 3. We were supposed to have been boarded crew meals for our second leg (ZZZ7-ZZZ) but for some odd reason, the FO's hot meal was boarded and I was offered a hodge-podge of a snack box, beef jerky, a cookie, three dried apricots and a packet of honey. I snacked on that offering but needed to find a real meal back in ZZZ between flights. 4. Please appreciate the 64 minutes on the ground is from parking brake set on Flight number, (inbound flight), complete the parking checklist, collect our belongings, traipse over to a different gate (thankfully, the gates were close), download and review: Flight Number's OFP, NOTAMs, and aircraft maintenance and history, review weather on WSI iPad app, pre-flight a new aircraft, load and check the FMC, brief flight attendants especially on the weather conditions, receive an ATC clearance, departure brief between pilots, accomplish both the pre-flight checklist and before push checklist, and then release the parking brake for push-back. Given the lower ceilings and reduced visibility with snow-rain mix and strong direct gusty crosswinds in the TAF I felt it prudent to add contingency fuel. I called our dispatcher at the gate in ZZZ and we agreed to add approximately 30 minutes of fuel; specifically, 3,000 pounds. I had hoped that our dispatcher was cognizant the conditions forecast in ZZZ1 warranted more consideration than a milk-run, day, VFR landing, but truthfully, I had a whisper of uneasy misgivings. Perhaps I felt this was the fuel plan SABRE popped out and there could have been more... more human QA to it... perhaps. Then again, maybe it was nothing... yet the voice in the back of my mind wasn't letting up. Something felt unsettled. Was our dispatcher a little susceptible to Automation and Anchoring Bias... was our dispatcher's Situational Awareness appropriately elevated? Was her Review/Monitor/Predict loop firing on all cylinders? I decided: "I'll set it aside for now--relax, captain--it's probably nothing." (spoiler alert: it turned out to be nothing but the ambiguity of whether it was or not, before and during the flight was distracting.) I do not have the ATIS but I did reconstruct the conditions from a historical AWOS archive 01 XA: 51Z: 330/19G26 6SM -RASN BR BKN009 OVC016 02/01 A29.60 PK WND 33033 01 XB: 51Z: 330/18G27 3SM -SN BR BKN008 OVC013 02/01 A29.61 PK WND 32032 01 XC: 06Z: 330/16G29 3SM -SN BR BKN010 OVC015 02/00 A29.61 PK WND 32029 01 XC: 14Z: 320/16G24 2-1/2SM -SN BR BKN008 OVC 013 02/00 A29.61 PK WND 32029 01 XC: 23Z: 320/14G28 1-3/4SM -SN BR OVC010 01/00 A29.61 PK WND 32029 01 XC: 30Z: 330/18G22 1-3/4SM -SN BR BKN008 OVC012 01/00 A 29.61 PK WND 32029 The ATIS stated ILS RWY XXL and RCC (Runway Condition Code) 5/5/5 at XJ:00Z, XXR/YYL and XY/YX CLSD, and various CLSD taxiways. The RCC time stamp of XJ:Z caught my attention as being roughly 16+ hours old. [Aircraft type] landing crosswind component "guidelines" in the Flight Manual Limitations Chapter: RCC 5 and 6: 40 knots RCC 4: 35 knots RCC 3: 25 knots "NOTE: The crosswind guidelines presented... .. The use of these guidelines

should be based on the current weather conditions and the pilot's ability and experience level." Even with the recent uptick in flying the overwhelming majority of us are feeling "rusty". Generally, with my XX+ years flying experience it seems to come back fairly quickly but I definitely don't feel the same high level of finesse as I did a year ago. I'm aware of it, very aware. I'm working diligently to trap the errors and as minor as they seem there are more of them. Actively seeking and countering threats, setting the right tone on the flight deck, and ensuring we are working well with dispatch these are some of the best tools we have. Overconfidence bias especially in challenging conditions while none of us are flying as much as we usually do is probably at the top of the list. Going the extra step of resolving seemingly small ambiguities seems especially appropriate right now. Plan continuation bias, expectancy bias, and optimism bias creep into the mix a little more insidiously than usual. The ever-present threat of complacency has absolutely not waned. I wonder is Dispatch in the same boat? I suspect so. I want to be cognizant and understanding of that likelihood--we are a team and we need to lift each other up. A little over an hour prior to touchdown we began planning our ILS runway XX approach and landing with the most current conditions at the time. We reviewed the NOTAMs, assiduously marking up the myriad of closed taxiways on our -9 pages. We pulled landing performance data and reviewed it intently. With the strong direct and gusty crosswinds we might have preferred a flaps 40 landing on Runway YX but it was closed. I felt the RCC 5/5/5 at XJ:00Z (16+ hours old) was a remnant and if we just encouraged dispatch to make a call to ZZZ1 Tower, we could get something much more useful, more akin to an hourly observation. Actively countering the ambiguity of a very stale RCC given the worsening weather conditions. Making allowance that Dispatch is planning and monitoring somewhere between several and a small slew of flights they aren't going to catch everything. The ACARS reply from "X Dispatch" for an updated RCC: "ZZZ1 CITY OPS SAYS 5/5/5. THEY WON'T UPDATE THE NOTAM/FICON UNTIL THERE IS SOMETHING SIGNIFICANT TO UPDATE." Ambiguity not resolved. Concern we were being led down a path... heightened. With time for more nuanced decision points running out, I replied to X Dispatch: "Name, JUST WANT US ALL TO HAVE THE SAME UNDERSTANDING ABOUT HOW CRITICAL I VIEW A CURRENT AND ACCURATE FICON\* WITH THE GUSTY DIRECT CROSSWIND TEMP/DP 02/01... I WILL NOT ATTEMPT A LANDING WITHOUT IT. IS THE 5/5/5 FROM XJ:00Z OR HAVE THEY MEASURED IT MORE RECENTLY... I WILL NOT ALLOW A GREEN BAY OFF THE END COMPLACENCY FROM ZZZ1 CITY OPS TO SUFFICE. PLS INFO FODM OF THIS" (\*FICON, I should have used "RCC" instead) X Dispatch reply: "OKAY. I GOT THE [Flight Operations Manager] IN ON A CALL TO ZZZ1 TOWER. FODM IS UP TO SPEED ON THE CONCERN. THEY REPORTED: RWY XXL AT XS:54Z. 5/5/5. 100 PCT WET. AGAIN, THEY DO NOT ANTICIPATE TO UPDATE UNLESS THERE IS AN ACCUMULATION ON THE RUNWAY OR ANOTHER CHANGE IN CONDITION." Did I feel like we were pushing a rope? Yes. Yes, I did. I felt like we were being dismissed and my confidence in X Dispatch was significantly diminished. I felt like X Dispatch was not proactively leaning forward in the saddle and was content to accept whatever ZZZ1 City Ops said. Rather than feeling supported, rather than feeling like the increased risk was being adequately considered and mitigated, I felt a certain inappropriate nonchalance had insidiously permeated. I feel like I had to kick up a ruckus to finally get an RCC 5/5/5 at XC:00Z--as the XS:54Z RCC was still 7-ish hours old... DURING a RASN event. Finally, I feel like the fact that nothing bad happened adds to the confirmation bias that it was much ado about nothing... right up until it's not nothing. And "Not Nothing" happens in a blazingly fast moment. What could I have done differently and more effectively? I should have called X Dispatch from ZZZ7 on leg #2, asking her to work up our leg #3 early--I could have alleviated the time compression I felt on the ground in ZZZ. In retrospect, I wish I had noted the XJ:00Z RCC from the ATIS available in either FD Pro X or just pulled the ZZZ1 ATIS on ACARS before pushing and added resolving the stale RCC to the fuel increase phone call with X Dispatch. I should have used "X" words in the ACARS messages with dispatch to convey the level of

my unease. I should have started descent planning and landing in those conditions at Top of Climb (TOC) to allow more time to get "the ball rolling". I should have taken the time to call after the flight, to debrief with our dispatcher... really wish I had done that. Ongoing concerns/questions X Dispatch: 1. How early can I ask for a flight to be planned? 2. What fuel contingency plan is appropriate in these meteorological conditions for delayed arrival (E.G., holding while treating the runway) or the preceding aircraft doesn't clear the runway in a timely manner or a gusty wind event causes an unstabilized approach condition? To name but a few possibilities... 3. What could I have done differently from X Dispatch's perspective? I would like the feedback to make me a better Captain. ATC: 1. How long before an RCC gets updated? Is there an upper number of hours? 2 hours? 36 hours? 2. In these particular conditions of strong gusty crosswinds and rain snow mix, what is an appropriate update interval to give us "end-users" a reasonable level of confidence in the data? 3. How are RCCs actually determined? I am going to end this unusual report with a few words from a recently would-have-been furloughed-but-took-advantage-of-voluntary-separation-program and much-liked coworker. It's important to recognize that Name was an administrative co-worker. He's not a pilot himself but he certainly recognized how important his part in the team mattered. We could all profit from his example. "I made it my goal to make sure every pilot left the flight planning area with a clear head. No matter what issue they had coming in the door, when they went out to fly that issue was taken care of or they knew that I would do my best to take care of it and follow up with them on its outcome. I did not want to be the one to cause a distraction. I was proud to be the one who cleaned up the distractions." "...cleaned up distractions" ... Indeed.

## Synopsis

Air carrier Captain reported weather and associated planning issues at many airports and in particular one that was an alternate for the flight.

My tablet was fully charged at hotel. After 2 hours of flight it would not retain battery. I went to operations in ZZZ to receive [a] loaner and the case was inop. However the tablet received was fully functional. My equipment hasn't been used in some time due to not flying during COVID. I've made arrangements to replace all.

## Synopsis

Flight Attendant reported that the company provided tablet would not retain the charge and stated it had not been used for some time due to lack of flying.

Narrative: 1

I was PF, hand-flying. On departure, we were cleared to 10,000 feet. Northbound on the SID, climbing through approximately 7,500, I increased pitch to avoid a small build-up off the nose. Climbing thru approximately 8,800 feet, I realized that I was going to have a difficult time leveling off by 10,000 feet. I asked the CA to advise ATC of the potential altitude excursion and aggressively, but smoothly, reduced pitch to level off. I exceeded our assigned altitude by 450 feet, and promptly descended back to 10,000 feet. ATC did not seem concerned by our deviation and cleared us to 16,000 feet. This was one of my first sequences after a 6-month leave of absence. The CA is new to the airplane and new to the seat. These factors contributed to our poor altitude SA and slow cross-check. Our threat-forward briefing focused on our lack of recent flying. We needed to be even more vigilant to trap decision and execution errors.

## Synopsis

Air carrier First Officer reported overshooting an assigned altitude during departure.

#### Narrative: 1

When I arrived at the airplane for departure I was informed that the FA X had called in sick. Apparently he had been exposed [to] COVID-19. I discussed the need for a new general declaration with the agent once they had found a replacement. About 30 minutes before push back they gave me the new declaration with all positions filled, and I signed it. About 20 minutes before pushing the agent returned and told me that they had pulled the new crew member off for another flight, and asked me if we could go with XX [number] of FAs. Not catching my error I said yes and asked for a new general declaration, it arrived just before departure time I signed it and we departed shortly thereafter. This was my first flight in over nine months with passengers, I had a discussion with the Lead FA about the FA that had called in sick, and wanted to be sure none of the other FAs had been exposed to him, apparently none had. We also discussed the fact that we would be getting a replacement. I just missed the fact that our duty time would require XY [number of] FAs. For myself having been on leave and away from flying for so long, I need to slow everything down, take a little more time.

#### Narrative: 2

Last minute flight attendant sick call and another reassignment. Misunderstood flight attendant minimum requirements. Was unaware that requirements were based on duty day and not flight time. Departed 1 flight attendant undermanned. Last minute changes at a critical time. COVID-19 concerns and maximum limit of XX passengers. We should seek waiver for restricted load passenger flights. Need assistance from dispatch, flight attendants and load to help watch for errors in manning requirements.

### Narrative: 3

I was a Relief Pilot on flight ABC when we left with less than the required amount of flight attendants. I was performing pre-flight duties when this occurred and or discussed and didn't realize there was a problem until today when called by the safety representative. Flight attendant supervisors should closely monitor their personnel requirements.

### Narrative: 4

[Report narrative contained no additional information.]

### Synopsis

Air carrier flight crew reported inadvertently departing with one less Flight Attendant than required for the flight.

## Narrative: 1

Working a slow but steady local session with Supervisor working GC/CD combined. Very **low staffing due to COVID. Steady traffic all day, I wouldn't call it too busy though.** Very last transmission of my shift was to Aircraft X. Aircraft X called on about a 7 mile final (new pilot). I cleared it to land on Runway XX right and then started my position relief briefing within seconds of my transmission. Finished the brief and my 2 minute overlap, said bye to my fellow coworkers and left. Aircraft X was probably on a 2 mile final by then. I was paged at the bottom of elevator and Supervisor asked "Did you give Aircraft X **Runway XX right or Runway XX left?** I told him I didn't remember. Turned out aircraft landed on Runway XX left instead of Runway XX right. No separation issues luckily. All they said was "cleared to land" I didn't even realize it at the time. I was distracted,

ready for the briefing to be done after a long, busy day with a skeleton crew. Expectation bias all the way, I just assumed they said XX right in their transmission. All controllers tend to get complacent in this job when everything goes right for some time, I need to stay vigilant and listen to every transmission. If I would've just listened to that pilot's readback instead of thinking about getting off position and being done for the day, I **wouldâ€™ve noticed it and I wouldâ€™ve got verification that she was cleared to land on runway XX right and all wouldâ€™ve been good.**

## Synopsis

Tower Controller reported communication issues with an aircraft resulted in a wrong runway landing.

## Narrative: 1

On a visual approach to Runway X, the FO was flying, he started the approach a little high but managed to get back on a 3 degree glide to the runway. By the time I noticed we were

at 500 feet and his airspeed was still about 20 knots above Vref. The airspeed managed to get down to Vapp with the engines spooled before touchdown. I hadn't flown in a month so my situational awareness was not on a level it should have been and I should have called a go-around.

## Synopsis

Air carrier Captain reported an unstabilized approach and stated they should have executed a go-around.

## Narrative: 1

Enroute to ZZZ1 we failed to set altimeters to 29.92 when climbing through 18,000 feet. Due to the very high altimeter setting at our departure field, it lead to us inadvertently leveling off 300 feet below our assigned altitude. ATC queried our altimeter setting and we immediately corrected. Inconsistent scheduling and continued ongoing stress from the organization's uncertain future lead to a flight deck environment prime for small errors such as this one.

## Synopsis

Air carrier First Officer reported not setting the correct altimeter and leveling off below their assigned altitude.

## Narrative: 1

We were given a taxi instruction from Gate X to Runway XXL via "Romeo, Yankee, Uniform, Kilo cross [Runway] Y, to XXL" but we taxied Romeo to Yankee, taxied on Y past Uniform (apparently missed it) and crossed [Runway] Y at Yankee. The ZZZ Ground Controller caught our mistake and gave us amended clearance to XXL via "Victor to Kilo, Kilo to XXL." I believe I simply misheard the Ground Control clearance, because I briefed the taxi route as I executed it, and I believe the FO repeated it to Ground without anyone questioning it. It was only questioned after we crossed Runway Y, and the Controller realized we were not on K but on Y taxiway. So, either I simply misheard, or I was tired and did not catch the error, and the FO did not catch it either. Either way, my error. This shows how easy it is to get a clearance wrong, especially when you have not flown into a particular hub airport in nearly a year. It points out how we have to stay extra vigilant, especially in these COVID-19 times, because crews are not flying as much, and ATC controllers are handling multiple sectors/tasks, so even if one repeats the clearance the way you believe it is, the ATC Controller may not catch the error.

## Synopsis

Air carrier Captain reported miscommunication with ATC resulted in a taxiway incursion during taxi-out.

## Narrative: 1

While trying to clear Runway XL, the Tower Controller told us which taxiway to take. I could not understand him and asked again. I understood the second transmission, and we cleared the runway. Once clear I asked him where he wanted us to go. He gave instructions and then tried to explain why he gave a specific taxiway. We could not understand that transmission nearly at all. I then said, "Sir, I can't understand what you're saying, your transmission is very muffled." He then came through perfectly clear and then said, "it's the mask," or something to that effect.

## Synopsis

Air carrier First Officer reported communication difficulties with the Tower Controller due to the Controller wearing a mask which possibly muffled the transmission.

## Narrative: 1

Company Flights Aircraft X (event flight) and Aircraft Y had all the elements in play for a severe collision during taxi operations at ZZZ airport, had it not been for the keen and alert awareness of the First Officer (FO) on our flight. Other Company Flight Aircraft Y had just landed on Runway XXC, exited onto Taxiway B, and received clearance to back-taxi on Runway XXR full-length and proceed to the gate. Shortly thereafter Aircraft X received taxi clearance to taxi to Runway XXC via Taxiway P, cross Runway XXR, left onto Taxiway G, and join Taxiway EX. Both flights were taxiing toward the intersection of Runway XXR and Taxiway P when it is assumed that Tower saw the potential collision as both aircraft had "ALL LIGHTS ON" indicating that Aircraft Y was taxiing with clearance on an active runway, and Aircraft X was preparing to cross an active runway with proper clearance. Tower then attempted to modify the taxi clearance for Aircraft X but made an error by initiating the call with Aircraft Y's call sign. The transmission was unfortunately interrupted by a third aircraft trying to transmit as the Tower was attempting to correct the call sign, resulting in the amended clearance transmission being unintelligible to both Flights X and Y. Aircraft X was underway at a nominal taxi speed, and Aircraft Y was observed taxiing at a higher-than-normal speed as they back-taxed toward the turnoff point at the end of Runway XXR. Taxiway P enters at a slight angle preventing the Captain of Aircraft X from clearly seeing any approaching traffic from his right. As the Captain of Aircraft X, we had full intention of entering the intersection as initially cleared. Just prior I initiated a Safety call by saying "Clear left." At that point the FO looked right and said, "Wow, they're moving fast; and don't think they're intending to stop." **Hearing that, I immediately began a full stop of our aircraft prior to crossing the hold short line, followed by turning our lights off, and yielding to Aircraft Y, in case we were the ones in error with the crossing clearance.** Startled that we had just avoided a serious collision, we discussed the possibility of us missing a clearance or how that collision seemed inevitable had we not made the final "Clearing check" prior to crossing the runway. Because of the frequency congestion with Tower working all three frequencies (Clearance, Ground, and Tower) and the fact that we didn't actually cross the hold short line, we held any immediate inquiry as to the miscommunication of the clearance to ourselves. Upon further discussion among ourselves after departure, we were certain that we did not miss any clearances from ATC and that this was a certain potential mishap that needed further investigation to acknowledge the chain of events from going unrecognized in the future. We discovered that both aircraft had the appropriate clearance to be where they were and that there was an attempt by ATC to issue an amended clearance to us. Tower initially called Aircraft Y then quickly attempted to correct to Aircraft X, but the transmission was interrupted by a third aircraft rendering the call sign and amended clearance unintelligible for either aircraft to be warned appropriately about each other. Due to the angle to which Aircraft X was

approaching Runway XXR, there wasn't a good line of sight for the Captain to see any approaching traffic back-taxing on Runway XXR until it would have been too late. It was only due to the vigilance and discipline from the FO in effectively communicating the immediate danger that we were able to avoid a severe collision given the circumstances. It is believed that Tower was operating at reduced staffing levels even though there were a lot of aircraft movements at ZZZ that evening. This was likely due to COVID protocols in place with ATC. The increased workload enabled him to issue clearances to both Flight X and Y to be on Runway XXR at the same time if timing was ideal. In this case, an amendment to the clearance was attempted to be issued; however, time was not in our favor for the Tower to initiate the call with the wrong call sign and be interrupted by a third aircraft making the transition intelligible by either flight.

## Synopsis

Air carrier Captain reported a near ground collision due to communication issues with ATC. Captain stated that Tower staffing levels may have contributed to the event.

## Narrative: 1

While climbing on the ZZZ4 departure, ATC issued a turn to heading 265 and a climb to 17,000 feet. I read back the climb instructions, and both I and the Captain confirmed the instructions. While climbing through 8,300 feet, Departure asked if we were leveling at 8,000 feet, to which I responded, that our last instructions where to climb to 17,000 feet. Departure then instructed us to descend to 8,000 feet and turn left 30 degrees, at which time we received a TA and we acquired the aircraft visually. After the TA cleared, Departure issued a new climb clearance to 16,000 feet and we continued on to our destination. Conditions at the time were clear skies with low traffic chatter on the frequency, normal workload on climbout, and the Captain hand flew the aircraft to about 16,000 feet and all through the incident. Not sure there is any issue on the flight crew side, but perhaps ATC may have to look into this. I have noticed that the ATC staffing levels have changed since COVID and that they are working more than one frequency per Controller. Not sure if this was the case and was given wrong instructions by mistake.

## Narrative: 2

During climbout from ZZZ, we switched to Departure and a received a clearance to turn to the west and a climb to 17,000 feet. FO, who was PM, read back the clearance and set the heading bug and 17,000 feet. This was also the clearance I heard and read back both of the changes to the PM. Approaching 8,000 feet Departure Control queried if we were leveling at 8,000 feet. As the PF I immediately started to correct back to 8,000 feet (highest I saw was 8,600 feet) and began a left turn as directed by ATC. During this time, we received a brief TA alert. As we were rolling out FO saw the traffic and called it out and said it was no factor. Almost immediately after that we received a clearance back to a heading of 270 and a climb to 16,000 feet.

## Synopsis

Air carrier flight crew reported a clearance misunderstanding resulted in an altitude deviation and an airborne conflict during departure. First Officer cited ATC staffing levels due to COVID-19 as a possible contributing factor in the miscommunication.

## Narrative: 1

ZZZ Approach was closed for staffing reasons due to COVID illness / quarantine on the midnight shift. Sector X (my sector) was in control of the airspace. Sector Y had Aircraft X arriving to ZZZ from the southeast. The pilot dialed up the ATIS at ZZZ which told the pilot to come up on my frequency for a weather update. I read the weather to the pilot then sent them back to sector Y freq. I kept the datablock up on my scope assuming that I would get a hand off soon and clear the Aircraft X for an approach. Since ZZZ is really close to the boundary with [sectors] X / Y, the Controller decided to work the aircraft all the way into ZZZ. I treated it like a point-out as did he although we made no official coordination. At the same time, I had another aircraft (Aircraft Y) about 60 miles north of ZZZ inbound to the field and was asking about runway conditions at ZZZ. I had a number to call the field operations for updates because the TRACON /Tower was closed. When calling from the line, I got a recording stating the "This line is no longer in service and to hang up and try again." I asked the second Controller in my area if he knew of an issue with the phone number. He got on the Supervisor's phone and called for an update. The field ops told him about the snow on the runways as well as Runway X Left being closed for snow removal. This was not in our NOTAMs. That Controller then ran down to the other area who was working the Aircraft X and told them what was going on. Luckily the Aircraft X wasn't too low for radio coverage, the Controller issued them present heading and a climb back up to 6,000. The Aircraft X was then put on my frequency where I let them fly out to the west a bit farther and set up for a turn back to the IAF for Runway X Right. The plane then landed safely at ZZZ. There should have been formal coordination between Sector Y and myself on who was working the Aircraft X into ZZZ. It doesn't change the fact that a runway was closed at ZZZ without a NOTAM in our system. The only reason we found out was because of the Aircraft Y inbound from the north asking about updates on the field conditions and the other Controller making the phone call for me. I'm not sure how long it takes for NOTAMs to populate in our system but it's not fast enough. I

guess they hit enter on the keyboard and immediately jumped in snowplows and took to the runway. The NOTAM did eventually populate in our system, but it was after this event took place.

## Narrative: 2

I was notified of a poorly handled situation on the mid shift. There were several major breakdowns in communication causing a "swiss cheese" situation that could have ended devastatingly. Likely some minor changes to ZZZZ/ZZZ (ZZZ ATC 0) Contingency Plan. At roughly XA:00 in the morning Sector Y was working Aircraft X, during the enroute/initial descent portion of the flight arriving ZZZ. Keeping in mind ZZZ Approach is ATC 0 and Sector X assumes ALL of their airspace with procedures in place. At some point Aircraft X calls Sector X, likely on a second radio while in communication with Sector Y, to obtain the weather since the ATIS is not updated hourly and instructs pilots to do exactly that for the latest weather and field conditions. Presumably the pilot was then instructed to return to Sector Y frequency since the flight was a little ways out (and no radar contact) where Sector Y proceeded to work the aircraft all the way into the airport with no coordination to Sector X. Sector X Controller proceeded to watch this unfold without attempting to initiate the coordination to Sector Y to say "radar contact" or even "point-out approved" since there was no traffic for this aircraft. This was wrong in and of itself for several reasons including questioning the reach of Sector Y frequencies. Sector Y has this aircraft set up for an instrument approach, runway unknown to Sector X. Simultaneously, Sector X is in communication with Aircraft Y, inbound to ZZZ. The pilot of this flight asked us for runway conditions. The Controller working the sector was unable to get a hold of ZZZ airport operations with the line for an unknown reason. The Sector X, A-side called on another phone and after a brief conversation with operations learned that operations had tried calling Sector X on frequency to inform us that Runway XL is closed while they clear the runway of snow. It was also about this time that the NOTAM populated in ERIDS (En-route Information Display System) which is definitely not enough time between NOTAM being received and giving [the] Controller time to see [the] NOTAM relative to the location and phase of flight to Aircraft X arrival, especially if NOTAMs had already been checked and issued at the initial descent per 7110.65. While this phone call was taking place, Aircraft X was on final at approximately 3,500 feet or less. A-side ran to Sector Y and asked what runway the flight is set up for and was told Runway XL and was immediately told to cancel approach clearance and climb aircraft to 6,000 runway heading and place the aircraft on Sector X's frequency. It's amazing that Sector Y's frequency was able to even reach the aircraft. With poor visibility and snow plows kicking up snow, the plows would never have been seen even if the runway had been. Recommendations: 1. Airport operations not getting a hold of an actual person to communicate runway closure and in a timely manner. 2. Sector Y working an aircraft into airspace that wasn't their own. Breakdown in understanding ownership of ZZZ1 or negligence? 3. Sector X Controller not initiating "radar contact" of this flight. 4. Retrain OM's. Many overnight OM's are not properly executing text files at time of ATC 0 placing ZZZ approach airspace at a sector that's adjacent to the actual sector being worked. Sector X is one scope on the mid at Sector Z. ZZZ approach is being opened at Sector X and more often than not, is NOT followed up with a CS message to combine with Sector Z. Until a few years ago, Sector X was the mid scope and text file needs updated. This second step was clear in an email prior to this **period of ZZZ, ATC 0 but is being overlooked. Controllers in Sector X assume it's being done correctly by having the airspace next to them and don't speak up about it.** So if an aircraft didn't call Sector X for weather, Sector X could potentially be completely unaware of Sector Y working aircraft into ZZZ as "auto-pop" would happen on the adjacent scope. During this incident, ZZZ Approach was opened at the adjacent scope as I was told. That did not cause this though or factor into it, however. 5. Airport operations told to contact ZZZ Center on frequency which was never going to work. Needs to be a phone call to

center and nothing done until this takes place. It was discussed this morning after this incident that regardless of the weather, ZZZ (Sector X) shall reach out to airport operations for ALL arrivals to make sure they are clear of the runway. Supposedly one of the operators on the runway had a radio with a dead battery and obviously would not have heard a pilot calling short final or any other calls. Why wouldn't a radio be tested with another handheld and how could it have been unknown that it was dead? Changes to the ATC-0 plan may need to happen to stop this from happening again.

## Synopsis

Center Controller reported communication issue with a TRACON that was ATC Zero involving an aircraft inbound to an airport with a non-NOTAMed closed runway.

## Narrative: 1

[I have concerns with] the COVID pre-takeoff PA, which now instructs passenger that flight attendants will collect trash during safety compliance checks. Topics of concern: 1. Would this action not be a direct conflict with FAR 121.391 (d)? It is understood that collecting a few used cleaning wipes and some cups does not present an issue. Some may even consider it like collecting pre-departure beverage cups prior to takeoff. However, managing empty pizza boxes (and similar bulky items) will require flight attendants to unlock carts (and/or trash cart doors) since the openings are too narrow to accept such items (FAR 121.577 (c)). 2. The Flight Attendant could offer to return later for bigger items, but would that not require a judgement call during an extremely limited period? This adds a new distraction from more critical safety matters (seat-belts, tray tables, etc.). A Flight Attendant is responsible for (depending upon aircraft) checking for more than 20 items during routine pre-takeoff/landing compliance checks. 3. The Flight Attendant must now

carry a trash bag during compliance checks leaving only one hand free to steady themselves from a fall. It is confirmed that taxi surface movement is a high-risk period for injuries. Also, the revised policy now adds more time (additional duty) before being able to secure in a jumpseat. Knowing first-hand the history of Flight Attendant injuries related to surface movement, I strongly recommend the company reevaluate and consider changing to a more reasonable expectation of trash collection after takeoff.

## Synopsis

Flight Attendant reported concerns regarding the COVID-19 pre-takeoff PA instructing passengers to give the FAs trash during the safety compliance check. Flight Attendant believes this detracts from the main reason for the safety check.

## Narrative: 1

I received a call from our Chief Safety Officer stating that the aircraft we flew yesterday had an open maintenance write-up which we and 8 other crews had flown with. The day before, I was briefed by my PIC on the information related to our flight that day including weather, NOTAMs, and other applicable concerns. No open write up was mentioned and we continued with our flight per usual. As an SIC I suggest that in the future I should specifically ask the PIC during the pre-flight briefing if there are any maintenance concerns. This would provide an extra layer of safety and redundancy in our processes and would hopefully help mitigate the risk of a situation like this occurring in the future.

## Narrative: 2

We were dispatched to fly on commercial flight to pick up the aircraft at the maintenance center. Concerns with COVID exposure while traveling on commercial airlines are aggravating. Upon arrival at the airport we were directed to contact the maintenance base to have their van pick us up. When I called, the base informed me that the van service was discontinued. I put in an on-line request for a taxi ride. The address given did not take us to the service center, and there was much confusion and aggravation dealing with the taxi driver to try to get to the proper location. Upon eventual arrival at the service center the aircraft was ready for us, and I ordered fuel. I talked to maintenance both before leaving and during the trip, verifying that all of the paperwork for the maintenance performed was completed to their satisfaction. While completing pre-flight paperwork I apparently overlooked that the flight crew that had originally ferried the aircraft in had written up the pilot seat as a discrepancy, and that the open write-up had not been dealt with, either by being fixed or MELED. Verifying no open write-ups prior to flight is a company SOP, and one that I feel that I normally do as a matter of course. I can only think that dealing with the major maintenance paperwork on the maintenance issues

pushed the possibility of an open write-up not related to that work to the side, and I did not properly review the past flight logs in the flight can, thus missing the write-up. My aggravated mental state at dealing with airlines and COVID concerns, multiplied by the ground transportation snafus, were certainly contributing factors. When non-typical operations are being dealt with, stop and take the time to triple-check every detail.

## Synopsis

Corporate flight crew reported flying with an open maintenance write-up. The Captain stated COVID-19 concerns were a distraction.

## Narrative: 1

I was on Local Control. Ground Control was combined with Flight Data and Clearance Delivery. There was a stand-alone Controller in Charge. Aircraft X was rundown for an IFR release. The release was granted by ZZZ TRACON and Aircraft X departed from ZZZ to

ZZZ1. At the time ZZZ1 had a ground stop [GS] due to COVID cleaning and we did not coordinate a departure time with TMU. Prior to Aircraft X taxiing, there was a strip printed from TMU stating that there was a ground stop to ZZZ1. That strip was placed near the Status Information Area by the Ground Controller. During Aircraft X's departure roll ZZZ TRACON called over on the shout line to advise us of the ground stop and that is when we became aware that Aircraft X should have been delayed on the ground. We as a Tower team did not catch that Aircraft X needed to be delayed and we should have been more observant to the ground stop strip and requested a departure time from TMU for Aircraft X. I recommend that when a GS is in effect that the GS is displayed on the SIA [Systems Information Area] and that a strip is sent to all facilities at the same time. Often we will receive a flight strip with a CFR, GS, GDP...ect., but the information is not displayed on or SIA for several minutes if at all.

## Synopsis

Tower Controller reported an aircraft got off the ground that was in a ground stop due to its destination airport being closed for COVID-19 cleaning.

## Narrative: 1

Was experiencing fatigue, headache and mild nausea, didn't feel well enough to do another two flights after the turn I had already done. Crew was concerned about COVID. Tested my temperature and it was elevated. Crew and I no longer felt it would be safe to keep me on the aircraft. Called in sick on line.

## Synopsis

Flight Attendant reported having a headache, elevated temperature, nausea and feeling fatigued during the flight. The crew was concerned it could be COVID-19 symptoms, so the Flight Attendant called in sick for the next flight.

## Narrative: 1

I was working from ZZZ to ZZZ1. I was working in the AFT position. As I was in the back I watched the passengers as they were boarding, even helped a few out with questions. I noticed Passenger X and Y seated in seat XX3 had her mask under her chin and XX4 did not have on a mask at all. Once everyone was settled and I was able to move toward the front of the cabin I approached the passenger who was seated in seat XX3 and I told her she must put her mask on over her nose and mouth. She has the mask under her chin. I then noticed the child seated in XX4 did not have on a mask at all. I then asked passenger **seated in XX3 (the mother) "How old is your daughter?" She then responded "She's four (4)" I then told her that the little girl had to wear a mask as well. She immediately told me "No, she doesn't like that and how do I expect her to breathe?"** The little girl was very aggressive towards the mother and began yelling at her and telling her "No, No, Noooooooooo..." She also pinched and hit at her mother for talking to her in their language about the mask. I politely **explained to the mother the company's policy and** she then said "Ok" She pulled out the child's mask from her pocket and placed it on her face. The little girl snatched the mask off, threw it on the floor and yelled out **"NOOOOOOOO!" in her mother's face. I** told the Captain what was going on and gave him full details. So once the door closed and we did our safety demo and was sitting waiting to push back both passengers seated in seat XX3 and XX4 had their mask down and off. I went back to her and told her (the mother) that she had to keep her mask on. She looked at me and rolled her eyes and she put the mask back up on her face. I offered to give her another mask (that are provided on the aircraft) she said "No!" The passenger seated in the exit row seat looked surprised and began shaking their heads at her (the mother & child's behavior) The child was not listening to her mother and she kept screaming at her. The mother was trying to negotiate with the child but she was not paying her any attention. I told the Captain and he told me to go back to the passenger and tell her that they must wear the mask or we will re-open the door and have them removed from the aircraft. She then responded "Ok, we will keep it on." So once we get in the air and we get the 10,000 chime I get up to walk toward the galley and I pass seat XX3 and XX4 they both have their mask down and not on at all. It was the same exact thing I spoke to her about on the ground twice. I then had to tell her for the third time to put her mask back on her face covering her nose and mouth. Once service was done and I went to collect the garbage passengers seated in XX3 and XX4 was non-compliant once again. They were the only passengers on the flight who has to be spoken to on several times about the mask. At this point I issued a policy violation to her and as she was reading it she began to challenge me on the wording of the card. She said the violation stated kids two (2) did not have to wear a mask. I was confused because the child was four (4) going on five (5). This passenger was trying to find reason as to why her child should not wear a mask or why she could have her mask under her chin or top lip. After reading it she put the mask on both herself and the child. The child looked up and rolled her eyes at me because her mom said something to her in their language about her wearing the mask. Once we deplaned, I told the Captain that I had to issue the policy violation to her and that I was going to write a report about the incident and he said "Ok."

## Synopsis

Flight Attendant reported a mother and young daughter would not comply with face mask policy.

## Narrative: 1

I was assisting a bathroom break for the flight deck. Both pilots were not wearing masks! The First Officer put the mask on when I went in. It is ridiculous that they are allowed to take off their masks in the cockpit. The Captain wasn't wearing his. I asked him, "Where's your mask?," He acted as if he didn't hear me. I was very very uncomfortable. It was like he violated my boundary. I am stunned this is a reality at our company. Since when are they allowed not to wear a mask? I hate to think that flight attendants need to deal with this absolute nonsense. If they are not wearing one before we go in, we are to deal with millions of droplets. It is the end of November. Well into the pandemic, if one doesn't understand the importance of wearing a mask, then why do we have them as company employees? It's a shame this became a political agenda. It never should have been.

## Synopsis

Flight Attendant reported the flight crew did not wear face masks on the flight deck while the Flight Attendant was assisting with lavatory breaks.

## Narrative: 1

The Captain was flying. We got switched from the ZZZZZ to the ZZZZZ1 arrival and told to keep 300 knots. ZZZ was busier than normal since COVID and we got task saturated. They cleared us for the ILS XX approach and direct to ZZZZZ2 to join the final. We were then cleared for the approach and proceeded to descend to 2,300 feet via VNAV before hitting approach mode. Since ZZZ had wanted us at 300 knots we were in manual speeds. We descended below 10,000 feet at 300 knots and noticed it at about 9,300 feet. We leveled off to slow to 250 knots by 9,100 feet and continued as normal. It was a simple and common error caused by task saturation and typical ZZZ switching approaches 3 times and arrivals twice. ATC did not say anything. This is a common issue with ZZZ but also something we should have seen. We were more careful to monitor throughout the rest of the trip. This is also an issue of COVID and not flying much. No pilot is flying the amount that we used to. Especially Captains and First Officers on reserve. That is not an excuse, but an observation. ZZZ was busy like it used to be and none of us have been used to that since before the pandemic. We will be more careful, and I will more closely monitor events as well as prevent task saturation so this doesn't happen again.

## Synopsis

First Officer reported the flight exceeded the 10,000 foot FAR speed restriction. Task saturation and time off during COVID-19 were cited as contributing factors.

## Narrative: 1

We were told to Taxi C - G cross Runway XX to the gate. We contacted ramp and were given taxi to the gate. Our gate was X2 and we made the mistake of picking the wrong

alley and started down the odd gate side. We realized our mistake as well as Ramp Control and we asked to go up the next line over and then to the even numbered side gates. We apologized for this and Ramp was pleasant towards us, told us "Oh you're good, don't worry" allowing us to turn. It was not a busy time on the ground and we had plenty of room to make our turns to get to our gate. There was no safety issue involved but I feel it to be the correct choice in filing this. Contributing factors: I had not touched an airplane in over 1 month and I had not flown as Captain in well over 1.5 months or been to ZZZ in over 2 months, so I was focusing and not splitting attention accordingly I would say. I had my charts open and just misread. We were delayed all day so there was a time pressure. The gate that I was going to next was on the odd numbered side and I think I was thinking of the odd side due to this. I had been sitting in a crash pad for a few days and I believe that the stress of commuting and not being home for over 6 days may have had a factor on my mental state. Things learned: Slow down and read the charts better as well as make sure to properly look at the gate information displayed on the ACARS. It is always OK to ask for help. Never assume one gate vs the other. Not actively working means focus more on the task at hand for degraded skills.

## Synopsis

Air carrier pilot reported a ramp incursion and cited lack of flying as a contributing factor.

## Narrative: 1

Maintenance placarded potable water in lavatory LX inoperative per MEL. I asked the Maintenance Technician who brought logbook up to cockpit to confirm compliance with correction requiring the entire lavatory be placarded inoperative due to COVID precautions. He said he understood that placarding the sink was sufficient to comply with MEL. My interpretation was different, and out of an abundance of caution I asked him to place a "lavatory inop" placard on the affected lavatory door. We advised FA A, and did not use that lavatory. During cruise, after additional review of the maintenance text, I contacted Maintenance Control. They confirmed that to comply with the correction, the entire lavatory should have been placarded and requested I make a Logbook entry to that effect before arrival into ZZZ.

## Synopsis

Air Carrier Captain reported blocking off the entire lavatory from use due to the potable water in the lavatory being placarded inoperative. Captain decided to block the entire lavatory for COVID-19 precautions.

## Narrative: 1

During climbout on a heading of east on the ZZZZZ2 SID while passing 8,000 feet between ZZZZZ and ZZZZZ1 we got a TCAS TA regarding traffic descending off ZZZZZ3 on the ZZZZZ4 flowing south at 1 o'clock, 3-5 miles ahead that was no factor. This is something we see every day on climb out or descent in and out of ZZZ due to climb and descent rates. ATC then called traffic at our "10-11 O'clock 3 miles descending to one one (11) thousandâ€• I called "traffic in site no factor, they're passing above and behind us." ATC then asked our Altitude. I replied "level 10,000 feet. He asked our altitude again, I replied "Level 10,000 feet, he said he saw us at 10,500 feet and gave us an updated Altimeter setting, and cleared us to climb to 17,000 feet. Passing 12,000 feet he asked us what altitude we were passing. I replied "12,000 feet." He then replied "That's what we show as well. For some reason I had you at 10,500 feet back there. I have a phone number to copy when you are ready." We took the number down, and he said "Call us when you get to your destination to discuss a possible pilot deviation." The Captain called when we got to ZZZ1. The Controller Supervisor who answered said he had just sat down, had no idea what we were talking about, said he would do some research and call us back. 5 minutes later he called us back and said, "After review, the previous Controller showed you slightly high and stopped traffic on the arrival at 12,000 feet (which I thought was at 11,000 based on his advisory call). Then showed our altitude correct in the climb after he inquired again passing 12,000 feet. Said there was no conflicts or loss of separation, not a big deal, and that he would just file it as an RA report and close It out, however, we had no known RA's, nor any TA/RA indications for the potential conflicting traffic passing above and behind us? The ATC Supervisor didn't take any further action or questions, and wished us a safe rest of our day and left It at that. We thought It would behoove of us to fill out this report regardless. Wrong altimeter setting. We had a lot of distractions from multiple visitors on the flight deck at the gate while setting up cockpit and during the before start checklist (flight attendants, gate agents, deadheading crew and commuting pilots who we knew who stopped by to visit). Flight attendants held off boarding passengers who were held up at the door, until catering, who arrived at the aircraft late, had cleared the forward galley and aisle, and got them their snack/sanitary packages set up to hand out. So this backlogged the jet bridge, had the flight attendants coming in and out of the cockpit along with the commuting pilots, and gave us a lot of distractions. This back log seemed to frustrate the agent, for It was the flight attendants who were keeping the passengers out of the way until they were ready for them. For that, the gate agent was rushing to close the flight (We still pushed 10 min early). The FA A seemed rushed, and just closed the flight deck door before verifying if we were ready or saying "seated and stowed," which was nonstandard. These multiple interruptions (which seem to happen every flight these days) just added up, we had the current ATIS printed off, but when back tracked to get caught up, we missed the altimeter settings, which must have been set from a flight a day or two prior due to the difference in what It actually was at the time. Verify, Verify, Verify, Trap the Errors, Don't let the distractions of the daily operations knock you off your game. It was a beautiful cold VFR morning, flying with a Captain I had enjoyed flying with in the past, so I felt we were both comfortable and familiar with how each other operates within the SOP's and as a person. The Aircraft had sat overnight. I would like to see more operational (non-flying) related distraction/awareness incorporated into training. The day prior on a separate flight we had a passenger removed by law enforcement for non-compliance/and possible criminal related activity. Gate agents are constantly under stress to get flights out on time or early. To top It all off, everyone has been under stress of the pandemic, furlough related, or state of the airline related issues. -

## Synopsis

Air Carrier First Officer reported the pilot crew failed to set the correct altimeter setting causing an altitude deviation. Pre-flight distractions, including the current pandemic situation, were cited for the error.

Narrative: 1

Passenger in seat XX1 would not comply with the Company Face Mask Policy, pre-departure and in cruise. PAs were made from the flight deck addressing the face mask policy. Flight attendants requested numerous times for the passenger to comply. The passenger was verbally abusive during one of the requests. Personnel met the flight in ZZZ. The passenger might have been under the influence per conversations with the lead Flight Attendant.

## Synopsis

Air Carrier Captain reported a passenger became verbally abusive and would not comply with face mask policy.

## Narrative: 1

As we were boarding, Passenger X came onboard with her face mask not covering her nose. I politely asked her if she could please cover her nose and mouth with her face mask

before entering the aircraft. Passenger X complied and went to her assigned seat. I had to inform Passenger X two other times during a trash walk-through and after I closed the main cabin door to place her face mask over her nose and mouth because she completely took it off both times. Around the fourth time I caught Passenger X with her face mask completely off her face, I politely asked her to comply with Airline's face mask policy. Also, I asked my coworker to double check to see if Passenger X was complying with Airline's face mask policy during another trash walk-through, to which Passenger X wasn't complying with. Passenger X would place her face mask on when we asked her to comply with the face mask policy, but as soon as we walked away she would take it off again. I **informed the Captain about Passenger X's non-compliance** issues with wearing her face mask. The captain gave me permission to give her the final notice. When I [told] Passenger X the final notice: she pulled her face mask completely down and rolled her eyes at me. I informed the Captain and asked him to call for a CSR to meet us at the gate in ZZZ. When we made it to the gate in ZZZ, the CSR was there waiting. The CSR came on and I told her Passenger X was the one who was having face mask compliance issues. The CSR asked me what happened and I briefly explained. However, the CSR ended up letting **Passenger X race right pass her and let her get away. The CSR ask me "What am I supposed to do now?"** I was at a loss for words. I explained to the CSR that you'll have to go after her because it's not like I could have walked off the aircraft because we were deplaning with an aircraft full of passengers onboard. I pointed Passenger X out to the CSR.

## Synopsis

Flight Attendant reported a passenger did not comply with face mask policy throughout the flight.

## Narrative: 1

Passenger X was seated in XX3 during this flight. I asked Passenger X three times to wear his face cover (he had a bandanna). The third time I asked I had a face mask and informed him if his bandanna was giving him trouble he could have the face mask. He said no, he will wear the bandanna and he told me to get away from him. This conversation happened during Taxi and after our safety Demo. I informed the Aft FA [and] the Captain. The Captain said he will make an announcement reminding passengers about wearing the mask. After the double chime, the Aft FA informed me that XX3 took off his bandanna again. I called the Flight Deck and informed them that I was [giving Passenger X] the final

warning. I explained to Passenger X. Once I finished he was very angry. He said that he is a veteran who is disabled, he breathed in lots of chemicals during the war and the best think he can do is use the bandanna to cover his mouth. He said he hopes that is enough to keep people from freaking out. I thanked him for his services to our country and empathy for his disabilities. Then he told me aggressively to leave him alone, he said he has not slept for 3 days and that I better not come back and wake him up again. I informed the Captain of everything that was said between Passenger X and I and he said that a CSR will meet us at the gate. I did not approach Passenger X again and he did leave his mask off for the remainder of the flight. I told the CSR everything when he pulled the Jet bridge up to the gate. During the Deplaning process he apologized for how he spoke to me. He said he hadn't sleep for 3 days and it is getting to him and he did have his bandanna covering his nose and mouth. The gate agent spoke to him after he deplaned.

## Synopsis

Flight Attendant reported a passenger refused to wear a proper face mask citing a medical condition as the reason for not wearing it.

## Narrative: 1

Please strongly address the lack of cooperation on the part of some pilots regarding mask wearing. Flight attendants are not comfortable being in a small enclosed area with fellow employees not following the mask mandate. We are not concerned about what they do when we are not doing lavatory breaks, but are requesting that they follow company policy for the short amount of time we are required to be in the cockpit. This is as much for their safety as ours as we are indeed the ones in contact with dozens of individuals in the cabin.

## Synopsis

Flight attendant reported lack of cooperation from pilots when it comes to wearing masks while flight attendants are performing their duties in the cockpit area.

Narrative: 1

After doing safety demo and walking through the cabin for the final safety check, my A FA informed me that the passenger seated in XX1 was not wearing her mask and that she informed her that she needed to put it on. A FA then asked me when I was doing my walk thru to see if she was complying with her request and I said sure. On my way back to my galley I observed passenger XX1 sitting with her mask off. Since this was the second time I used the last approach to try to get her to comply. I spoke with her about her mask she said she couldn't wear it because she was drinking coffee I said I understand but as the announcement states if she isn't actively drinking she has to replace her mask. She then pulled her mask up and said this is ridiculous. I walked back to my galley and informed my A FA that I had spoken with her again about her mask because she had removed it again. At that point we had made the decision that once inflight we would have the Captain make another general announcement reminding everyone to wear a mask. When I walked through the cabin for my final compliance check before landing she had her mask on.

## Synopsis

Flight Attendant reported a passenger not complying with face mask policy.

## Narrative: 1

I was assigned today to operate SuperTug X, a towbarless aircraft tow tractor, while working at ZZZ. After towing the aircraft to Gate X, after disconnecting the SuperTug and while attempting to maneuver away, I made light contact with the pushback tractor which was parked behind me. At the time, I was feeling rushed, because I knew there were more tows scheduled for us and there was also someone waiting for me to clear the area so he could connect the ground power to the aircraft. While backing up I felt that I had the proper radius in the turn to clear the parked pushback but apparently did not, and made a light inadvertent contact with either the SuperTug hitch or bumper. I did notice that on this and a few other occasions that day, because I was wearing a different than usual but still company issued face mask, my depth perception seemed to be affected as the mask kept creeping up into my peripheral vision. I think this was a factor in my misjudging the turn in what were already very confined conditions. Another issue is that the SuperTug onboard GPU had recently been repaired, and we were using it for the first time in months, with a commensurate disruption to normal workflow. Although I thought I had clearance at

the time, in retrospect I should have taken a minute to move the pushback and reduce the risk. There was no pushback parking spot painted at this gate, so it was parked right against the edge of the OSZ [Outer Safety Zone], even there there was approximately 80 additional linear feet of space behind it available to park. Even if I had moved it, I doubt there was a user check performed on it that day, and therefore moving it without doing one myself would technically put me in violation. There are many more things that can be taken into consideration than just the blatantly obvious in a situational dynamic environment like an airport. Because the contact I made felt light, and I know from experience that the equipment is built to take that kind of minor impact, I made the snap decision to continue with the operation. If you take a look at any piece of airport ground equipment, including SuperTugs, it will immediately become apparent that it is literally covered with innumerable scratches and dents of varying severity, and if we would stop to report and investigate each one, the operation would literally grind to a halt. Therefore, it was my decision in this instance, based on my experience, observations, and common sense to continue. There were other factors which came into play in this decision, which I will briefly expand upon. I need to be clear that if this situation had been one in which I had reason to suspect that there was damage to equipment or even the possibility of damage to an aircraft, that I would have stopped and reported it at once. In this instance I deemed that it would be unreasonable to bring it up. Today was the X day back from my vacation of Y days, and when checking my work assignments for the month, this was only my Z day assigned to a SuperTug for the month, and the first assigned to X brand SuperTug. The other days I was at work during this time I was assigned to auxiliary functions. I believe this is significant in that it feels that this period of lack of hands-on experience caused a perception that my skills may have deteriorated or that I had become rusty. To that point, I noticed that I was taking some calculated risks, most notably when maneuvering on the gate areas, especially around stationary ground equipment, while preparing to capture or egressing from the vicinity of aircraft. My reasoning for this, and which I explained to the Supervisor during the course of the day, was that I was attempting to refresh or hone my skills, which I felt may have become dulled. Another way to put it is that I was trying to find my corners, as persons who operate various types of vehicles say when describing how they feel or sense where the vehicle is in relation to the surrounding environment. While doing this I felt that I was on point, secure and aware of myself and tasks at hand. I could say that in fact I was over-zealous or over-confident, too gung ho, and I should have taken a step back at some point and put all this information together, which I only do now after the fact. I would have to say that the primary reason I did not take that step back was workload / task saturation and distraction, described as follows: Because of the substantial number of people who were not able to work, apparently due to the public health crisis yet ongoing, the manpower available was at or just over half of which would normally be on the team on a given shift. There was not a substantial reduction in workload, and we had what I would consider based on precedent to be a moderately but not excessively heavy day. There was therefore an underlying perception of increased pressure to perform, especially in consideration of supporting the needs of the operation because of the diminished staffing during an unusually trying time. I had also noticed multiple issues during the day, which could have been brought to the attention of management or also could have been overlooked and dealt with at a time of less operational urgency. The most notable of those issues were; a broken seat belt in the SuperTug, radios whose display units were not lighted and hence not visible after sunset, and all the fire extinguishers on the SuperTug were missing the inspection placards. Additionally, no less than three sets of portable stairs that we used during the day had operational deficiencies which would have deemed them unsafe or usable, and which I have been seriously doing a report on. For any or all of these reasons or others, I could have stopped the operation. I chose not to so as not to interrupt the operational tempo but more so because these types of inconsistencies are regularly not recognized as such

but instead accepted as the norm, and ignored and worked around, regularly and without second thought or concern. For a company that emphasizes a focus safety as the primary value, in actuality the primary focus appears more to be, unless there is a glaring issue present, in many but not all instances, getting the task accomplished with little or no regard given to risk mitigation. This attitude is part of the culture of this workforce, is long going, omnipresent and systemic. Combined with other negative attitudes and attributes it conspires to create a corporation which says one thing, and does another. To an employee who wants to do the right thing because of the recognition of the fact that it is mutually beneficial to do so, working in this environment can be disheartening, frustrating and disappointing. To be frankly honest, I feel quite often that I am being singled out on occasion for attempting to bring these sorts of things to light, and that local management's attitude towards me is becoming that, if you want to hold us accountable then we will do the same towards you, watch you like a hawk and bring to bear any issue or inconsistency in your performance also. This does feel to me to be somewhat unfair, at times. When I decide to bring an issue to light, I give it careful consideration, more than I probably should, and more often than not I keep quiet about it, do my job and let management do theirs. We should be striving to work together, especially in a critical time such as this now is. I do admit that at some point during the day, I should have recognized that the pressure levels were increasing and should have voluntarily and proactively taken a few minutes to step back and regain composure and reintegrate myself appropriately into the operational flow. I did not do so largely because of operational pressure but also due to the distraction caused by various inconsistencies I described, keeping a running mental tally of these while still maintaining a focus on my tasks. Based on my analysis of the events of this situation, I consider that it would be more likely that I take a pause given another encounter of a similar chain of events.

## Narrative: 1

The First Officer was flying a visual approach to ZZZ Runway XXR with right traffic from ZZZZZ3 arrival. Radar vector to final, cleared to 3,000 feet from 4,000 feet and cleared the visual. First Officer was in vertical speed and I set 3,000 feet in the MCP window. He armed approach mode and captured the localizer. The aircraft leveled at 3,000 feet and did not capture the glide slope as we were too high. Gear was down, flaps 20 and speed was 163. First Officer disconnected the autopilot and dove down to capture the glide slope. I suggested speed brakes, which he used to get down. This rapid descent caused the Tower to issue an altitude warning. I then became very busy stowing speed brakes, landing flaps, checklists, and verifying stable approach parameters. We never did the 1,000 feet call for set M/A altitude and cleared to land check (which we were). The event, although satisfying the stable approach parameters, was highly irregular and borderline go-around scenario. The debrief included mostly what went wrong and why. We discussed and I noted the main errors. The First Officer said not flying for 7 months was the issue.

## Synopsis

Air carrier Captain reported an unstabilized approach. The First Officer's lack of recent flying was cited as a contributing factor.

#### Narrative: 1

Please listen to the Phoenix [P50] TRACON sectors during peak periods. The Controller could not work all of the traffic. The COVID-19 cutback by ATC is dangerous during peak use hours. The controllers are magnificent but need help/more controllers. One Controller is working an area twice to 3 times the reasonable area. Please let them get back to work like it was before the COVID slowdown. I have been actively flying for XX+ years. Please don't blow this off. The environment is dangerous.

#### Synopsis

Pilot reported the P50 TRACON controllers appear to be working unreasonably large areas and expressed concern over COVID-19 related cutbacks in ATC staffing.

## Narrative: 1

I was returning to BED from the West. It was dark. I tuned in the ATIS. The current ATIS was broadcasting that BED was "landing and departing Runway 23." After copying the ATIS, I called BED Tower and reported my position as near Minuteman Airport (6B6) and informed the Tower that I was inbound landing with ATIS. The Tower Controller initially cleared me to enter a right downwind for Runway 29. This confused me because the ATIS had stated that BED was "landing and departing Runway 23." I asked the Controller for confirmation of the runway assignment and he acknowledged that he had "made a mistake" and told me to enter a right downwind for Runway 23. After I entered the control space, and near the airport, I noticed the high intensity runway lights and landing traffic was on Runway 29, while runway 23 had their lights on "dim". Since the ATIS had not mentioned simultaneous operations to intersecting runways, I became disoriented. I mistook Runway 29 for Runway 23. I was so concerned that I even called the Tower and asked the Controller: "Is the Aircraft Y lined up with the right runway?" The Tower Controller realized that something was not right and called me and asked me to confirm that I was setting up for right downwind 23 and offered me a clearance to enter a right downwind for Runway 29. I told him that I thought I could still correct, but I ended up flying through the final for Runway 23 and ended up on a left downwind for 23. At about this time, another aircraft, which I later learned was Aircraft Z arriving from the west had also turned inbound to Runway 23 from the north. The Tower Controller told me to turn 20 degrees further right which I did to widen out my downwind leg. Thanks to the Controller, the Aircraft Z was able to land safely and so was I. I now realize that several other factors contributed to my confusion. I was more tired than I realized. I had a very long work week, yet this night was an opportunity to start flying more night flights, after being

absent from this experience for over 16 months. The pandemic means hazard [but not] if I bring an instructor to help me re-acquaint to night flying. I allowed myself to be fooled by the warm weather, the light winds and the great visibility into thinking that it would be a good night to re-acquaint myself to cross-country night flying. Tonight, with the lights dimmed in the cockpit, and the high intensity lights on Runway 29, a plane landing on 29, the lights dimmed on Runway 23, and my lack of night flying practice did this happen. I now realize that I had vastly underestimated the combined effects of fatigue, distraction and "rust." Added to that, my confusion resulting from the initial mistaken clearance to enter a right downwind for 29, the combination of bright runway lighting on a conflicting runway without any warning that such operations were being conducted, and traffic operating in unexpected directions all combined to make for a much more confusing situation than I ever would have expected. The controllers explained to me that even when Runway 23 is the operating runway, they still allow traffic to land and depart Runway 29 because Runway 23 is too short for some aircraft that use the field. Nevertheless, I believe that safety would be greatly improved if, during nighttime operations, the ATIS included the warning concerning operations being conducted simultaneously to conflicting runways. This is especially true at BED where runway alignment issues are already an issue. I believe that such a warning would have eliminated my confusion at seeing traffic landing and departing on Runway 29 and then mistaking it for Runway 23.

## Synopsis

GA Pilot reported an airborne conflict after confusion identifying the correct runway for a night visual landing at BED airport. Reporter cited lack of flying due to the COVID-19 pandemic was a contributing factor.

## Narrative: 1

Day 1 of the cycle I was arriving in ZZZ to meet up with my First Officer (FO) for flights that afternoon. I came on duty and was scheduled to land in ZZZ this afternoon. I was in contact with my original FO who was home on standby in the morning and was coming to the airport this afternoon for our flights. When I landed in ZZZ, Flights Operations informed me my original FO had been taken off of the flight-line due to COVID. Flight Operations informed me I had another FO coming in to replace him and I should be able to maintain my original departure time out of ZZZ. I was texting my new FO asking when he would be at the airport and he said around XA30. In the meantime I got the airplane ready, so that we could depart as soon as he arrived. When he arrived we called Flight Operations to confirm our flights and then we took off. The next day, Flight Operations reached out to my FO and told him that we had taken off while he was in FAR rest period. I had no idea he was still in rest, I was under the impression he was already on duty as home standby and had been called in for the flight. Upon finding this out I called the Chief Pilot's Office and explained the situation. Looking forward, I'm going to confirm the FO's duty start time so that we are all on the same page and staying legal within flight duty.

## Synopsis

Corporate Captain reported the original First Officer (FO) was replaced because of COVID-19 and the replacement FO was still in FAR rest period when the flight took off.

## Narrative: 1

I have X years of experience flying helicopters both IFR and VFR in the area. I know the area well. I know the rhythm of sporting TFRs and where to find the information (usually ForeFlight). Unfortunately, COVID in 2020 has effectively eliminated almost all of the normal sporting events. I actually thought that since fans couldn't go to sporting events that there would not be any active sporting event TFR's at all since they wouldn't meet the people density standard. Tonight, while en-route to ZZZ1 from ZZZ2, I learned that is not the case. While following my normal routing from ZZZ1 to ZZZ2 following Interstate-number Southbound and asking for a ZZZ transition over the south field to ZZZZZ, I called ZZZ Tower to ask for the transition when the Controller asked me if I knew that I was in a TFR. I apologized and informed the Controller that I didn't and that I didn't see the TFR on my Garmin GTN nor on ForeFlight. Another pilot chimed in on freq and also said that he didn't see the TFR. The Controller simply said copy and gave me the transition without mentioning the issue further. I then saw that I did not have the TFR layer on my iPad (ForeFlight) turned on. As soon as I landed in ZZZ2 I turned on the layer and sure enough there was the TFR. I must have clipped the edge of it on my track inbound just north of ZZZ. This issue really stems from unacceptable complacency to sporting event TFR's during the COVID year and also the fact that they don't populate to my Garmin GTN via XM like normal TFRs do. I really wish they would standardize the delivery of TFRs so that we can see them across all services. Regardless, it was unacceptable to not have fully reviewed the flight path for all TFRs prior to departing ZZZ1. ...a mistake I won't be making again.

## Synopsis

Helicopter pilot reported a sporting event TFR violation.

Narrative: 1

I was the D Flight Attendant sitting in seat X4 (assigned jump seat). There was a [reward system passenger] sitting behind me in [seat] Y4 and his traveling partner in [seat] Y6. This was my first flight back after a COVID exposure from the plane. During boarding I asked Y6 to make sure her mask stayed over her nose. She said it kept falling down. I offered one of ours but she declined. During the safety demo I once again asked her to pull up her mask. As soon as we took off they both removed their masks. Multiple times I asked them to put their masks on. When we were cleaning up for landing the passenger in Y4 started shouting at me asking for my name. He said because he had a drink in front of him he didn't need to put on his mask. I once again explained our policy was that it was only supposed to be removed briefly. He said he had been on 7 different flights and nobody had asked him to put on his mask. I was the first one. I called the B Flight Attendant to join the conversation. She reiterated our policy. After talking to him for a while he said he was extremely frustrated with the inconsistency of mask policy enforcement. He calmed down when we all agreed there should be more consistency with enforcing or explaining our mask policy. Just wanted to write this up as a safety issue. He also said he would be writing in to Airline. As a [person in the reward system] not sure if he knew better and just didn't want to wear the mask or if nobody on other flights has actually enforced our mask policy. But as someone who travels as often as he does. He clearly needs some clarification.

## Synopsis

Flight attendant reported a passenger was not compliant with face mask policy.

## Narrative: 1

Upon stepping aboard Aircraft X, I immediately detected an odor that had a burnt wire smell. The other FA's also made comments such as, "What is that smell? It smells like something is burning" as they stepped onboard. I was the D FA and began checking my safety equipment. I looked in the galley to see if any circuit breakers had popped and also looked in the oven to determine if the odor was from a forgotten burnt meal. All circuits were in proper place and there was no food in oven. I then walked down the aisle to determine if the burnt-wire smell was coming from the aft galley. I stopped at Row 21, aircraft right and stepped up on Seat 21 D as the odor was very strong above the OH bin. I could not visibly see any sign of smoke but the odor was quite strong. I then walked back up to fwd galley as I saw that the Captain was beginning a briefing. Captain stated that this aircraft had just come out of "mothballs" and had just cleared a major inspection in State X. He stated that it had just arrived to ZZZ and the Captain of that flight informed him that a smoke alarm for the aft cabin activated upon landing. Captain stated that this happens from time to time and poses no threat of fire. All of us 4 FAs told him that we smelled a burnt wire odor in the cabin. A male individual, name unknown, representing Maintenance stated that we "probably were smelling new carpet glue". Captain waited for the Maintenance personnel member to step off of the aircraft and then told us FA's that if we were not comfortable with the odor that he backed us and would insist that we fly a different aircraft to ZZZ1 or return to hotel if aircraft was not available. All 4 of us FA's unanimously and instantly stated that we did not feel comfortable on this aircraft and we wanted to change aircraft in the interest of Safety First. I then told the Captain that I noticed the odor was particularly strong by OH compartment of 21D. We then walked to that row and Captain also noticed that it had a strong odor of either "heated dust" or "hot wire" on the lighting ballast. He then asked me if I personally felt safe taking this aircraft. I told him that I am very safety minded and the odor was not normal or usual to me. We all stayed in the first class seating area and continued personal conversations among us. The Captain was not present as he was talking to Operations. After approximately 15 minutes of remaining in the first class seating area, the other FAs noticed that my voice was getting hoarse and that I was beginning to lose my voice. To the best of my recollection, I believe that C FA, and B FA, both stated that their throats felt scratchy. After approximately another 15 minutes of staying and waiting for a decision onboard, in the first class seating area, we were told by [the] Captain that we were changing into different aircraft for our flight back to ZZZ1. We then deplaned the aircraft and walked to the other waiting aircraft. My voice remained coarse for an additional 30 minutes and I developed a migraine during the boarding process. I had the migraine the entire flight to ZZZ1, and it continued until early afternoon of date. Additionally, I awoke on the morning of date with a sore and scratchy throat. Both my migraine and scratchy throat subsided around 1400 hours on date. I have had a continuous low-grade headache since date through present date. I did not seek any medical attention as I "normally" suffer from low grade sinus headaches regularly and use an OTC nasal spray along with Tylenol. I commend our Captain, for valuing and backing our decision to prioritize safety first. I

would hope that Aircraft X was ferried back to ZZZ without full crew and guests in the pursuit of safety.

## Narrative: 2

Upon crew boarding aircraft for return ZZZ-ZZZ1, [flight attendants] smelled what seemed like an electrical burning smell. It was not possible to find a fresh place of air on the plane, but the smell did seem worse as we walked further back. Our Pilots were met by that aircraft's ferrying pilots who also explained an aft lav smoke alarm went off while they were flying/descending after couple hours flight. The aircraft had just completed its mechanical run through after being "unparked" from its holding location where it had been for 5 months. Unsure what that smell was, and given the circumstances of the aft lav smoke detector going off just previous to our boarding, our crew was offered another aircraft to take back to ZZZ1 which we accepted. At that point we had sat on the plane for likely about 30-45 minutes waiting for the phone calls and approvals and aircraft delay or swap or grounding decisions to be made. The flight attendants were in the cabin the whole time. Pilots came and left to discuss in jetway. Agents boarded for a couple of minutes and concurred on the smell immediately. Crew spoke of headaches, sore throat, and itchy/stuffy nose afterwards. Just concerned for aircraft returning to operation after long time [of being] parked.

## Synopsis

Flight attendants reported smelling a burning odor during boarding and experiencing health issues.

## Narrative: 1

Upon boarding a passenger assigned seat XX1 was walking up the aisle with her mask pulled down. I asked her to cover her nose and mouth with her mask. She does not comply. She asks "does this plane have oxygen? I can't wear this mask." I ask her if she is telling me she has a condition that requires oxygen during the flight then she needs to bring an approved Oxygen Canister on the flight. Meanwhile the passenger in [seat] YY1 sits down, mask below nose, and will not comply with many requests from me to pull her mask to cover her nose. I call the Captain to have him contact a Supervisor to remove these passengers and to let him know the passenger who sat in ZZ1 was demanding that I administer oxygen. Now a young man is trying to sit in ZZ2. I ask if that is his assigned seat. He was assigned [seat] XX2 I ask him to sit in his assigned seat. He complies. Then a passenger shows up in [seat] YY2. He gets inside my personal space and is belly to belly with me saying he doesn't like how I am talking to these passengers. [Passenger in seat] ZZ1 is asking me what was I going to do. And I told them that I had called the Captain to get someone to take them off because everyone has to properly wear a mask. I was hemmed in by passenger [in seat] YY2. I finally got past him and went up front. At that point Paramedics came and took the passenger in [seat] ZZ1 off in an aisle chair. The station manager finally shows up and I tell her removal for mask compliance of passenger in [seat] YY1 and passenger in [seat] YY2 [is necessary] for interference of crew member duties. All said and done the whole party was removed from the flight.

## Synopsis

Flight Attendant reported several passengers were removed from the flight because they would not comply with face mask policy and were interfering with cabin crew duties.

## Narrative: 1

We had an issue with a family in regards to our mask policy. After we did the demo I walked back to compliance and saw that the mother, in [seat] XX4, the face mask was below her nose and when I got closer she pulled it up. The three kids in [seats] XX 123 pulled their masks up and kept them on. I turned to the mother and said that "I need your mask to stay over your nose at all times." As I'm saying this she has it pinched between her finger pulled away from her face. She snapped back, "It's there or it's covering" something along those lines and dismissively continued her conversation with the woman across from her. When I walked to the front of the plane before the demo I told the woman in XX3 to follow the mask policy so XX4 knew we were enforcing it. After my first encounter I informed the crew that I already talked to her and received attitude back and for them to keep an eye out. My second encounter was shortly after that when I went to pass out the [snacks] to the family next to her. As I walked up the mask again was down below her nose and when she saw me there she moved it up. I told her I really need her to keep the mask up and she snapped that it was up. I said it wasn't a moment ago and that I didn't want to have any issues on this long flight. Her responses to that was did I know that the politicians didn't believe in masks and I told her that this wasn't political, it was me doing my job to enforce our policy. She continued to give me attitude and talking about it was political. I went to the back and informed Flight Attendant (FA) C and D how my second encounter went and that she would be an issue the remainder of the flight and I strongly believe we should give her the Warning. They both offered to be the one to talk and give it to her. Flight Attendant C took care of that. While passing out the snack mix, I got to the row the husband was in. He asked for the wife's snack and his mask was down and FA D asked him to make sure his mask was up. XX4 had some kind of response that I missed but FA D told her not to have attitude towards us when we were just doing our job. Then she responded as a victim, saying she's been yelled at the whole flight and that she has been talking to us respectfully and not yelling at us. Which is not the truth because my encounters with her were very unpleasant, disrespectful and had the intent to belittle me and the policy. The remainder of the flight the entire family didn't comply with the mask policy. Their son rarely had the mask on when I passed, the daughters below their nose and the husband as well even though he would pull it up as we passed by. We all spoke to the family at one point and most of us multiple times. The mother was constantly having the mask below her nose or pulling the mask away from her face as she spoke to her kids and the woman across from her. I also was informed that another guest moved his seat because he was so uncomfortable sitting in front of them. I was told after everyone was off that they didn't have their mask on properly while deplaning either.

## Narrative: 1

Passenger A in [seat] X3 did not have his mask on properly when I took his beverage order. I asked him to please cover his nose. As soon as I turned around to do the next row of service he turned his head where I couldn't see and pulled the mask below his nose. I picked up garbage and he again/still did not want to comply with our COVID mask policy and had it down. I asked him again. He'd pull it up then pull it down again being non-compliant. I let our Flight Attendant (FA) D know. Flight Attendants A, B, D and F were doing two trash pick-ups and told him twice to comply. I walked up doing trash and he had it down under his nose again. I told him that we had asked him for compliance multiple

times and we would have to take further steps of compliance wasn't reached. He muttered something I could [not] hear. I let FA A know and she said she'd keep an eye on him. We saw that he and his father in [seat] X1 were traveling on to ZZZ. I guarantee he will cause issues on his next flight. We all agreed that if he didn't comply again we would issue a warning. We actually gave him more warnings than we should have as he kept pulling the face mask down after we would walk away. I walked by doing visas and Passenger A again was non compliant with his mask under his nose. I told our FA A to have a chat with him. He should have been issued a warning but due to bumps on descent we didn't have time and it wasn't safe. Again I know he will be non-compliant on his next leg. He repeatedly did not follow our request to wear his mask properly. He was non-compliant to our COVID safety mask policy. Though a warning wasn't issued I think it should have. Any crew in the future will have problems getting compliance.

## Narrative: 1

There were some mask compliance issues with passengers in XX1 and XX3 as well as YY1 and YY2. Both separate parties did later comply. Row XX complied after I informed them

I'd be issuing a warning if they continued to not comply. I told them that they will be banned from our airline if it continued. That was my 3rd time telling them and they complied. All parties eventually complied.

## Synopsis

Flight Attendant reported passengers in 2 separate parties would not initially comply with face mask policy until given a warning.

Narrative: 1

Passenger A would not comply with our mask policy. He was first informed to place his mask on over his nose and mouth and then when I passed by a few minutes later collecting trash, I also noticed he had removed his mask and I reminded him that he needed to place his mask on. He then covered his face with his hoodie and I then handed him one of our masks on board. He then showed me he had one already and I asked him to place it over his mouth and nose, which he didn't when we were in final descent. During deplaning when he walked to the front of the aircraft he still didn't have a mask on, and chose to ignore us again when I told him he needs to have a mask on. We did not serve him a warning because this occurred during initial and final descent. A notice should be placed on his reservation regarding him not complying with the company's face mask policy.

## Narrative: 1

As Passenger A boarded our flight, I asked her to please make sure that her mask was on over both her mouth and nose. She did not comply. Then while in the cabin during boarding, I noticed Passenger A was still not wearing her mask properly. I again asked for her to please fix it as it was required. She informed me that her mask was too large. I then went and retrieved a mask from the inflight kit and brought it to her. Passenger A told me that she did not want our mask and that she was not going to change it...I gave her our required paperwork, informed the Captain and asked the gate agent to speak with her. We decided to continue with her on our flight. In flight, she was asked multiple times

to comply with our policy again to no avail. I asked for a Supervisor to meet the aircraft. The Customer Service supervisors met the flight. Passenger A continued to disregard the safety of everyone on board.

## Narrative: 1

The aircraft was late arriving. There were fumes and a very strong smell coming out of door 1L from the sanitizing spray while we were standing out on the jetway. The training that all FAs are required to complete, states we must wait at least XX minutes before entering the aircraft after spraying is completed. The agents started boarding while we were still on jetway and the customers told the agents. So the gate agents came down to ask what the problem was and we stated the fumes are too strong for us to board. We were pressured to start boarding as to not cause a delay!

## Synopsis

Flight Attendant reported the gate agents tried to board the passengers right after the aircraft was sanitized, disregarding the mandatory wait time.

## Narrative: 1

Upon executing a missed approach, the aircraft was leveled off early. The error was recognized and the aircraft put back into a climb to reach its target altitude for the missed approach. Pilot flying became disoriented after the acceleration and climb on the go-around in IMC. The aircraft was light and the majority of experience was on the Y series. It had been 15 days since the last flight, and 76 days since flying in an X [series] for the pilot flying. The PF reaction to the increased pitch attitude and acceleration was to level the plane prematurely. [Need] Review of SOP procedures for go-around, and mental preparation for pitch attitude changes from the Y to X series on the X type aircraft on takeoff and go-around configurations.

## Synopsis

Air Carrier First Officer reported not following SOP's during a missed approach and stated that an extended period of time off was a contributing factor.

## Narrative: 1

Arriving at security at XA:00pm, we found all security check points and KCM [Known Crew Member] closed. We were directed to security for airport employees in another terminal. After setting off the alarm, I was instructed to start removing various articles of clothing. With a line of airport employees behind me, I asked for a private search. I was taken to yet another terminal and told to enter a room the size of an average walk in closet. Two security personnel crammed in behind me. There was poor ventilation and no possibility of distancing ourselves. We all stood within a foot of each other. I would suggest in this time of COVID, TSA like every other organization must adapt procedures and protocols to

prevent the spread of COVID-19. Utilizing KCM decreases the time and contact between security personnel and flight crews, two groups exposed to more human interaction than most. Increasing the hours of KCM operation and relaxing constraints within the program to facilitate secure social distancing is a reasonable adaptation to help mitigate the spread of COVID among both essential workers and the public at large.

## Synopsis

Air carrier Captain reported concerns with security checks in the terminal area that do not allow for proper social distancing.

## Narrative: 1

While taxiing out to Runway XR at ZZZ I might have failed to hold short at the hold short line. The FO and I recognized the error at the same time. He yelled stop as I hit the brakes. Looking out at the line, it was difficult to tell if the nose of the aircraft had crossed over the line. The Tower was informed immediately. The Tower then cleared us for takeoff. No other issues. Both the FO and I had reviewed the bulletin for ZZZ about this problem and it still may have bitten us. Other issues that may have affected our situational awareness was a last minute weight and balance issue that required us to stop on the taxiway to move passengers and get our numbers. Another issue is that I and the FO are starting to fly again after three months. It is taking time to re-acclimate to line operations. Even being aware of this and taking our time to get it done right, we may have still gotten bit by the error.

## Narrative: 2

Approaching Runway XR hold line Captain began to apply brakes, so I thought he was coming to a stop. I looked down to bring up the legs page on my FMC and when I looked up again it was apparent he was not going to stop short of the hold line. I told him to stop and he brought the plane to an immediate stop. We had crossed the line by a few feet. Captain told the Tower we may have crossed the hold line and they asked if we could take an immediate takeoff, we said yes and proceeded to takeoff on XR without incident.

## Narrative: 1

Hand flying on climbout when ATC asks us about icing and temperature. We respond with light rime and the SAT. This happened just before reaching FL210. I looked down at EICAS for temperature and in the process climbed through FL210 by 400 feet, but immediately corrected. ATC did call us on it but we were back at FL210. At no time was there any traffic conflict or separation issue. Being new to the airplane, I was hand flying to get a better feel for the airplane. Might be worth mentioning that plane was light and was climbing like a rocket ship but previous to this event, we had complied with correctly with all other altitude assignments.

## Synopsis

Air carrier Captain reported an altitude deviation during climbout.

## Narrative: 1

I unknowingly rode in a van with, and flew with a Flight Attendant who had exhibited COVID symptoms the day prior to our flight. On [date 1], the Flight Attendant reported from ZZZ that she had been vomiting and had a temperature above 100. She reportedly called in sick at that time, but still flew the next day with us ZZZ-ZZZ1. That day she also rode with us in the van, a 15 minute ride from the hotel. Only once airborne, from ZZZ-ZZZ1, was I made aware of the Flight Attendant's situation, and reported it immediately. I must not have all the information, because it appears that she called in sick on [date 1] with COVID symptoms, but was allowed to fly the [to] ZZZ1, then was on sick list again when she got to ZZZ1. Because I was in close proximity to the Flight Attendant with COVID symptoms for more than 15 minutes, I called in sick for the remainder of my trip.

## Synopsis

Air carrier Captain reported concerns with being in close contact with a Flight Attendant that had called in sick the day before for COVID-19 like symptoms.

## Narrative: 1

The foreign City X flights are a big problem with the issue of a large number of the passengers refusing to wear their mask from after boarding and throughout the entire duration of the flight. The flight attendants are nonstop in the processes of enforcing the mask requirement and a constant barrage of calls to the cockpit, in addition they are being verbally abused and disrespected by the non-compliant passengers . Company needs to find a way to strongly inform the passengers of the requirement and the seriousness of the lack of respect to the crew and fellow passengers. This is becoming such a problem that I as Captain of the aircraft am going to be forced to land the aircraft at the nearest suitable airport along our route and deplane the instigators.

## Synopsis

Air carrier Captain reported many passengers refuse to wear face masks during flights to a specific international destination.

## Narrative: 1

Aircraft requested IFR clearance airborne. I proceeded to find the flight plan and issue a clearance when pilot was out of 2,900 feet when the MIA was 3,000. This was my first day

back in the facility in 4 months due to COVID. Prior to that I worked straight mid shifts for the preceding months. I haven't seen any day/evening traffic since month (8 months). This session appeared complex for me due to my absence. I was told I would have this 1 single day to OJT and then I must get an Over The Shoulder. Jumping immediately into the job made me overthink a lot and I rushed the clearance without thinking of the MIA. Provide more than 8 hours of OJT prior to forcing people to re-certify. This would make the transition back a little smoother.

## Narrative: 1

The incident with Aircraft X can best be described as the perfect storm where in this case the R-side Controller working [two sectors] was very busy and on top of that had numerous aircraft that departed ZZZ Approach level at 160 in his airspace without communication. Prior to me sitting on his position he reached out to the Supervisor to request a D-side along with advising that ZZZ Approach was not shipping aircraft in a timely manner. One aircraft he had was Aircraft Y who was 53 miles into his airspace level at 160 still not on frequency and Aircraft Z, 23 miles into his airspace with the same issue. I mention this because I believe this was the biggest contributing factor to the event with Aircraft X. Aircraft A was at 160 and he descended the aircraft to 10,000 thinking he was a ZZZ1/ZZZ2 arrival and to alleviate all potential traffic conflicts. The main problem was as soon as I sat down and signed in, the R-side was too busy to give me a brief but I was eager to help and to catch up on anything. As I was beginning my scan I noticed Aircraft X getting close to the ZZZ1 Approach airspace at 10,000 without a hand-off and I immediately jumped on the line to coordinate with the ZZZ1 Approach Controller. I began to try to APREQ the aircraft at 10,000 but the ZZZ1 Controller realizing he had an arrival to ZZZZ [Intersection] already at 10,000 he instructed me to descend Aircraft X to 080,

the R-side complied. There was no loss of separation between any aircraft, however; I have decided to report this event because I was talked to by management because of it. I advised my Supervisor in the X area that I did the best I could given I had just sat down and had just noticed the aircraft not handed off to ZZZ1 Approach. Given the coordination could have been done in a more efficient and timely manner I had to work with what I had. **According to the safety board's review of the event there was an airspace violation** as a result of this coordination. In my opinion this happened because the ZZZ1 Controller and his uncertainty of what needed to be done. I offered to descend Aircraft X to 080, but he advised me to just leave him at 10,000 and then instructed another aircraft to descend below the Aircraft X flight. This back and forth coordination and being reluctant to take the hand off is what resulted in Aircraft X entering his airspace without a hand off. I would like to add that overflights are not allowed over ZZZ NAVAID per our LOA, however the situation dictated a different solution. I would also like to emphasize that as the D-side Controller in this situation had I not immediately gotten on the line with the ZZZ1 Controller this would have been a much different and ultimately worse issue. I am almost certain a loss of separation would have occurred. My Supervisor agreed and the R-side backed me up on it. I have chosen to report this event because even though management advised me this was not disciplinary in any way shape or form, I would still like to bring this up to the safety council's attention. Because of COVID, staffing has been an issue and the traffic volume was high. We had staffing later in the day that helped tremendously but this particular situation we were at minimum. I would also like to receive guidance as to what I could have done better given I was forced into a bad situation and I did my best to separate aircraft and coordinate what I could before an incident may have occurred.

## Synopsis

Center Controller reported an airspace violation due aircraft hand-off issues with a TRACON facility.

## Narrative: 1

Early morning at roughly XA: 30, Aircraft X flew from the west into ZZZ for pattern work. At the time Aircraft X was the only aircraft that was currently in ZZZ's airspace at the time of the event. Initially Aircraft X made a call to ZZZ Tower asking for pattern work. Since the aircraft was positioned over the mountains the response for ZZZ Tower came in weak. Clarification was requested by pilot flying and stated that the Air Traffic Control Tower was closed. The pilot flying treated the airport as a non-towered airport and switched frequency to XYY.Z. From that point the pilot flying used non-towered airport call outs to announce position. After completing three laps in the pattern an airport operations vehicle flagged down the pilot in command. The pilot in command then preceded to reject the takeoff and continue to the run up area. Airport operations advised the pilot to contact Tower at XXZ.A where the pilot was advised that he could continue pattern work yet had to take a phone number down. Pilot took down phone number and contacted Tower staff after the flight. Due to COVID-19 many ATC facilities are having to temporary close down due to cleaning. ZZZ has also been changing hours of ATC operation in the last ninety days. Pilots from ZZZ1 have also run into the problem of not properly reaching Air Traffic Control due to altered non-posted hours. The pilot in command flying was a student pilot that had recently soloed. When contacted by an airport operations vehicle, [they] only asked for intentions which the pilot responded that he was doing pattern work. At the time it could not be depicted if the airport operations vehicle told on XYY.Z to contact Tower on XXZ.A. In the future [if] airport operations could do this it would help. At the time the pilot thought the airport operations vehicle was attempting to do a FOD patrol of the runway since it was the early morning. The aircraft has been in the past known to have radio issues at random times. The student pilot will go over procedures with Class Delta airports with a flight instructor to mitigate problems in the future.

## Synopsis

GA student pilot reported frequency communications issues while flying to an airport whose Tower services were not in use.

## Narrative: 1

In ZZZ airport, we have employees testing positive for COVID-19, but yet the process of notification (notifying the crew) is very subjective. There are technicians, which have tested positive. The company has only notified a selective few to quarantine. There are technicians who have tested positive and have contaminated the rest of the crew. Some have been forced to take their own sick time because the company refuses to acknowledge they have been exposed at work. The exposure happened at work because they were all in the same room and worked together. The company says they have followed CDC guidelines, but how can that be when more technicians are testing positive at work.

**Let's have guys who were at work quarantine and have the company notify the work areas that maybe have been exposed.**

## Synopsis

Technician reported concerns with company procedures related to notification of possible exposure to other employees who have tested positive for COVID-19.

ACN: 1773770

## Narrative: 1

Two passengers, traveling together, in seats, X1 and X2, were wearing non-compliant masks. FA C noticed the non-complaint masks in main cabin when I was beginning the

safety announcement. From the front of plane, I could see the couple arguing with FA C and refusing to put the company provided masks that Flight Attendant was offering. I approached passengers, with FA C still present, and asked them to wear the compliant masks, and they initially refused me as well. I then asked them to make a decision to wear the compliant masks, or we would be required to return the plane to the gate. They complied. We took off. Once at cruise phase, the gentleman in X1 stopped me and started to engage me as to how he has been allowed to wear those masks on previous flights and that they were safer masks. I responded that he could reach out to customer care and write to the FAA about the masks they were wearing.

## Synopsis

Flight Attendant reported two passengers traveling together were wearing non-compliant face masks and initially refused to wear company supplied compliant face masks.

## Narrative: 1

I was [the] Purser on Aircraft X. When we boarded I noticed the entire phone was missing from XLR Jumpseat. The cockpit also informed me it was missing and that it was okay to go. I said that used to be a "no go" item. I have no way of notifying the cockpit if there was any emergency- be it evacuation, a threat level, a medical emergency, etc. I asked if there was another plane that we could take. I notified the system that we were checking within maintenance on an issue before we board. We still had 15 minutes left to board. I was told that I was to refer to the Flight Attendant Manual regarding other means of communicating. I'm not sure if you've worn a mask and spoken through a megaphone, but that's not really a reliable means of communication with a mask on. And it still does not allow me to communicate with the cockpit. We were on a type X aircraft where the other FAs are backwards facing and would not know if a situation were to arise up front. We were also advised that it was to be a bumpy flight and we might need to remain seated for the duration of the flight. An in-flight Supervisor met the aircraft. Captain said he would refuse the aircraft if I was uncomfortable. I said that decision should not solely rely on me. However, this was the second flight in a row where the forward intercom was broken. This one happened to be completely missing a phone. The one prior was hanging off a screw. A Mechanic also came up during boarding to see what the problem was. I said this should be a "no go" item referring to the missing phone. He said he deferred it that morning and that the part was awaiting the aircraft in ZZZ. So the aircraft had flown two previous legs before mine in this condition. I believe that a PA INOP is "not" a no-go. A missing intercom should be a no-go item.

## Synopsis

Flight Attendant reported the phone by a jumpseat was missing and requested the aircraft be swapped due possible communication issues in case of an emergency.

## Narrative: 1

A party of 3 came on just as we were to close the flight, the agents stated he was exempt from wearing a mask, to which we questioned what he was told he was going to be able to do for the flight, which was not to wear his mask. The crew on the whole questioned what the Agent was saying, the Purser approached the Captain who said he would ask ZZZ operations, in the meantime the Lead came down and agreed with the crew that there were no exceptions to our mask policy, with debate and talking to the passenger we all looked to find it in black and white, while waiting for ZZZ to call back, the gate agents closed the door and pulled the jet bridge. The Purser explained to the passenger from

[seat number] that he and one of his guests could move to seat area X to keep them separated from the majority of our guests, during the flight I have to say I had to tell his friend to keep his mask on more, I chatted to them prior to landing and informed them they would have to wear their mask for their trip itinerary as there were no exceptions...that they had been miss informed prior to our flight. They actually seemed nice.

## Synopsis

Flight Attendant reported having to explain to a passenger that there were no exemptions to having to wear a face mask. Passenger and two others traveling with him were not compliant during the flight.

## Narrative: 1

The last few month wearing a mask has affected my health. I have had constant headaches, brain fog, difficult concentrating and exhaustion. My eyesight is also affected when wearing a mask. The depletion of oxygen, increased exposure to carbon dioxide may be to blame. I fear risk of infection only because we are all touching our faces more than EVER with masks on. I used an oximeter to check my levels on a deadhead segment from ZZZ to ZZZ1. In hotel room [it was] 99, when on flight [it was] 89-94 for just a 2 hour flight. We are masked for 10-15 [hours] lately, sometimes 5 days a week. I have noticed I'm also sneezing a lot more, which, now finding out may be the poisonous spray being sprayed on the planes. Every flight attendants health is being affected.

## Synopsis

Flight Attendant reported concerns relating to health and oxygen levels in the body due to constantly wearing a face mask while working.

## Narrative: 1

Passenger X boarded the aircraft and proceeded to self-upgrade himself to a better seat. When he was asked about this by another FA, he held his ground. Apparently, out in the gate area, he was quite belligerent. So, a member of the ground staff had to come on board and move him back to his assigned seat. He said that he was fine. After takeoff and constantly throughout the flight, I had to ask him to put his mask on. It happened several times. He was not happy that I kept asking him. I guess he felt that he was exempt from the wearing of masks.

## Synopsis

Flight Attendant reported a passenger was not compliant with face mask policy and also moved to a better seat without asking FAs.

## Narrative: 1

Approximately 3 hours into our flight from ZZZZ-ZZZ, Flight Attendant X told me that his daughter had tested positive for COVID-19 the previous day. Flight Attendant X said that he contacted Airline when he learned of his child's positive test result and was advised to continue with his pairing, despite his immediate family member receiving a positive COVID test result. It made me extremely uncomfortable to hear that Flight Attendant X was directly exposed and that he chose to continue to work, possibly endangering the health

and safety of others. Flight Attendant X also mentioned that he is a [Medical Professional] and exposed to COVID positive patients regularly at his other job. While Flight Attendant X may not have received the support from the company in line with our responsibility to keep one another as safe as possible during the global pandemic, common sense and personal ethos would dictate that one would remove them self from flying until they had a negative test result and quarantine period of 14 days. I contacted ZZZ Supervisor upon landing in ZZZ and expressed my concerns.

## Synopsis

Flight Attendant reported concerns with another Flight Attendant showing up for work after a family member had tested positive for COVID-19 the day before.

## Narrative: 1

Lost SA partially on arrival. Approach gave us a 240 heading and asked us to call the field. I had selected managed speed out of 10,000 and was configuring. Extended gear descending through 9,200, so we could continue to slow. Aircraft wasn't slowing. Captured LOC, but overshot a bit. Glide slope didn't capture. Once I saw the PAPI I saw I was low I leveled, continued to configure and slow. Leveled at 1,000 feet AFL momentarily to rejoin glideslope and ensure configured for stabilized approach. Had runway in sight the whole time after turning final, met gates at 1,000 feet AFL and 500 feet AFL, but felt behind and should have gone around. Maintenance delay, unfamiliar airport, late runway change, long day (nearly 9 hours of flying), no approach control (ZZZ Center handling approach due to COVID outage). I should have asked for vectors onto the approach rather than accepting visual. ZZZ is surrounded by high terrain, I was unfamiliar even though I felt I had prepared carefully, vectors would have provided a less dynamic environment. Also, if I were in a similar situation, I would go-around and ensure I don't press when I feel at all like I have lost SA. Also, the high altitude made slowing the aircraft down more difficult. I didn't include that in my briefing. I know better, but after the long day I failed to consider that as a factor.

## Narrative: 2

ATC gave us a 90 degree plus vector for Runway XXR and asked us to call the field. We had it in sight and were cleared for the visual. We were above the glideslope, with flaps 1, put the gear down to slow down, and used managed speed. The approach was armed, caught, but overshot the localizer because the aircraft wasn't slowing down. The glideslope didn't capture and we were then low on the glide slope as we passed through it from above. We leveled off, slowed down and finished configuring. We were within stable criteria at 1,000 and 500 feet, but it was a messy approach. Cause - Long duty day, extended due to maintenance. Bad vector from ATC and pressure to go visual. Approach was closed and Denver center was handling approach. Don't be pressured into accepting a visual at night with mountainous terrain. Go-around if an approach is feeling uncomfortable. Slow down earlier when at a higher elevation airport.

## Synopsis

Air carrier flight crew reported an unstabilized approach into an unfamiliar airport.

## Narrative: 1

I came from ZZZ airport and boarded the employee bus to the employee parking lot. The bus sat for about 20 minutes before leaving and waited to overfill the bus with employees. There were more employees than seats available on the bus. The driver still continued to wait for more people to board after people were already standing without seats. This not only puts everyone on the bus at increased risk for the spread of COVID, but also increases risk for injury for those standing on the bus. We were just asked to not board a crowded bus and instead wait for the next one, however, if all the buses are being filled in this way than this leaves no choice for everyone, but to either put themselves in an unsafe situation or find other means to get to the employee parking lot.

## Synopsis

Air carrier First Officer reported a full bus of people on the employee bus which put everyone at risk of COVID-19 and increased risk for injury on the bus ride.

Narrative: 1

Our release for this flight included the following under the MEL Item Info "Treated Fuel". A search of the MEL manual and the FOM revealed no information to further describe what this means. The Captain called Dispatch who had to conference in maintenance to inform us of the meaning. Maintenance said the plane had been in storage and was only on its second leg after coming out of storage. A review of all the maintenance paperwork provided to the pilots did not communicate this information.

## Synopsis

Air carrier First Officer reported not being able to find information on a treated fuel related MEL. First Officer stated the aircraft had just come out of storage.

## Narrative: 1

Received an early am short call assignment. Assigned pairing ZZZ. 2 gate returns were made for maintenance and FO timing out on second gate return as well. Aircraft swap was made to continue flight with new FO. After realizing how tired I was and that I was paired up with another FO who hadn't flown in nearly the same amount of time as me (9 months), and after a self-perceived degradation in my performance from the extended maintenance delays, I removed myself from the operation due to safety concerns. I feel as though if I had been flying more I could have powered through this event by relying on recent "**habit patterns**" or "muscle Memory" from currency of a normal schedule. That, with the self-awareness of fatigue setting in led me to believe that the safe thing to do was to remove myself from the flight. I have flown aircraft for decades. I know when to remove myself from flight duty. I believe that this extended duty period with disrupted sleep and a degraded sense of performance would have been in poor judgement for me to continue.

## Synopsis

Air carrier Captain reported multiple ground delays and lack of proper sleep resulted in physical degradation/fatigue and decided to remove himself from the flight.

## Narrative: 1

Radio communication with ZZZ Center was not established over State X enroute on a flight from ZZZ to ZZZ1. I was able to re-establish radio communication with ZZZ1 Center North of City X on frequency XYZ.AB using the number 2 communications radio. I regularly fly this route and I know most of the high altitude center frequencies by memory. While speaking with ZZZ1 Center I was advised to call ZZZ Center after landing. My normal procedure is to monitor "On-Guard" XYX.BC with the number 2 radio, however, there was an ELT transmitting. The XYX.BC frequency was congested and was only occasionally monitored to wait for the ELT transmission to dissipate. The number 2 radio was operating with much less static than the number 1 radio. After landing I spoke to the pilot that previously flew the aircraft and they confirmed that the number 1 radio has been having reception issues. The number 1 radio was troubleshot and found to have a bonding issue between the fuselage and number 1 communications antenna due to corrosion. The antenna is in the process of being replaced. In conclusion, improved aircraft maintenance would have prevented this event. As a side note: I have noticed more "NORDO" events since the COVID-19 pandemic began. Now, a day does not go by that an aircraft is not being summoned to remedy a "NORDO" situation. Previously, these events were less. I speculate that a change in ATC staffing and increased size of control boundaries for one Controller to be responsible is a possible contributing factor. I notice now that the high sector controllers (usually working FL260 and above) are working considerably larger areas including the low sector. It is now not uncommon to hear a high sector Controller clearing low altitude aircraft for approaches and handing them off to Local Approach ATC. Juxtaposed to this increased workload for the Controller is less flying for air crew. The reduced flying during this pandemic may contribute to these "NORDO" events due to crews having reduced flying schedules and reduced recent experience.

## Synopsis

Pilot reported not being able to contact a Center Control due to aircraft radio communication issues and frequency saturation.

## Narrative: 1

On Aircraft X to ZZZ, we were given a turn to base for a visual approach to XR inside the final approach fix 600 feet above the FAF. We realized we weren't going to be able to complete the approach under the stable approach criteria so I called the go-around at 1,000 feet AGL. Once we got the aircraft climbing I called ATC saying that we are going around. ATC said climb and maintain 3000 feet, we were already climbing and had a high rate of climb because we only had about XX people on board. While we were cleaning up the aircraft and setting up the FCP, I realized our Climb rate was high and we were approaching 3,000 feet quickly. I said "watch your altitude" and asked ATC if we could get 3,500 feet. ATC denied it and said to maintain 3,000 feet and contact departure. Unfortunately, the correction of bringing the nose down and power back happened too late and we climbed through our altitude by about 200 feet. The correction came and we corrected our altitude back to 3,000 feet. On the second attempt approach tried to do the same thing to us again however we denied it and asked to be vectored for the ILS. ATC turned us to intercept the final approach course too close and I told them we won't be able to do it due to us having a tailwind, and that we are going to need to intercept it from the other side. I told ATC the intercept we would need. On that attempt we completed the approach successfully and landed with no further complications. Due to having a poor vector for the approach, and no warning of a close approach, we ended up high on a visual approach to Runway XR. For that reason we decided to go-around. The altitude assigned to us was only about 1,200 feet above the altitude we decided to go-around at. By the time we got the aircraft configured for the go around and contacted ATC we were even closer to that altitude. Due to having a high workload in that environment, a light weight, and being already close to the altitude assigned to us the climb rate was too high when I made the call out to the Captain. I also tried to rectify the situation before it happened by asking ATC for a higher altitude but was denied. Deny the visual approach and ask ATC to just fly the ILS to give us more time. Say unable instead of asking for a higher altitude.

## Narrative: 2

Today on Aircraft X to ZZZ we were given a turn inside of the FAF for Runway XR into ZZZ. ZZZ Approach had us at 3,000 feet. The FAF is 2,400 feet. We were unable to widen the approach due to a snowstorm to the west and had been cleared for the visual. We were too high, so we completed a missed approach. On the missed we went above our assigned altitude of 3,000 feet by 200 feet. We requested higher but were rejected, so we descended the 150-200 feet. On the second attempt, approach tried to give us the same

turn at the same altitude. We asked for the ILS. We were again given a bad vector, however, farther out. We were given a 060 heading to intercept. Due to a 40 knot tailwind we flew through and requested a 120 heading to join. It was accepted. We landed successfully. We got a bad vector inside the final approach fix while 600 feet above the FAF altitude. We were given no indication or expectation of a short approach. We were too high and too fast for our approach. We conducted a go-around and subsequently climbed 150-200 feet high.

## Synopsis

Air carrier flight crew reported a turn inside the Final Approach Fix, an altitude excursion and having to make two attempts to land.

Narrative: 1

My first trip 'solo' as CO [Commanding Officer] was going well. I had a good crew and we performed well as a crew. On arrival after receiving vectors for approach to Runway XXL and established, the PF was looking around - sighting...flaps were at 15...I was focused on the required speed and frequency change at ZZZZZ, and the Relief Pilot was daydreaming as well. At 1,000 feet the PF called "stable"...and I saw his speed and ILS tracking were spot-on...and then we both realized at the same time that the gear was still UP and the flaps were at 15!! He called gear down and flaps 25, which I did out of habit as response to the fallout. I realized then, at the same time he did, that the approach was NOT going to work, at which point we both called "go-around". The go-around was at 800 feet AFL and was UGLY!! Go-arounds from this altitude are often UGLY!! The subsequent vectors and second approach went as it should and we landed safely...the desired outcome. The debrief at the gate was thorough and each of us contributed, as well as took appropriate blame for our individual contribution to such an embarrassing and actually humiliating event. We each had recently been through a simulator check. The Relief Pilot and I (CO) each having less than 40 hours in type, and the FO having just returned from a 7 month period of not flying. Combined total flight time of this 3-man crew exceeded X0,000 hours. However on this day we were each victims of a few different causal factors: fatigue...we had just flown XA+45 hours from ZZZZ; neither of us slept well the previous night; and we were each the victims of relative inactivity due to COVID-related restrictions; each of these led us to be distracted, lackadaisical, and only partially effective as a crew. Causal factors contributing to this outrageously ridiculous display of airman-ship are deemed to be at least the following: longer layovers, [lack of] more well established activity schedules during our layovers-even during times of social restrictions, [lack of] better food onboard flights for crews, [lack of] better procedural discipline is possibly another even considering each of us had been through simulator training very recently.

## Synopsis

Air carrier Captain reported an unstabilized approach resulting in a go-around. The Captain cited crew fatigue and lack of flying contributed to the event.

## Narrative: 1

Takeoff and initial climb from DCA, Runway 01. Captain Pilot Monitoring, First Officer Pilot Flying. Pre-flight duties completed and route review completed at gate. Engine start and taxi was normal to Runway 01, before takeoff checklist completed to the line before crossing Runway 04, below the line after crossing Runway 04. As we taxied to runway, Aircraft Y was cleared to cross Runway 04 before us on another taxiway then into the box. As we were approaching Runway 01, Tower Controller asked Aircraft Y if they were ready for departure, Aircraft Y responded they needed 2 minutes. Tower asked if we were ready for departure and we responded we were ready, completed final checklist items. We lined up on Runway 01 and were cleared for takeoff. I do not recall checking FMA for NAV annunciation as we taxied on to the runway and checked final for traffic. Light passenger load/light takeoff weight. After takeoff, aircraft climb was rapid with a quick change to Departure frequency. We were at clean-up altitude quickly after takeoff. After thrust set to climb power and frequency change to departure (prior to check-in on frequency with departure) I noticed FMA annunciation was RWY TRK and we had not yet initiated a left turn for the departure. I told the First Officer to turn left, which he accomplished, initially coming left to approximately a 290-300 degree heading. I cross checked Nav Display for 1 NM circle around point PLVIA and outside references. I do not believe we entered Prohibited Area 56A or Prohibited Area 56B. After initial left turn, we then turned back to the right to rejoin the departure. A turn to point ADAXE would have required an aggressive right turn, so we turned to rejoin the departure between ADAXE and BEBLE After turning to rejoin departure I checked-in with departure control when they asked if we were on frequency. Remainder of the flight was uneventful. This was my (Captain) first flight back on the line after several months away due to combination of leave of absence and

quarantine for close contact with [someone] with COVID-19. I had just completed recurrent training the week before this flight. In the pre-flight briefing the First Officer had noted that with light passenger loads the aircraft takeoff and climb would happen quickly. Given my lack of recent flying, I should not have accepted departure prior to the aircraft in front of us on the ground, even though I felt I was in the green. I was slow to notice we had not initiated left turn on the departure where I would normally expect to begin a turn, possibly due to lack of recent line flying experience, the combination of quick climb after takeoff to acceleration altitude and frequency change slowing my monitoring and recognition of aircraft not being in NAV mode. Though I did direct the pilot flying to make a left turn, if I had done so earlier we would have been able to maintain the departure track without tracking close to Prohibited Area 56. The time from takeoff to overshooting the departure turn on takeoff from Runway 01 at DCA happens fast! I would like to see a similar event during simulator training to illustrate just how quickly you can get close to Prohibited Area 56 after takeoff from DCA when combining a timely distraction with lack of aircraft going in to NAV mode. PLVIA with 1 NM ring on NAV display did assist me as a barrier for this event.

## Narrative: 2

Takeoff and initial climb from DCA, Runway 01. Captain Pilot Monitoring, First Officer Pilot Flying. Pre-flight duties completed and route review completed at gate. Engine start and taxi was normal to Runway 01, before takeoff checklist completed to the line before crossing Runway 04, below the line after crossing Runway 04. As we taxied to runway, Aircraft Y was cleared to cross Runway 04 before us on another taxiway then into the box. As we were approaching Runway 01, Tower Controller asked Aircraft Y if they were ready for departure, Aircraft Y responded they needed 2 minutes. Tower asked if we were ready for departure and we responded we were ready, completed final checklist items. We lined up on Runway 01 and were cleared for takeoff. I do not recall checking FMA for NAV annunciation as we taxied on to the runway. Light passenger load/light takeoff weight. After takeoff, aircraft climb was rapid with a quick change to departure frequency. We were at clean-up altitude quickly after takeoff. After thrust set to climb power and frequency change to departure (prior to check-in on frequency with departure) PM noticed FMA annunciation was RWY TRK and we had not yet initiated a left turn for the departure. PF was focused on aircraft control since it was a light aircraft and I did notice the PLVIA circle rapidly approaching with no direction to turn by the Flight Directors. I also noticed the route was dashed and started a shallow turn to the left primarily due to the PLVIA circle. The PM/Captain having SA told me to turn left, which I accomplished, initially coming left to approximately a 290-300 degree heading. I cross checked Nav Display for 1 NM circle around point PLVIA and outside references. I do not believe we entered Prohibited Area 56A or Prohibited Area 56B. After initial left turn, we then turned back to the right to rejoin the departure. A turn to point ADAXE would have required an aggressive right turn, so we turned to rejoin the departure between ADAXE and BEBLE. After turning to rejoin departure PM checked-in with departure control when they asked if we were on frequency. Remainder of the flight was uneventful. I used a technique taught in the school-house of Red over Blue, Climb/NAV, Flight Dir 1 and 2 while at the gate. I do this on every flight. We are supposed to check NAV again prior to departure and due to the rushed situation and proficiency I don't recall either PM or PF saying anything about NAV. We had briefed the departure in full to include Prohibited Area 56 and the EO SID. I still don't know why it was not in NAV after takeoff roll. I had seen a technique of starting the turn regardless of the flight directors in DCA but up until now I have always used the flight directors. In this case the PLVIA circle was a timely final barrier that prevented me from going into Prohibited Area 56 along with the PM's callout. The time from takeoff to overshooting the departure turn on takeoff from RWY 01 at DCA happens fast! I would like to see a similar event during simulator training to illustrate just how quickly you can get

close to Prohibited Area 56 after takeoff from DCA when combining a timely distraction with lack of aircraft going in to NAV mode. Keep the PLVIA circle in the 10-7 and emphasize in training, it is a critical last barrier.

## Synopsis

Air carrier flight crew reported the FMS not flying correctly during departure and having to manually turn the aircraft to avoid a possible airspace violation.

## Narrative: 1

I am a Ramp Agent in ZZZ. There is no one to take employees temps as they report to work at the airport. There is currently a sign that reads, take your own temperature and sign your name off. That thermometer has given me reading of 90, 91, 96, etc... Recently, I cannot absolutely confirm, but one of my fellow employees is quarantining with no taste etc...no one that I know of that was working with that employee last week has been notified that they may have been exposed. Why isn't airline following the rules that are so important. We have had fellow employees close family members die of COVID and I along with many others are high risk. It feels like they are not taking this seriously and many of us are concerned and don't want to die.

## Synopsis

Ramp Agent reported issues with temperature check procedures at work and the company's lack of communication regarding employees that may have contracted COVID-19.

## Narrative: 1

During my briefing with FAs I communicated that masks were not going to be worn while in the cockpit, at any phase of the operation by me or my First Officer and that we were going to keep cockpit door closed while on the ground and no visitors. At that time FA A proceeded to instruct me about her own requirements to visit the cockpit, if pilots didn't have a mask...pilots will not speak while she's in the cockpit and if they needed to, it would be only facing forward and not facing her at all. I immediately told her that her demands were not part of any policy or procedure stated in any company publishing and that it was not going to be granted. FA A's attitude was very receptive and she conducted herself in a very nice and respectful manner. As I was deplaning the plane in ZZZ, FA A and Chief Purser called my attention to the screen of the Purser's cell phone, stating that it was a note from my Flight Duty Manager showing that masks must be worn during flight attendant's visits to the cockpit regardless. I suggested them to file a report because I had no time to go over their claim as I had just few minutes to go to our next flight.

## Synopsis

Air carrier Captain reported a Flight Attendant did not agree with the Captain not wearing a mask in the cockpit.

## Narrative: 1

I was CPC [Career Professional Controller] training an FLM-IT [Front Line Manager-In Training]. We had a Small Aircraft (Aircraft X) overflight at 090. Air Carrier X (Aircraft Y) departed. Trainee climbed Aircraft Y up to 100. There was plenty of room to turn Aircraft Y, so I did not have trainee amend altitude. But then FLM-IT got distracted with traffic on the east side of the airport. I prompted trainee to turn Aircraft Y. FLM-IT keyed up, so I thought that is what FLM-IT was doing, then FLM-IT talked to other aircraft. I still felt FLM-IT had time to fix it, so I prompted again a second time. FLM-IT keyed up and talked to another same Air Carrier X (Aircraft Z) on the east side of the airport and not Aircraft Y that I was referring to. Finally the third prompt FLM-IT talked to Aircraft Y. I knew it was close to a loss of 3 miles, but thought FLM-IT turned Aircraft Y early enough, but it was not. When discussed after the session, FLM-IT did not hear me say to turn Aircraft Y. Which could have been because I was talking thru a mask and communication is muffled. When training I need to use full call sign with the numbers when telling the trainee to do something. I kept saying turn Air Carrier X. We had more than one Air Carrier X that we were working. So I need to be more specific. I can also just key up and turn the aircraft myself which I normally do if I feel like it is warranted. I honestly thought she caught it early enough.

## Narrative: 1

Customers in XX1 and 2 didn't know each other and asked me if they can move because they didn't think they could be seated next to each other. I told them once we're finished boarding we can see if there's empty seats or you can talk to the gate agent if not. One of them sits across in XX4 for time being. Customer Service Agent (CSA) comes on and says

someone else is assigned that seat. He goes back to see who should be in that seat, comes back and finds him sitting in row XY next to someone, I guess they knew each other. So the other customer stays in XX4. The customer in Y2 was also seated next to a stranger, and asked about moving up to row 1. I said unfortunately because we have seating caps, first class is at its max up there. I said once CSA comes back you can talk to him. I go to get a trash bag to collect the purell wipes, and he's right behind me when I turn around. I was confused why he was there all of a sudden. He said he would go talk to the gate agent. I told him to make sure he has all his bags if he's stepping off, but didn't understand why he didn't just wait for GA to come back. Because he had to come back to sort out the customers in row XX. And he asked why he had to take his things, thinking that meant he'd miss the flight. I asked why not just wait in your seat until the gate agent comes back, and he calmed down and nodded, saying that's a better idea. I guess he didn't hear me when I initially told him to wait for CSA to come back. Then CSA comes on and finishes sorting [out] XX12. Then he talks to Y2 and says exactly what I told him about seat caps, maybe he told him something more I'm not sure. Y2 kept complaining about the whole row 1 being open, and why can't he sit there, as if nobody explained the covid seating caps to him (both me and CSA did). Then, I finish collecting wipes and notice XX2 has a lace mask. Like lacey dress or underwear material, super thin with holes in it. And I ask if she has a regular mask without holes, or we can give one to her. And she has a startled/insulted look on her face, and says how she needs the holes because "I can only breathe out of my left nostril." I told her if it's a medical concern, it's not showing up on our end, and we weren't informed of any passengers with medical exceptions. So we would need to talk to the CSA and get that on your booking, so you can get an exception. And then she says how she flew with that mask from ZZZ, and it was fine. I told her it was possible nobody noticed on those flights, and unfortunately it's not allowed. Even if nobody else noticed before, that doesn't mean I can ignore it when I notice. So I go back up and flag down the CSA as he's closing the jetbridge doors. And I ask him about any medical exceptions, and he said nobody was approved for that and that he didn't notice anyone with a lace mask. So he says he'll be back with a mask. We have masks onboard but it was better he did that because she was already giving me attitude about it. He comes back and asks who it was and I said XX2, one of the ones we were talking with earlier. He goes back and gives her the mask and comes back saying how she told him that she wore that mask from ZZZ and I that he told her that it doesn't matter what happened on previous flights. Basically the same stuff from when I spoke to her. She got past him during boarding, then the other FA up front, then me in back during the whole seat issue, and then the GA again when he helped with the seat issue. And it wasn't until near departure time that I even noticed. So I think there's a good chance that on her other flights, those CSAs and FAs didn't notice either. Also, it was obvious she didn't have a medical exemption because she told me she needs a hole-y mask since she can only breathe out of 1 nostril. What I did not tell her was that she was speaking to a FA who hasn't been able to breathe out of either nostril in years because of a medical issue, and I was wearing a regular mask just fine. I would feel blessed if I could breathe out of even just one nostril. Somehow she didn't think that breathing out of one's mouth alone is possible in a mask. And I know I'm not the only FA with a similar sinus issue, too, and we all wear regular masks.

## Synopsis

Flight Attendant reported that several passengers had seat location issues and another passenger was not wearing a proper face mask.

## Narrative: 1

During boarding, the passenger originally seated in X2 moved herself to exit row XYA. I was in the back, waiting for the aisle to clear so I could close the overhead bins and brief exit rows. I noticed the customer was in the galley speaking with the forward FA. I wasn't sure what her seat was, so I waited for her to go to her seat before I started walking forward and closing the bins. She grabbed her bag from row X and then sat in XYA, the exit row. I just assumed that was her assigned seat at the time. I closed the bins all the

way to the front. I noticed a pilot commuting in row Z who had his mask around his chin and wasn't eating. I requested he put his mask back up and he did. The man behind him in X4 had his mask completely off, so I asked him to put it on and he did. When I asked that guy to put his on, another customer across also pulled theirs up, so I didn't have to ask that third person. I don't recall where the third person was sitting, I only remember they sat in [the area] on the left side of the aircraft. They put their mask up before I asked, so I didn't think much of that. I was quite annoyed that I had to remind so many customers to put their masks up. I briefed the exits like normal. After the door was closed and I did my compliance checks, other flight attendant motioned me toward her before the safety demo. She said that the woman who moved to the exit row was originally seated in [in a different area], and that many customers had their masks off in that area, so she requested to move else where, and that's why she moved. I told other Flight Attendant that I did notice a lot more than usual with their masks off or down, especially in those first few rows of [that area]. Especially the [commuting] pilot and the guy behind him. Other flight attendant said the woman said something about a crew member not wearing a mask. There were a few flight attendants commuting, too, but they all had their masks on that I knew of. Later, inflight I spoke to the woman who moved, and I apologized and told her that it was not okay that they weren't wearing their masks, and that I did tell them to put them on and they did. She said she was especially appalled that a pilot wasn't wearing one, and said she was traveling to see a family member and was stressed enough. I gave her [a voucher] and offered her wine or beer, which she would have gotten in her [original] seat anyway. She seemed calmer and thanked me a lot. Later, I spoke with the [commuting] pilot and reminded him the importance of wearing masks around customers, and that one did move herself back because he wasn't wearing his. After I told him the first time (before door was closed) to put it back on, he kept it on except when eating or drinking. The man behind him, however, I told twice more (three times total including before door was closed) to put his mask on. Once inflight when I was collecting trash and he was sleeping. He had his mask all the way below his chin, near the collar of his shirt so that it didn't even look like he had one there. And another before landing, when I was doing my final compliance check. There was another guy in main cabin who fell asleep twice and I had to shake him awake and remind him to put his mask up, but his was covering his mouth, it just wasn't over his nose. I checked on the customer in XYA again and told her I spoke with that pilot again, and he has complied with mask requirement since the door was closed. Hopefully he just forgot and takes the mask requirement seriously. I only told him once, so I'm not sure how long he had it off or if he was eating before and just forgot to put it back on. I spoke with flight deck before I spoke with that commuter because our paper work and guest service tool app did not say there was a non-rev seated in Z4. So I asked FD if maybe he was listed as jumpseater, which didn't make sense because there were enough seats for all the non-revs to get on and he had higher priority. So I told FD about the customer complaint about that commuting pilot. When I spoke with him, he said he asked gate agent for a seat without the bulkhead, since he was originally given seat A3. So it seemed the woman who was seated in Z3, was swapped to A3. And the pilot was moved to Z4. I'm not sure exactly.

## Synopsis

Flight Attendant reported that many passengers, including a commuting pilot, were not compliant with the face mask policy.

## Narrative: 1

I was briefing the over-wing window exit as the C Flight Attendant with my safety information card in hand. When I asked the gentleman in the two-seater if he was willing and able to sit in the exit row and ask for a verbal confirmation he asked for water. I told him no sir I was asking him if he was willing and able to sit in the exit row he said yeah. He said do you want me to move? I said no you're fine I just wanna make sure that you're aware that you're in the exit row. And that was it. I don't know if you could not hear me because of the mask. Or I was speaking too fast. Or not clearly enough for him. I will need to work on that.

## Synopsis

Flight Attendant reported that communication with a passenger regarding exit row seating may have been misheard due to speaking through a face mask.

## Narrative: 1

On descent into ZZZ, we momentarily exceeded Vmo by approximately 1 knot for less than 3 seconds. I later completed an AML entry and notified Maintenance Control. There was no operational impact. I was the CA and PF. While on descent into ZZZ, ATC halted our descent at FL240. This put us behind our VPATH solution. When we were next cleared to descend, I elected to go into Vertical Speed Mode, selecting 2000 FPM in order to recapture the VPATH. The task saturation over the next few seconds took my scan away from our airspeed, and we surpassed and we surpassed XXX knots, our "barber pole" airspeed. I immediately disconnected the AP, overrode the autothrottles and raised the nose of the aircraft. The max airspeed reached [was] XXY knots for a second or two, before returning to green numbers. There appeared to be no adverse effect on the aircraft or passengers. I later completed an AML entry and notified Maintenance Control. I had not flown in 3 weeks, due to my inactivity on reserve status. I now know that I must be more diligent on my scan, especially when I have not flown in a while. On descent, I must be more cognizant of airspeed when using the VS mode. In this case, using Green FLCH would have been a better choice. It was an excellent learning opportunity.

## Synopsis

Air carrier Captain reported momentarily exceeding the aircraft's maximum operating limit speed on descent. The Captain cited lack of flying as a contributing factor.

## Narrative: 1

On short final to land Runway XXR we heard a "too low, flaps" audible warning. As the PM, I saw we were at flaps 25 with a planned flaps 30. I called this out to the First Officer who was the flying pilot as I selected flaps 25 and performed the landing check which we had apparently missed on approach. We made a normal landing. This was our second day in a row of very early flights with wake up calls and 3 time zone changes. While I didn't feel fatigued, I suspect I was more tired than I realized. We had just flown a nearly 5 hour cross country flight with a breakfast of a couple spoonfuls of granola, a couple spoonfuls of yogurt, and a few grapes. This was our company provided meal for the flight. While I normally take responsibility for providing my own food, this is not always possible in the current COVID environment. I believe this was a significant contributing factor. In hindsight, the proper response would have been to perform a go around and set up for another approach. While I don't feel my handling of the situation was unsafe, it was not consistent with company procedures. With reasonable sleep and nutrition I'd like to think I would have made a different decision.

## Synopsis

Air carrier Captain reported receiving a flap aural warning message due to having an incorrect flap setting on final approach.

## Narrative: 1

On a flight from ZZZ-ZZZ1, we were cleared on the standard route. Having not flown as much as usual during the COVID-19 pandemic, I tried my best to stay ahead of the airplane where possible. We began performing the brief for the ZZZZX arrival before performing the climb checklist, and also briefed our eventual landing on [Runway] XXL at ZZZ1. During this time, we reached our cruising altitude of FL220, but did not realize that we had missed the completion of the climb checklist. ATC notified our aircraft that our altitude readout was between 250-300 feet higher than it should have been. This was because we did not reset the altimeter through FL180. The decision to brief the arrival and approach earlier than expected caused a routine checklist to not be performed at the normal time. Altimeters were reset, the checklist was performed, and altitude was corrected. Although staying ahead of the airplane is generally a good idea, don't allow the neglect of standard procedures to be what breaks the barrier to safety.

## Synopsis

Air Carrier Captain reported not completing the climb checklist resulted in an altitude deviation during departure. The Captain cited the decision to brief the arrival and approach earlier than expected caused a routine checklist to not be performed at the normal time.

## Narrative: 1

The reason for this report is in regard to the air filters that we have at work. I am looking to see if we can have HEPA filters in the workplace because of the spike in COVID-19 that we are having in ZZZ. These filters will help out a lot with this virus. If the aircrafts have them I believe it's just right to have the airport with them, as well as break rooms and offices. We still have many people at work that don't wear their mask, sneeze out in the open and cough. I witnessed this in the office environment I'm currently in.

## Synopsis

Air Carrier office employee reported the office area for work would benefit from the installation of a higher-grade air filter to combat COVID-19.

## Narrative: 1

We as employees are very concerned on the conduct and unsafe work environment that is going on at the ZZZ facility with the COVID precautions. With many of our employees getting sick and even passing away, we have noticed the lack of safety regarding the management of COVID-19. There has been a couple of outbreaks and the company never identified the outbreak area, no investigation on the outbreak and especially no contact tracing efforts or warnings of contact exposure. The weather is getting colder, the breakrooms are packed with no social distancing and no improvement in the ventilation. This is giving us high stress and anxiety in this work environment.

## Synopsis

Ground employee reported COVID-19 related concerns in their work environment.

## Narrative: 1

Captain did not conduct pre-flight briefings per Standard Operating Procedures. Even after advising of the threat that [are] due to COVID, I have not flown regularly at all, and may need a little bit more time or to be watched closely, Captain still skipped virtually all briefing elements. I missed that we did not login to CPDLC and get our departure clearance, which I absolutely would have caught with a proper briefing. When contacting Ground Control, ATC stated it didn't look like we had our clearance. I logged into CPDLC and received our clearance and verified all the elements before departure.

## Synopsis

Air Carrier First Officer reported not obtaining an ATC departure clearance prior to pushback, and cited a nonstandard pre-flight briefing given by the Captain and lack of flying as contributing factors.

Narrative: 1

I was Captain [on] Flight ABC ZZZ to ZZZ1. We flew the inbound in the same aircraft from ZZZ1, both flights were completely full. In between the flights, I did my setup for departure, and then went to walk the terminal for a moment. What I saw as I left the jetway into ZZZ terminal was a little shocking in today's safety and COVID environment. The end of the terminal had about four flights all trying to load or unload at the same time. The area isn't large but there was at least 1,000 people crammed into the jet way area. No one had room to social distance. Everyone did have a mask on, but it was very uncomfortable. I navigated as well as I could past the crowd as quickly as I could and went much further into the terminal to find an open area. I kept an eye on the loading area from afar but it took a long time to empty the crowd as they boarded. I didn't go back near the gate until about 10 minutes to departure. It was still crowded on my flight and the other boarding planes had crowds around. The jet bridge backed up and our airplane didn't get loaded until just before departure time. I know the agents were trying as best they could, but when that many planes are set to depart at the same time it was difficult. I asked about it and was told that also [another aircraft] had a mechanical and had to de-board all of its passengers into the same crowd as it was awaiting parts. An agent asked our passengers who were at a standstill on the jetway to please get seated quickly, so we didn't have to delay the flight. One passenger said there isn't anywhere to go as the line was just stopped. I feel the management of this boarding process was not well thought out. If flights are departing that close in time they should be spaced in gates down the concourse apart from each other. If this is the operation each day of the week, it should be looked at to see if there is a better way.

## Synopsis

Air carrier Captain reported that a large number of passengers waiting to board at several adjacent gates were standing so close together that social distancing was not possible. The Captain suggested that the gates in use be spaced out.

## Narrative: 1

I have spent this pandemic sitting reserve and trying to minimize my risk of catching COVID by minimizing my flying. I have family members in my household that have respiratory issues so we all work hard to stay as safe as we reasonably can and we have made many sacrifices this year as a family. Of course on occasion I will get called out to fly, and when I do, I am as cautious as I can be. But I am getting increasingly frustrated showing up in the flight deck with pilots with no regard for the mask wearing

recommendations. Also troubling, is learning they are frequenting bars and regularly visiting others. I know individual choice is just that. But I do not understand why we as a company and union have not made it a norm to require a mask, at all times at work, not just for show in front of the passengers. I have a right to feel as safe as I can on the flight deck too. I understand at this point mask wearing is a choice on the flight deck, and it is one that I made. But it should be a requirement. As for arguments about communications issues and oxygen use, I have worn a variety of masks including those provided by the company and have not had any internal or external communications issues and removing an over the ear mask is no more problematic than sunglasses or a headset. They are non-issues that can be managed easily by a professional crew. As the infection rate goes up and we try to spread out the flying among more pilots, this conflict will become more of an issue. It is best to err on the side of caution and safety and just wear a mask at work. All the time. Nurses and doctors wear them all day long and are able to communicate just fine. There is no reason why we shouldn't too.

## Synopsis

Air Carrier First Officer reported being uncomfortable and frustrated because many other pilots choose not to wear a face mask in the flight deck.

## Narrative: 1

Upon arrival in ZZZZ, we experienced some health and safety concerns. Everyone that interacted with us was in full PPE but the most concerning part was we were followed by a guy that sprayed some chemical into the air around us. Some type of fogging machine - no idea what the chemicals were. They even had another person spray a liquid chemical onto the floor after we walked through customs. (That was the only point where we were actually inside a building). They transported us in an airport bus that also had a strong chlorine smell to it. Arrival at the hotel was like a scene from the movie Outbreak. The entire inside of the hotel is drenched in a white powder substance (probably from fogging) and carpets/floors haven't been cleaned or vacuumed in weeks. Room floors were covered in dust, lint, and other crumbs. Trash bags were all over the hotel hallways. To add to the chemical list, we were even given chlorine tablets to drop in the toilet prior to defecation. Food was delivered to the room as you were not allowed to leave your room during the entire stay. Although we were supposed to have set times for food drop-off, it was never

consistent. Coordinating your international sleep around their food delivery was impossible. Some people like to sleep upon arrival at XA:00 pm to catch some of your previous WOCL - in that case your dinner sits outside and potentially spoils. I'm writing this report a couple days later as I still have a slight sore throat that developed during the layover. The Captain has had similar symptoms along with congestion. It's unlikely we contracted COVID as we all tested negative the morning of that trip but do think it could be related to all the chemical/cleaning agents they used around us.

## Synopsis

Air carrier First Officer reported multiple concerns with the COVID-19 sanitizing protocols used at the layover airport and hotel in a foreign country.

## Narrative: 1

ZZZ Tower was closed due to mandatory cleaning when a Controller tested positive. The airport was operating under CTAF frequency. We got the ATIS after pattern work at ZZZ1, then decided to shoot the RNAV XX, with the winds reporting 300 @ 12 knots. We contacted approach and got vectors for the RNAV XX. After being switched over to the CTAF frequency from Approach, we heard multiple aircraft utilizing Runway XYR. With the traffic using Runway XYR we decided it would be best to circle to Runway XYR, since a circle to Runway XYL is NA per the approach plate. When reaching circling minimums and within the circling radius we began to circle east of the field on a left base to Runway XYR. This required us [to] cross over the extended centerline of [Runway] XYL. We flew the rest of the pattern and landed with no incident or traffic conflict. Additionally, no traffic was in the pattern for [Runway] XYL at the time and no traffic was affected by this decision. I believe that the other traffic using Runway XYR instead of Runway XX (based on what the wind was calling) was a huge factor. My student and I were concerned on entering right traffic for Runway XYR and overflying the field roughly 1,480 MSL/600 AGL feet above and potentially creating a traffic conflict for those operating on [Runway] XYR. This is what drove us to make left traffic for Runway XYR.

## Narrative: 2

I was flying the RNAV XX into ZZZ with CFI (Certified Flight Instructor). ZZZ Tower was closed early due to mandatory cleaning after Controller tested positive for COVID-19. Airport was operating under CTAF frequency. After checking ZZZ ATIS after pattern work at ZZZ1, the decision was made to shoot the RNAV XX into ZZZ as winds were 300@12. Contacted Approach, who granted us the approach clearance. Upon switching to ZZZ CTAF, it became clear that traffic was using [Runway] XYR/L despite the winds favoring Runway XX. We made the decision to break off the approach at CAT B circling minimums and circle to [Runway] XYR as a circle to [Runway] XYL from RNAV XX is NA per the approach plate. This required us to cross over the extended centerline of [Runway] XYL. We circled east of the field and entered a left base for Runway XYR and proceeded to fly a normal pattern with no incident or traffic conflict. If we were to fly right traffic instead for Runway XYR that would have required us to cross midfield at 1,480 MSL (approximately 600 FT AGL), which could create a potential conflict for traffic on go-around/missed.

Rather, we elected to essentially perform a circle [Runway] XYL with a sidestep to [Runway] XYR (as the circle to land [Runway] XYL from [Runway] XX is NA). Additionally, no traffic was affected by this decision.

## Synopsis

Flight Instructor and student reported conducting a circle to land approach to a runway which resulted in crossing over the extended centerline of the parallel runway. The crew stated the Tower was closed for COVID-19 cleaning.

## Narrative: 1

VFR instrument currency flight at ZZZ on RNAV GPS Runway XX with safety pilot. When outbound to ZZZZZ IAF at 3,300 MSL and entering the course reversal saw airspace indicated on GNS 530. I realized the floor of ZZZ C airspace was 2,000 MSL and penetrated airspace. I immediately descended to 2,000 MSL and continued the course reversal at that elevation and completed the practice approach. Traffic display from ADS-B did not show any traffic conflict while at 3,300 in ZZZ C airspace. Lack of flying in past 6 months due to COVID limits contributed to reduced situational awareness and unfamiliar with this area and airspace. Flying more and better use of EFB charts would have corrected this situation.

## Synopsis

GA pilot reported having an airspace incursion while on an instrument currency flight and cited lack of recent flying due to COVID-19 and unfamiliarity with the airspace as contributing factors.

## Narrative: 1

I was working enroute Center for two hours and 20 minutes with heavy to moderate traffic without the help of a D side. Sector XX. Normally this would not be a problem but during the coronavirus situation there is a skeleton crew of controllers in the area and we are short staffed. Training in the area was also underway. Also, we had no management in the area acting as a Supervisor. We had a Controller-in-Charge position staffed by one of the FPLs in the area. After working 2 hours of heavy traffic I began to tire and was transposing callsigns and missing check-ins. I asked one of the controllers working another less busy sector to swap positions with me. I just could not work that volume of traffic anymore. The

Controller was kind enough to swap with me. I was mentally drained. The culture does not generally allow for complaints of this type. After my break (which I am on right now) I will do it all over again. If this continues the risk grows of a Controller contributing to error within the airspace. This is normally not necessary. This is a very busy time of the year and it is unbelievable that the FAA would allow this lack of staffing and allow the normal flow of traffic. This situation routinely happens at ZZZ (Center) in Area X, I am not sure about the other areas, but I have heard similar things from other controllers.

## Synopsis

Center Controller reported becoming fatigued due to working heavy traffic for an extended period of time and cited low staffing levels as a contributing factor.

## Narrative: 1

With the COVID-19 pandemic, technicians are concerned about proper safety with the removal and disposal of HEPA filters. The procedures are consistent with all of company fleet types, including both Manufacturer X and Manufacturer Y aircraft types. All of the AMM procedures include a list of the necessary PPE as well as Disposal requirements. Description STD-XXXX Coveralls - Hooded STD-XXXY Goggles - Safety, Non Vented STD-XXXZ Respirator - Particulate, meets NIOSH 42 CFR 84 Class N95, N99, N100 The question here is, what qualifications (if any) are needed and where can we find the company policy. The main item is the use of the respirator Class N95 as is called out for in the AMM procedures [for several aircraft types]. The second question concerns proper disposal of used HEPA filters and used PPE. Obey the airline policy, local health department and law enforcement regulations when you discard this material. Obey these instructions to prevent injuries to personnel.

## Synopsis

Technician reported requesting to know the company policy that governs the safe removal and disposal of HEPA filters and used PPE. Technician is also unsure of what qualifications are needed to perform those tasks.

## Narrative: 1

Captain came out to brief FAs. Told us [the] FO was not going to wear [a] mask in cockpit, anyone [have] a problem. I said I did. And would prefer to have him wearing [one] when we [are] in the cockpit. Captain continued to look for another FA to go in the cockpit. My take: If there is no courtesy to me or any of my flight attendants, why should we have to go in the cockpit? When I said I had a problem, he should have backed off. Yet, now he was telling us, he had no problem wearing a mask, but the FO had. Then, later, [the] FO comes out of cockpit not wearing a mask, and proceeds to talk (very close) to a FA standing near him, with no mask on. I reminded him, to go out, he had to wear a mask. He put his mask on. I have a problem with a pilot who does not care about our well being. Our health, our ability to work and stay healthy to support our families, and all that comes with us exposing ourselves. It is not acceptable and it should not be tolerated to continue to ask for a FA to go inside the cockpit when the FO was not going to wear a mask. Today, we had an XX:59 minutes duty day + hour before and hour after wearing a mask. The least he could do is wearing a mask for 5 minutes when one of us goes inside to relieve them. **It's intimidating, it's a disregard of others and disrespectful to all FA group, as if**

we do not matter. This is not company policy and someone should speak with him about caring for his coworkers, or anyone for that matter. Because I bet he is not wearing a mask where he goes. Just unacceptable. I have a problem with a pilot refusing to wear a mask when a FA goes in the cockpit, and whoever is reading this, should too.

## Synopsis

Flight Attendant reported refusing to be in the cockpit to provide break relief because the First Officer would not wear a face mask. The Flight Attendant reported that the Captain asked for other flight attendants who would be willing to provide break relief under those conditions.

## Narrative: 1

We got our IFR clearance from ZZZ Tower about 30 minutes prior to departure. We were surprised that ZZZ Tower closed shortly after getting our clearance, at XB:00 p.m. we taxied to the runway and made position announcements on the CTAF. After takeoff we contacted ZZZ Approach at about 1,500 feet AGL. Approach informed us that we should have gotten an IFR release from them on the ground. We need to remember to get an IFR release for departure from Approach Control if the Tower closes after issuing our clearance.

## Narrative: 2

In ZZZ, I called ZZZ Clearance and received our IFR clearance to ZZZ1 at approximately XA:30 p.m. local time. After a slight ramp delay, we pushed back around XB:10 p.m. The Tower at ZZZ closes at XB:00. We made all our CTAF calls and took off in clear VFR conditions. I checked in with departure at 1,400 feet. At that time Departure let us know we did not get our IFR release on the ground. I recommend once a Tower closes, even with a clearance received prior to closing, always contact Departure on the ground prior to departing and pick up your IFR release to destination. The cause was some confusion with already receiving the clearance and picking up the release after the Tower closed. Lesson learned is as described above, once Tower closes you need to pick up your clearance from Departure prior to taking off.

## Synopsis

Air Carrier flight crew reported obtaining an IFR clearance before Tower closed; however, they departed after Tower closed and did not obtain an IFR release for departure.

## Narrative: 1

Climbing out of ZZZ on the ZZZZZ2 RNAV Departure. The departure lists the fix ZZZZZ as cross at or below. As monitoring pilot I was waiting for the hand off from Tower to Departure. Tower was busy handling other aircraft, and sometimes they hang on to you a little longer than normal. My mind was fixed on listening for the hand off, and wondering why we didn't get it. Not to mention I am brand new to the aircraft and have not flown much in the last several months. I finally decided to switch to Departure on my own and about that time I noticed the autothrottles retarding. I realized what had happened, the flying pilot had overlooked the level off and we crossed the fix 600-700 feet high. I contacted Departure and we continued the flight without further incident.

## Synopsis

Air Carrier First Officer reported an altitude deviation during departure and cited poor CRM and lack of flying as contributing factors.

## Narrative: 1

During my third flight back after a 7 month absence (first flight back into ZZZ), I forgot to call the ramp prior to parking at Gate XXX, one of the exterior gates. I believe ground control cleared us "taxi to the gate" or a similar clearance, and I simply forgot that I was supposed to call Ramp Tower.

## Narrative: 2

Taxed into gate without ramp clearance. The self park was green with wing walkers. It is a short taxi from Runway XXR.

## Synopsis

Air Carrier flight crew reported a ramp incursion and cited lack of flying as a contributing factor.

## Narrative: 1

I signed in to work, and went to get the person out of positions at Sector X. The CPC who was working had just gotten someone else out 5 minutes earlier, which added to the confusion in my opinion. During all of this, I was not wearing my eyeglasses because they fog up badly when I wear a mask for COVID. I received a quick briefing, and during the briefing, I vaguely heard Sector Y tell the Controller who was working to "start the Aircraft X down to FL310." Then I recall hearing a straight descent to FL310. I was unable to really scan accurately because I could not see any data blocks. Anyways, the briefing completes, and I sit down and put my glasses on and start working and scanning. I answer a landline call or two, issue a few clearances, then look at Aircraft X who was now FL390 for FL310. I notice that it looks like it will be close with an aircraft level at FL350; so I call Sector Y and asked them what they want me to do with the two planes and that I had just sat down. After some back and forth, they told me to stop the guy at FL360. Well, the first Controller at Sector X should have never given a pilot's discretion clearance to FL250. Secondly, we're supposed to comply with the SOP with ZZZ Center Sector Y, which would have the Aircraft X crossing the boundary AOB FL310; this was never done. I believe all of the relief briefings had a part to play with the lack of communication in this scenario. Another aspect which compounded this all is that I wasn't able to wear my glasses due to the fogging up issue. I wasn't able to properly scan before I really sat down because I trust the members on my crew.

## Synopsis

Center Controller reported a near loss of separation and cited fogged up glasses due to wearing a face mask and poor coordination during a controller switch contributed to the event.

## Narrative: 1

I did not remove my mask to during demo to show oxygen mask use because passenger in X1, was eating and I cannot socially distance while he was not wearing a mask. I did not feel safe removing my mask because of risk of COVID exposure. He wasn't wearing a mask while I was in close proximity to him. I recommend not removing face mask during oxygen demo. We touch shared safety cards in the seat back for the demo and then directly touch our masks to remove to demo the oxygen mask. There is no opportunity to sanitize in between touching dirty, shared items before touching our masks which are

supposed to be done with clean hands. This is unsafe during a pandemic and can spread COVID.

## Synopsis

Flight Attendant reported not removing the face mask during the safety demonstration due to the close proximity of a passenger with face mask off while eating.

## Narrative: 1

After getting on the aircraft to fly, I did all my pre-flight duties including putting my personal luggage away and doing my safety checks. Just before we were ready to board, the flight crew including myself, was notified that someone had tested positive for COVID-19 from the inbound flight. We were later told that it was a passenger who tested positive for COVID-19. After waiting and many phone calls by the ground management as well as the pilots, it was decided ground personnel would clean the area where the customer had sat more thoroughly than just the tray table areas. The passenger was said to have been sitting in row X that tested positive. The cleaning personnel who wipe down the areas cleaned row X and the surrounding 6 rows behind it as a precaution. They then did it again because the cleaning solution being used says on the directions that it must sit for at least XX minutes on the surfaces being cleaned to properly be effective. Once the cleaning process was finished and completed, we boarded the flight and went on our way. The safety concern here is that there is no protocol for this exact situation and possible exposure. Our whole working crew and whatever ground personnel who entered the plane post flight are possibly exposed to this virus. I personally work in the affected area of the row. I sat in the row waiting for answers as to the protocols on what we were to do next. I touched all overhead bins around row X, the bathroom, bulkhead working station, and all surrounding areas that all could have been affected by this customer who tested positive. It's also not known if this customer had affected any other parts of the cabin and if this virus is on surfaces of the plane in more than just row X and the area of the aircraft that all the crew had to walk on to get on the aircraft.

## Synopsis

Flight Attendant reported possible COVID-19 exposure from a passenger on the inbound flight. The crew used the same aircraft outbound after being notified of the positive test.

## Narrative: 1

Approximately 3 hours into flight a group of 3 passengers would not comply with the Flight Attendant instructions regarding wearing their face masks. She notified us and we told

Dispatch of the situation and their seat location. Shortly after, they became belligerent to the flight attendants and continued [with] non-compliance. Now they were using foul language and disrupting other passengers. The Captain asked one of the foreign language speaking flight attendants to go try and deescalate the situation but that only made things worse. We looked in the Flight Operations manual and technically this was a threat level 1. We discussed whether should we notify Dispatch and we agreed by the definition it was, but we did not really think this was anything other than a couple of intoxicated passengers. The Captain got on the PA and addressed the cabin of the importance of wearing the mask. After this announcement we had no further trouble with these passengers. They apologized to the Flight Attendant as they exited the plane in ZZZ. Mask requirements in cabin, possible intoxication, lack of respect for airline rules. As soon as the Captain made the announcement this problem went away. Maybe we should have tried that sooner.

## Synopsis

Air Carrier First Officer reported 3 passengers would not comply with the face mask policy during flight and became belligerent toward the flight attendants.

### Narrative: 1

I was working all positions combined in RADAR. Traffic started to pick up far more than what we have had over the past few months due to COVID. Aircraft Y was level at 10k westbound and Aircraft X was east, inbound ZZZ out of 11 for 2500. I saw the traffic and turned Aircraft X 15 degrees left to maintain separation from Aircraft Y. I thought the turn would have been enough for 3 miles and degrees of divergence but ended up not being so. At the closest point I had 2.87 laterally and 800 ft. We went from a slow COVID season to busier than normal with a lot of crossing traffic.

### Synopsis

TRACON Controller reported a loss of separation.

## Narrative: 1

I was working Position X with numerous runway restrictions. Due to taxiway and runway closures we were running 4-8 MIT (Mile in Trail) to our runways we utilize except for Runway XXL which was normal. Due to these restrictions, over feeding an arrival controller happens quickly unless you build space by vectoring and speed reductions. Although this is necessary almost every push now, you begin to get backed up and run out of airspace. ZZZ [TRACON] already does not have much airspace and when you vector almost an entire base leg that is entering the metroplex airspace it becomes congested rather quickly. I was utilizing Runway YJR for as many aircraft that I could from the ZZZ1 Center, Position Y sector. We have had issues getting our spacing from this sector so we have to start taking aircraft off of the arrivals and slow them to make it work. I had assigned Aircraft X, Runway XXC because he was too close to the proceeding aircraft to land Runway YJR. The Controller working Runway XXC was already turning a 25 mile final so I vectored Aircraft X 130 [heading] down the Runway YJR final descending to 5,000 to put them in the downwind. I was also feeding ZZZ2 downwind aircraft to Runway YJR if I had gaps. Aircraft Y was one of these aircraft and turned to a 310 descending to 060 for right downwind to Runway YJR. I kept working and noticed the CA on both aircraft and immediately intervened by climbing and turning away Aircraft X. Aircraft Y also got a descent to 4,000. Closest proximity was 500 FT and 1.7 miles. I was in my airspace the entire time but the controller working YJR was so busy that he did not see my aircraft descending to 5,000. Aircraft X was not in a good place to begin with. I usually stop these vectored aircraft at 7,000 so I assume the other Controller was just not expecting anyone there at 5,000. We have an incredible amount of traffic with very little staffing. We should certainly keep the staffing the way it is for COVID-19 for the safety of the facility personnel. The issue is the amount of concrete we have at ZZZ available to us. We are constantly doing things out of the norm that could potentially cause an error. I could have handled this better by stopping at 7,000 or 8,000.

## Synopsis

TRACON Controller reported a loss of separation and cited traffic volume and staffing issues as contributing factors.

## Narrative: 1

I have been having severe headaches after flying lately. Being masked on an airplane and duty day that are now on average 10-15 hours a day. I had a deadhead recently and wore an oxygen sensor from start to finish. My oxygen in the hotel was 99/98 on the pulse oximeter. During the flight from ZZZ to ZZZ1 I wore it the whole time. My oxygen was between 89 and 94 the whole way until landing. It then was back up to 98, 20 minutes after landing. It is a fact that extra oxygen is pumped into hospital rooms during long surgeries because the doctors are masked. I feel this shows that lack of oxygen, just on 1 flight is proving how I'm getting my headaches, let alone being masked as well. I have never felt more unsafe flying than I have since having to wear masks.

## Synopsis

Flight Attendant reported the requirement to wear a mask during flights is resulting in having low blood oxygen levels and associated headaches.

## Narrative: 1

During boarding, I was standing in an exit row scanning passengers for meeting the selection criteria to sit there. There was a lot going on in the exit row and I was preoccupied with confirming that two younger passengers met the age requirement and whether another passenger was willing to assist. One of the last passengers to board was holding a really small dog in front of her face and I was concerned with whether or not she was wearing a mask with a valve on it. After she sat in the exit row and I determined she had a mask with a valve and needed to get her a disposable mask, I failed to realize that her dog disqualified her from sitting there because I was distracted by her mask and addressing the other passengers' needs to meet exit seat criteria. I did confirm the other passengers' eligibility and briefed the exit row passengers, but during cruise, the B Flight Attendant notified me there was a passenger with a dog in the exit row. I was shocked to realize my mistake and immediately moved the passenger to an empty seat behind the exit row, so the passengers met the exit seat criteria for final descent. Focus my attention on scanning each passenger again for selection criteria prior to briefing and really check on their laps and under their seats for pets. Have the B or D Flight Attendant cross check exit row passenger selection criteria after boarding is complete. Ensure the operations agent gives out disposable masks to passengers with valves prior to boarding, so flight attendants can focus more on other safety precautions. Have operations agent notify any passengers with pets that they cannot occupy an exit seat as they scan their boarding pass.

## Synopsis

Flight Attendant reported a passenger with a dog was seated in the exit row; however, the flight attendant did not recognize this due to being distracted with the passenger's face mask non-compliance.

## Narrative: 1

The employee buses that service the X lot have become severely overcrowded with all seats being used as well as people standing in the aisle. The bus schedule has changed which has reduced the frequency of trips to and from the lot and terminal. Signs were posted on the insides of the bus stating the bus can carry an occupancy of XX people which does not allow any of us to social distance at all. The COVID-19 virus is spiking quickly in recent weeks, forcing the state's Governor to mandate a curfew in ZZZ, along with early closings of businesses and a mandate which limits a gathering of only 10 people in a home dwelling. So why are we allowed to pack our buses and put our lives and our families lives in jeopardy of contracting this virus? This is unacceptable! Safety should always be our first concern and it has clearly been tossed away.

## Synopsis

Ground employee reported the employee bus is overcrowded with all seats taken and passengers standing making social distancing impossible.

## Narrative: 1

I am in the ZZZ pilot crew room lounge area. There are greater than 12 pilots not wearing masks. Approximately 8-9 at the table area and another 5 at the recliners/lounge area. I thought wearing a mask is required. I just heard a PA announcement upstairs in the terminal that says masks are required inside the terminal. Don't you have cameras down here? This is a blatant disregard for the face mask and social distancing policy!! I guess I have to leave because I don't want to be down here.

## Synopsis

Air Carrier First Officer reported pilots are not adhering to face mask policy in the crew lounge area.

## Narrative: 1

I was training my trainee at Sector X only. We had all of the airspace combined as well due to COVID traffic (normal). My trainee pointed out Aircraft Y to Sector Y in ZZZZ center. They were combined with Sector Z as well. They approved the point out on Aircraft Y and then started a hand off on an aircraft we did not know about or see yet (Aircraft X). Neither of us said anything because we did not know what aircraft [in] Sector Y was talking about. After about 3, 4 seconds of silence from my trainee, Sector Y said "disregard." So we never took the hand off. A couple minutes later, Aircraft X checked on out of about 160 for FL230. Sector A airspace was hot FL180 - FL230 with 4 drones delaying. There was no data block displayed, but we eventually found the limited data block and pulled it up and stole track control and immediately my trainee told Aircraft X to descend and maintain 170 to miss the airspace. Prior to stealing the track, the status of who had track control was listed "Unknown." My trainee said it was OK if he was already above 170, but to descend anyways. He was climbing really well and got up to about 185 before starting back down. Aircraft X may have clipped the Sector A airspace for a hit or two while descending. Safety was never compromised because we had clear radar on all 4 other type aircraft and the closest one was well south of where Aircraft X was 15-20 miles. I would have intervened if safety was at risk and vectored the aircraft away from danger. Just [need] better coordination and more timely hand off from the north. Maybe a heads up prior to departure on ZZZZ departures entering our airspace due to proximity to our airspace.

## Synopsis

Center Controller reported a hand off issue with adjacent airspace resulting in an airspace violation.

## Narrative: 1

I was paged back to work the D side on Sector X to assist the Radar Controller. The previous evening we were told that we had to take over ZZZ TRACON airspace because they had too many COVID cases to staff it properly. We have been working without any clear guidelines and it feels like every shift when we come in we get new information about what we're gonna do and how to work aircraft in and out of this airspace without any training. While having to work Sector X and ZZZ TRACON airspace, he got request from Aircraft X to do a flyby at Park X and University X. He then started getting requests from Aircraft Y and Aircraft Z to also do those without any flight plans. Controller Y was working a light to moderate workload until all of these requests came in. Because we had no information about the flybys, (there was actual information offered to ZZZ TRACON, but they did not share it until we complained). This session became extremely confusing. I was attempting to coordinate with ZZZ Tower about them coming in bound, but they were staying above their space. Our side kept giving them communication changes over to the Tower and then they were being sent back. Luckily no incident occurred but this made for an extremely high workload and high stress scenario. Because of the confusion at the sector I had a very difficult time even being able to help from the D side. The more information we have ahead of time the better. But having zero information was really difficult to manage with the increased workload of our own airspace and TRACON's as well. The coordination between TRACON and our Center requiring that we take over this airspace for two weeks has been very poor. The supervisors and operation manager on duty have attempted to coordinate for us, but with every day I walk in, we get new information about how we have to change what we had done the day before or what we were doing was wrong. This also leads to controllers in charge being responsible for the area much more this week than normal. We needed the support of our airspace and procedures staff to step in and get some coordination done to give us clear guidance as to what we should be doing because our LOA with TRACON does not clearly cover how we take over their space. There's been confusion all week as to whether they are Class C surface area or a Class D. Also, they have a waiver to be within 1 mile of a restricted airspace RXXXX while fixed wing aircraft are in the space. They've been in there operating

all week long while we've been doing mostly visual approaches but sometimes IFR approaches. But apparently some of the IFR approaches are not separated from the restricted airspace. Which creates a very unsafe situation for us to take over the space with no training. We also need any of the flyby information passed to us. We now have that information, but we didn't until date, one week after taking over their airspace. If we had the information about the flyover, the session would not have been nearly as stressful and confusing. And my XX years here I've never been so confused on sector. Luckily, he was not overwhelmingly busy with his other traffic.

## Synopsis

Center Controller reported confusion with taking over a TRACON's airspace and difficulty with coordination with Tower on how to handle some flights.

## Narrative: 1

Aircraft X was climbing out of 5,000 feet for 10,000 feet. Aircraft Y was 25 NM NW and level at 9,000 feet SE bound. The sectors were combined and busy with a full workload including practice approaches on the north side of the sector configuration, with multiple in-bounds as well as terminal arrival and departure traffic. Aircraft X initially had a good climb rate which declined with altitude, and became traffic for Aircraft Y. The two aircraft were opposite directions and at around 7 miles apart Aircraft X was only at 8,300 feet and climbing and would not top Aircraft Y at 9,000 feet. Traffic alert was issued to Aircraft X and given a 30 degree turn to the right and a descent to 8,000 feet. Traffic was issued to Aircraft Y and a climb to 10,000 feet. Aircraft Y reported Aircraft X in sight and was instructed to maintain visual separation and to climb and maintain 10,000 feet. To my knowledge separation was never lost but was close. Due to very short staffing, along with COVID-19 scheduling this makes it hard to mitigate busy traffic by splitting sectors in the optimal efficiency of running the NAS. Other issues that could have been preventive, would be the presence of a Supervisor to staff the area when a Supervisor was scheduled for work, however; the Supervisor was on break and a Controller in Charge took the position which greatly hurts the staffing of able bodies to the operation.

## Synopsis

Center Controller reported a possible loss of separation and cited COVID-19 related staffing issues as a contributing factor.

## Narrative: 1

This flight was designated as a quick turn. Once cleaners were off the aircraft flight attendants boarded and less than 30 seconds later three members of management were

asking the crew if we can board the customers that were shoulder to shoulder with poor ventilation and no signs of social distancing on the jet bridge. I understand that safety checks must be done before door closure. It is extremely difficult to do safety checks during the boarding process of a full X type aircraft with the added pressure of the three members of management standing outside the boarding door. An in-flight Supervisor was standing in front of the flight attendant jump-seat, at door one left during the boarding, to have a look at the boarding process and kept asking how the overhead bins looked. As the A Flight Attendant, I discussed this matter with CS and would contact them when bins were getting full. To complicate things, we had an extra pilot doing a check ride so we had a total of three, we also had a maintenance issue with the aircraft and at one time I was pressed against the door at one right, as we had three pilots three mechanics two flight attendants and one in-flight Supervisor standing in the forward part of the plane along with customers boarding . It was clear that everything that happened during the boarding process showed we need to do a better job during this COVID-19 pandemic and the quick turn needs to be updated to reflect that.

## Synopsis

Flight Attendant reported social distancing problems/concerns involving passengers, crew and maintenance personnel during boarding on a quick turn flight.

## Narrative: 1

I was PF and the Captain was PM. We had winds gusting to 190/22G40 knots and low-level wind shear advisories in effect. Around 500 feet or so, I was task saturated just trying to fly the plane and I did not see the altitude. We got a wind shear caution. I said "continuing" and the Captain agreed. He later mentioned he was watching the altitude and we were continuously trending up. We should have used the wind shear escape maneuver according to the SOP. We had wind shear advisories on the first two approaches, had reviewed the SOPs and briefed that with a caution we may choose to continue or perform the wind shear escape maneuver. A warning and we would be getting out of there. We briefed the entire maneuver to ensure it was fresh for both of us and we were clear on our individual roles. Since we briefed on the approach that we would decide with a Caution, it was fresh in our minds. The Captain mentioned in cruise that we should have performed the wind shear escape maneuver because we were departing. Contributing causes, last leg of 4 flying around weather, moderate turbulence all day, almost diverted and had to hold due to weather on last leg, wind shear on approach and flying at night. I am relatively low time ~120 hours in 7 months, an average of 17 hours a month, which has led to poor consolidation of knowledge.

## Synopsis

Air Carrier First Officer reported not following Standard Operating Procedures in a wind shear situation during departure and cited fatigue, weather, and low flight time in the last several months as contributing factors.

## Narrative: 1

While departing ZZZ we were cleared up to 7,000 feet and receiving vectors. The First Officer was hand flying and we received a TA alerting us to a crossing aircraft on the arrival that was leveling at 8,000 feet. I told the First Officer I had the traffic in sight, it was no factor and he had already begun leveling off. Due to our light aircraft and high rate of climb an RA was triggered. Since the First Officer was already hand flying and in the process of leveling off we complied with the RA and continued the flight uneventfully. Due to a light aircraft and dense air there was a high rate of climb. The First Officer was hand-flying and slowly leveling off while not busting altitude and triggered an RA.

## Narrative: 2

While departing ZZZ for ZZZ1 we received a TCAS RA. I, the First Officer, was hand-flying and cleared to 7,000 feet MSL. The Captain called traffic in sight as the system said "traffic," so I began to level off, while doing so we received "monitor vertical speed" which I was already doing. This RA was likely triggered due to our light GTOW and high rate of climb. We continued the flight uneventfully.

## Synopsis

Air Carrier flight crew reported receiving a TCAS RA during departure. The TCAS RA was reportedly due to the aircraft's high rate of climb as a result of having a light gross takeoff weight.

## Narrative: 1

The break-room had dividers poorly installed on the round lunch tables, they were just set on the tables and move around freely. The dividers also have many sharp edges on them and someone will end up being injured and or cut on these sharp edges. Along with moving around, our department has actual man-sized employees here and the room that is being given to us to sit and have lunch is the size [for children]. If this ridiculousness continues I feel that the training room needs dividers between all the computers and the break-room computers as well. There also needs to be dividers installed in between the seats along the wall as we cannot afford to remove any of these seats since our break-room is already too small for our size of group. I also feel that our vans and trucks need dividers that we move our employees in since masks are clearly not enough for this very "deadly disease."

## Narrative: 2

As I came to the break-room for lunch I noticed that dividers were installed on our break room tables well after this supposed "pandemic" hit us. Someone with obviously way too much time on their hands thought it prudent to install clear dividers on the tables. If this "pandemic" is so very deadly as the media portrays it to be I suggest very strongly that we need to install these unnecessary dividers in our Super Tugs since we sit much closer in the cab of that than in a break-room for a few minutes while we eat lunch. Anything less than putting dividers is Unacceptable and will show that our lives do not matter to this company and prove that you can put a price on our safety.

## Events

Anomaly.Deviation / Discrepancy - Procedural : Landing Without Clearance

Narrative: 1

I had been off from flying since [Month] due to the Covid19 slowdown and my leave over the summer. This was my OE after completing training to get me refreshed and up to speed with line flying. I was definitely a currency and recency of experience threat that was discussed in the cockpit and prior to the top of descent going into ZZZ. After being cleared for the ILS approach to XXR, we were using VNAV and either LOC or LNAV to track the approach course to the runway. There was a lot of haze and smoke from the fires in the area that was obscuring our ability to see the runway. We flew the approach and eventually selected APPR mode on the MCP with approx 5 miles until touch down. Approach told us to contact tower around the Final Approach Fix. I was almost exclusively focused on flying and failed to cross-check the Captain to make sure he contacted Tower for our landing clearance. Even at the 1,000 foot call, I thought we were most likely cleared to land, and I was so focused flying that I didn't suggest the Captain query ATC. Poor workload management on my behalf. I felt very compressed as the work load increased. I flew a stabilized SOP ILS approach and landed uneventfully on XXR. Upon contacting Ground Control we realized that Tower was never contacted and clearance to land was never received. Ground Control made no mention of this failure and cleared us to our gate.

## Synopsis

Air carrier First Officer reported that the crew landed without a clearance after forgetting to contact Tower. The First Officer cited poor workload management and lack of recent flying as contributing factors.

## Narrative: 1

ZZZ was going ATC zero for a cleaning due to coronavirus. We had aircraft still in our airspace at the time of the scheduled cleaning. We were advised by management to terminate radar and to flash the aircraft to the next facility or sector that they would be

entering next. Fellow controllers later told us that we couldn't do this, but no official guidance from the FAA has been given to us on what the proper way was to handle this.

## Synopsis

Center Controller reported there was no official FAA guidance regarding how to handle traffic in the airspace when the facility went ATC zero for COVID-19 cleaning.

## Narrative: 1

I had just descended through IMC and was worried about the potential icing and high winds. I hand flew the approach and due in part to lack of recent experience (rustiness due to 2020/COVID), I inadvertently descended to ~2,100 feet MSL between ZZZZZ (IF) and ZZZZZ1 (FAF) on the RNAV XX approach into ZZZ, about 200 feet lower than the 2,300 feet minimums. I recognized my error and climbed back to 2,300 feet by ZZZZZ1 then continued to an uneventful landing. I should not have hand flown the approach given my rustiness--despite having done well in an IPC (Instrument Proficiency Check) a week or so ago--as I was preoccupied with studying wings for evidence of icing in the fast approaching twilight/dusk, and I was fighting strong winds that had me watching airspeed more than altitude. All in all, it was 100% my fault and reemphasized to me that currency does not equal proficiency.

## Synopsis

GA pilot reported an altitude excursion during approach and cited lack of recent flying as a contributing factor.

## Narrative: 1

After [working] on Aircraft X, returned to shop to research history on item. Upon return to aircraft ramp had removed the crew stairs from Gate X to Gate Y for next inbound flight. After arrival of inbound Flight ABB Gate Y, could not return to Flight CBBD, Gate X, until crew stairs were returned.

Need to have 2 crew stairs so AMT is not split between gates. Normal staffing is 2 AMT's for shift, but one AMT was out sick with COVID-19. Operations could have allowed more ground time by tail swapping aircraft.

## Synopsis

Technician reported not having enough air stairs and having to wait to accomplish a task.

## Narrative: 1

Approximately 8 hours into our flight, my ears started to block. I swallowed to clear them, but it came back repeatedly. I spoke with 3 other flight attendants and they said they had the same symptoms. I called the cockpit and talked with the flight crew about the situation. They informed me that everything checked out all right. We were informed about a "PAC" being "out" during the Captain to crew, pre-flight briefing. I questioned flight crew if this had anything to do with our ears being blocked. Captain told me that the PAC that was out was like having a "spare tire." I questioned him because he informed the

crew that the temperature in the cabin might be a problem. I asked him if the PAC situation had anything to do with air circulation or filtration, due to COVID transmittal. He said it was not going to affect the pressurization, air circulation or filtration. The ear blockage lasted for 15-20 minutes and didn't return the rest of the flight. Captain asked if we needed MedLink and we declined.

## Synopsis

Flight Attendant reported having ear blockage problems during flight and questioned if it had to do with one Pack being "out."

## Narrative: 1

We were assigned the ZZZZX RNAV departure off Runway X at ZZZ. The clearance was to climb via the SID, top altitude of FL230 was set in the MCP. All the fixes and altitude restrictions were correct in the FMC, I was the PM, the airplane was light, so we had a good climb rate. The PF was hand flying as we approached the first fix which has a crossing restriction of at or below 10,000. LNAV/VNAV and VNAV PTH was selected. Close to the first fix the PF called for the autopilot as the airplane started its turn to cross the fix that placed the sun directly into our face which affected our visibility. As I turned my head to get my sunshade, ATC asked if we were going to stop at 10,000 feet, we got as high as 10,300 the PF turned the autopilot off and went down to 10,000. In this situation I think turning the autopilot on earlier would have helped. Also anticipating the sun and take steps earlier to mitigate the effects of the sun would have helped us to maintain better situational awareness.

## Narrative: 2

Our departure SID was the ZZZZX. Our departure plan was for Runway YYR per the ATIS. During taxiout our runway assignment was changed to Runway X with the same SID. My First Officer ran the runway change checklist and briefed me on the changes to the SID departing Runway X. During the climbout I called for the autopilot sometime prior to 10,000 feet. There is a fix named ZZZZ that has a crossing altitude of 10,000 or below. Our automation level was LNAV/VNAV with the autopilot engaged. Approaching 10,000 feet I noticed that the FMA went to VNAV PTH. About that time, I also got a face full of morning sunrise. It briefly made it hard to see and I had not deployed my sunshade or put on my sunglasses yet. When my vision adjusted to the glare of the sun I noticed that the aircraft did not level at 10,000 feet. It overshoot the altitude by 300 feet. I disengaged the autopilot and returned to 10,000 feet. The Controller did query us on our altitude during the overshoot. One other piece of useful information is that the aircraft was very light. I'm wondering if the system was respecting a G-Load vs. an altitude because I

have no other explanation as to why it did not level at 10,000 feet. Factors that I feel contributed to this event were the runway change on the ground, high airport elevation, sunrise, fatigue and maybe our light weight. Next time I will not accept the immediate line up and wait from ATC. Instead I would re-brief the SID so that my situational awareness would be better.

## Narrative: 1

I was originally told by the company none of my sick time would be used if I needed [it] due [to] contraction [of] COVID. My sick time has not been replenished. Due to this policy now, there has been talk in our breakroom that if someone contracts COVID [they] will not inform the company and will come to work potentially infecting coworkers. So the possibility of our work area becoming a safety hazard is dangerously probable. The company should do the right [thing] during this pandemic and do their part to keep employees and customers safe.

## Narrative: 1

The procedure for screening crewmembers at ZZZ KCM [Known Crew Members] allows for social distancing, if the crewmembers follow it, right up to the actual point of screening. There are 2 screeners/podiums, which is great and efficient, but they are located within

inches of each other. The screeners keep waving people forward to move the line, but this requires standing within a few inches of the person you were just trying to distance from.

When I mentioned this to the screener he offered to send me back into the line, which I declined.

## Synopsis

Air carrier Captain reported social distancing concerns during TSA screening.

## Narrative: 1

Upon arrival to Gate X in ZZZ we were asked to call OPS. The Captain called them and we were reminded that we should call ramp before entering the ramp next time. I couldn't believe that I had made such a mistake after over XXXXX hours on the fleet and almost XX years of flying at the company with many many ZZZ arrivals. I looked at the Captain and I said, "I am sorry I have no excuse," which is how I felt. I then called the ramp and apologized. I called them on the frequency that I had set on stby at Comm 2 prior to the top of descend when I was setting up for our arrival to ZZZ. As we debriefed I started questioning the why of my mistake and I realize that I am taking for granted my lack of situational awareness as a result of my 7 month absence from flying.

When I went to ZZZ1 I was very serious about it, during my OE trip I was still very conscious of my weaknesses because of my lack of recency but now as I am finishing my second trip after OE I feel that "I am back" which obviously I am not. There were a few other threats that contributed to my mistake. We had thoroughly briefed a [Runway] XXL arrival and taxi in but had spent way less time discussing [Runway] XYR. Our set up for XYR and execution was great but created a distraction and increased the workload. We cleared XYR on Taxiway 1, were given instruction to cross XYL on 1 and call Ground. Both myself and the Captain were anticipating taxi via 1, but when I called Ground we were told "Taxi via 2, 3 hold short of 4 and at the half way point on November call Ground at XXX.YY." A lot of information to digest especially if you aren't very familiar with the airport, you have been out for a long time (this is the Captain's first trip after RQ (Recurrent Qualification) training and OE). We were both expecting to go straight on Taxiway 1.

I told the Captain to stop. Which he very nicely did as he was also figuring out that we were not suppose to continue on 1. The Captain taxied as instructed, I called Ground Control and was told to taxi via 3, 4 to the gate. After making the turn on 4 we were instructed to give way to opposite direction traffic on 4 that was turning on 5. We then were told to turn right on 5 and continue via 6 to the gate. As I am debriefing this I realized that ZZZ unlike ZZZ1 or ZZZ2 doesn't instruct you to contact ramp. They simply say taxi to the gate/ramp. Finally as we were approaching the gate area I was trying to time my APU start so it is running when we come to a full stop, and I also noticed that there was a lot of vehicle traffic traveling parallel to us and I was a little concerned on whether or not they will stop at X7 for our turn. There was no traffic in the alley and we taxied to Gate X uneventfully.

## Synopsis

Air carrier First Officer reported not contacting the ramp before entering and cited as contributing factors a lack of recent flying and ATC not instructing them to contact ramp.

## Narrative: 1

As the flight progressed, I was made aware that two particular passengers, seated XX5 and XX6, were repeatedly not in compliance with the mask policy. I made the announcement encouraging everyone to wear their masks. Subsequently, the passengers XX5 and XX6, failed to comply and attempted to use "Active eating and drinking" as an excuse not to wear the mask. The purser advised me that they were non-compliant for most of the X+ hour flight, so I forwarded their names and seat numbers to Dispatch to support the flight attendants and to document the passengers' non-compliance so that company can evaluate whether they be allowed future travel. The customers were met by Customer Service representatives upon arrival in ZZZ.

## Synopsis

Air carrier Captain reported two passengers were not complaint with face mask policy during flight.

## Narrative: 1

We exceeded 250 knots below 10,000 and were on speed by 9,600. I (PM) was looking at weather and the STAR and when I went to monitor the aircraft displays I noticed we were doing 300 knots at about 9,760 feet. I said check speed and the PF disengaged the autopilot, reduced power, deployed speed brakes, and leveled off. He had the speed window open and we both failed to monitor the speed window. He is very good about VVM (Verbalize, Verify, Monitor) and not doing something without informing the PM, so I feel I'm just as much responsible for the incident. I believe the speed window was open from a previous instruction from a Controller.

## Narrative: 2

On the ZZZZX south of ZZZZ [Intersection], we exceeded 250 knots below 10,000 feet.

ATC had originally asked us to cross ZZZZ at 15,000 feet leaving us high for the next restriction (ZZZZ1 at 8,000 feet and 250 knots). I was using speed intervene (300 knots) and flight spoilers to make the anticipated restrictions at ZZZZ1 while descending from 15,000 feet. The FMA switched from VNAV SPD to VNAV PATH at approximately 12,500 feet. At this point, I began focusing more attention on small build-ups and ensuring the flight attendants were seated. Upon crossing 10,000 feet, the PM called out "speed" and we quickly corrected to 250 knots by 9,650 feet. ATC passed us off to Approach without commenting about the speed deviation.

The FO did a great job as the PM. However, we did debrief that, despite verbalizing the use of speed intervene, we ended up below 10,000 feet above 250 knots. The error is mine and I own that, but recency of experience may have been contributory as well.

## Synopsis

Air carrier flight crew reported a speed violation below 10,000 feet.

## Narrative: 1

I was training on the X Scope and traffic volume was fairly high compared to the previous several weeks. ZZZ was landing Runway X and ZZZ1 Runway Y Right, making for a complex approach pattern. Aircraft Y was NW bound toward ZZZZZ, the South fix for RNAV X approach at ZZZ level at 030. Aircraft X was on the Localizer Y Right approach at ZZZ1 east of ZZZZZ1, descending out of 030 for 020, not cleared for the approach. The close proximity was recognized as Aircraft X (now at 025, still descending) was established on the localizer and Aircraft Y (still level at 030) was approximately 1 NM away from ZZZZZ, the situation was recognized just as 3 mile separation was lost. I turned Aircraft X to a 180 HDG as they were out of 022 for 020 to avoid a further loss of separation.

Aircraft X was slow to descend and I did not recognize the altitude in sufficient time.

Training has been intermittent for a long time due to the COVID situation. Also, unusually frequent storms and bad weather had kept traffic volume low for the past few weeks, keeping training complexity low as well. Today presented lots of training and volume, I was getting tired due to not being conditioned for constant traffic and lost focus. I would [recommend that I] recognize my own fatigue and ask for training or to work a slower or less complex position for a mid day break or to change things up.

## Synopsis

TRACON Developmental reported a loss of separation and cited lack of training in high traffic volume as a contributing factor.

Narrative: 1

After completing a flight with a passenger and entering the flight into my logbook, I realized I had only 2 takeoffs and landings within the last 90 days and was not compliant with FAR 61.57(a). Prior to the flight that included 2 landings on [date], I had not been flying since March 2020. I think lack of recency led to the mistake. I had not thought of the requirement until after the flight was completed and I was making the logbook entry. As a corrective action for myself, I made a checklist to use before every flight that includes currency requirements to carry passengers in VFR day and VFR night.

## Synopsis

GA pilot reported flying with a passenger, but not being current for takeoffs and landings to do so.

## Narrative: 1

I arrived at the aircraft as relief pilot an hour before takeoff for a cargo flight to ZZZZ. The FO was at the aircraft and had completed much of the cockpit preflight. Because it was a cargo flight I went through the cabin and secured the overhead bins and many of the storage /catering carts. The Captain arrived and we went through the standard cockpit flight preparation prior to departure. After we pushed from the gate and initiated the engine start, I realized I had not done the Pre-Fight Walk Around Inspection. I asked the FO if he had completed it and he said he had not. He thought I was doing that when I was actually securing the cabin for departure. I told the Captain I forgot to do the walk around. The Captain got clearance and we turned around on the ramp and went back into the gate. The Agent came back, hooked up the jet bridge and I went out and completed the walk around inspection. We re-accomplished all the pre-departure checks and ended up departing to ZZZZ about XX minutes late. Most of the delay was a result of getting personnel back to park us and recalling another push crew.

I think that because it was a cargo flight, I was possibly distracted by some non-standard items in the cabin and got out of my habit pattern. Like most of us, I haven't been flying too much but the bottom line is that I simply forgot to do the walk around preflight and realized it after the push.

In the future I will report to the FO that the walk around has been completed and as the FO I will verify with the relief pilot that it has been complete. I have been flying airplanes for XX years and have never forgotten to do a walk around inspection.

## Narrative: 2

During the pushback from the gate, the flight crew realized a communication error occurred resulting in the non completion of the pre-flight walk around duties by a pilot. A return to a gate commenced to complete the required tasks.

Contributing factors may have been one crew member being newly experienced to three-four pilot crew tasks combined with a multi month period of not working.

Making the crew cross information in this specific area a mandatory portion of any preflight operations area briefing, crew text preflight contact, or aircraft boarding process.

## Synopsis

Air carrier Relief Pilot and Captain reported forgetting to do the pre-flight walkaround and cited communication, distraction and lack of recent flying as contributing factors.

## Narrative: 1

Forgot to submit my COVID assessment prior to the first leg in the morning. I did the assessment and became distracted through my preparation to begin my day and forgot to submit my COVID assessment. I submitted my assessment once the first flight segment was completed.

[Cause was being] distracted and not following personal reminding procedures.

Maybe there is a way that we can acknowledge that we have performed the COVID

assessment in the same way we acknowledge that we are FIT for Duty. This would make a normal part of the procedures we already have in place.

## Synopsis

Air carrier Captain reported forgetting to submit the COVID assessment form prior to the first leg.

## Narrative: 1

I contacted First Officer X to notify him of my desire to wear masks on the flight deck. The FO replied that he did not want to wear a mask in the cockpit. As per policy we both agreed to contact the Union. The Union notified me that they would contact me. They called me to give me the option to remove myself from the trip either with or without pay. I was informed that I could be removed from the trip by using my vacation time thereby retaining my pay. The other option was to be removed from the trip without pay and suffer no other adverse consequences. Although I did not believe that the offers to remove myself from the trip were fair, I felt compelled to drop the trip because of my desire to

protect myself from potentially being exposed to COVID-19 on the flight deck. The practice of offering crew members the option of taking vacation time is not sustainable. Considering the variables of the extended time COVID-19 may be affecting operations as well as personal choice to refuse mask wearing, one's vacation time could potentially be quickly exhausted. The company mandates pilots that masks be worn in all public places upon reporting to work to include the employee bus, the terminal, and the cabin to protect ourselves and others. This leads me to question why, when COVID-19 cases among pilots are growing, there is no direction strongly encouraging the wearing of masks even when it is not currently FAA directed.

## Synopsis

Air carrier Captain reported the First Officer did not want to wear a mask in the cockpit. The Captain decided due to concerns about exposure to COVID-19, to take the only option given of dropping the trip.

## Narrative: 1

As the pandemic is surging to record levels again, I feel compelled to highlight an ongoing and now seemingly institutionally entrenched intentional violation of basic company safety policy regarding mask wear in the ZZZ base pilot lounge. According to the policy letter from management, employees are required to wear face coverings in crew bases whenever not actively eating, drinking, or taking medicine. This does not occur with the vast majority of employees I observe regularly regardless of time of day, number of occupants, lack or not of social distancing, and is an ongoing situation. I have even heard some say they spend more time in the lounge these days in order to avoid the gate/terminal areas where other work group members might express the need for compliance. The ZZZ base pilot lounge is seen by nearly everyone as a "safe space" to

willfully flaunt company face covering policy and could easily end up being a major source of COVID-19 transmission, resulting in increased sick calls, company health expenses, or even employee deaths.

This starts at the top. I can't speak about other bases, but there is no messaging, signage, or even leadership by good example by base leadership for this simplest and most effective of pandemic mitigations. If company policy is meant to actually have a positive effect and not be simply lip service, leadership needs to inform and demand compliance and show leadership by demonstrating compliance. This needs to be standard across ALL employee work spaces and leadership must be held accountable. I refuse to spend any more time than absolutely necessary in my company workspace of the pilot lounge because it jeopardizes my health and that of my co-workers and family.

## Synopsis

Air carrier pilot reported that many employees in the pilot lounge do not comply with company face mask policy.

## Narrative: 1

I was in bed sleeping at XA:05am. My scheduled shift for the day was supposed to begin at XE:00L. I received a phone call at XA:05 from my operations manager. He said that this phone call was not a joke and that he needed me to report to work ASAP because the Tower was being evacuated due to a COVID-19 case and the "need for secondary cleaning." I was aware of the fellow colleague who had been out on quarantine. The colleague had last worked a shift on [date] in the Tower. Apparently managers above me had become aware that this colleague had contracted the virus.

A telcon had been convened in the earlier hours of the morning and during that telcon it was determined that cleaning the Tower was necessary due to the COVID case of an employee who hadn't worked in the Tower in over XX days. It was determined that this

cleaning needed to take place ASAP. No regard was given to the fact that the employee hadn't worked for XX days and that controllers had worked in the permanent Tower for close to two weeks.

Even more frustrating was the fact that this cleaning would take place during the busiest and most complex traffic times of the facility. There was no pre-planning for this transition to take place. From the time I was awakened, I was on the phone communicating and preparing for a very complex transition to a temporary Tower. As this was early in the morning, there were almost no resources available to prepare for and to facilitate this transition.

In my opinion, those that made this decision were extremely short-sighted and negligent in considering the impact to the safety of the operation and to those working in the operation. With the help of the ZZZ Airport Manager on Duty and my Operations Manager, I reported alone to a contingency Tower at the terminal at with two portable radios. Prior to leaving the permanent Tower I met with one of the two controllers on duty for the graveyard shift and explained to them the transition. These two controllers stayed beyond the end of their shifts to facilitate the transition. Their actions were exemplary.

By XF:00 am all X controllers who were scheduled to work the day shift were with me in the temporary Tower. I had coordinated with the TRACON to have the Developmental Controller on shift stay in the TRACON to work flight data.

The actions of the controllers that morning were heroic. Working with 3 radios, two telephones, and a few pads of paper and pens. The controllers on shift safely moved the three busiest traffic banks of the day while the permanent Tower was cleaned. I was in awe of their professionalism and commitment to safety. Their expertise was truly heroic.

At XH:00 am Local, the cleaning was completed and we were able to transition to the permanent Tower. As a team we were proud of what we had accomplished in spite of very difficult circumstance.

The timing of this event was horrific. Those who demanded the cleaning take place took no regard for operational safety. There is no reason that after XX days of working in the permanent Tower under possible exposure that it would not have hurt to delay the cleaning until the operation was in a better position to support cleaning. This cleaning should have happened on a mid shift and the facility should have been closed for the duration of the cleaning. I am aware of multiple enroute centers that have been closed for cleaning. The cleaning is always done overnight and there is sufficient traffic management support and communication to the users about the event. This decision to clean the Tower was made in the early hours of the morning and as the one who facilitated the transition I am aware of no support or awareness that come from outside the facility.

In this event I am not aware of any communications to the users that we were in a temporary Tower. This event was mitigated by the expertise of air traffic controllers who have been heroically working for months through this pandemic. They are already working short staffed in less than ideal conditions. Instead of recognizing these circumstances, those on the telcon who mandated the cleaning ignored the safety of the operation.

## Synopsis

Tower Controller reported safety concerns while transitioning to a temporary contingency tower while the permanent tower underwent COVID-19 cleaning procedures during a busy traffic time of day.

## Narrative: 1

I was told by our company Chief Pilot, my 61.58 check-ride had lapsed after I had been flying PIC for several flights in our aircraft under Part 91. I was told I had operated the aircraft as PIC outside of my 61.58 requirements. I had received a check-ride which I was told was for my PIC currency under 61.58 with our Chief Pilot/Check Airman. My company says they have no record of a signoff of my completion of the 61.58 flight during my 2 month COVID-19 SFAR put forth by the FAA. I was told by my Chief Pilot I am illegally operating as PIC 3 months after I had been evaluated after the check-ride. My usual check-ride month is X, and fell under the SFAR time period and our training facility was essentially closed due to COVID-19, so an in-house check-ride to satisfy my 61.58 requirements was performed, within the SFAR grace period specifications. Apparently my company never logged/lost the flight training records and put me in a situation where I am in violation of 61.58. In the near future my company is going to perform another in-house check-ride with the same Chief Pilot/Check Airman to satisfy my 61.58 requirements. In the meantime I will not be performing any PIC duties going forward until my new signoff is complete.

I had understood my 61.58 requirements were to be met that day, so I continued to operate our aircraft as PIC under normal circumstances. It wasn't until I was to be contracted out by my company to ferry an aircraft that this clerical error was discovered in my records. I have a log book entry of this flight occurring and there is company records of this flight occurring as well as a training flight.

My company should be held accountable for any issues that arise from this in the future as I performed the check-ride to satisfaction and was under the false assumption that my Check Airman followed through with his paperwork for company records.

Going forward, I will now require a copy of my training record for my own personal files.

## Synopsis

Corporate pilot reported the company lost or misplaced SFAR (Special Federal Aviation Regulation) records of the pilot's completed check ride during this pandemic period.

## Narrative: 1

Flight Attendant (FA) B came to me to let me know that the passenger seated in X1 was repeatedly reminded to put on his mask appropriately over his nose and mouth. He would do it and then later remove it. He was told at least 5 times before the crew let me know

that they had each told the passenger to comply. As the only FA who had not approached the passenger I went up to ask him to comply with our mask policy. After I left the passenger, the crew let me know that he took it off again and that other passengers around him were asking to make sure he was wearing his mask. I then went to grab one of our on board masks and policy document to give to him. When giving him one of our masks he grabbed it, put it on and then closed his eyes and proceeded to go to sleep. I tried to give him an explanation of the policy document but he proceeded to ignore me. After beginning service FA D and FA C saw him again not complying. As a result, the flight deck was notified by FA A of the non-compliant passenger. FA A also went to speak to the passenger one more time to make sure he was aware of our mask policy and what was being provided by the policy document.

Make sure the passenger is spoken to about our mask policy.

## Synopsis

Flight Attendant reported a passenger was not compliant with face mask policy during flight.

## Narrative: 1

I cannot count how many times recently the pilots are not wearing masks. I was sitting up front for my flight to ZZZ when the flight deck came out of cockpit to find a seat. No one wearing a mask. One was but around his chin. I moved to a different Zone. Then additional pilots came on, no masks. It's either our policy or not. I do not feel it is my place as a FA to point this out to pilots. I know quite a few crews are getting sick. It makes me very uneasy to fly in these conditions. I have family members I return home to. This is not limited to pilots even though it's very prevalent. Some FAs will also take off masks when passengers leave. It is alarming and I feel a very unsafe workplace. We can't have 1/2 the workforce adhering to a serious policy regarding a pandemic and 1/2 not. The

precautions such as masks are only effective if there is 100% compliance. I do not want to wear a mask for hours, sometimes 20+, but I do.

[Cause is a] total disregard for policy and others safety.

Safety and security is either important to the company or not. My suggestion would be a no exceptions policy or we will continue to see a rise in sick flight crews.

## Synopsis

Flight Attendant reported concerns over pilots and flight attendants not adhering to company face mask policy.

## Narrative: 1

The mission was a short flight. Aircraft was level at 3,000 feet after initial climb when clearance was received to climb to 5,000 feet. I thought I heard 9,000 feet and both of us failed to confirm with each other due to short communication from person in jump seat. I began a rather aggressive climb to exit the turbulence and detected command bars moving downward as I passed 5,100 feet. I reduced power and returned to assigned altitude while verifying clearance. Aircraft reached 5,450 feet. Total time above 5,000 was approximately 8-10 seconds. No communication from ATC or action required.

Due to COVID-19 slowdown I had not flown in 4 weeks and my last flight before that was 5 weeks before that. Clearly flight discipline suffered from lack of recent experience and teamwork. I allowed a distraction to prevent me from completing an altitude readback with PNF and neither one of us performed the "1,000 feet to go" call prior to reaching assigned altitude.

## Synopsis

Corporate Captain reported an altitude deviation during climb and cited lack of flying as a contributing factor.

## Narrative: 1

On my turnover to the next shift I realized I had not applied an over-burn to the flight plan. I ran the numbers, contacted the crew and sent them the information as they were already airborne. I told my relief what I was doing.

Busy shift, during the shift we got the second notification in less than a week we were moving from our primary location to our contingency for COVID cleaning. This caused an interruption in flight planning...as I've got immune compromised relatives that I cannot see again until this is resolved. Plus maintenance over flight restrictions on flights...and late inbound flights that require monitoring as soon as they are airborne to fly fast since

they were not planned that way by the day shift. Also, multiple center closures were being announced during the shift...trying to determine if my flights were going to be affected was a concern.

I had the over-burn highlighted with a pink marker on my worksheet...I just got busy and failed to look at it again while trying to determine if we would be landing to the north or south. Sent the crew updated numbers with the burn applied and advised what happened.

## Synopsis

Dispatcher reported incorrect fuel burn numbers were given to a flight crew and cited workload, COVID related cleaning interruptions and ATC closures as contributing factors.

## Narrative: 1

Workload is starting to reach critical mass for the current staffing level. Between normal flights and adhoc; ZZZ desk had 31 flights load up with 15 to release (last week 30 flights with 15 to release). Many flights between the XA00-XB00 hour were sent under the allotted time as stated per the Manual due to the vast geographic area, reroute around storm, numerous domestic flights tagged at the end of international flights, last minute ATC Zero, and COVID cleaning. Other desks are also getting workload saturated due to charters and adhoc. Management was notified last week to evaluate staffing levels and workload.

Suggestions - 1) Increase staffing levels to account for the workload. 2) Keep current staffing level and send domestic legs to the Domestic desk.

## Synopsis

Dispatcher reported concerns with current staffing levels, especially when workload is increased due to weather divers, last minute ATC closures for sanitizing and international plus domestic re-routes.

## Narrative: 1

Flight Attendant (FA) A called the flight deck to advise Passenger X, seated in X5, was experiencing a skin irritation/allergy that may have been due to the cleaning solutions/disinfectant used on the aircraft interior. Passenger asked if Benadryl cream was available. A FA had a sealed hydrocortisone packet which was given to them by Operations, but to ensure proper action we requested a call into our medical partner to secure authorization going forward.

Captain initiated a Medical patch via Dispatch and relayed the passenger information and asked about best first aid, if any, to provide. Medical recommended Benadryl/Diphenhydramine which is available in the EMK. (Note, both an ampule as well as oral tablet forms of Benadryl are present in the EMK.) Medical felt that would address the passenger discomfort and requested further contact if the situation deteriorated.

While completing the Medical call, a passenger seated next to Passenger X offered some Benadryl hand cream which appeared to resolve the issue. As such no further action by our flight attendants was carried out other than filling out the medical report. The EMK was not opened nor were onboard medical professionals requested. During that process FA A learned the original name she provided the cockpit was erroneous as she assumed the person in seat X5 was the person listed in her PNR. Conversation with Passenger X revealed she was booked in X2 and moved and once notified the Captain relayed the updated name information to Dispatch for the reports.

Flight continued to ZZZ without further incident.

## Synopsis

Air Carrier Captain reported a passenger may have had an allergic reaction to the sanitizing agent used on the aircraft.

## Narrative: 1

I repeatedly asked Employee X to place his mask over his mouth and nose at least 10 times. Even the Lead Cleaner asked him to comply and he refused. The Captain came off the flight and asked him, he said he can't breathe with it on and still refused to cover his mouth and nose. Then he put it somewhat over his mouth, but would not cover his nose. He totally ignored his Lead Supervisor and both myself and the Captain.

## Synopsis

Flight Attendant reported an aircraft cleaner employee would not comply with face mask policy.

### Narrative: 1

Uniformed crew member was reminded by both flight attendants multiple times to comply with our mask policy and keep her mask over both her nose and mouth. At one point FA B walked by her and reminded her politely to wear her mask, it was off at this point, and the employee responded "clearly I'm drinking this water, thank you." Unfortunately the passenger was not drinking water when she was reminded or else FA B would have not said anything to her.

The employee was given a warning at this point, after both FAs reminded her at least one more time. Totalling 6 times she was kindly reminded. The Flight Deck was notified after the warning was given and the passenger complied after the warning was given.

### Narrative: 2

A uniformed flight crew passenger would not comply with our company mask policy for either FA's. We both asked her three times to comply with our mask policy. And our next step was to check one last time to see without asking her again if she complied on her own, and she had not. We then issued her a warning, a fresh mask and ask if she had any more questions or excuses. Then she complied the rest of the flight.

## Narrative: 1

We swapped airplanes, and during cabin prep for pre-departure I noticed that the R1 door was still armed. I never touched it prior except to pre-flight the slide gage. I immediately dis-armed the door. I turned off the music, and the L1 door had just been closed. We were waiting for them to move the jetway back. As soon as they did that I made the PA to arm doors, cross check and stand by for call. I armed L1 and re-armed R1. I called my FA partner and told her forward doors armed and cross checked. She said aft doors armed and cross checked. I told the Captain cabin secure. After the safety demo I told the FA that the R1 was armed when we got on the plane but didn't notice it until I turned off the music. She said she had seen that before. It made me nervous as to why the last crew did not disarm it. I told the Captain on taxi out that it was armed, I disarmed it and rearmed it when we were supposed to arm it. I asked if there could be a reason why it was never disarmed? The Captain said he would call me during cruise to discuss it. My FA partner lectured me because it was not important to tell the Captain and that it was not a live door. I told her I had been on leave for 7 months, and just wanted to verify that it was OK. The Captain called during cruise. We discussed the door. I told him I noticed it was armed still and had never previously touched it. So it must have never been disarmed from the last crew. I disarmed it, and then rearmed it. He said does it look normal to you? I said yes. He said the door should be fine. He didn't have any other indications of an abnormal condition. He even came out for a lavatory break and I showed him. He said it was fine and to not worry. We landed, and parked, I disarmed R1, and all was fine with the door. The Captain appreciated that I was concerned and informed him. He said it was good to verify.

Make sure that crews follow dis-arming procedure. Stop distractions. Make it a pre-flight item to make sure it was disarmed.

## Narrative: 1

Passenger originally assigned seat X1 boarded via a wheelchair. Once she was at the top of the ramp it was discovered she cannot walk on her own. She sat in heavy rain for

several minutes while the assisting agent ordered an aisle chair. Due to the rain, her daughter, who was originally seated in X3, picked her up and helped her on board. The Ground Service Agent also assisted and I did as well once she was inside the plane. Because she was completely unable to walk on her own, shaking and extremely unsteady, I advised her to take seat Y3 as it was the most accessible to her immediate seating need. I did not move her. Once she was seated, and with her daughter's permission, I opened the blanket bag and covered her. I also moved her daughter to be near her. I did not follow our company policy to keep seat Y3 unoccupied due to COVID.

## Synopsis

Air Carrier Flight Attendant reported not following COVID-19 seat policy in order to assist a passenger.

## Narrative: 1

During boarding a guest arrived with what appeared to be a vented mask. As I initiated a conversation I received a frustrated response that he had traveled with the mask often. He had taped the valves shut and said there had been no prior issues.

Acknowledging his concerns and actions he had taken with his mask, I referenced our face mask policy and the absence of any guidance on taping valves. I let the guest know I would return after consulting with other FAs and the Gate Agent.

FA B and I felt although the vents were noted the valves were not referenced in the policy. Gate informed us they would be happy to have a conversation about this with the guest and would bring a disposable mask on board. I elected to document the event and inform the guest he may be directed to take a different mask in the future.

Please follow up with proper guidance to the flight crew and guest.

## Synopsis

Air Carrier Flight Attendant reported a passenger was using a face mask with vents. The passenger had taped over the vents and Flight Attendant stated policy did not specifically address the taping of the vents.

## Narrative: 1

I was shutting the cockpit door and coming back to the galley and a ceiling panel fell down on the back of my head and neck. I called the Captain to let him know what happened. We returned to the gate, so that maintenance could fix it.

We've had lots of panels falling from this aircraft and this aircraft came from the desert and was put into service.

## Narrative: 2

We were pushing back and flight attendants called to say a panel fell from row XX. I called the cockpit to let them know and the pilot asked if I could close it. I went to the back to try but couldn't. The pilot asked if I had any tape to close it and I said the only tape I had was in the Flight Attendant kit which was a blue sticker that I could use. So I taped it up, but it fell during landing. We also had another panel fall and hit a passenger in the head. We had a Supervisor come meet the flight to talk to the passenger. Row XX1 had a panel down during our pre-flight check and we called for mechanics to come fix it. This plane just came out of the desert and was put into service. The aircraft also just came from the hangar.

## Synopsis

Air Carrier flight attendants reported a few ceiling panels fell and hit a flight attendant and a passenger. Flight attendants stated the aircraft had been parked in the desert.

## Narrative: 1

I looked at the short term due list just as I got a flight request within minutes of starting my shift. Seen that the power check was over 4 hours out. I looked at this on the computer screen and didn't print out a new copy like I do every day at the start of my shift. Just after our second flight we got a call that our crew from the last shift was COVID-19 Positive. I got the third flight just after this for another team and was trying to figure out if I was at risk and what about the team. Do I go, don't go. Put on all PPE or just a mask. I just forgot about the power check getting close with the two flights in the bag and looking at a long trip. After the last flight I was XX minutes over the engine power check.

After XX years, of this type of flying, this is my first time over flying inspection. Only as good as your last flight. I always print out my fresh list at the start of my shift. I didn't stop and take the time to print off a new one. Looking at the list on the screen is not as good, it's hard to read and easy to miss things. If doing lots of flights make sure you go back and recheck the list and times. I forgot about the inspection and didn't recheck my numbers. Don't rush when you get a call, things get missed or forgot. Print out your lists every time don't just read off the computer screen. Use a hi-lighter marker to mark things getting close. 3-5 hours out from due time is the time to call your maintenance department on the phone and start working a plan.

## Synopsis

Helicopter Captain reported flying with an overdue engine power check inspection. Reporter cited being distracted after being informed that the crew from the previous shift was COVID-19 positive.

## Narrative: 1

I flew into the boundary and landed with a patient during a TFR without notifying ZZZ TRACON of my departure or route. I was fully aware of the TFR. I read the NOTAM. I had the phone number for ZZZ TRACON on speed dial. I received the notification for the flight via phone and text. The extenuating circumstance that I let allow me to lose situational awareness was when the office told me that this patient was COVID positive. I started concerning myself with securing the proper PPE and the steps necessary to complete the flight. I missed a crucial step of notifying TRACON.

I have been thinking about this since the moment that I was notified. I have flown during many TFRs. On a personal level what I can do is take the time and create printed reminders all around the office. I had briefed the crew to help, however; they were fairly new and were concerned with critical patient care. It is of course my responsibility to make sure all steps are completed before, during and after the flight.

## Synopsis

Helicopter Captain reported getting distracted and losing situational awareness resulting in a TFR incursion.

## Narrative: 1

Departing ZZZ the pilot flying rotated to about 12 degrees. The aircraft was relatively lightly loaded. During the climb below acceleration height the airspeed increased (possibly due to being lightly loaded and current winds). I told the pilot flying to increase pitch, but the airspeed reached around 165 (possibly 166) for around 1 second. The airspeed stayed well below the AFM flaps 15 limit. I contacted the company for clarification on whether or not this required a logbook entry and was advised that this did not require an entry. This was the last leg of the trip that night after sitting around for several hours. I should have been more proactive in identifying the airspeed trend increase and brought it to the PF's attention sooner.

Being more proactive in identifying the airspeed trend would have allowed me to bring it to the PF's attention sooner.

## Synopsis

Air Carrier First Officer reported a flap over-speed due to a rapid climb rate, resulting from a light passenger load.

## Narrative: 1

Climbing out of ZZZ to FL380. Being very light and a slight wind shift, we went through FL370 at about 3,000 FPM. It went to altitude alert almost immediately before I could use vertical speed to arrest the rate. ATC gave us traffic at FL390 that we had in sight for a minute or so. The TCAS gave us the caution traffic then immediately a RA of level off. We leveled off at FL380 and traffic was at FL390.

With our very light loads arresting climb rate needs to happen before a thousand feet.

## Synopsis

Air Carrier Captain reported an altitude overshoot resulting in an RA. The Captain stated the aircraft was very light in weight, which contributed to the event.

## Narrative: 1

While the FO was flying the RNAV RNP Y approach to the runway at ZZZ with the Tower out of operation, we were cleared for the approach by ZZZ Approach following the report from the previous aircraft that they were clear and canceling IFR. We were then told to switch over to CTAF frequency. Upon making my first report on CTAF, and in the vicinity of ZZZZ [Intersection], we got a TCAS traffic alert. Neither the FO, nor I were able to locate the traffic, we then got an RA to reduce our decent rate. We complied with the RA and the TCAS advised us that we were clear of conflict. It appeared that we were within 100 feet of what turned out to be a helicopter that was beneath us. The remainder of the approach and landing were normal. Upon landing we reported to ZZZ Approach that we had gotten an RA on approach. We also talked to the helicopter and he said he had us on TCAS. I think that meant he had gotten an RA also.

Tower being closed when it was supposed to be open is a cause for this event. ZZZ Approach not advising about traffic in the area when cleared for the approach is a contributor. The helicopter flying through an approach corridor when active approaches are going on is a contributor.

Why is the Tower not operating at XA:00 at night?? Why are we flying to places that don't have an operating Tower? Why didn't ZZZ Approach know anything about the helicopter?

What was the helicopter doing in that area? We were one of several aircraft in a line for that very same approach and were exactly where we were supposed to be when we got the RA. To think we were 100 feet away from a major aircraft incident doesn't set well with me. The ZZZ approach and landing is challenging enough with terrain, nighttime etc. We are a large commercial airline operation. We are not some small aircraft out for a weekend joy ride at our local FBO. We need to have all the available tools working for us. We shouldn't have to be making calls on CTAF, figuring out our own traffic separation, clicking the mic to get the runway lights to come on etc., etc.

## Narrative: 2

RA on approach. While flying the RNAV RNP Y Runway XXL, in night VFR conditions, received an RA in the vicinity of ZZZZZ [Intersection].

Approach control cleared the flight to fly the approach lateral path, but maintain altitude, ATC provided step downs to keep us on profile while awaiting IFR cancellation from preceding aircraft.

Received approach clearance in the vicinity of ZZZZZ1, advised by Approach Control to switch to CTAF. CA was pilot monitoring and made position report on CTAF.

Shortly thereafter, received TCAS traffic advisory. Observed, unknown and unreported traffic on TCAS display. Both pilots searched visually for traffic outside. If I remember corrected target disappeared from TCAS display momentarily, then reappeared.

While searching visually for traffic, received a TCAS RA and pitch command to reduce descent. Disconnected autopilot and followed command. Continued to search for traffic visually. Received clear of conflict advisory from TCAS. Observed subject traffic now displaying on TCAS behind and above. Continued descending on approach and monitoring TCAS display. Horizontal and vertical separation from traffic continued to increase. Continued on approach and landing profile. Landed without incident.

While clearing runway I noticed an aircraft flying approximately parallel to Runway XXL off airport. Contacted traffic on CTAF as I suspected it was the aircraft we received RA for. Aircraft identified itself as helicopter and indicated he had us in sight. I continued to announce on CTAF until we were on ramp. When cancelling IFR with approach control on ground, advised controller we had received an RA for traffic.

## Synopsis

Air Carrier flight crew reported an RA while on approach. The Captain reported the Tower at this location was closed earlier than expected and this contributed to the event.

## Narrative: 1

Vectored off of ZZZZZ 4 STAR and directed to descend to 5,000 feet and proceed direct to ZZZZZ and intercept the Runway XXL LOC. Loaded ZZZZZ in FMS, selected LNAV and armed LOC. While on a roughly southwest heading and proceeding direct to ZZZZZ in LNAV/VNAV, but still well east of Runway XXL we experienced a false LOC capture and the AFDS turned the aircraft to a heading of 176 degrees. Disconnected AFDS and de-armed the LOC and then used HDG Select to turn back to ZZZZZ. While in the process of turning back to ZZZZZ, Approach Control called us and said "Flight AAAB I need you direct to ZZZZZ, turn right heading XXX." We proceeded direct to ZZZZZ and landed uneventfully.

PF and PM both recently returned to flying after long layoffs and that may have contributed. I knew for sure not to arm the Approach (APP) mode too early due to the aircraft either climbing to join the glide slope or descending on the glide slope before being established on the localizer, and was aware of the possibility of false localizer capture, but had never experienced a false LOC capture before.

Using LNAV to intercept the LOC is a normal procedure, but possibly don't arm not only the APP mode, but also the LOC until within a few degrees of the ILS final approach course. However this procedure could cause its own set of problems/conflicts by setting you up for flying through the LOC if you forget to arm the LOC.

## Narrative: 2

We were assigned 5,000 feet, and given direct to ZZZZZ with instructions to join the localizer for [Runway] XXL there. Captain selected ZZZZZ and we proceeded direct in LNAV mode. He also armed LOC. About 8-10 miles northeast of ZZZZZ the aircraft falsely captured the localizer and began a turn south. Captain tried to select heading mode, but it initially would not select due to the false LOC capture. When we realized what happened, he deselected the LOC mode and began our turn back to ZZZZZ. About halfway through

the turn back, ATC called and said he needed us direct ZZZZZ. We informed him we were in the turn, proceeded to ZZZZZ, and completed the approach without incident.

The main cause was the premature capture of the localizer. I have not seen the aircraft do this before, and don't recall a warning or admonishment that it may. I don't plan on selecting LOC until closer to the intercept fix from now on, but I still don't believe this to be a crew error except that a slightly more timely response to the errant capture probably could have happened. The delay in response may have been quicker with a bit more recency of experience as both the Captain and I had recently returned from months long absences.

Delaying LOC arming until closer to intercept is what I plan to do, though I don't think that is a perfect solution. I will study my manuals to try to determine why it happened, and a closer monitoring of the system should catch the fault earlier in the errant turn.

## Synopsis

Air Carrier flight crew reported a false localizer capture, they were slow to react to the event and a track deviation occurred. The pilots stated an extended period of time off was a factor in their reaction time.

## Narrative: 1

On date at XA: 15L, ZZZ went ATC Zero for COVID cleaning.

There are NO procedures in place to assist controllers to properly close the sectors. Coordination was/is left up to the controller's judgment. Should controllers really be "shooting from the hip" and guessing how to handle an event of this magnitude?

Controllers are being instructed (and audited for proper usage) to use position relief checklist EVERYTIME we're relieved, R-R, D-R, D-D, R-D, but we are left to make up how we walk away from the scope with AIRCRAFT STILL FLYING within the sector.

We were at the tail end of the busy morning departure push. Aircraft were still in the sector and we were instructed to "put the aircraft on non-radar routings" and TERMINATE RADAR SERVICE to IFR aircraft and leave the control room!

IFR aircraft were still departing ZZZ1 at XA: 15L!

Why wasn't the airspace sterilized FIRST before controllers were instructed to shut the sectors down?!?

Instructing aircraft flying IFR, "Radar service terminated, frequency change approved" does not seem morally right. We're not trained on Oceanic procedures if that's what we were trying to use. How do these aircraft know which frequencies to change too? How is it legal to allow IFR aircraft to just penetrate adjacent centers without coordination and/or flight plan information?

What good are "non-radar" routings if no one is insuring separation will exist? For example, three sectors, 31, 28 and 46 are all routing an airplane at FL340 to fix XYZ. Did anyone know about anyone else's traffic, no. How is that SAFE or ORDERLY? How is that PREVENTING a COLLISION?

Procedures must be developed for this.

FAAO 7110.65 2-1-1 para a and b was not adhered to!

"The primary purpose of the ATC system is to prevent a collision involving aircraft operating in the system."

"In addition to its primary purpose, the ATC system also provides a safe, orderly, and expeditious flow of air traffic."

Checklist and procedures must be developed!

Why aren't we using our Facility Contingency plans?

Why isn't traffic stopped from entering ZZZ airspace if they can't exit ZZZ airspace before we go ATC zero?

The following are a few suggestion that MUST be included:

- STOP departures from tower and approach controlled airspace at a time that will allow the aircraft to exit ZZZ (Center) airspace while they're still be radar monitored by center controllers.
- Have a cut off where adjacent facilities reroute traffic around ZZZ.
- Planes should NOT still be in ZZZ airspace while on an IFR flight plan at FL300, FL350, etc, when we leave the control room.

Narrative: 2

At XA: 15L ZZZ was to enter an ATC zero status due to positive COVID-19 cases in the building and the need for a cleaning crew to sterilize the affected areas. At approximately XA: 00:00L, the controller I was working with notified the watch desk that we would still have aircraft in our airspace at the time the facility's ATC zero was to begin. The two supervisors walked down to the area and told us to explain the situation to the aircraft and, when the time came, terminate their radar services, flash them to the next appropriate facility and provide a time/mileage for the aircraft to switch to the next facility frequency. My sector, at the time of ATC zero, only had 1 aircraft in in. The aircraft was in level flight at FL210 direct to ZZZ2. I explained the situation to the pilot who understood and told him, when the time came, to contact ZZZ1 100 miles from ZZZ2. I called to coordinate this with ZZZ1's low altitude sector who understood and acknowledged the plan. At 0515L, I told the pilot his radar services were terminated, started flashing the a/c's datablock to ZZZ1 and told the pilot to contact ZZZ1 at the previously coordinated mileage. The operations manager walked down to the area to ensure we terminated radar and got rid of any airplanes we could. I then made a blanket statement on frequency that ZZZ was now ATC zero.

I think there could have been better planning/Implementation of ATC zero. I also think we should have waited to sterilize the airspace instead of leaving multiple aircraft in ZZZ airspace in class A airspace flying along without ATC services. Had an event occurred, there was no one here to even monitor the airspace.

Synopsis

ATC Controllers reported after "ATC Zero" was enacted in their building there were no procedures to assist controllers to safely close sectors.

Narrative: 1

Several times during my flight I had to inform customer about the company face covering policy. During boarding I informed customer about company face covering policy. After the beverage service while I was picking up used service items I told passenger that his mask needed to cover his nose as well as his mouth. During my cabin security walk throughs, I reminded the passenger about the face covering policy. During seat belt compliance checks I also had to remind customer about company face covering policy. I consulted a member of my crew. The A Flight Attendant was informed and the Captain notified. The Captain made a PA announcement. Then the customer was given a warning. The flight continued with no further incident.

## Synopsis

Flight Attendant reported a passenger would not comply with face mask policy during flight.

## Narrative: 1

We checked in and the agent let us onto the airplane. I asked if the plane had been cleaned and sprayed and he said he didn't know. I asked if he would check for us due to COVID protection and the company's cleaning procedures. He came back down and told us that, no it had not. He said ZZZ only has 4 sprayers and they are all broken so there is no

spraying of disinfectant. I feel this is a safety issue not just for flight attendants, but also passengers. We make mandatory announcements telling passengers that our planes are cleaned after every flight and we spray disinfectant and that is not the case. How long and how many planes are not being done in ZZZ? At a time when COVID is at an all time high I feel this needs to be addressed.

## Synopsis

Flight Attendant reported concern regarding the station's lack of aircraft sanitizing procedures.

## Narrative: 1

My crew and I boarded the flight in ZZZZ bound for ZZZ. While we were in engaged in pre-flight duties in the cockpit, our in-flight crew boarded sometime after us. While my flying FO and I were in our seats, the A Flight Attendant came to the cockpit door to inform us of what he has just been told by ZZZZ customer service reps. He proceeded to tell us that XX passengers on their inbound flight the previous night, tested positive upon arrival in ZZZZ for COVID-19 and that at least a couple have already been admitted to the hospital for their symptoms. This conversation took place just before the boarding of passengers was about to begin. We decided to halt any boarding of passengers and asked the A FA and the rest of the inflight crew to stand back and remain clear the area around the cockpit and await a briefing after we spoke with the company.

I preceded to conference in our Dispatcher and Duty Pilot on a Satcom call from the cockpit. While we discussed our options, the A FA was on a phone call with his in-flight duty manager. After much discussion with the Duty Officer and my crew, we decided that our risk of exposure was low. We all agreed that we would be able to operate flight to ZZZ with our inflight crew and two deadheads with the restriction of them remaining out of the forward part of the airplane during the flight.

Here are some highlights of things that we learned during this process. 1. A message was sent to our company security by ZZZZ station operations. 2. This message triggered a zero response to ZZZZ station, inflight and flight operations. 3. A group of COVID positive passengers were able to board a company flight. 4. If ZZZZ customer service had not mentioned to our inflight crew what had happened to their inbound flight, we would potentially have had a bigger problem.

I also want to highlight that once the problem was discovered, ZZZZ station, Inflight, Duty Officer, Dispatch, and the Cockpit was able to formulate a plan to keep safety first, take care of our passengers, and get our inflight crew and aircraft home safely.

## Synopsis

Air carrier Captain reported that the cabin crew for the flight had been on an earlier flight that had passengers who had tested positive for COVID-19. Due to low exposure risk, it was decided the cabin crew could work the current flight.

## Narrative: 1

After landing on Runway XXR in ZZZ, upon clearing the runway we were told via ground to taxi north on Taxiway 1 and enter the ramp at Taxiway 2 for parking at the Gate X. I was the FO acting as an LCA. Both ZZZ ground and ZZZ X concourse ramp frequencies were completely saturated with traffic both inbound and outbound. Upon making the left 90 degree turn onto Taxiway 2, I noticed a rapidly approaching taxi light of an aircraft northbound on Taxiway 3. I immediately directed the Captain to stop and I also abruptly braked from the right seat. Aircraft Y continued to taxi right in front of us and then stopped short of Gate Y to give way to an outbound aircraft. We were never notified by Ground of a potential conflict or to give way to the northbound aircraft. We subsequently were cleared by ramp onto the ramp and to our gate. We missed the other aircraft by about 50 feet.

## Narrative: 2

Taxiing north on Taxiway 1 with a Taxiway 2 entry to ramp for the Gate X. Cleared Taxiway 2 to enter but not cleared to enter ramp. I made left turn on Taxiway 2 was prepared to stop at Spot XX. Captain was monitoring ground on VHF1 and Ramp on VHF2. I was only monitoring Ground on VHF1. I started the turn and was about to cross Taxiway 3 when LCA Captain in right seat yelled "STOP STOP STOP!" I applied immediate max braking and abruptly stopped the aircraft.

What I did not see was another taxiing aircraft from my left on Taxiway 3. I was given no radio call to give way to that traffic. My clearance was to the ramp. I do not know why I did not see the approaching aircraft. It was dark and their taxi light was not pointed at

me. Regardless, I should have seen it. We stopped and I would guess our nose was within 50 feet of their wingtip. I do not know if they saw us or not. No comment from Ground or ramp about what just transpired.

I will say that fatigue may have been an issue. This was an OE after a 6+ month break in flying and I was feeling some mental fatigue.

## Synopsis

Air carrier flight crew reported a ground conflict. The Captain stated fatigue and months without flying contributed to the event.

## Narrative: 1

During our preflight the Captain and I discussed how recently we had each flown. I had not flown for about 5 weeks and the Captain had just done landings class at training after not flying since March, as I recall. This was the Captain's first trip since then.

After takeoff, Captain was hand flying the airplane and I was performing PM duties. We were on the ZZZZZ2 departure and I had checked in with ZZZ Departure. They told us about a storm directly to our south that other flights were having to leave the departure route to avoid. ATC said we could continue to the west and turn to a 150 heading when able. After looking at the radar return I acknowledged the instruction and added we would have to go about another 10 miles west. ATC acknowledged and cleared us to climb to 12,000 feet.

I should also mention this was in a very compressed time line. Tower turned us over to Departure, I was doing the After Takeoff Check and making FMC modifications under the Captain's instructions, and checking in and talking with ATC. The plane was also very light, so we were climbing rapidly. I was interrupted three times while trying to read the After

Takeoff Checklist and I think we were nearly at 10,000 feet by the time I was able to accomplish the checklist. I guess, what I'm trying to say is, I felt that I was very busy, and surprisingly so. ZZZZZ can get busy, apparently even now, but the thunderstorm and the communication and coordination involved with that probably took us to task saturation.

After being cleared to 12,000, we got another frequency change and ATC cleared us to 14,000 feet. I set it in the MCP and saw the flight director was still in LNAV and commanding a left turn. I asked if Captain wanted HDG SEL and Captain did which I accomplished. ATC then asked us about the turn to the south and I answered we still were going to have to go further west, but the tops were lowering and I thought the turn could be made soon. ATC then amended our cleared altitude to 12,000 feet again.

I reset the MCP again and got acknowledgment from the Captain. ATC then cleared us to go direct to ZZZZZ1 when we were able. I put it in the FMC to see how the course looked compared to the radar return. I looked out the window to see how the tops were looking. I heard the altitude alert chime then looked at our altimeter and saw we were climbing through 12,000 feet. I immediately exclaimed we were cleared to 12,000 feet and I think the Captain swore and immediately reversed the climb.

ATC then informed us we were cleared to 12,000 feet. I re-acknowledged the altitude clearance and we descended back to 12,000 feet. I don't think we got above 12,600 feet.

I wish I could remember when we were re-cleared to 12,000 feet, because I don't remember hearing the approaching altitude alert chime. I think the altitude may have been above 11,000 feet so we were already within the 900 foot alert window. When the chime did sound, I thought it was the 900 feet to go, but it was really the 300 foot off warning.

## Narrative: 2

We were on the departure and had been told to maintain a heading due to weather. Altitude clearance was to 14,000 feet. A series of instructions came regarding weather deviations, cleared to a fix when able, etc. Somewhere in here our altitude clearance was modified to 12,000 feet. We were discussing our strategy with regards to getting back on course when the FO realized and announced I had passed 12,000 feet and was at 12,400 feet. I still had 14,000 feet in my mind as our clearance limit. Neither of us remembers an altitude warning horn sounding as we passed 11,000 feet. We both felt task saturated at the time. Neither pilot has been actively flying over the past several months, and currency/recency of experience was absolutely a contributing factor.

## Synopsis

Air carrier flight crew reported a track and altitude deviation during departure. Flight crew cited task saturation and lack of flying were contributing factors.

## Narrative: 1

After we started our taxi, we got a call from the Lead Flight Attendant (FA) that a passenger's two year old child was refusing to wear his mask. They stated that the child's

Dad was very upset, and had some choice words about the situation. They also said they tried multiple times to get the child to wear the mask, but he refused. We made a decision to return to the gate and requested a Customer Service Agent meet us. After we return to the gate, the FA and Customer Service Agent talked to the Dad. They said he apologized, and that the child was finally wearing his mask. I asked the FAs if they were okay with leaving with the Dad and his child, they said yes. We pushed off the gate and continued to our destination without any further incident.

## Synopsis

Air carrier Captain reported returning to gate because a child passenger would not conform to face mask policy and the passenger's father was confrontational with the flight attendants.

## Narrative: 1

The First Officer briefed the ZZZZZ SID Runway XXL, which has the same initial altitude then a turn to ZZZZZ1, as is listed for Runway XY. As we performed the Before Push Checklist we became distracted during the runway response by the confirmation of receiving Report X. As we began the climb, we then noticed that the FMC was setup for XXL. As we passed 5,XXX feet, the FMC sequenced to turn direct ZZZZZ1, which was the same flight path for a Runway XY departure for the ZZZZZ SID, therefore no flight path deviation occurred.

## Narrative: 2

During loading of the FMC route the runway was initially loaded as XXL, after verifying with the Ramp that Runway XY was the intended departure runway for the ZZZZZ SID, I began to update the FMC. At that time the FA informed me of an issue that required the Ops Agent; therefore, distracting me from completing the runway change. When I returned, in my mind I had completed the runway change. I briefed the departure and we did not catch the error as the altitude of the turn coded in the FMC, and all the waypoints are identical for the two runways.

As we performed the Before Push Checklist we were also distracted during the runway response by the confirmation of receiving Report X. We taxied out single engine and my focus was on starting the #2 engine. As we approached the end of Taxiway G we were cleared for takeoff. As we began the initial climb, I noticed that the FMC was setup for XXL. As we passed 5,XXX feet, the FMC sequenced to turn direct ZZZZZ1, which was actually the intended flight path for a Runway XY departure for the ZZZZZ SID, therefore no lateral flight path deviation occurred. Some additional external factors involved that led to additional distractions are the possibilities of furloughs related to COVID-19.

## Synopsis

Air Carrier flight crew reported loading the incorrect departure runway in the FMS but no track deviation occurred due to the flight path being the same. The First Officer reported distraction and COVID-19 job related concerns contributed to the event.

## Narrative: 1

I accepted a flight request for a patient transfer flight to ZZZ. I completed my preflight planning which included a review of possible sporting event TFRs on my route of flight, I saw none.

I departed from our base and flew to the hospital. We then loaded the patient and we departed for ZZZ. I began my descent from cruise down to approximately 500 feet AGL while about 5 miles from the hospital, we landed on top of the hospital without incident.

We were at the hospital for about 35 minutes, and I then began my flight planning for the leg home. I opened my FOREFLIGHT app to double check Weather on my phone and immediately saw that we were inside a TFR. It said the TFR was active although it listed a "Warning," "that the start time for this event could not be determined." It was a TFR for a sporting event. I am unsure whether or not this TFR was Active when we entered the Vicinity of ZZZ and landed at the hospital. I also began to wonder why No information on my G500 or G650 with TFR warnings (turned On) had Not activated. I turned my avionics On while on the roof and again there was NO red circle or any indication of a TFR being displayed.

I called ZZZ Controllers and told them I was located on top of at ZZZ Hospital roof as a medical helicopter and am requesting clearance to depart the TFR with a squawk code back enroute to ZZZ1. The Controller gave me a squawk code and said I could depart at any time and simply squawk 1200 when I was well clear of the TFR. I programmed my transponder with the code and we departed ZZZ back to ZZZ1.

Later the same day we had another flight request back to the hospital in ZZZ, I contacted ZZZ Controllers and was again given a squawk code, we entered and exited the TFR without incident. It is also noteworthy that when I departed the hospital for the second time that the TFR was showing ACTIVE on FOREFLIGHT and ZZZ1 Controllers said it was no longer active. And again, no indication of a TFR on my G500 or G650.

In the future I will be more diligent during my preflight planning and multiple Legs and stops to check Multiple sources to confirm if a TFR is on my route of Flight. I also think with COVID-19 game day schedules are more fluid and subject to change and this has made the preflight planning more challenging in determining whether or not a TFR is active or not.

## Synopsis

Helicopter Pilot reported a possible sporting event TFR violation. Pilot states the times of these active TFRs appear to change with little notice because COVID-19 is causing many changes to event schedules.

## Narrative: 1

I arrived at the airport before dawn with my copilot, an equally qualified ATP, for a planned departure around sunrise from an uncontrolled field overlaid by Class G airspace. The flight involved carrying a group of passengers on a transcontinental itinerary, with two short stops. Knowing the morning surface temps were likely to be at or near freezing, with potential for frost, we had arranged for the aircraft to be hangared for the night and to be pulled out around the time we intended to arrive. We had anticipated clear skies, based on the available forecasts.

On arrival at the airport we discovered the upper surfaces of the wings were covered in frozen droplets. The line crew explained that a rain shower had blown through before they put the aircraft in the hangar the previous evening, and that the wings were still wet when they towed it out in the am. Unfortunately, they had pulled it out a little earlier than arranged, which had given the water time to freeze. The temp reported by the AWOS at that time was -XC. Another unanticipated factor was a low broken cloud layer instead of clear skies. I asked the line crew to put the plane back in the hangar and called the passengers and informed them there would be a delay.

Once the drops had melted we dried the surfaces with towels, then called the passengers to come to the airport. With passengers onboard I started the engine, began the taxi, and had the copilot call the clearance. Clearance informed us there would be several minutes delay due to traffic departing a nearby field. The delay turned into 20 minutes and as we sat at the hold line a fog settled in, restricting surface visibility to around 1/4 mile. The OAT read minus 1. Given the restricted visibility and potential surface icing conditions we decided it was unwise to depart, even though we suspected the fog layer was only a few hundred feet thick. I went aft and explained the situation to the passengers, then taxied back to the ramp. By this time we were already almost two hours' delayed.

The fog persisted another 90 minutes or so, during which time the passengers grew increasingly anxious about the prospect of having to postpone the trip to the following day. We had learned that morning of an impending inter-state COVID quarantine rule change with potentially very negative consequences for us in the event of further delay. All this put us under considerable pressure to depart.

The fog eventually lifted into low clouds, and we noticed an area of blue sky appear off the

departure end of the runway. Surrounding fields were reporting clear skies. The AWOS at our departure field was reporting 400 feet overcast and 6 miles visibility. Under normal circumstances I would have elected to depart IFR. However, faced with the already considerable delay and irritated passengers I made a quick decision to depart VFR, anticipating that we could maintain class G cloud clearance requirements in the initial climb and would be beyond the area of low clouds over the field by the time we were entered Class E airspace. I was highly familiar with the terrain in the area, having landed at the field several times in the preceding week and noted no local traffic on TCAS or the CTAF.

In the initial climb, however, I discovered I had misjudged the cloud coverage off the departure end, and was felt the safest route was to climb into IMC instead of stay below the deck. We ended up IMC as we entered Class E airspace, only clearing the tops around 1,000 AGL, in violation of FAR 91.155.

After departure I asked my copilot to pick up our IFR clearance with the Local Controller. He then informed me that he had actually activated a hold for release clearance with clearance before departure while I had been outside the airplane informing the passengers that we were ready to board. While a hold for release clearance does not prohibit a VFR departure, the AIM does state that the hold for release should be canceled before a VFR departure.

In hindsight it is clear to me I should have handled the situation differently. I should have resisted the pressure to get wheels up quickly, and remained on the ground until either an IFR departure clearance could be obtained from clearance, or the weather had lifted to the point I could be absolutely certain a VMC departure and climbout could be made. My rushed decision making and hasty conduct of the takeoff resulted in poor judgment and a lapse in good CRM.

## Synopsis

Corporate Captain reported poor judgment resulted in flying VFR into IMC. Captain reported outside pressures to depart contributed to the event.

## Narrative: 1

Passenger assigned to [seat] XX1 or XX2; sat in XX2. He requested several times to switch seats to the AFT FA for social distancing. During our briefing with the Gate, we witnessed her inform all passengers that our aircraft was at capacity in terms of social distancing and offered passengers to travel on a later flight. The Agent also called passengers up one by one and spoke to each passenger regarding their seat assignments. We had several passengers during our flight complain regarding our capacity. The specific passenger asked the AFT FA several times and she apologized and offered him to speak to the Gate Agent, he declined. After we completed our safety demo the passenger got buckled up and stretched completely out in YY3/4. The AFT FA asked me to follow up with this passenger and I spoke to him apologizing, stating that row YY was blocked to allow social distancing for the FA's. He was very curt and rude when asked to return to his assigned seat for safety. I also explained that we were actively taxiing to the runway and that it is a federal regulation to [not] move around the cabin at this time. I notified the Captain that reassured me that I handled it properly. He was also aware that we were over capacity in terms of social distancing and told passengers that he would get them as quickly and safely as possible to their destinations during his welcome announcement at the gate. He asked me to document. The passenger requested my name as he exited the aircraft.

Several passengers were dissatisfied regarding social distancing on the aircraft.

## Synopsis

Air Carrier Flight Attendant reported the flight was over capacity per social distancing policy and reported one passenger was uncooperative regarding social distancing during the flight.

## Narrative: 1

While on the ZZZZZ4 [arrival], approaching ZZZZZ we were given a vector to the North. We were asked if we had the river in sight, which we responded, "Yes." We were cleared the ZZZZZ visual to Runway XX. CA wanted to cross ZZZZZ1 at 3,000 feet, so CA selected Flt Lvl Chg and proceeded down. Upon reaching the fix, CA failed to re-select VNAV as we commenced the approach. LNAV was selected and we were tracking correctly. Between ZZZZZ2 and ZZZZZ3, CA realized we were too low. CA saw the "1,700" at ZZZZZ3; we were at approximately 1,100 feet. CA clicked off the auto pilot and leveled the aircraft at 1,000 feet. We were given a "low Altitude" alert from the Tower. We maintained our altitude and tracked the approach. We landed without any further incident. We were below the charted altitudes at ZZZZZ3 and ZZZZZ4, possibly ZZZZZ5.

I believe currency was a significant factor. The CA had a total of 55 hours in the preceding 5+ months and the FO had just come back from 6 month leave.

Because this was an RNAV approach, briefing the importance of verifying both LNAV/VNAV on the FMA would have reminded both pilots to look for this upon the commencement of the approach.

## Narrative: 2

We were descending for the ZZZZZ Visual approach to [Runway] XX. We had the RNV-F approach selected in the FMS. Descending through approximately 5,000 feet ATC had given us a lower altitude so the Captain selected LVL CHG. A short time later ATC asked if we had the river in sight, we did, so we were cleared for the visual approach. We set our briefed minimums for the approach and continued our descent. However we had not gone back to VNAV and confirmed VNAV PATH. As we approached 1,000 feet we both realized we were too low. The Captain disengaged the autopilot. Stopped the descent until we were reestablished on the path. From there we continued the approach to landing.

This was my first leg back from a six month leave and the captain is on reserve and had not flown in two months. We had briefed before the flight that our biggest threat was our lack of recent flying. This proves that even when a threat is identified and discussed, it does not go away.

The company and [union] need to continue to stress as more of us return to work that observance to SOPs is vital to the priority of safety.

## Synopsis

Air carrier flight crew reported descending below charted altitudes while on approach and cited lack of recent flying as a contributing factor.

## Narrative: 1

Due to COVID and the closure of my domicile, I was on [reserve] lines since Month 2 or Month 3. I was then furloughed for Month 7 and recalled for Month 8. My last flight before all this started was on date in Month 1. My annual recurrent training was on dates in Month 4. My 90-day FAA currency expired on date in Month 7. In the first bid after my recall, I was awarded a line that included a trip beginning on date in Month 8. I contacted my union representative and discussed whether or not I was current. They showed me the company announcement that involved the XXX day currency extension if a pilot had XXX hours in the [aircraft type]. I [did not have enough] hours in the plane at that time, so I was not eligible. Over the next several days we stayed in touch and they continued to look into it for me. On date in Month 7, I contacted Crew Scheduling to inform them that I was not current and could not fly the trip on date in Month 8. They referred me to Person X to schedule my recurrent landings. Person X informed me that I was actually current and did not need additional landings due to the fact that "The FAA extended the landing currency and the hour requirement is being reduced." I asked for more information so that I could fully understand the legality of my currency, and they referred me to Person Y. Person Y explained to me that the company was using latest FAA exemption and that since my landing currency expired in Month 7, that exemption allowed me currency an extra grace month and that I could complete the necessary landings in Month 8.

With the report from the company, and after reading the exemption myself and satisfied that I did meet the FAA legal requirements, I proceeded to fly the trip starting on date in Month 8. I spoke again with my union representative and started to learn that the union was not fully aware of what exemptions the company was operating under or what policies were currently active. I informed them what I had learned and sent over the FAA exemptions I had read. I was again contacted by a different union representative who asked for more information about how my legality had been determined. It is at this time that it was brought to my attention that the company had not made public statements to the pilot group about what company policies were currently being used to determine legal currency requirements for pilots and that my case represented a change that had not previously been announced or made public. The suggestion was that while I may have been legally current per the FAA, I may not have been legally current under company policy. I am writing this report to bring attention to this confusing situation surrounding the safety policy of recency of experience.

My suggestion for this situation would be for the company to publicly announce exactly what policies and exemptions are being utilized at this time to better inform the pilots of what their legal requirements are, and to prevent safety issues from appearing due to policies that may or may not exist that are not publicly known.

## Synopsis

Air carrier First Officer reported confusion about being current under the company's policy as compared to the FAA currency exemptions.

## Narrative: 1

After pushing back from the gate from ZZZ on the way to ZZZ1, a STEERING INOP caution message appeared. I addressed the message with the QRH and the message cleared. I sent an ACARS message to maintenance telling them of the situation. They replied to call them when we completed the flight. During taxi out, while turning, the heading indicators on the PDFs momentarily disagreed and a caution message presented. The message cleared after 2 seconds and did not reoccur during the rest of the flight. There is a QRH procedure addressing that problem that I reviewed, but did not need to perform because the message was gone and the heading indications were matched and normal. Upon reaching ZZZ1, I called maintenance and wrote up the two discrepancies. Maintenance said that we should have called them on the phone in ZZZ where we have mechanics available. He said that a mechanic would probably have to do a road trip to come to ZZZ1. That could have cancelled our flight to ZZZ and caused inconvenience for all involved. After submitting the write ups, I felt stressed because of the situation. I did not know if there would be negative consequences and I thought back about everything I had done to consider what I should have done differently. After over an hour, I was contacted by Maintenance and told that a contract mechanic was coming to the aircraft and that I should help him with the maintenance procedures by showing him where the cockpit switches were that would be checked. I met the mechanic and worked with him through the required procedures. By the time that was done, we were 20 minutes late. Then I was concerned about the passengers making connections and the other crew that also had connections to make in ZZZ. We rushed to board the passengers, complete the maintenance paperwork, and prepare for the flight. After pushing back from the gate, I noticed that we had forgot to turn on the cabin signs. This is a task for preflight and a checklist item on the Pre-Start Checklist. After I noticed the cabin signs were off, I turned on the cabin signs and commenced the taxi.

The cause of this event was distraction during preflight duties and rushing. The pressure that I felt to hurry up so that everyone's travel arrangements would not be ruined was a factor. I divided the preflight duties between myself and the other pilot. Normally I would have used a mnemonic device to remember the cabin signs, but I did not take the time to think of it. I relied too much on the checklist to catch mistakes. During the checklist, I was distracted so I did not identify that a checklist item was not completed. During this period, we are under heightened scrutiny for documenting mechanical irregularities. We are also under heightened pressure to depart and arrive on time due to industry competitiveness during the COVID-19 pandemic. The combination of these pressures has made maintenance issues and delays more stressful.

We already thoroughly debriefed this incident as a flight crew. I think that will help avoid that type of problem in the future. Taking the time to do the tasks and checklists during the preflight must be prioritized, so that mistakes are caught. Pressure to hurry should not be allowed to affect performance. During checklists, I should avoid complacency and distractions. I should be aware and focused on each checklist item. I should visually look at the associated area of the cockpit during the checklists. I usually do that, but during this event I did not.

## Synopsis

Air Carrier Captain reported company procedures were not followed during a mechanical irregularity. Captain stated outside issues, including pressure to maintain schedule, disrupted the normal flow of crew duties.

## Narrative: 1

Soon after departure from ZZZ, we were given a lower cruise altitude. All of these changes spanned the climb, cruise and descent segments, so PF accomplished numerous FMS program changes. Prior to ZZZZZ, we were given a vector for spacing - heading 290, I think - and subsequent descents and speed changes. At some point during the changes, PF lost track of things and turned toward ZZZZZ waypoint without clearance. ATC issued a turn back to heading 300. PM noticed the turn, but was in third leg since returning from five months leave, so did not intervene or call out the discrepancy as he, also, was not certain the turn was incorrect. Crew was subsequently cleared to ZZZZZ and to descend VIA ZZZZZ arrival and landed XXR without incident. I think even the Controller lost track of all of the instructions.

I attribute the error to task saturation, hunger and some dehydration. I was also a little distracted by some personal issues going on which I started to think about while we were waiting during flow control from ZZZ-ZZZ1. I think we will have lots of issues going forward as pilots come off of extended leaves of absence.

I should not have let myself get distracted and dehydrated.

## Synopsis

Air Carrier Captain reported a track deviation and cited task saturation, hunger and lack of flying as contributing factors.

## Narrative: 1

I was loading the front of the aircraft with the loader of a Widebody aircraft. While pallets were being loaded on the aircraft, I miscalculated the locks to be up on each pallet as to how I did it, which was in the front and rear. I have been on a leave of absence due to COVID, for three months and this was my first Widebody I have worked on since my return.

## Synopsis

Ramp Agent reported incorrectly operating the cargo loader and made reference to being off of work due to a leave of absence for COVID-19.

## Narrative: 1

While descending on the ZZZ1 arrival we were cleared to FL290. While passing FL300 ATC issued a pilot discretion descent clearance to 17,000 feet. My PNF waited to set 17,000 feet until the autopilot went into ALT CAP and began to capture FL290. Upon setting 17,000 feet I noticed the autopilot no longer holding FL290 and disconnected the autopilot and manually held altitude and then selected manual ALT to hold FL290. At that point the autopilot was forgotten to be reengaged, and the aircraft slowly climbed to almost 29,800 feet before the PF noticed it and manually initiated descent to 17,000 feet. ATC was notified of the correction and that we were beginning our discretion descent from current altitude to 17,000 feet. ATC did not say anything about the brief climb and only verified we were beginning our descent to cross ZZZZ [Intersection] at 17,000 feet.

Human factors of disconnecting the automation while correcting for the unanticipated non capture, manually setting ALT hold without resetting the ALT selector caused no bug to appear on the altitude tape and the action of selecting ALT hold caused the PF to be the live autopilot, holding altitude, although only the FD was since the autopilot had not been reengaged. Usually we would correct an autopilot behavior such as this while still engaged by resetting the ALT selector and using VS or Pitch mode, but that level of automation had been removed.

Problem was identified and quickly discussed and understood by the flight crew to ensure better communication and pilot automation interface in the future.

A likely contributing factor is lack of flying hours in the recent 6 months for both crewmembers due to the COVID-19 pandemic.

## Synopsis

Corporate Captain reported nonstandard procedures were used causing an attitude deviation. Captain stated lack of flying due to the COVID-19 pandemic was a contributing factor.

## Narrative: 1

The Captain had not flown in 5 months, and I am still relatively new to the airplane while only sporadically flying until this month. The bulletin for this issue was issued during a time that there were many outside factors affecting everyone's lives and then most of us did not fly very much. I feel that a bulletin as important as this should also be listed on the Approach Checklist to remind the crews.

On the arrival to ZZZ, we were cleared direct to the airport from over 100 nautical miles away. ZZZ approach then kept us higher than normal. The Captain as the pilot flying attempted to descend and configure with speed brakes. We were given a tight base turn and cleared for the visual to XXR. Once it was obvious that we would not be stable by 1,000 feet AGL, the Captain called for a go-around. As I was notifying ATC, he proceeded to push the thrust levers to TOGA and then return them to MCT. The airplane immediately began an aggressive pitch up from about 2 degrees to over 25 degrees in less than 3 seconds. It was at that point that I remembered the bulletin for this aircraft in regards to the CG being less than 30.0%. The Captain disconnected the autopilot and lowered the nose. We circled back for XXR and landed without event.

## Synopsis

Air Carrier First Officer reported an important CG related bulletin for this aircraft was issued during a period of time when many crew members were not flying, and contributed to an unstabilized approach.

## Narrative: 1

After receiving clearance from approach for visual approach Runway XXC, I was advised to stay with approach until ZZZZZ (Final approach fix) and then call Tower frequency. Landing checklist was completed, and we were stable at 1,000 feet. I was the Captain and pilot monitoring. The weather was day VFR -clear visibility and a crosswind wind gusting to 22 knots. After landing I realized that I forgot to switch the frequency to receive landing clearance. After clearing the runway, I contact tower and apologized. I was told by Tower that they gave me the green light as landing clearance.

I always try to verbalize my landing clearance as technique and check the landing lights/ turn off lights position as required. For some reason I didn't do it this time. I'm not sure if the frequency switch location in conjunction with landing check list procedures was the reason for forgetting to switch to Tower. I take full responsibility and will learn to pay better attention in the future.

## Narrative: 2

I was pilot flying in VFR conditions. The Approach Controller vectored us to join the final approach for [Runway] XXC between the course fix and final fix. He also cleared us for the approach and instructed us to contact Tower at the final fix. Upon capturing the localizer and as we intercepted the glideslope outside the final fix, I called for final flaps and landing checklist. We set the missed approach altitude and started down the glide slope. I used the autopilot until below 1,000 feet then hand flew the aircraft to landing in a crosswind. After landing, as we approached our anticipated exit from the runway, the Captain (pilot monitoring) queried ATC for exit/taxi instructions when we realized we had not switched to Tower or received a landing clearance. We immediately contacted Tower [and were told we] were cleared to land. We continued to parking without further incident. Traffic was light and weather was clear. Our actions did not disrupt any other operations/aircraft.

This was my first operational leg after having been off for a month. I was so focused on my flying duties and landing in a crosswind I forgot to confirm we had received landing clearance. Contacting Tower at the final fix is a very routine action, yet was overlooked/missed by all crew members in this situation. Not exactly sure why I failed to

confirm landing clearance except perhaps I was too fixated on the aviating and failed to communicate.

## Synopsis

Air Carrier flight crew reported they forgot to receive clearance to land. First Officer reported this was the first flight after an extended period of time off.

## Narrative: 1

The company requirement to use X type headsets is a safety issue. It exposes flight crew members to COVID-19. It also contributes to fatigue because these headsets do not have active noise reduction. Provide headset adapters on each aircraft, so personal headsets may be used. I'm sure most of the pilots would be willing to donate their adapters.

## Synopsis

Captain reported pilots are being exposed to COVID-19 because the company requires the use of specific headsets on the flight deck.

## Narrative: 1

While I was training on Local during the busiest session since returning to training as well as it being my trainer's first time training on local in more than 6 months the traffic volume was enough that required us to split Local and Ground. For most of the

year our airport had been on a straight runway configuration due to construction and we had only been back to 2 runway operations for about a week. We had Aircraft Z doing full stop taxi backs and Aircraft A doing stop and go's with afternoon push of arrivals and departures. I had cleared Aircraft Y to land on runway YY (IFR arrival) and Aircraft X was ready to go on runway XX (VFR departure). I asked Aircraft X if he needed time on the runway or if he was ready to go and the pilot replied that he was ready to go. When I cleared Aircraft X for takeoff the Aircraft Z was on 2.5 mile final and traffic was exchanged. After takeoff clearance I went back and told Aircraft X to clear for immediate takeoff and the pilot read it back. After 30 seconds the departing aircraft had not began its takeoff roll yet and my instructor told them to start roll now. At this time the arrival was at 1 mile final runway YY. When the arrival was at the threshold the departure had barely cleared the intersection due to the delay it made on the runway.

To prevent this situation I could have waited until the arrival had landed to clear the departure for takeoff. I relied on expectation bias that the departure was going to begin their takeoff roll immediately and not take time on the runway. I could have also told the Aircraft Y to reduce to final approach speed to create a bigger hole for the departure. Knowing when to slow down during busy sessions is also something that could have prevented this situation.

## Narrative: 2

(Training in progress on Local Control on one of the busier sessions seen by all in months. Trainer's first time training on LC in over 9 months)

Ground had been split off a couple minutes before due to increased traffic and proposed traffic. In addition to multiple arrivals and departures, there was Aircraft Z doing multiple take offs with full stop taxi backs, and Aircraft A doing stop & go's. Aircraft X taxied out for departure contacted tower holding short of Runway XX. Traffic was within a mile final for Runway XX so they were waiting to depart. Because there was another aircraft inbound to Runway YY that we were going to try to depart inside of, Local Trainee was instructed to ask Aircraft X if they would need time on the runway or if they would be ready to go-they said they would be ready. Once the Stop and Go traffic was rolling and we would have our separation, Aircraft X was cleared for takeoff and told about traffic on final for crossing runway. No hustle from aircraft. Trainee then told Aircraft X cleared for immediate takeoff. He still sat on the runway. Trainer keyed up and told Aircraft X to start their roll.

The runway separation was extremely close to call and in the moment the trainer decided that it was safer to let the arrival land than issue a go around and potentially cause an evasive maneuver at a critical stage of flight with another departure.

We should have just waited to clear Aircraft X for takeoff due to their tendency to be slow and spend time on the runway. Once they did not move with an immediate takeoff, take off clearance should have been canceled.

I do believe that traffic volume and complexity added and distracted the tower-team from checking every aspect of the situation (speeds, timing, rolling of aircraft), but I do not believe we should refrain from training on busy sessions like these.

## Synopsis

ATC Developmental and Instructor reported an aircraft that did not depart as anticipated with an arrival on final.

## Narrative: 1

Right before we start our landing service, Purser came to the AFT Galley and told us that a Supervisor will be meeting the flight and debrief us with the latest that one of the FOs was tested "inconclusive." After meeting with Supervisor, she explained that inconclusive does not mean it's positive, it is just inconclusive. She said we're welcomed to get tested after

we clear customs. At this point, I would like to know the result from FO test today. Maybe for privacy issue, they can't really reveal much, but some of us have trips in the next few days. In fact many of us are scheduled to fly on the X'th. How should we answer the health [related questions]?

## Synopsis

Flight Attendant reported wanting to know the results of a First Officer's COVID-19 test before upcoming trips due to concern about exposure.

## Narrative: 1

We pushed back and were starting an engine when the tug driver told us there were three more passengers coming on a bus we called ops to verify and then shut down the engine and had the tug pull us back into the gate. We opened the doors and loaded the three passengers. I then went and asked the tug driver if we were getting a new pin. He said no they were included in the original count. We then called ops to verify the passenger count. We had the Flight Attendant do a head count and the numbers matched. We closed the doors and pushed the rest of the flight was uneventful.

This was caused because of the multiple buses that are used to move passengers due to the COVID-19 social distancing. We were told all passengers were onboard. I will have the flight attendant do a head count for all flights that are done with remote parking.

## Synopsis

Air Carrier Captain reported being pulled back to the gate to receive 3 passengers who were not on the flight yet due to being transported in a different bus for COVID-19 distancing.

## Narrative: 1

Flight Attendant Y informed me of a passenger in [seat] XX3 not complying with CDC mask regulations. She told me he told him 3 times. I was picking up garbage and I passed by [seat] XX3 and he had his mask off and didn't want to talk to me or put on his mask after

I gave him the [mask compliance policy] and a mask. The Captain was informed and actions were taken to meet the passenger in ZZZ.

## Synopsis

Flight Attendant reported a passenger was non-compliant with face mask policy.

## Narrative: 1

My flying partner [FA Y] was told to walk sideways down the aisle or I'm not sure what. There were 2 men about 400 pounds sitting at a 3 and 4 seat in back of plane. She let them know that it isn't always possible to see everything and avoid hitting people, especially with the cart. He wasn't having it. I decided to work in the back and switch with

FA Y to avoid escalation of the problem and remove her from any more contact. We sat in our own jumpseats, but switched work positions to help avoid any problems. I would like to stress that communication while masked is extremely difficult. I'm confused that the pilots are allowed to communicate without masks, but we are not allowed to do the same. I get extreme headaches every time that I am masked for long periods of time. This last time was 6 days on with about 70 hours of a mask on my face. It is starting to affect me as far as dizziness and sore throat. Our trips seem to be longer days, most being 13 hour duty days, which is almost 14 and half hours with a mask on and on/off a plane.

## Synopsis

Flight Attendant reported concerns with communication and possible health issues resulting from wearing a face mask for so long.

## Narrative: 1

The FO told me upon our initial meeting at the gate that she had been off for the past 7 months, that she flew for the first time "yesterday" (a ZZZ1 turn), and that this was her second day back after 7 months off. While pre-flighting and briefing on the flight deck, at Gate X, Runway XXL auto-populated for departure when the FO loaded the FMC, as it usually does for a destination airport to the west (ZZZ2 in this case). I told the FO that, during COVID, we often get east side departure runways (ie, [Runway XXR in this case) when we depart from east side gates. So, I told her, she could change it to XXR now, if she wanted to, or we could leave YYL in the box, wait for our runway assignment, and I would taxi very slowly while she loaded the box if we got the east side. We left YYL in the box. We departed the Ramp from Spot X and Ground assigned XXR, which was a very short taxi from Spot X. I made the Takeoff PA, and, as I said I would, I taxied very slowly while the FO loaded the box with the new data, read the Legs page aloud (from the new runway) as I followed along on the ZZZZZ 3 Dept on my iPad, and briefed the Takeoff Data. As we were in the middle of the pad, northbound on taxiway, still fairly far from the departure end of the runway, Tower asked if we were up. The FO said we were. Tower then asked if we would be ready at the end. The FO and I briefly checked with each other and acknowledged that, yes, we would be ready at the end. In my recollection, I then heard "RNAV to ZZZZZ1, Cleared for Takeoff, XXR." I chimed the flight attendants and turned on my two Landing Light switches, which is something I purposefully only do once Cleared for Takeoff. The FO finished the checklist with plenty of time (everything was properly set up before she began it), and prior to crossing the hold short line onto XXR, she said something like, "I'm pretty sure I heard Cleared for Takeoff, but do you want me to verify with them?" I looked at my Landing Lights, saw that I had moved them to the ON position, which I 'only do' once cleared for Takeoff, and thought I specifically heard "RNAV to ZZZZZ1, Cleared for Takeoff." So, I said to her, "No. I don't need you to verify. I heard Cleared for Takeoff, too. ... But please ... verify if you want to! Do you want to?" She said something like, "No, I think we're good. We both heard the same thing." I said something like, "I specifically remember hearing "RNAV to ZZZZZ1," which they never say until they clear us for Takeoff. We're okay."

While on the Takeoff Roll and prior to V1, Tower called, "Aircraft X?" We did not answer. They called again once we were airborne and told us to fly Runway Heading. I pretty much knew at that point that we either were NOT cleared for Takeoff ... OR we WERE cleared for

Takeoff and the Tower Controller forgot that he cleared us. Shortly after that call, the Tower Controller said something like, "Aircraft X, Possible Pilot Deviation, Advise when ready to copy." And of course, at this point, I had a very sinking feeling. We copied down the number for Tower. Once clean and on our way, I sincerely apologized to the Tower and told him that, in my recollection, he asked us, while we were still fairly far back in the pad, if we would be ready at the end; we said we would; and then he cleared us 'RNAV to ZZZZ1, Cleared for Takeoff.' He apologized as well, for any confusion, and we went on our way to ZZZ1. Naturally, I had a sinking feeling that perhaps I was at fault ... but I also thought my memory of it was clear ... and I felt just a little hopeful by the fact that the FO and I both independently thought we were cleared for Takeoff. Once at the gate at destination and off of the aircraft, I called the number for ZZZ East Tower. I spoke with a very professional, very kind gentlemen who said he had listened to the tape 3 times and that we were only cleared to Line Up and Wait. I felt so very disappointed with myself at that point.

I see several causal factors in this event. The number one Causal Factor in my mind was that I should have immediately said to the FO, when she asked me if I wanted her to clarify while crossing the Hold Short Line, "Yes! Please clarify. Thank you!" If there's ANY doubt in ANYBODY'S mind, then clarify! There were other Causal Factors as well. Two: the FO was on her second day back from a 7 month leave. She was a good stick and has good general knowledge, but she was very understandably 'slower in hearing' and 'slower in doing' than she otherwise would have been had she been more current. Reduced currency of either party in a two-person cockpit, particularly on the first leg of a trip, often results in a more cumbersome, somewhat disjointed crew coordination experience. And that is how I experienced the beginning of our first leg together -- less coordinated than usual, but understandably so. I say this with no disregard or criticism of the FO, who does very good work, and is clearly a sharp, experienced, very good pilot. Three: this was our first leg together of our first day together. We were just getting used to working together as we pre-flighted and taxied out. Four: For many months now, with fewer operating flights, we are often assigned east side runways when departing from east side gates. This is something that is fairly recent in ZZZ, presumably because of reduced operations during COVID and because of runway construction on the west side. However, particularly when departing from Spots X, Y, or Z, and no other aircraft in sight (as was the case this morning), a runway XXR departure often results in a crunch period while the FO re-loads the FMC and re-verifies the departure LEGS page while I cross-check the chart. Though I did not personally feel rushed, and though the FO said she did not feel rushed, a last-minute runway change is just one more thing to do on a short taxi. Five: I long ago established in my mind that I would not turn on the Landing Lights until Cleared for Takeoff. But today, I clearly, for some reason, turned them on anyway when we were apparently NOT cleared for takeoff ... and then I fairly comfortably relied on the fact that I turned them on as further evidence that we WERE cleared for takeoff. Six: It was fairly unusual in ZZZ to be cleared for Takeoff OR Line Up and Wait, from such a distance from the runway. Today, we were still fine-tuning our crew coordination and were working in a more disjointed way than usual. I was taxiing very slowly, and while time didn't consciously seem to be a factor to me (the FO was done with all duties well before we crossed the Hold Short line and entered the runway), I was aware that the FO was briefing me, checking the box, and starting the checklist, at the time that Tower called us ... AND that we accepted an important clearance in the midst of what was actually a very busy time. It is my guess that the distractions of our work at hand, at that time, interfered with the way we each interpreted the clearance. And we later learned that we interpreted it incorrectly. I have no other explanation for the misunderstanding and am still surprised that both the FO and I jointly misunderstood.

I have several suggestions ... mostly for myself ... as to how I will prevent this type of event from occurring in the future. Starting from the beginning, in point of time ... ONE: Over the next few days I am going to give strong consideration to the idea of directing the FO to change the auto-populated runway in the FMC RTE Page AT THE GATE, to match the runway that I'm expecting for departure, or at least to match the runway that is closest to the departure gate. It will be less disruptive to change a runway during taxi out to a runway that is FARTHER AWAY from us, than it is to change a runway during taxi out to a runway that is much closer to us. TWO: As the FO loaded the runway change, briefed the takeoff data, ran the checklist, and answered the Tower's call and clearance, despite the fact that there was plenty of distance and time between us and the runway, and despite the fact that I knew I was in control of how fast I taxied (two factors I considered while all this was going on), it would have been so much wiser to tell the Tower controller to Standby rather than taking on One More Thing while on the taxi out. Perhaps if we were not so busy during that particular time when Tower called, we may have heard the proper clearance exactly as it was issued! THREE: It would have been wise to simply say to the FO, "Don't worry about time at all. We will plan on stopping short of the runway and taking a close look at all of this together." Particularly under the circumstances (the FO's lack of currency), that would have been the smart-and-considerate-Captain thing to do. I regret not making that choice. It would have removed all pressure. I will be particularly vigilant with less-current and/or new FO's, but I will also try to be mindful of this option in all circumstances. I fear that I may have rushed the FO. FOUR: It was extraordinarily foolish of me not to take the FO up on her suggestion that we clarify the clearance! She asked me if I wanted her to. I should have simply said "YES! PLEASE! And THANK YOU!" For this, I am most regretful. The answer, ALWAYS, when there is ANY doubt from ANYBODY is to say, YES, Please Clarify! FIVE: And on that note, I will no longer let my own habits lull me into any false sense of security. I have the habit of turning on the Landing Lights ONLY AFTER I have been Cleared for Takeoff. I turned on the Landing Lights while still taxiing north on taxiway, and then I allowed my own habit to lull me into a sense of security that I HAD BEEN cleared. But that was foolishness. I apparently misheard the clearance while distracted by several other obligations. The fact that I turned the lights on, or participated in any other habit of my own, does not necessarily mean I heard or interpreted anything correctly. I will be more vigilant in the future.

## Narrative: 2

Our flight was cleared to taxi to [Runway] XXR in ZZZ. We were taxiing on a parallel toward the end of XXR. There were no airplanes in line and about 200 yards from the end of runway Tower asked if we were ready at the end. I acknowledged we were. We both believed he then cleared us for takeoff. As we turned the corner toward the runway I questioned myself and asked the Captain if we were indeed cleared for takeoff. The Captain said yes, but also added I could verify if I wanted too. I felt almost sure we were cleared for takeoff, so I felt comfortable not asking tower. On takeoff roll we were told of the deviation.

This was my second day of work coming back from a 7 month leave. Although it was a short taxi I felt comfortable and prepared for the takeoff. Just prior to the "clearance" I was busy, but felt we had caught up with everything when he asked if we were going to be ready at the end. I do not know how both the Captain and myself felt certain we were cleared for takeoff. It was quite shocking to find out we were wrong. Even though I questioned myself, I really thought we were cleared to go.

My biggest takeaway is whenever I question myself on a clearance just ask ATC to clarify. That would have been the best option. In the future if I doubt myself I will do this first, if

possible. Now that I have had this experience, I will most certainly never accept a -- "TO clearance" -- so far from the end of a runway without clarifying with Tower before TO.

## Synopsis

Air Carrier flight crew reported thinking they were cleared for takeoff, but were only cleared to line up and wait.

## Narrative: 1

Enroute to a patient pickup, I and the crew were notified that the patient was potentially COVID-positive. Upon acceptance of the patient, I requested a protective suit from the ground ambulance crew. At that point I became more concerned with protecting myself from infection and distracted from performing a complete and accurate pre-flight walkaround. Due to this I missed the fact that the chocks were still installed and left them at the helipad at the pickup site.

When unusual factors or outside distraction interfere with routine duties, ensure that pilots are aware (including me) that proper procedures and checklists are doublechecked before taking flight.

## Synopsis

Helicopter pilot reported being distracted during preflight due to concern about avoiding COVID-19 and left the chocks at the departure heliport.

## Narrative: 1

Upon contacting Departure Control after takeoff, we were cleared to 16,000 feet. We were vectored west as usual. Climbing through about 14,500 feet, ATC told us to descend back to 14,000 feet saying he had given us a clearance to stop at 14,000 feet. We complied. We were never given a clearance to stop at 14,000 feet. The traffic passed a little bit later and we continued on without incident. The frequency was very congested with people stepping all over each other. If the Controller did give us a clearance to stop at 14,000 feet, we never heard, nor acknowledged it.

## Narrative: 2

Believe we were already handed off to ZZZ Center. On initial contact with them they cleared us to climb and maintain 16,000 feet MSL. Passing 14,500 feet, the Controller asked us to return to 14,000 feet MSL as he asked us to. The Pilot Monitoring stated that we never received that clearance and were climbing to 16,000 feet MSL as previously cleared. The Controller then stated that we had conflicting traffic and must go down to 14,000 feet MSL. I immediately leveled off the aircraft on the initial call and then proceeded to return to 14,000 feet MSL once the situation was clarified. The aircraft reached 15,100 feet MSL during the transition back to a descent. I am confident we never received the call to stop the climb at 14,000 feet and am sure we never responded to such a call. The radios were busy and ATCs initial call to level off may have been blocked by other transmissions.

The Crew reacted appropriately with the information we had received during the situation. It has become apparent that ATC Personnel are working multiple frequencies since the

reduction in flying due to COVID. In my opinion, the flying is returning faster than the ATC manning and causing some increased ATC workload and some communication errors.

## Synopsis

Air carrier flight crew reported ATC requested they descend back to their cleared altitude of 14,000 during departure. The flight crew stated they never heard ATC cleared them to 14,000 feet and cited frequency congestion as a contributing factor.

## Narrative: 1

Due to "COVID" related sick leave and lack of staffing, a south satellite CIC was not utilized during one of the three daily rushes into ZZZ. I was assigned Flight Data, but observed a problem developing with ZZZ1 Approach who handles half the feed into ZZZ. The CIC was combined to the AF position which was being staffed by a Supervisor. The Supervisor was involved with a conversation related to staffing and break rotation with other supervisors and not actively monitoring the south satellite line.

I was assigned Flight Data, however I sat down at the X position and started acting as a CIC despite not being assigned the position. X is a supervisory position and I was acting in a supervisory capacity without being delegated the duties. I am certified on the position. I could not just sit by and watch management not supervise and act according just let the controllers flounder. I ended up slowing the fix and doing all of sector Y's coordination. While he worked the traffic.

A CIC needs to be sat down any time there is a rush. At a minimum management needs to pay at least some attention to a line they are in charge of during a rush.

## Synopsis

TRACON Controller reported assuming a position to act as CIC because in reporter's mind the Supervisor CIC was not properly monitoring.

## Narrative: 1

This event was a complex setup with numerous contributing factors that led to a slight and uneventful course deviation on a flight from ZZZ to ZZZ1. Having spent 30+ years in the part of the US I was quite familiar with the dynamics of the environment. In preparing the flight, I ran a prelim flight plan which recommended a route I would expect, a SID that meshed with the ZZZZZ3 arrival to ZZZ1. For arrivals from the south into ZZZ1 it is customary and without exception have flown the ZZZZZ3 which runs with the arrivals and departures to several airports. There were numerous TFR's along and around the route of flight this day. I filed a flight plan using app which recommended a different route, a SID to Victor airways, no STAR into ZZZ1. It was presumed this route was preferred to accommodate the numerous TFR's. I know for certain in the app I had selected FL230 as I wanted to either be rerouted as necessary for the TFRs or be above as the TFRs were below FL180. These issues were disclosed, briefed between the two pilots prior to filing flight plan, discussed verbally in the takeoff briefing, and even added extra fuel for possible reroute. When our clearance was obtained to depart ZZZ, it was for the SID and Victor airways as filed with app, further reinforcing the presumption that it was ATC preferred due to the TFR's. The final altitude cleared was 17,000 feet due to the Victor airways chosen, not FL230 as was desired.

As we began our taxi, we were expecting Runway XX for departure which was a fairly long taxi. Traffic was light, and Ground Control stated Runway XXC was available which we accepted. This now being a very short taxi. I stated to the copilot would taxi slowly to allow time to load new departure runway in FMS, the SID chart was retrieved, compared to the FMS, and the takeoff briefing verbally amended accordingly. In doing these things, we verified only page one of the flight plan in the FMS. At this point we were not aware that in reloading the departure RW, the FMS had on the second page not only inserted a discontinuity, but had deleted two waypoints, the last one on the SID and first point on the filed Victor airway.

As we were flying the departure and level at 15,000 feet, we crossed the second to last waypoint on the SID. At this point when the FMS sequenced, the discontinuity appeared on page one. This FMS has known issues and several Service Information Letters (SIL's) from the manufacturer regarding runway changes with SIDs and STARs. Having seen the occurrence a vast number of times for arrivals when changing or loading the arrival runway after the STAR, the resolve had always been to delete the discontinuity as no waypoints had ever been seen deleted and verify altitude/speed restrictions. When the discontinuity appeared on page one of the FMS flight plan, it was simply deleted without verifying the fix meshed with the filed route. As two waypoints had also been deleted, this created the issue at hand. Soon after we crossed the waypoint in question, ATC asked if we were beginning our RH turn. This exchange revealed the error at hand and we were given a vector. Believe it was just prior to that waypoint that ATC asked if we could join the ZZZZZ3 arrival, to which we stated yes. The Controller stated this will be vectors to join the ZZZZZ3 and cleared us to 17,000 feet. At this point we inserted the missing

waypoints and queried ATC to confirm our currently assigned route. ATC again stated expect the ZZZZZ3 without confirming assigned route, and did not provide an expect to waypoint to join the ZZZZZ3. A level of uncertainty remained as the ZZZZZ3 has six (6) transitions into the arrival. We briefed and had STAR displayed to deal with the coming short notice for the join waypoint as the fixes along this arrival are close together with several altitude and speed restrictions. Throughout this event, we could hear ATC transmitting to other aircraft, but never heard other aircraft respond, thus the controller was obviously working multiple frequencies/sectors with a resulting high workload likely contributing to not providing an expect to waypoint. This also presented a certain level of distraction on our part. Once we were cleared to a waypoint on the ZZZZZ3, and with a descend via clearance, the remainder of the flight was uneventful. The slight deviation actually took us further away from the TFRs, no restricted airspace was encroached, and there were no traffic conflicts.

## Synopsis

Corporate Captain reported a track heading deviation during departure and cited ATC workload as a contributing factor.

## Narrative: 1

I was instructed by the ZZZ1 Tower after taking off on Runway XR to follow another small aircraft who had taken off before me before turning right downwind to depart to the north east. I was expecting to get clearance through the [ZZZ] Class B because the Tower had indicated so. The aircraft I was following never turned crosswind, so I initiated my turn and was a little faster than normal climb because I was trying to stay below 1,800 feet which was the bottom of the Class B airspace straight ahead. In turning right to depart to the east, I clipped the corner of the Class B surrounding ZZZ2 just to the north of ZZZ1. The Tower asked if I was familiar with the airspace around ZZZ1 and I stated that I am and that I had clipped the corner of the Class B and was expediting turning south. I thought the bottom at that point was 1,800 feet and I remained below 1,800 feet before getting south of that corner, however, after landing at home ZZZ3, I checked my actual track and saw that at that point where I briefly went in to the Class B it exists from ground to 10,000 feet, not 1,800 feet to 10,000 as I had thought. In this particular area the Class B just to the west of me showed 1,800 feet to 10,000 feet which is what I saw on my chart. Tower thanked me for getting out quickly and handed me off to ZZZ Departure who gave me an unrestricted climb to 10,500 feet, my filed encounter altitude. Departure never specifically cleared me through the Class B to the east which has a base of 4,800 feet and top of 10,000 feet, but they did give me an unrestricted climb to 10,500. It's possible that I was above 4,800 feet, on my climbout which also would have been flight in to the Class B without a specific clearance which I failed to ask for.

I have flown down to ZZZ1 3 times in the past few months and because of the reduced traffic during COVID I've been cleared through the Class B and even offered it by ATC without asking, which is unusual.

ATC is very pleasant in that area, but I thought I should report this to help others with this type of potential confusion. ZZZ1 gets a lot of local flights and the Tower issues quite a few follow another aircraft instructions as well as "stay south of highway XXX that only locals would know, I presume to stay away from the nearby Class B airspace from the ground to 10,000 feet.

## Synopsis

GA pilot reported a Class B airspace violation.

## Narrative: 1

The aircraft arrived from the hangar for the trip. We were told that the aircraft had surpassed its parking to greater than XX hours. We were told by management to accomplish parking per XX.XX.X that led us to work orders XX and XX1 before its next trip that was due out in the morning, requiring a lengthy delay and out of service condition.

The aircraft bill of work was never updated to reflect the parking orders being required before the next flight.

Find a way to monitor aircraft ground times and work requiring accomplishment.

## Synopsis

Technician reported the aircraft was parked and the parking orders never updated requiring a further maintenance delay.

## Narrative: 1

I am the A Flight Attendant. Passenger X was making a connection. She also needed an aisle chair. My tablet was acting glitchy and I could not pull the station flight service phone numbers. There was not a jet bridge phone and no plane phone numbers. There were 2 passengers trapped at the 1 and 2 seats while the aisle passenger was in the 3 seat. Total of 3 people stuck. Passenger X was getting very restless and stressed. I was not aware, for the passenger's safety, I was not to leave and inform the Agent of the urgency for the aisle chair. I deeply apologize, this will never happen again. Working conditions with COVID, are very stressful.

Make sure that every flight has availability to jet bridge phones numbers, to communicate with the Gate Agents.

## Synopsis

Flight Attendant reported staff shortage and poor customer service due to the COVID-19 pandemic contributed to some passengers not being able to deplane in a timely manner.

## Narrative: 1

Guests sitting at X1 and X3.

X1 keeps coughing.

X3 is wearing the mask with bottom tie off.

X1 stood up and opened the overhead bin when the cockpit door was open during the break. I told him loudly to sit down please. He asked "Why?" I answered "Because the cockpit door is open."

X3 said "Seatbelt sign is not on."

They both say "That is so stupid." shaking their heads.

Every time X1 coughs, guests at X5 & X6 are concerned and look over to him.

Get consents from guests about staying seated during pilot breaks.

## Synopsis

Flight Attendant reported two passengers who were not complying with face mask policy did not want to remain seated while the cockpit door was open.

## Narrative: 1

I asked a passenger multiple times to make sure his mask was covering his nose and mouth not just his chin. I made all the required announcements, so I believe 4 PAs were made referring to masks. The pilots also made an additional mask announcement. Once we got in the air the passenger took his mask off completely. We serve so much food on a two hour flight that he constantly had food in front of him. Every time I asked him to put

his mask on he would take a bite of food. Every time I looked at him, he would take a bite. I could not really give him a warning because every time I looked at him, he would take a bite of something. But he did not wear his mask the entire flight until we were cleaning up at 10,000 feet. Do we really need to serve so much food. On a two-hour flight we provide several food services. Tough to enforce the mask policy when people are constantly eating. This passenger knew better, but just refused to wear his mask. Reevaluate the amount of food served on a two hour flight.

## Synopsis

Flight Attendant reported that by providing passengers several food services allowed passengers to eat constantly and not have to comply with the face mask policy.

## Narrative: 1

There was a guest assigned X3, despite the fact the seat is blocked as per social distancing guidelines and safety of FA's.

The Customer Service Agent (CSA) refused to reseat the guest, which made me feel very uncomfortable to say the least. A CSA was informed and asked to reseat, however they refused the request, which violated the policy, jeopardizing safety of flight attendants, as well as created a major inconsistency. As a solution there was an option to move a guest traveling by themselves, like anyone from Row X-Y, that was not done by the CSA.

## Synopsis

Flight Attendant reported the blocked seat in front of the FA jumpseat was assigned to a passenger. The CSA would not reassign the passenger per social distancing policy.

## Narrative: 1

Was advised inflight by ZZZZZ controllers that they were unable to contact ZZZ Approach controllers. ZZZ had closed one hour early due to their reduced hours, however, there was no NOTAM in our flight plan that advised of the early closure. In addition to there being no NOTAM, ZZZ had also failed to "release" the airspace over to the Center before going home. As a result, ZZZZZ could not clear us for an approach into the airspace. We were issued holding instructions until someone in ZZZ returned to the airport to release the airspace. Initially, ZZZZZ seemed unsure if ZZZ was even open or not. I told them that they had indeed closed based off of the remarks section of the AWOS. I knew that ZZZ closed at XA00 local based on recent flights. Plus, the airport itself (Runways and taxiways) would close later due to the construction that takes place at night. However, because there were no NOTAMs for either closure this time, I thought that they would be open. We had no alternate, as the weather was good, and as such had limited time to hold. Fortunately, we eventually got clearance to proceed into ZZZ.

ZZZ ATC failed to release the airspace to ZZZZZ prior to signing off for the night. As a result, we were held until the airspace could be released. In addition, there were no NOTAMs noting the early closure of the ATC facilities at ZZZ.

## Synopsis

Air Carrier First Officer reported unable to land and entered holding due to the shortened hours of Approach Control at the destination. The destination Approach Control had failed to release the airspace before closing.

## Narrative: 1

Runway XXR was NOTAMed closed for 2 hours due to a crane on the departure end of the runway. Runway XXL was in use. Aircraft inbound from the west was given a right downwind entry for Runway XXL. The aircraft was sequenced to follow multiple aircraft ahead. On short final, I noticed that he appeared to be lined up for the closed runway (Runway XXR). I instructed the pilot to go-around and re-enter right traffic Runway XXL and emphasized to the pilot that Runway XXR is closed. When I cleared him to land Runway XXL, he again appeared to be lined up for XXR. I verified if he was lined up for the correct runway and on very short final, he appeared to maneuver for the correct runway.

Background: all controllers at ZZZ have been on 6 day work week for the last few months due to a shortage in staffing. Our facility has also been experiencing roughly a 20% increase in traffic volume compared to last year. In September, our traffic count index has reached the numbers for us to qualify for a level 8 upgrade. If we sustain our traffic numbers for the next couple of months, level 8 at ZZZ will become a reality once it gets approved by the National Validation Team.

We are all fatigued from the increase in traffic and the amount of overtime we have all been working. This is no doubt affecting our performance on position. Morale is down and controllers are becoming more and more impatient with pilots as a result of being over-worked. I worry that this will impact safety by increasing the possibility of human error.

I felt noticeably fatigued towards the end of my work week. If I had not been as fatigued, I may have been able to recognize the aircraft lined up for the incorrect runway sooner. Thankfully, I recognized it at the last second, but it was very close.

Yesterday, I was working CIC combined with GC. Traffic was busy. A Controller who was finishing an overlap in the back of the cab was on the phone with someone and relayed information to me. I was in the middle of working a lot of traffic on ground and what I thought I heard was to have the pilot of an Aircraft X with an XXXXX tail number call the airport manager when he lands. It turned out that the airport manager wanted us to call him when the aircraft landed. Had we had more staffing and CIC was de-combined, this information would have been properly relayed to me. I would have been able to figure out that we had to call the airport manager and not have the pilot call. Again, my lapse in judgement may have also been due to fatigue from prolonged 6 day work weeks.

For the safe of safety, the agency needs to take our staffing situation seriously. In the midst of the pandemic, our tower hours have changed to XC:00am to XO:00pm. Even though we have a staffing issue, due to the compressed tour hours, there is a good amount of overlap between controllers so we can keep LC split into 2 positions. In a little over a week, we will be going back to our normal hours which are XA:00am until XQ:00pm. This means the staffing will be spread out and during peak work hours, we may be forced to combine the LC position. As busy as it has been, it is very unsafe to work the volume of traffic we have been working with a combined LC position. This will result in 2 hour holdovers for many of us on top of the 6 day work weeks we have already been working.

We have been begging for better staffing for years. There has been word that the higher ups in our region are finally taking the situation seriously. I hope this is true and we get more staffing numbers to alleviate this serious issue.

## Synopsis

ATC Controller reported fatigue and safety concerns due to 6 day a week shifts and short staffing related to the COVID-19 pandemic.

## Narrative: 1

Good VFR weather and Forecast for destination, enroute, and return. Morning flight to destination was uneventful. Afternoon return flight at 6,500 feet, and 80 NM to destination an overcast layer developed. Obtained weather reports which indicated ceilings of 2,500 feet tapering to 900 feet at destination (forecast for improvement). Overcast conditions about 2,000 feet thick. Since it would be getting dark by the time I got to the destination, I elected to stay on top. Temperature at 6,500 feet was 45F (although I was flying North and knew it would decrease), surface temperatures around freezing. Obtained IFR clearance and completed ILS approach. Entered tops at 4,500 feet MSL and broke out at 2,800 feet MSL (1,400 foot ceiling). As soon as I entered the clouds the temperature dropped to freezing. Picked up about 1/8 inch of ice on the horizontal stabilizer, with less on the main wing. Windshield was warm enough and didn't have any ice.

Best option would have been to land and stay overnight--while this is always a hassle, COVID pandemic has made this even less appealing. Flying underneath a deteriorating ceiling, I believe would have been a bad option, especially at night. The weather and temperatures of the upper Midwest limit the use of an airplane without deicing equipment for six months of the year. Anything other than local flights, always plan an option for a rental car, or overnight stays, and utilize those options.

## Synopsis

GA pilot reported that, due to deteriorating weather, an overnight at a location other than the destination would have been a better idea than continuing the flight. But the COVID pandemic made the intermediate stop unappealing.

## Narrative: 1

Due to the COVID-19 slow down our department has flown our aircraft every X weeks to keep the plane and crew flight ready for our corporation. On this particular flight I the Captain, and the Second in Command were briefing the approach into ZZZ airport. While briefing we were headed direct to ZZZZZ intersection for the ZZZZZ6 arrival. The plane had not flown for two weeks and due to a cancelled trip I had not flown for 56 days. The Second in Command had flown a trip 2 weeks prior to this flight. On receiving the ATIS the approach advertised was different than what was usual and anticipated. So we as a crew briefed the approach thoroughly (it was noted it had some updated information). During this briefing I noticed we were below 10,000 feet, around 8,000 feet and traveling at 270 knots indicated airspeed. Upon this observation I slowed the aircraft to below 250 knots. The Controller never mentioned anything and there was no traffic noted on the TCAS or visually.

The procedure I should have done differently/better was to transfer control or to have the Second in Command brief the approach.

## Synopsis

Corporate Captain reported a speed deviation and cited lack of flying during the COVID-19 pandemic as a contributing factor.

## Narrative: 1

I was moving a lift to do a door lube. When done with the R2 door I moved the lift while looking to the rear, I did not realize that the lift was in drive not reverse. While looking over my shoulder I felt the tug go forward I hit the brakes. I did not feel it strike the aircraft. I then moved the lift to the L2 door and completed the lube on the L2 door and then moved the lift back to the parking area. I did not know that I had contacted the

aircraft until notified by the Senior Manager. The lighting was poor and I had never done a door lube on this type of aircraft. I also had just come back from almost three weeks off from being quarantined for COVID-19. I was not used to night and was very tired.

When selecting the lift to Reverse it inadvertently ended up in Drive. Some of our lifts have drive forward on the gear selector and some have drive in the back of the gear selector. Shifters are not lit and some go forward to go forward and some go forward to go aft.

I really have no idea [for suggestions] other than making sure all lifts have the gear selectors the same way. Gear selector levers should be lit at night so they can be observed.

## Synopsis

Technician reported making contact with an aircraft after moving a lift in the wrong direction.

## Narrative: 1

Passenger X that was escorted off previous flight for acting erratically and refusing to wear his mask was then given a boarding pass to fly on the flight I was working. Agent never

informed Captain or crew of this passenger's history. The only way we found out was by Captain asking agent when she came to close the flight about the information of this certain passenger! I had to ask this passenger numerous times to follow the mask policy.

Communication on the agents behalf would be a good start and for the company to actually follow through with the mask policy! I am risking my health and safety every time I come to work, it would be nice if my company would actually start to act like they care. Working on an aircraft has become a dangerous place to be. I'm begging the company to pull their head out of the sand and start taking my overall health and safety seriously!

## Synopsis

Flight Attendant reported a passenger, whom had acted erratically and refused to wear a face mask on a previous flight, was allowed to board the flight.

Passenger seated on X4 continued to disregard our request for him to keep his facial covering on at all times. We asked him several times (FA's # A, B & C) but continued to disregard our request. I even gave him a face mask but still, no compliance. Passenger seated nearby in X6 was very disturbed by it.

## Synopsis

Flight Attendant reported a passenger would not comply with the face mask policy.

## Narrative: 1

A gentleman walked on the aircraft without a mask, I nicely asked him if he had a mask and if not, I would supply one for him. He said he did have a mask, but just needed to find it. He made his way to his seat in X6 and was putting his seatbelt on. I told him since he was in the bulkhead he'd have to stow his bags above him in the overhead bin. He is now moving around, bending down close to the gentleman beside him, who clearly looked uncomfortable. I then handed him a mask and told him he needed to put it on. He said once again, he has one. My B-FA then comes up and I inform him of the situation. B FA says to the gentleman he needs to put his mask on and the man loudly and rudely says, "Oh would you just shut your mouth!!" Now, I inform our Captain on what is happening in the back and he said, "He can't talk to you guys like that, get him off." So I tell the gate agent, she gets her manager and the security coordinator and the man is escorted off.

## Synopsis

Air carrier Flight Attendant in Charge reported a passenger became belligerent about the face mask policy and was removed from the flight.

## Narrative: 1

On our enroute descent 30 miles west of ZZZ, ZZZ Center had to cancel our IFR flight plan due the ZZZ1 Center COVID related airspace closures. There was a miscommunication when we checked in with ZZZ Approach Control with us being VFR with the airport in sight. We picked up an IFR clearance with a Visual approach to the airport. We continued our arrival and landed uneventfully.

The cause was that ZZZ1 airspace closed and there was a communication gap between ZZZ Center and ZZZ Approach.

No suggestions, as our required cancellation of our IFR enroute with ZZZ Center and our subsequent picking up of our IFR with a visual approach from ZZZ Approach is what was required due to the ZZZ1 Airspace closures.

## Synopsis

Air carrier First Officer reported the flight's IFR flight plan was canceled near the destination airport because the ATC Center had airspace closures due to COVID-19.

## Narrative: 1

When I arrived at work for my XB00-XJ00 shift there was a CIC on the Supervisor desk. The area was still combined at the mid sector (XX) except for sector XY which sits 4 inches from sector XX. Sector XY was open and staffed by a Supervisor not wearing a face covering over any part of his face other than his neck. This Supervisor has been repeatedly told to do so, but most of the time doesn't do so. The adjacent airspace was ATC zero for a positive COVID case that had been reported the previous afternoon. This Supervisor often opens this sector between XA00 and XC00 am to avoid going to stand up and also avoid any sort of volume or complexity in the airspace. I understand normally it's not an issue besides that it's an awkward configuration that confuses everyone in and around the area, but today it was much more than that. Today marked ZZZ's X confirmed positive COVID case in X days' time and X [number] in X weeks. This supervisor not

wearing a mask and opening the sector to get time was not only dangerous but just plain rude as the controllers sitting next to him were forced to work the other sectors while properly adhering to mask wearing guidance.

I wish this was the end of this report however the day progressed to be even worse. During the morning the contingency plan was abandoned and we were told we could go through the sterilized airspace however far "we felt comfortable." In fact we were told it would be OK to give IFR clearances off the ground in the sterilized airspace as well. I don't think this is a safe idea. One person's comfort level could be more than a different person's. We don't know how far frequency coverage goes into the sterilized airspace and this could result in NORDO aircraft in conflict in the airspace with no way to resolve the confliction.

To add further to this, later in the day a D-side trainee was brought to the area to give an over the shoulder for the resumption of training. 4 people were plugged in to one sector while the same Supervisor still wore his mask around his neck. This put 3 more controllers at risk unnecessarily during the middle of a facility outbreak.

This D-side trainee is now fully certified again on all the area D-sides after working a total of 1 week in the past 7 months which presents even more risk both to proficiency and also to proper social distancing measures. After this certification was complete he was used throughout the day and told to "pick a D-side" at the instruction of the Supervisor further combating any social distancing guidelines that have been set in place by state health officials, NATCA, and facility management.

If this is how ZZZ center is going to continue to operate this is only the tip of the iceberg with how much crossing paths there is since the return of normal schedules and staffing. Supervisors do not need sector currency.

## Synopsis

Center Controller reported a facility Supervisor continually does not follow state and NATCA guidelines regarding face mask policy.

## Narrative: 1

I arrived at Flight ABC early and started sanitizing the phone and high touch-point areas in the forward galley. I also stocked the cockpit with a 6 pack of water and continued to do my security checks. C Flight Attendant arrived a little later and we chatted catching up since we last worked together. Shortly thereafter, B Flight Attendant arrived. B Flight Attendant and I started chatting and catching up since we had not worked together since 2019. Toward the end of B Flight Attendant and my conversation with C Flight Attendant present, I stated, "These are crazy times since COVID. C Flight Attendant and I have recently worked together. So that we can better protect each other and social distance as much as possible, B Flight Attendant and I can do the water service. You (B Flight Attendant) can serve from the back and I can serve from the front and that we can meet somewhere in the middle of the cabin. C Flight Attendant can pass out the snacks. We all can take turns making trash runs individually. You and I can also pass out the paperwork the same way. You can distribute paperwork starting from the back of the cabin and I will start from the front of the cabin and we will meet somewhere in the middle of the cabin." We all agreed.

C Flight Attendant and B Flight Attendant continued to chat and I continued setting up and arranging my workspace in the forward galley. As I was kneeling checking my compartment in the forward bulkhead, the First Officer walked onto the aircraft. As he was making his greeting of "Hello, I'm FO [name]," I responded "Hello, I'm (A Flight Attendant)" as I raised up to greet him. As I stood up, [the] FO and I were face to face and I was startled that he was not wearing a mask. I immediately asked while stepping back creating social distance, "Where's your mask?" FO responded, "Where's my mask?" I repeated, "Yes, where is your mask. We all need to wear our mask to help prevent the spread of the Coronavirus and to keep each other and their families safe." [The] FO reached into his pocket and pulled his face mask out of it. He then rolled his bags into the cockpit with his mask in his hand. I then pushed up the cockpit door as I completed my rev napkin and completed the security document.

Shortly after [the] FO got settled in the cockpit, he came out back into the cabin, but wearing his mask this time. He then said, "Do you feel safer now that I am wearing the mask?" I responded, "Absolutely. Thank You." He then walked further into the cabin where C Flight Attendant and B Flight Attendant were standing between the bulkhead and row X talking. [The] FO was standing with his back against the bulkhead on the Captain side of the cabin/leaning into the aisle and B Flight Attendant was in the center of the aisle between row 1 and 2; C Flight Attendant was standing in front of row X in front of the bulkhead leaning toward the aisle. The Operations agent came and informed me of the specials and that boarding would be starting [soon]. I then went to retrieve gloves from the bulkhead compartment when I noticed that B Flight Attendant was no longer wearing her mask. She had her mask in her right hand. FO did not have his mask on properly. FO's mask was dangling by one strap on his right ear hanging down the right side of his face. Both of their noses and mouths were completely exposed as they were engaging in conversations. I then stated, "Guys, we are about to start boarding and we are crew and it is very important that we all wear our masks over our nose and mouths while we are on the aircraft for our safety as well as the passengers who will be here shortly." B Flight Attendant just stared at me. No one attempted to put their masks on immediately. I then repeated, "Can I have both of you put your masks on to help the efforts of reducing the spread of COVID?" B Flight Attendant rolled her eyes at me and put her mask on covering her nose and mouth and started to walk down the aisle. FO then put on his mask and started walking back the main entrance area where I was standing.

I then initiated the high-low chime to initiate that boarding would be starting shortly. FO says, as he is looking in the mirror adjusting his mask, "Does this thing make you feel

safer?" I said, "Definitely. The masks when worn properly and with social distancing and good hand hygiene slows the spread of COVID." FO says sarcastically, "What is COVID?" I responded, "Everyone in the U.S. knows what COVID is since we have been dealing with it since March/April." FO says, "Well, I have never heard of it." I said, "It is a worldwide Pandemic therefore, you and everyone else has heard of it and knows exactly what it is for certain. The CDC, NIH, WHO, and the company have set guidelines stating that we all must wear mask on the planes. This should be second nature for all of us since most states have a mask mandate for public places since March/April."

We started boarding. The Captain came on the aircraft. He introduced himself and asked how things were going. I said, "Hi! I'm (A Flight Attendant). Everything is okay except, the FO came on the aircraft without a mask and he was condescending, sarcastic, responding to me. He said, "I wasn't here for that. I'm sorry that happened. With the exception to the mask situation is everything okay. I said, "Yes." He gave me the pre-flight briefing to pass to the other Flight Attendants. He went into the cockpit. Boarding continued.

In between the lag in the boarding process, B Flight Attendant comes up front from her boarding position in the back. She then opens the cockpit door (that I have pushed up as a protection since the pilots are not masked on the flight deck) and enters the cockpit and closed the door behind her. I continued to stay in my boarding position and continued the boarding process. After about 5-7 minutes B Flight Attendant came out of the cockpit and went back to her boarding position. We continued the boarding process. I had completed the Opening PA and secured the cabin. (C Flight Attendant) came up front to tell me that the overwing was briefed. Captain then comes out of the cockpit and asked C-FA and I if everything was okay. C-FA and I responded, "Yes."

Captain then went the back galley and talked to (B Flight Attendant) for a few minutes. During this time, I started to feel that the conversations that (B Flight Attendant) had when she entered the cockpit and their current conversation, I am the subject of discussion. So, when the Captain came back to the front of the plane I motioned for him to join me in the jetbridge to give him my version of events of (B Flight Attendant) and FO being annoyed with me for asking them to wear their masks on the plane. Since the passengers were on the plane, Captain and I stepped into the jetbridge. I told the Captain that I had asked (B Flight Attendant) and FO to put on their mask in effort to prevent or slow the spread of COVID. I told him that B Flight Attendant rolled her eyes at me and FO responded very sarcastically and condescendingly antagonizing me with a lengthy conversation regarding the mask. I did not ask anything of them outside of established protocols and guidelines established by the company, the State, and the CDC. The masks are a necessary piece of PPE that is necessary to prevent or slow the spread of COVID."

The Captain then said, "I just need to know if you are going to be comfortable working with your crew on the plane." I was startled and confused. I said, "I'm sorry, I am not understanding your line of questioning." He said, "I don't know if you are comfortable working in a small space that is not going to give you 6 feet of space between you and your crew." I said, "I am talking to you about the mask policy and you are talking about social distancing. Then it dawned on me that B Flight Attendant must have said something to him about our social distancing conversation. He then repeated, "I don't know if you are comfortable working in a small space that is not going to give you 6 feet of space between you and your crew." I then said, "WHOA, don't put words in my mouth. I never said anything about 6 feet of distancing to you or anyone else. There is ABSOLUTELY no way you can do our jobs with 6 feet of separation that is absurd and totally unrealistic. The passengers with the middle empty seat doesn't even have 6 feet between them. The C Flight Attendant sitting on row X is not 6 feet from the X jumpseat. When you briefed me

earlier you were far less than 6 feet from me and I had no issues with distance. At this very moment that we are talking you are far less than 6 feet from me and I am fine; therefore, I think you know the answer to your question. If you need me to verbally say it, then I am fine being less than 6 feet from my crew and passengers." He then said, "With everything that you have on it is hard to believe that." I said, "I am wearing my mask and gloves which the company has approved as acceptable PPE for COVID when working; therefore I do not understand why it's concerning to you as an indication that I am uncomfortable being less than 6 feet from the passengers and my crew. We all should be using reasonable social distancing, PPE, and best hygiene practices collectively to prevent or slow the spread of COVID. I am just asking that protocol is being followed regarding my crew and passengers wearing face masks."

He then asked, "Well is it protocol to close the cockpit door during boarding?" I said, "I never closed the door. The door was ajar with the latch/lock extended to prevent closing because you all (Captain and FO) did not have on mask on the flight deck and I had to remain in my boarding position that would put me in grave risk of potential COVID exposure or contracting COVID. My masks and PPE that I am wearing protects you and your family. If you and FO are in the cockpit without mask, there is nothing to protect me and my family since I must stand there for 30 minutes or longer. I used the ajar door as a protective shield for me from a potential COVID infection." He said, "You did not ask me." I said, "Sir, we obviously are having miscommunication, because you did not tell me that it bothered you." He said, "We do not have to wear masks when we are in the cockpit and when you close the door I can't hear the FO do the checks." I said, "That's a first. Most of the pilots close to door to hear better in the cockpit, but if you don't want the door ajar, then I won't do that. Will you at least wear the mask when the cockpit door is open to help protect me and my family from potentially contracting COVID since a lot of us may be asymptomatic spreaders?" He said, "So you are asking us to wear a mask in the flight deck even though that is not our protocol?" I said, "Sir, I am wearing my PPE and the passengers are wearing their PPE to protect others including you; therefore, I am asking you to wear PPE anytime you are on the plane where COVID could be potentially spread to me and others." He said, "Let me get this right. You want us to wear mask in the cockpit even though that is not our protocol." I said, "Sir, I am asking you to reciprocate the protections that I am affording you and your family by wearing my PPE properly. I am just asking for you to wear the mask to protect me and my family. How is it that we require passengers to do what we as crew are not willing to do? I have to stand in my boarding position which would be gross negligence since I would be in the path of a potential COVID exposure with no protections if you and the FO do not wear the mask with the door open. No problem. I am not willing to expose myself and my family to that level of risk. That level of consequence should not be required or expected of me while doing my job. I will have to just stand on the outside of the aircraft in front of the entrance and greet the passengers who will be wearing masks during boarding and deplaning."

He then asked, "If there is a medical emergency and the passenger needs assistance, how do I know that you will be willing to assist." I said, "Sir let's not try to make this situation bigger than it needs to be. I just had a medical situation on my flight the other day and it was not an issue. It is clearly a RISK vs BENEFIT assessment that prevails and someone's personal real dire situation would take precedent over a potential risk. It just like being in a high rise building with the room on fire. You wouldn't typically jump out the window, but in that moment the benefit of saving a life outweighs the potential of physical bodily injury." He then says, "This flight is going to be over X hours. How do I know that we will be able to be relieved to go to the rest room." I said, "That is a non-issue. You will definitely be relieved to go to the restroom. Only one Flight Attendant is required on the flight deck to relieve you all for restroom breaks. Again, do not attempt to make this

situation something that it is not or bigger than it really is. I just need for everyone to be willing to wear masks to protect the crew, passengers, and all of our families."

There were [several] ground personnel in the jetbridge overhearing our entire conversation. Captain then talked to the Ground Supervisor. I then spoke to the Ground Supervisor because it seemed that the Captain was presenting the situation to management with hypotheticals that were not an issue and paint me in a lighting that I was asking for unreasonable accommodations. I just asked that masks be worn by the whole crew. The ground supervisor then spoke to the Captain and then we all agreed that there was no longer an issue and that we would be fine working the flight. The rest of the day was uneventful. During the flight the Captain and FO were relieved for restroom breaks on both subsequent legs going and returning to ZZZ.

I placed a call to the company office once we returned, but the office was closed. I spoke to a company representative and explained my concerns of crew members not wearing their masks properly or not at all when there are so many people that have COVID, but are asymptomatic. I also expressed my concerns of pilots who have not been medically certified as COVID negative being exempt from any face covering when on the flight deck, but in close proximity to flight attendants. I also informed her that the pilots should be required to wear a mask at all times when on the aircraft, whether it be a surgical mask or an oxygen mask to protect other crew members from potential COVID exposure or COVID contraction. Is this not a reasonable request during these unprecedented times of COVID or are the flight attendants and their families dispensable and sacrificial for operational profits?

Better procedures and protocols need to be established for crew mandates for wearing mask during this COVID Pandemic. Enforcement of masks among crew members AT ALL TIMES, especially on airport property (i.e., plane's cabin, cockpit, and gate areas). Better techniques and procedures for identifying COVID symptomatic and asymptomatic [personnel].

## Synopsis

Flight Attendant reported having a disagreement with the Captain and First Officer regarding their compliance with wearing face masks.

## Narrative: 1

We were on a left downwind for [Runway] XXC at ZZZ at 4,000 feet. The Captain, who has only flown 1 trip since February 2020 (and done 1 [training] event), was the pilot flying. It was at the end of a ZZZ1 - ZZZ all-nighter. Approach Control assigned us to turn left to heading 360. I acknowledged the heading assignment while the Captain entered the heading in the MCP and pushed HDG SEL which I watched him do. A few seconds later I realized that we had not started turning, so I pointed that out to the Captain who re-pushed HDG SEL. We both verified the FMA and the airplane started its turn. A few seconds later Approach called, said something about being behind the turn and gave us farther left to heading 310 which I acknowledged and the Captain dialed in. Then a few seconds later Approach called again and asked if there was something wrong with the initial heading assignment of 360 and he mentioned that we went 3 - 4 miles before actually starting our turn for 360. I answered: 'No, we dialed it in, pushed for heading but it didn't take and it just took us a few seconds to realize it.' The Controller responded with 'OK' and the rest of the flight went uneventfully.

## Narrative: 2

Final Approach Controller gave us a left turn to 350. I put 350 in the window and pushed heading select. I looked to the left to see if the airport was in sight. I did not verify the FMA. After 10-15 seconds my First Officer said, you're not turning. Immediately reselected heading select, VERIFIED the FMA and verified turn.

## Synopsis

Air carrier flight crew reported the aircraft did not start the turn as expected because they had not activated heading select.

Narrative: 1

Passenger refused to comply with mask policy. Flight attendants requested compliance numerous occasions by making announcements and directly communicating with the passenger. The customer continued to ignore flight attendant requests. I personally asked for compliance and so did the other FA working the aft cabin. The passenger was angry with the flight attendants and stated we singled him out. This is a setup for failure and flight attendants are going to get hurt as a result. The mask policy needs to be reassessed and other policies need to be implemented to protect the flight attendants from situations like this one. At one point the passenger was fast asleep with the mask off. The passenger was outwardly defiant and had no intentions of complying with anything we asked. I am not here to be mask police we are safety professionals. The company has to come up with a better policy to protect us. This is creating a hostile work environment because I am fearful that the passenger could retaliate with physical violence. This was a horrible experience.

## Synopsis

Captain reported a passenger was non-compliant about wearing a mask.

## Narrative: 1

Flying into ZZZ. Because of the weather we setup for a CAT 2 to Runway XXL. I briefed the CAT 2 off the pages. We were cleared for the approach. I armed the approach. CAT 3, dual. I was looking outside to pick up the runway. We got the Land green. I picked up the lead in lights then the runway. I said landing. At approximately 50 feet the aircraft said retard. I retarded the thrust levers. At approximately 30 feet and descending quickly I realize the aircraft was not going to flare. I pulled back on the stick and we landed firmly. We taxied to the gate. I called the maintenance control person and explained what went on. He look at the data. He said there was a "momentary glitch" in the FMC.

I don't know if we received a flare display and neither does the FO. I think when I said landing the FO also started looking outside. We debriefed the approach and landing sequence. I think also so many of our FOs are very distracted because of the virus situation, the furloughs, etc. If we were in the military it would be a good time for a Safety Stand-down. I understand we can't do that, but it is very tough out here for the line pilots, FA, Gate Agents etc.

[I suggest] ensuring everyone does their job all the way to engine shutdown.

## Narrative: 2

On descent into ZZZ we were prepared for an ILS approach to [Runway] XXR when the weather was reporting below minimums for the approach. 3,000 RVR was reported and 4,000 RVR was needed. We requested an approach to XXL which has a CAT 2 ILS approach and were vectored around for the approach. The approach was loaded and CAT 2 autoland procedures briefed. The approach was normal breaking out at about 200 feet with blowing snow but fairly good visibility. As we approached the 40 foot flare point I was distracted and not looking at the PFD. The Captain noticed the aircraft was not flaring and

turned off the autopilot and landed the airplane firmly.

We briefed the autoland approach and I quickly reviewed the required callouts. I was distracted when we entered visual conditions and my sight was drawn outside the aircraft. I missed the flare annunciation and not sure if it was presented. Captain noticed the lack of flare and took the appropriate action landing the aircraft. If I had called out no flare at 40 feet a go-around probably would have been more appropriate.

When conducting autoland approaches the First Officer needs to remain focused on the flight mode annunciator during the whole approach all the way through rollout. Emphasis needs to be placed on this importance during the briefing. We rarely conduct autoland approaches and thus can be overlooked along with the natural tendency to want to look up and out the window when going visual on an approach.

## Synopsis

Air carrier flight crew reported a hard landing after the aircraft did not flare during a CAT 3 approach.

## Narrative: 1

The issue was that we departed on a revenue flight without reviewing all required forms. I was acting as First Officer and non flying pilot in a three pilot crew of Aircraft X ZZZ-ZZZ1. This was my first time working in the First Officer position in two months which was during initial OE training. We were initially setup for a departure on Runway XXR. On the taxiout we were given a last minute runway change to Runway XYR. Performance data for this runway was not provided on the release. This required me to "manually" acquire the data from the MCDU. This was the first time online or in training for me of obtaining data in this fashion. It requires me to input the current conditions at the airport. When the takeoff data printed out it was in a format that I wasn't accustomed to. I then inputted the computed speeds and verified the thrust settings were proper, we weighed less than the assumed weight, there was no tailwind, and the temperatures were correct. The Captain and Relief Pilot then reviewed the data and we all agreed we were legal for takeoff. I mistakenly assumed and convoluted the new takeoff date printout with the load closeout and this data superseded and included the load closeout information. Several hours into the flight the Relief Pilot advised myself and the Captain that the actual load closeout in fact printed out a few minutes after rotation. After reviewing the load closeout I determined the takeoff was well within the performance data I imputed. However, that

fact remains, we are required to review the load closeout prior to takeoff.

Causal factors for me include...

1. I am new on this type aircraft. I in fact picked the trip up in order to make sure I obtained enough hours to consolidate.
2. I had not worked in the First Officer position in about two months which was when I was receiving line training.
3. This was my first time be it ground training, line training, or on line where is was required to get new runway takeoff data and was not familiar with the outputted format.
4. We were rushed due to a last minute runway change.

I would be helpful if in the training environment pilots were required to at least once obtain new runway data to get the experience.

### Narrative: 2

Takeoff without load closeout. Runway change XXR to XYL. First Officer on consolidation after IOE. Received new TPS for XYL. Discussion for "takeoff data and bugs" for Runway XYL from First Officer included "weight is right on, T/O power, temp and wind. I responded to checklist item Takeoff Data and bugs with "checked Runway XYL. Normal first 5 hours of flight. After returning to flight deck from 2nd break I was advised that load close out came up on ACARS at about 1,000 feet. First Officer advised he had used TPS data. I highlighted and showed First Officer header on TPS- "This does not satisfy requirement for load closeout." Normal flight.

This is a first at XX years, I will not depart again without physical eyes on load closeout.

### Narrative: 3

I was working this flight as a relief pilot. I was in the cockpit for taxi and takeoff for this flight. I observed the CA (Captain) and FO (First Officer) complete the Before Takeoff checklist, including discussing the weather and takeoff data. Shortly after takeoff, the load closeout comes out of the printer. I thought that this was a revision to the original closeout. I could not discuss this immediately with the crew because of sterile cockpit rules. Later I mentioned to the Captain that the closeout was received about 2 minutes after takeoff. Both pilots were sure that they had the closeout and reviewed the numbers before takeoff. We searched the cockpit and could not find the load closeout. Also the closeout received after takeoff was the original numbers. All 3 of us have not flown much this year due to COVID, so that was a contributing factor, also received a runway change while taxiing out.

### Synopsis

Air carrier flight crew reported a runway change prior to departure and departing without the correct load closeout.

## Narrative: 1

The Lead Flight Attendant called during cruise to report that a family of three, mother, father, and child were not complying with the company required mask policy. They had been told repeatedly to wear their masks. The child was said to be older than two. We notified Dispatch through ACARS and requested a CSR meet the flight. On arrival in ZZZ no CSR met the flight. The agent that met the flight had not been informed of the incident. A radio call to operations verified that no one in ZZZ was aware of the situation.

This is the second occurrence in one month where a CSR was requested for a level 1 or level 2 incident and no CSR or additional support met the flight. Flight deck and in-flight crews are required to participate in threat level training, and in person recurrent training, every year. The trend of our company not supporting our crews with onboard incidents is alarming.

## Synopsis

Captain reported CSR was not aware of the need for them to be present when aircraft landed due to a family not complying with face mask policy during flight.

## Narrative: 1

Captain (CA) was PF on takeoff from ZZZ [Runway] XR. In the high speed phase, CA air data (airspeed and altitude) blanked out showing flags. Takeoff continued. Missed initial turn on the ZZZZ departure as both CA and FO lost flight directors. [I] guided CA back to SID using heading bug. Captain transferred controls to me as my air data seemed more reliable. Ran Unreliable Airspeed QRH. Determined that FO side was indeed working and regained automation per the procedure. As CA airspeed and altitude were intermittent, I became PF for rest of flight.

Discussed with CA and both agreed as a crew it was safe to continue flight. However, we forgot to discuss that we had a single altimetry system and entered RVSM. We operated in RVSM for remainder of flight. Aside for intermittent issues on Captain side, rest of flight was uneventful. It is noteworthy that the Airspeed Unreliable procedure didn't have a note regarding potential RVSM issues in the scenario of recovering a back air data and automation on one side.

## Narrative: 2

During the takeoff roll, the Captain's primary airspeed and altitude display blanked and autothrottle disengaged. Captain was PF and continued the takeoff. FO manually set takeoff thrust. We were cleared to climb via the ZZZZZ2 [departure] ZZZZZ1 transition. I was slightly late making the initial turn and FO communicated this, then used HDG SEL to return to course. I asked for flaps 5 (we had taken off using flaps 10). Once at wings level, I asked FO to take the controls and a positive transfer of controls occurred. FO appeared to have good attitude, airspeed and altitude information. FO continued to fly, and we retracted the rest of the flaps on schedule. At this point, we ran the Airspeed Unreliable checklist. We were able to confirm that the FO indeed had reliable airspeed, altitude and attitude information. We were able to re-engage the FO's flight director, and ultimately he engaged the right autopilot as well. We also determined that the autothrottle was working with the FO's flight director as master. We monitored the autothrottle closely throughout the flight and it functioned normally. We discussed the prudence and safety of continuing the flight without reliable primary airspeed and altitude information. We ultimately agreed that with the FO's side working normally, as well as having reliable standby airspeed and altitude information, that it was safe to continue the flight. The Captain's airspeed and altitude would return to normal periodically during the flight, but then blank again. This occurred throughout the flight.

I failed to notify ATC or dispatch about the failure, which would have been the correct thing to do, because of the requirements for entering RVSM airspace. Only after the flight did we realize this and debrief this as an error. We also debriefed the course deviation during the departure phase. The distraction of not having a primary display for altitude and airspeed was one reason for this deviation. Good crew communication from the FO was helpful in correcting this error and promptly returning to course.

This aircraft had a similar write-up from the previous day, and maintenance had replaced the Captain side PFD. During the preflight for our flight, the Mach airspeed warning system failed to test on the no. 1 side, so maintenance ultimately replaced the left ADIRU. We believed this to be the correct fix, since everything tested normally prior to pushback. (On a side note, we took this same aircraft the next day. Maintenance in ZZZ1 replaced the left AOA sensor and this fixed the problem.)

There were other threats that probably contributed to the errors mentioned above. Both of us had done very little flying in the weeks and months prior to this event. We were both due to lapse landing currency on date. I am new to this fleet as a Captain, and still have fewer than XXX hours in this type aircraft. My last flight prior to this flight was late August. The FO has more experience on the airplane but also hadn't flown much since March.

## Synopsis

Air carrier flight crew reported that the Captain's airspeed and altitude became unreliable and they did not notify ATC prior to entering RVSM airspace.

## Narrative: 1

From an XA:00 short call I was called at XD:00 AM for a XJ:20 two day to ZZZ. I was awake from that call and didn't have solid sleep before. This was my first trip in X months and arrived 2 hours before to departure to get prepared and do the online form for State X. The next night I slept approximately 7 hours, but awoke several times during the night

because I couldn't cool the room. I used a lot of caffeine to get through the flight home and arrived spent. 20 minutes after the trip the crew desk assigned a XF:59 flight time ZZZ1 ZZZ2 ZZZ1, 1 day on minimum rest. I was unable to get to sleep and called in fatigued. Undesirable pairing assignment along with operational fatigue.

## Synopsis

Air carrier Captain reported undesirable pairing assignment along with operational fatigue.

## Narrative: 1

COVID testing at ZZZ took approximately 45 minutes to complete. Any one individual crew member could probably have gotten through faster, but since most of the crew (pilots and flight attendants) was there at the same time, the process got very slow. The nasal swab was quite invasive. One of the pilots reported great discomfort after his test. He initially felt he was unfit for duty. However, his pain eventually subsided after approximately 15 minutes, and he decided he was fit enough to fly.

We blocked-in to ZZZZ. It was complete and utter chaos on the aircraft for the flight attendants. The Purser and the language flight attendants did a tremendous job attempting to help the customers fill out the form. Many of the customers were extremely frustrated by the slow, confusing process. This is something that Customer Service in ZZZ absolutely should have assisted passengers with before departure. There is no reason that they should have waited until arrival in ZZZZ to start this process. It took exactly one hour after block-in to deplane the passengers and crew.

After deplaning the crew was required to line up in approximately 6-7 different stations to have various health forms and passports checked, and to have our COVID-19 tests performed. The choice of tests were a nasal swab, a throat swab, or a blood test. After undergoing the uncomfortable nasal swab in ZZZ, most crew members chose the throat swab which was also uncomfortable and caused a lot of gagging, but generally better than the nasal swab. No one chose the blood test. At most of the stations the crew was simply mixed in line with the passengers. We finally exited customs, two and a half hours after block-in.

The crew was then escorted on the 15 minute walk to the back service entrance of the hotel. The service entrance was dark, smelly, and in general disrepair. The entire area around the hotel was deserted, and there seemed to be no apparent reason we couldn't be processed in through the front entrance. We finally arrived at our rooms. The entire process took exactly 3 hours from block-in.

Due to our late arrival at the hotel, we were unsure if we were going to be fed any dinner. When we initially inquired about our meals, we were told that dinner service [had] ended. It was unsettling to hear that we would not be afforded any meals since we were not allowed to leave our rooms. However, after several phone calls to the hotel/CDC staff by the Captain and the Purser, we were assured that meals would be forthcoming. Two hours and a half hours after arrival at the hotel and over five hours after block-in, meals for the crew started to arrive. Food quantity and quality were acceptable.

I don't believe there is much the company can do about the foreign country government's procedures for processing passengers and crew. However, one area we need to immediately improve upon is caring for our customers by helping them to obtain required information prior to departure. This would be extremely helpful in expediting deplaning and preventing confusion and frustration for both customers and flight attendants.

Another area we could improve upon is helping crews get through the rigorous process of health inspections and customs processing at ZZZZ. If the government would allow a company representative to be on hand, that would be extremely helpful. Our language flight attendants did their best, but at each station there were numerous question about what documents were needed, and what was to happen next.

Hopefully this information will be helpful for upcoming passenger flights from the U.S. to ZZZZ.

## Narrative: 2

I got the bag of food and a list for the layover. I'll address each item on the layover list included in the bag.

1. Let me start by saying this is the most slimy disgusting hotel I have ever stayed at. It is the ZZZZ1 airport hotel. I don't know who reviewed the hotel, but it is very run down, and lack of maintenance is very apparent, and feel that the conditions are not safe. We should not have any layovers in City Y as long as the COVID testing procedures are in effect and the government insists on keeping crews at this hotel.

2. The internet at the hotel is so slow it is not usable. I am unable to log into company system.

3. The hot oatmeal in the food bag is not edible, there is no safe water at the hotel, and no way to heat the water. The water is not safe to drink. They do offer bottled water on check-in.

4. We blocked in. We didn't get to the rooms till 3 hours [later]. This is time I am still on duty, but is not recognized.

5. We were required to undergo another round of COVID tests on arrival. I asked for and was granted the mouth swab, a few flight attendants asked for this instead of the nasal probe and were denied. On the way to the testing, they wanted us to leave our bags unattended while we went outside, to the testing center. I said, no, we will not leave our bags unattended as it was a security issue. They were not gentle with the nasal probes. Several flight attendants had sore noses after the tests, and were crying. Many said they will not come to ZZZZ again because of the invasiveness of the testing. One pilot was taken away for further scrutiny at one customs station. We were never told why. I hung back to make sure he was not taken somewhere else. I strongly recommend to not ever leave any crew behind. Stay together.

6. No company representatives were in attendance of our arrival, at least none I could tell. We could not tell who was who. No one knew what we were supposed to do. We finally, after an extensive delay found our security escort through the terminal. It took about an hour to get the passengers off the plane. Many did not have the COVID form filled out ahead of time, and were required to do this before they were let off the plane, which

meant we were also held as long as there were passengers on the plane.

7. We went through 3 different customs/COVID paperwork stations. At each station we waited for another set of paperwork to be filled out, greatly extending the time required to get to the hotel.

8. A customs employee walked us to the hotel to the back entrance. Water damage, moldy, run down hallways, and a rusty elevator that looks like it hasn't been maintained for the last decade was our route.

9. The room itself is not too bad, and is as described in the handout, except for temperature control.

10. I called several times, and asked the hotel representative about the food, no one had any answers about when or what kind of food would come. Finally, 1.5 hours after we arrived, food was delivered to the room. However, no room service, no menu, no food choices at all. Again, no information of any kind was available.

11. No fire sprinklers in the room, meaning it's not safe in the event of an emergency. If you have to leave the room in case of emergency, you do not have a room key and cannot get back into your room.

12. Unable to control the temperature in the room. It was uncomfortably warm.

13. The time to leave the hotel is set at 2 hours before departure. For a paper XX hour layover, we ended up with [4 hours less] in the room. These times need to be accounted for [to] make sure there is adequate layover time in the room, as well as duty day after block in, and prior to flight planning.

In conclusion, the procedures the Country officials have in place for our arrival are excessive and unneeded. Due to the treatment during the COVID tests, I will not be coming back on this trip again. The hotel is abysmal. Nowhere near in contractual compliance. Why [are we] even entertaining allowing flights/layovers here with the disgusting conditions? We should not be staying here and we need to stop this ASAP. No one in charge knows anything about the procedures, or has any answers for our [foreign language] speakers.

## Synopsis

Air carrier flight crew reported encountering multiple delays as passengers and crew members deplaned and went through a foreign country's required COVID-19 protocols. Crew also reported concerns with the layover accommodations.

## Narrative: 1

After the parking checklist was completed we found a ACARS printout informing us of an overweight landing. The printout listed the Max Structural Landing weight of 146,300, the actual landing weight section was blank. Using our ZFW and arrival gate fuel we were approximately 200 pounds overweight on landing. This overweight landing was due to two shortened routings we received by ATC saving time and fuel. We completed a post flight debriefing which included a review of the OFP (Off-line Flight Planning) - FMS INIT LOAD section. The flight was dispatched to land only 568 pounds below max structural landing weight. We failed to identify this threat before departure or enroute which led to the subsequent error.

Our expectation bias of recent low passenger loads and light aircraft combined with a lack of recency of experience was a threat we didn't identify properly. Plus in past experiences if a potential landing weight concern exists, Dispatchers have highlighted this threat as a note in the OFP.

## Narrative: 2

After arrival to the gate we received an overweight landing message. After reviewing our ZFW and fuel load we determined that we landed approximately 200 lbs over max landing weight. After discussion between the CA and I we agreed a lack of CRM was the ultimate cause of the deviation. My thought process was as follows:

Our flight from ZZZ to ZZZ1 was planned to land almost 1,000 lbs below MLW. As part of my pre-flight planning I always note the spread between both takeoff and landing weight verses the maximum values. A 1,000 lbs gap on landing did not stand out to me as something I would need to worry about. During our flight to ZZZ1 we received a number of shortcuts that shortened our route, and early in the flight we were certainly heavy on the fuel. However, as we neared the top of descent our fuel number vs the HOWGOZIT had dropped and was just several hundred pounds heavy.

When requesting the landing data our FMC wt was about 3,000 lbs over MLW, and while it mentally recognized this, I did not verbalize it to make sure the CA was also aware (again in my mind I was not thinking landing weight was going to be an issue). I also did not mention our weight as a potential threat during my arrival briefing.

## Synopsis

Air carrier flight crew reported an overweight landing.

## Narrative: 1

Yet again we are having problems with passengers not wearing their masks when told to, multiple times. In this case a passenger was told repeatedly by the purser to wear his mask. He was irritated and would not comply. I made a PA announcement to reinforce the purser's statements to him. He reluctantly complied, but then continued to be disruptive so the purser and I decided he should be removed from the aircraft. We called for a Supervisor to assist. The passenger was removed to the jetway where a heated discussion took place. I made it very clear that I wanted the passenger removed from the flight. Several supervisors showed up and again my decision to remove this passenger was second guessed. This went on for 30 minutes. In hindsight I guess I should have called Operations to end this never-ending discussion going on between the passenger and supervisors, but I shouldn't have to resort to that. I wanted the passenger removed and it wasn't happening. To not delay all our other passengers further the purser and I agreed to take him back on the aircraft. Later in the flight the passenger was intimidating the purser by staring at her and lowering his mask below his nose.

## Synopsis

Air carrier Captain reported wanting to remove a passenger for not complying with face mask policy, but was over ruled by supervisors. The passenger intimidated the Purser during flight and was still non-compliant with face mask policy.

## Narrative: 1

We flew the airplane in from ZZZ1 on Flight ABC, arriving late at XA:05L. We were late due to the previous flight arriving late into ZZZ1 and then circuitous ATC routing for an arrival from the NE (ZZZZ Intersection, ZZZZ1 STAR). Because of our late arrival our outbound flight was designated a quick turn. During this Pandemic, NO flight should be designated a quick turn or the time required to accomplish a quick turn should be greatly increased. During this Pandemic, designating a flight a quick turn leads to all the well-intentioned folks on the ground becoming rushed. Operations designates blame if the quick turn is not accomplished in the allotted time and this further complicates and rushes activities. Cleaning is rushed or inadequate, time required to spray the aircraft is not accounted for in the quick turn time. Catering is rushed, deplaning and boarding take much longer during the Pandemic, gate agents become rushed and mechanics are rushed to fix or defer any maintenance issues. This rushing leads to intense time pressure, mistakes in judgment and errors in execution, all of which could lead to an accident or incident.

Fortunately, there was not an accident or an incident on this flight. There were a few errors, however. During the Pandemic, ZZZ Catering has not been boarding any special meals, so the Captain had to leave the airplane to obtain a meal that he could eat. This takes some time to accomplish in a crowded ZZZ Airport around dinner time.

During the Pandemic, I (the Captain) accomplish a short pre-flight safety briefing to the passengers with special emphasis on seat belt usage during climbout, descent or during any en-route turbulence and proper mask wear throughout the flight to prevent the spread of COVID. Boarding had been completed, catering was finishing up as I started my PA with the cockpit door closed. The Gate Agent opened the cockpit door and without waiting a beat, announced loudly, "You got everything you need?" When I held up my hand to silence the Gate Agent because I was in the middle of making a PA, the Gate Agent turned to the FO and asked him loudly, "Well, do you got everything you need?" I stopped making my safety PA, put on my mask and told the Agent that "I'll be done in a minute, I'd like you to leave the cockpit, so that I can finish making my PA. I'll come let you know when I'm done; please shut the door on your way out." The Gate Agent turned and left the cockpit, but did not close the cockpit. I got up, slammed the cockpit door shut and made a few loud choice remarks to myself. The choice comments were definitely an error on my part. I composed myself and then finished making my safety PA. Shortly thereafter, I put my mask back on, exited the cockpit and told the Gate Agent that we had everything we needed and the Gate Agent could close the Cabin Door. The Gate Agent closed the cabin door, I returned to the cockpit and we accomplished the Before Push Checklist.

I checked in with the ground crew and she told me that catering had noticed some large scratches around Door 1R and that the Mechanic was telling her not to push. I asked to speak with the Mechanic and she promptly put him on the headset. The Mechanic had invalidated our current maintenance release and explained that catering had noticed several large scratches around Door 1R. He would need to measure the scratches and then go check the aircraft maintenance history to see if they had previously been noted and properly recorded. I told the FAs, made an announcement about the delay and turned the seat belt sign off. I asked the FO to call Operations and have them bring the jetway back

to the airplane. In a couple of minutes, the Agent returned the jetway to the aircraft and Door 1L was opened. During a Pandemic, it is not the time to keep passengers wearing masks, trapped on an airplane. Just having an opportunity to leave the airplane actually reduces the stress and anxiety to feel the need to do so. 15 minutes into the delay, a Maintenance Supervisor got on the headset and said we'd have a new maintenance release in 7 - 10 minutes. We got a new maintenance release in about 8 minutes, closed Door 1L, turned on the seat belt sign and pushed back 38 minutes late. We arrived safely in ZZZ3, only 14 minutes late.

Before departing, I quickly reviewed the new maintenance release, which looked OK in spite of it not showing a new write-up or a new / previously inspected / signed-off of the scratches around Door 1R. If it's important enough to delay an already late flight by another 25 minutes, it's important enough to write up the scratches or notate that those scratches were previously recorded and within limits. I don't believe there's anything wrong with adding a 2nd written sign-off to a previously recorded or to a verbally added maintenance gripe, but it would be helpful if the flight crew knew about it. Whenever pilots call in a maintenance gripe we are always advised to follow it up. If the rampers or catering verbally reports a maintenance gripe to a mechanic, then that mechanic should likewise have to make a written report of the gripe. He can then appropriately sign it off, defer it or notate as previously inspected. Verbally noting, recording and signing off of a valid maintenance gripe leaves much to be desired. I'll say it again, if it's important enough to delay an already late flight by another 25 minutes, it's important enough to write it up.

## Synopsis

Air carrier Captain reported concerns relating to a quick turn of an aircraft and the flight being delayed due to scratches found on a door requiring a new maintenance release.

## Narrative: 1

I was scheduled for the re-qualification X course. I requested a warm up sim and was denied by Person X going through my chief pilot office. Person X claims that warm up sims are a waste of time and don't improve an already high pass rate. Person X said training is designed to catch any lack of proficiency prior to the CQLOE [Continuing Qualification Line Operational Evaluation], so a warm up sim isn't necessary as normal training will catch any lack of proficiency.

I did the traditional re-qualification X course in month after being off the type X aircraft for X years. I only flew about 90 hours on the type X aircraft prior to the reduction of flying. I haven't flown since the middle of month. I thought requesting a warm up sim was reasonable considering my lack of recency/proficiency on the type X aircraft, and a new very short re-qualification course.

The new re-qualification X course has several areas that aren't covered prior to the LOE

[Line Operational Evaluation]. In the curriculum, it shows the initial 3 sims all start engines running on the runway. There is no practicing flows, FMS work on the ground, starting engines, or normal ground ops getting to the runway which are some of the most high risk areas. There is no time built into the curriculum to work on procedures for people that have [not] flown for 8-9 months and didn't have much recency.

I feel the company is focused on pushing through as many people through as quickly as possible when the company let them lose currency. I don't feel that the new re-qualification X course is appropriate or safe for all pilots that can be trained under it. There should be other recency requirements for pilots to be trained under the new re-qualification X.

## Synopsis

Air carrier First Officer reported requesting a warm up simulation prior to a re-qualification simulation and was denied.

## Narrative: 1

Aircraft was stopped at intersection X waiting to taxi to [Runway] XR. Last ground instruction was to use Taxiway E, but then was changed to follow company off right by different Controller. FO and I both missed transition to Taxiway F instruction. Controller said "No big deal," but it was clearly a pilot error in not understanding and reading back correctly the instructions. Day five of flying led to slight fatigue, coupled with change of ATC instructions leading to failure.

## Narrative: 2

We were approaching ramp number [X] from the gate for departure. Contacted Ground for taxi clearance. They instructed us to proceed onto Taxiway Echo westbound to Runway YR; the rest of the transmission was difficult to understand. We, instead, turned westbound on Taxiway Foxtrot. While I was trying to interpret what the second part of the transmission while I was starting the number one engine, a second Controller informed us of our error. Lots of time compression and task loading along with part of the Ground Controller's transmission being difficult to understand. The airport was busy; lots of aircraft simultaneously taxiing in and out with numerous 'stepped on' transmissions. An additional 'additive condition' was the Ground Controller's transmission. I believe a contributing factor was mask wearing in the Controller facility. If this is true, they need to standardize what type of masks they wear and work harder to enunciate their syllables.

## Synopsis

Air carrier flight crew reported turning the wrong way on taxiway due to not clearly understanding Controller instructions. FO stated controllers wearing face masks could have contributed to them not clearly understanding the clearance.

## Narrative: 1

Aircraft X overflight at 9,000 and Aircraft Y departed a satellite airport with 9,000 as his final altitude. I was working numerous aircraft doing IFR practice approaches in our airspace with weather that aircraft were starting to deviate around. I noticed these two aircraft were on converging courses about 5 miles separation between the two. I gave both aircraft heading altitudes and called traffic to try and keep separation. They got within about 2 to 2.5 miles lateral before altitude separation was established. It has been a difficult day as it's the first day being back on our bid schedule. Only having one day off after numerous months of time off between work sessions to recuperate. More positions open and not being able to maintain social distance, which is now requiring to wear a mask the entire time working. I am required to wear glasses all the time and wearing the mask is causing fogging of my glasses as my mask moves when I talk. Which is causing a distraction.

[I recommend being] more vigilant of altitudes. Eliminate or limit distractions or things distracting me. Maybe ask for a split of positions since some distractions like a mask can't be eliminated at this time allowing for more time to overcome the distraction.

## Synopsis

TRACON Controller reported an airborne conflict and cited distraction caused by having to wear a face mask.

## Narrative: 1

Our operation was just notified on Date 3 that our aircraft registration expired on Date 1. I operated one training flight as SIC. The flight was on Date 2. I am guilty of just looking to ensure that the document was on the airplane, while completely disregarding my duty to ensure that it was valid. A contributing factor to this is that the aircraft registration is addressed to our company headquarters, which is a different address than our operations base hangar. Due to COVID related staffing at our headquarters, our FAA reminder postcards were never delivered to our hangar. Again, it is my responsibility as a flying crew member to ensure that the correct paperwork is on the aircraft prior to each flight.

We have instituted the following changes to ensure that this does not happen again: 1) Added the registration expiration to our maintenance tracking software. This will flag our maintenance team when expiration is close to occurrence. This will also be printed on the preflight form that all pilots utilize. 2) Training will occur and language will be added to our General Operations Manual (GOM) and/or expanded normal procedures document emphasizing the action to ensure that a valid registration is onboard the aircraft. 3) A consultancy company has been hired in ZZZ1 to automatically renew our registration and deliver it directly to our hangar.

## Synopsis

Pilot reported flying an aircraft without current registration.

## Narrative: 1

The issue we had was that we departed on a revenue flight without reviewing all required forms. I was acting as First Officer and non flying pilot in a three pilot crew. This was my first time working in the First Officer position in X months which was in initial training.

We were initially setup for a departure on Runway XXR. On the taxi out we were given a last minute runway change to Runway XYR. Performance Data for this runway was not provided on the release. This required me to "manually" acquire the data from the MCDU. This was the first time online or in training for me of obtaining data in this fashion. It required me to input the current conditions at the airport. When the takeoff data printed out it was in a format that I was accustomed to. I imputed the computed speeds and verified the thrust settings were proper, we weighed less than the maximum allowed assumed weight, the current winds were within tolerances, and that the temperatures were correct. The Captain and Relief Pilot then reviewed the data and all agreed we were legal to takeoff. I mistakenly assumed that we had already received the load closeout and because of this the data I obtained superseded that and the load closeout data was contained with the new takeoff data.

Several hours into the flight the Relief Pilot advised myself and the Captain that the load close out in fact printed out a few minutes after rotation. After reviewing the closeout I determined the takeoff was well within the performance data I imputed. However, we are required to review the load closeout prior to takeoff.

## Synopsis

Air carrier First Officer reported departing without the correct flight load closeout paperwork.

## Narrative: 1

I was the PNF on this leg. The Captain was in the cockpit and started the right engine while I loaded equipment on board. I closed the main cabin door and briefed the passengers. This was their second leg with us so the briefing was abbreviated since a full briefing was given on the prior leg. I was in a COVID mask and it was warm outside (82 degrees). After the load I entered the cockpit and strapped in. I received a briefing on the clearance and we started the left engine. I was a bit rushed and I didn't review the departure procedure plate as thoroughly as I should have. We departed [Runway] XXR and I didn't hear or the captain didn't call for me to select NAV on the MCP. Therefore, we were late to make the required right turn to 025 degrees. The Tower asked us to begin the turn. I was rushed, hot and distracted by the COVID mask a bit. I should have prompted the NAV selection if the Captain didn't call for it. This was not a DP where there is a complicated course. It is RNAV but basically a heading to a vector. The heading change was subtle and I reviewed the DP in a hurry.

## Synopsis

Air taxi First Officer reported a track heading deviation during departure.

## Narrative: 1

While flying at an altitude of 3,000 feet, ATC assigned new altitude of 2,500 feet. I mistakenly entered 2,000 feet in my autopilot. Once leveling out at 2,000 feet ATC informed me of my error and reassigned existing altitude (2,000 feet) as my new altitude.

I believe this occurred due to a heightened work load environment I was experiencing at the time, rapid fire instructions being given by Controller within his busy airspace, and my reduced flight proficiency due to fewer hours flown over the prior several months. I plan on making a concerted effort to fly at a minimum of once per week to maintain suitable level of proficiency.

## Synopsis

GA pilot reported an altitude excursion and cited lack of flying as a contributing factor.

## Narrative: 1

On our third and final flight after an exceedingly long day with an early sign in, out of a remote co-terminal, (3 legs, with a 3 hour sit out of ZZZ1 having to leave my house at XA:00am to catch the shuttle) and dealing with mechanical issues, stressful delays, and upset passengers along the way, I became distracted when a dead heading crew member wanted to move his seat to a completely empty row in the unusually empty last flight, in order to increase social distancing.

He moved to the exit row seat XX4, and was talking to me during boarding about changing seats, seniority, furloughs, and the general state of things. The boarding was very short and the lead flight attendant said to prepare, I had thought she meant the cabin, and she had actually meant the doors.

She did the all call and I answered the phone but, being caught off guard, I failed to arm the doors, because I had still been talking to the deadheading crew member who would be working the return flight. Then I proceeded to head up to 2L and R, (which is my demo position,) to do the safety demo. During the demo the Captain called back to ask us to check the 2 and 3, L and R doors.

I verified the 2 L and R doors were armed and went to check my doors (the 3 L and R doors,) and realized they were disarmed. I immediately corrected the situation by arming the doors, and called the cockpit to verify. The cockpit confirmed, and we resumed the safety demo.

In the future I will NOT allow myself to become distracted from my door procedures by any and all outside influences. I have never failed to arm a door before, and realize now how easy it is to slip up on a long day when we let our guard down, and allow outside factors to affect us. I will practice constant vigilance in the future.

Also, I will visually verify and crosschecked myself during the all call, to make certain that the doors are armed, and if I would have done that this time, instead of being distracted, I would have noticed that the doors were Not in fact armed, and been able to correct the issue immediately rather than after the fact.

## Synopsis

Flight Attendant reported being distracted and not arming two assigned doors.

## Narrative: 1

I started work of a 3 day trip. 1st day 13 hour duty day so almost 15 hours with mask on!! I tried to take several masks (maybe 15). She said I could only take so much and I replied it gets wet so often I need to change it, especially if airline requires me to talk to people as much as we do. She finally gave me more. If I am required to wear something that I know is harming my health at least let me do less harm by changing it constantly. Then I was denied access to the bus because of social distancing. Airline must pick and choose which guidelines it would like to follow because every seat is taken and there is no social distancing on an airplane, but I can't even get to work to get to the packed airplane cause I need to social distance. This trip had 2 legs with severe turbulence. I am the one that has to sit in a passenger seat. I don't get the harness to keep my body from slamming all over the place. Yes, people were crying and screaming, that is how bad it was. But unfortunately our pilots took off without asking if we were okay. Wow, but the next flight into ZZZ1, she screamed over the PA to sit immediately!!! First officer made sure we were safe and apologized forever on how bad she felt with the last minute notice. I again was thrown to my seat and no harness. It is difficult to pass information on to each other that the passengers probably shouldn't hear, but there is no choice if I need to know. The FA in the back has to yell to me, not only because of a mask, but because I am so far away. Again, safety and security is tossed aside. After the 13 hour duty day my head was throbbing. I again get severe headaches the longer I am masked. These days are just too long wearing a mask and now they put out an article to the public about the safety of wearing a mask on a plane. I can do the same and say mask wearing does nothing. Both articles would be correct, because they aren't peer reviewed science. Science doesn't lie, people do.

## Synopsis

Flight Attendant reported concerns with having to wear a face mask for so long throughout trips.

## Narrative: 1

ILS approach into ZZZ. I briefed the approach with course and frequency and confirmed the points in the FMS. Vectors to final were activated and I missed the course was not set on the inbound and I think when I briefed the frequency I was reading the frequency from NAV 2. We turned inbound and not seeing the errors I told the PNF that he had control, but this time we were well above the GS. We notified ATC that we were going to go missed and were given new instructions. After the missed, I reset the inbound course and reset the frequency. I then told the PNF that I had control and the next approach was done to a safe landing.

I haven't flown in several months and the other pilot was his second flight in this type aircraft. I believe was a contributing factor on this approach.

## Narrative: 2

While being vectored to the ILS for Runway XX, the crew noticed that the localizer failed to auto-tune when the approach was armed. When it was determined that the course was not going to be captured the pilot transferred the auto pilot to the pilot monitoring side where the localizer did tune correctly. However, by this time the aircraft had flown through the course. The autopilot attempted to capture the course, but completed one or two "S" turns. The crew agreed that the approach was not stabilized and we indicated to ATC that we intended to go-around and try the approach again. We were given vectors and an altitude and were cleared for the approach again. The following approach to landing was completed without issue.

Crew should have been more vigilant to ensure that the correct NAV frequency was tuned and the decision to transfer the coupled side autopilot could have been made earlier.

## Synopsis

Corporate flight crew reported an unstabilized approach resulting in a missed approach/go-around.

## Narrative: 1

I was PM for this leg back to ZZZ1. We were cleared for takeoff on Runway XX, lined up on the runway, and I gave the controls to the FO. He set the thrust levers to CLIMB and called "set thrust." I checked the stack and verified the N1 indications were in the carats and stated "thrust set." I failed to push the thrust levers into the TOGA detent and neither of us noticed. The remainder of the takeoff was uneventful. When performing the after takeoff flow I realized that the thrust levers were already in the climb detent.

This was my first trip on the type aircraft since being checked out earlier this month. I have exclusively flown the different version of aircraft type for the last X months and have not become accustomed to setting the thrust in Aircraft X compared to the previous type aircraft. I was a type Y aircraft FO before upgrading into this type aircraft so my time in all three variants is very limited. I had only done three legs in this type aircraft as PM before today, the rest of the legs being as PF to practice landings. My habit of pushing the thrust levers past the climb detent and into the TOGA detent has not been set yet, as for the majority of my legs I was only setting them to CLIMB, then the PM pushing them up to TOGA before I put my hand back.

I need to fly this type aircraft more often to become/stay proficient. It also would have been better to do OE in this type of aircraft sooner to start those habits earlier and not get into such a groove in only the other type aircraft. I guarantee I will never make the same mistake again as it was quite a shock when I realized what I had/had not done.

## Synopsis

Air carrier Captain reported failing to push the thrust levers into the TOGA detent before takeoff.

## Narrative: 1

We were on Departure out of ZZZ on the ZZZ 4 from Runway XXR W intersection. The flying FO executed TO and initial left turn and then the subsequent right turn to 220 and started the level off at 2,500. ATC then issued climb to 6,000. Followed shortly by an additional right turn. The Captain changed the heading bug at about the time he would normally have called for 5 for 6 for level off. We were at high rate of climb and the flying FO started the level off late and ballooned through 6,000 feet to approx 6,400-6,500 feet and quickly corrected back to 6000.

## Narrative: 2

I was the pilot flying on Aircraft X, ZZZ-ZZZZ. We were cleared on the ZZZ4 Departure, maintain 2,500 feet. I was hand flying the departure. We were cleared to a new heading of 050 and altitude of 6,000 feet. I turned to the new heading as I continued to climb to our cleared altitude of 6,000 feet. While in the turn, I realized I had passed 6,000 feet and the altitude box turned yellow. I immediately stopped climbing and descended back to 6,000 feet. The highest altitude was 6,380 feet. ATC commented to us to maintain 6,000 feet. There were no other issues regarding the altitude deviation.

Other issues:

At about 30 minutes from departure, we had an issue regarding deadheading flight attendants that were exposed to a COVID-19 positive flight attendant on their crew. We had an extensive discussion with the company representatives from Flight Operations, Dispatch, Medlink, and Inflight Services. This situation was very distracting to the pre-flight planning and the subsequent departure.

I believe it was an influence in my altitude deviation.

I deviated from the altitude clearance of 6,000 feet. I allowed the aircraft to reach an altitude of 6,380 feet.

## Synopsis

Air carrier flight crew reported an altitude deviation during departure.

Narrative: 1

Aircraft X released by previous shift Dispatcher ZZZZ-ZZZ as a re-release flight plan as is normal. After I took over and flight had been in air for several hours over mid-Ocean, we received a no-notice NOTAM advising that ZZZ Center was going to be closing from XA: 30z-XC: 00z for COVID cleaning. Aircraft X planned right through that airspace during that time frame (release prepared well before NOTAM was ever issued or any notice was received). Spoke with both ZZZ Center watch desk who stated that absolutely no traffic would be allowed through, no matter when they departed and if they didn't have enough fuel to go-around, they would have to land. Attempted multiple different routings around ZZZ [Center] airspace but not enough to circumnavigate. Consequently, flight had to divert to ZZZ1 for fuel.

This was caused by ZZZ Center failing to provide notice of a closure in a timely manner as other centers have done when they have needed to close. Also at issue is why it requires shutting down the entire facility while someone sprays disinfectant. Absolutely no reason why Controller stations can't be shut down a few at a time to enable continued, if limited operation rather than a total shutdown.

FAA needs to establish contingency plans for each center to remain open for at least a minimal level of service during COVID cleanings. As an essential safety function, it is unacceptable for them to just decide to go ATC zero when planes are already in the air.

## Synopsis

Dispatcher reported late notice for a Center to be closed for COVID cleaning, which resulted in a divert.

## Narrative: 1

I received the inbound aircraft with an open AML write up for the aft cabin FA handset PA function inoperative. The interphone function was operative. I briefed the affected FAs on alternate communications as per the MEL. Maintenance personnel arrived at the aircraft just prior to departure and deferred the aft cabin handset as inoperative per the MEL. I received the AML, reviewed and signed it. While receiving the AML, myself, the FAs and the agents were dealing with a boarded passenger not properly wearing a face covering. All issues were resolved just in time to make departure which was otherwise uneventful. Shortly after getting airborne I realized that I had gotten distracted prior to departure and I had neglected to receive an amended release for the MEL item.

[I was] Distracted by operational, maintenance and passenger issues. Be more diligent.

## Narrative: 2

There was an MEL write up for rear cabin phone unable to do a PA. It was deferred, but we forgot to get an amended release with the MEL on it before we took off.

Cause - Flying a red eye. Late night departure.

## Synopsis

Air carrier flight crew reported being distracted prior to departure and neglected to receive an amended release for an MEL item.

## Narrative: 1

Upon starting number two engine, the FO miss-configured the pneumatics panel and left [the] left pack in auto. Could be due to both packs in high instead of auto while at the gate and boarding due to COVID-19. When number two N2 didn't rise to a normal RPM the FO mistakenly closed the cross feed valve instead of the left pack valve. The N2 RPM began to decrease. We realized what happened and did the memory item, the QRC, then the QRH. No engine limitations were exceeded. The subsequent start was normal.

## Synopsis

Air carrier Captain reported taking off with the pneumatics panel misconfigured and the left pack in Auto.

## Narrative: 1

Aircraft X [had] a pre-departure issue [that] contributed to a late and rushed departure and a distraction that affected the crew. Next the Runway XXR departure had a new heading clearance and a new altitude assignment in rapid succession that contributed to the distraction of PM not making the 1,000 foot call while trying to set new heading.

Prior to departure there was an issue that required the flight crew to discuss with Dispatch, the FOM and FA crew regarding X deadheading ZZZZ based FAs that had been exposed to COVID-19. With 25 minutes prior to departure I found out that deadheading FAs on my flight had been exposed to a COVID positive crew member for an extensive period of time and would be sitting in Area X with other revenue passengers. They had been cleared to travel by being asymptomatic with no temperature. The outcome was my decision to not allow them to travel on my flight with some pushback and pressure to have them fly. The crew was upset with the way this was handled. Once resolved we quickly finished prep and briefed to get flight pushed.

First Officer was flying the departure off of XXR at Intersection 1. Takeoff was normal with the typical busy departure of an initial XX0 heading then back to YY0 heading with an initial level off of 2,500 feet. Just as FO was heading YY0 and approaching 2,500 feet altitude we received a climb to 6,000 feet and a heading of OZO degrees which was more than XA0 degrees to the right. I acknowledged clearance and reset MCP to 6,000 feet with VVM sop. I then started to slowly spin the heading knob to heading of OZO so as not to induce a left turn because it was more than XA0 degrees from our current heading. While maintaining traffic watch and setting the new heading the FO went through 6,000 feet and I saw the 300 feet amber warning and an altitude of 6,380 as the FO was already correcting. This all occurred within a 30-45 second time frame. The remainder of departure was uneventful.

Once at altitude we debriefed as a crew and outlined contributing factors:

1. Pre-departure issue with COVID-19 deadheading crew members and airline's poor handling and pressure was a distracting and still on top of mind.
2. PM while setting MCP with ATC instructions was distracted and missed the sop 1,000 foot call (5,000 feet approaching 6,000 feet)
3. IRO started to put times on Master flight plan below 10,000 and was also not monitoring the PF and ATC clearance.

## Synopsis

Air carrier Captain reported they overshot an assigned altitude during departure.

## Narrative: 1

I observed the C Flight Attendant in the jetway in close proximity to other Company Employees without her mask on. I informed her that Company policy required use of a mask. Instead of putting on her mask, she initiated a phone call on her mobile phone and

proceeded to walk onto the aircraft and down the length of the cabin aisle to the rear galley. It should be noted that while she walked down the aisle talking on her phone and with her mask off, there were approximately 12 through passengers on board the aircraft.

## Synopsis

Air carrier Captain reported a Flight Attendant was not wearing a face mask and walking down the aisle of the aircraft with through passengers on board during a stop.

## Narrative: 1

We had approximately XXX passengers in coach. Many of the passengers were traveling in large groups/families. All came on with masks, but during boarding, masks started to come off and many were worn under the nose. It was a bit chaotic during boarding because about 1/2 of the passengers remained standing in the aisle, looked around to change seats, etc. PAs were made and we followed the new COVID-19 guidelines. However, during the flight, almost all of the many children would not wear their masks. Many of the adults wore their masks under their nose or not at all. We spent the entire flight reminding them to wear the masks. The parents did not enforce this with the children. Passengers around the families complained about the lack of social distancing because of the standing and no masks. I had to re-seat passengers who felt unsafe.

As a crew member, I felt we followed what was expected of us; however, there were so many passengers who did not follow the COVID-19 prevention guidelines. I do feel that we as flight attendants and passengers traveling in the coach cabin were at higher risk of being exposed to COVID-19 if anyone on the flight was infected. Many of [the] passengers were in non-compliance in all phases of the flight. The purser came back to speak with the groups that were not in compliance, but it did not change the behavior of the passengers. Additionally, we were over the Ocean, any threat of landing immediately to remove the non-compliant passengers could not be accomplished.

## Synopsis

Flight Attendant reported numerous passengers did not complying with face policy during flight.

## Narrative: 1

Family seated in Row XX traveling with an infant in the car seat. Father was seated in XX3 with 2 small children in XX1 and XX2. Mother sat in XX4 and put car seat into XX5. After takeoff the Mother moved back one row leaving the baby in the car seat unattended. She was also sleeping without a face mask. D FA woke Mother to tell her that she needed to

put on her mask and also talked to the Father and told him that the Mother needed to sit in the row with the baby. She explained that there was a safety concern that should there be a decompression there was no one within reach of the baby to apply the oxygen mask. The Father spoke to the Mother, but she refused to return to her seat with the baby.

Baby in car seat was unattended for most of the flight. Safety concern as baby in car seat was unattended while the Mother slept in the row behind the baby. Unable to get the Mother to return to the seat next to the baby. Family needs to agree to wearing masks and being responsible for their baby before they are allowed to fly again.

## Synopsis

Flight Attendant reported a mother leaving a baby in the car seat and sitting in the row behind the infant. Mother refused to wear a face mask and return to row where infant was.

## Narrative: 1

As we were nearing the end of boarding the CSA came and asked if we'd allow a commuting Flight Attendant to sit in X6. As [Flight Attendant] A I stated I didn't believe we could do that as we're not allowed to sit on the Jumpseat seat together. CSA stated it was "Up to us" actually said it was "up to the D Flight Attendant." I couldn't find anything regarding that in my EFB and the D Flight Attendant said she didn't care. So we took the CSA at her word and went with the commuter sitting in X6.

Upon arriving into ZZZ this morning I asked a Supervisor and she stated NO, no one is allowed by FAA to sit in X6 if there is a D Flight Attendant in X4.

If questions arise with new "COVID" Jumpseat or any other procedures I don't feel is correct. Take the time to contact a Supervisor to get the correct answer.

## Synopsis

Flight Attendant reported not being sure if a commuting Flight Attendant is allowed to sit in a specific seat when another Flight Attendant is sitting in adjacent seat.

## Narrative: 1

I was the A FA on this flight. I proceeded down the aisle. I saw seat number XX1 without a mask and I said, "Hey, you have to wear your mask." He just rolled his eyes and pull the

mask from his neck. Just as I finished, a lady was in front of me headed to her seat. I turned and walked back up front until she could get to her seat. I immediately returned to the back and passenger XXA had the mask pulled back down to his neck. I did exactly the same thing again, very politely, I stated, "Hey, you have to wear your mask." He looked at me and said, "Shut up." I responded, sorry, what did you say? He removed the mask and yelled very loudly, "SHUT UP!" and that's what I did and walked away. I proceeded to the back to inform the crew what had transpired and before I could finish, Flight Attendant Y asked me was it the guy with the X hair [style] at the window and I said yes, how do you know? He stated he had asked him several times already and once during boarding. At that time passenger in [seat] XY4 had come to the back and told me that the gate agents had an issue with him at the gate and during boarding before we left ZZZ about the mask and he has been a nuisance the whole time. I just said OK. I proceeded back to the front of the aircraft and when I looked at him, the mask was back down around his neck. I informed the Captain. Honestly, I felt like if this man is bold enough to scream "SHUT UP" at me in the cabin, there is no limits. I was too afraid to say anything else to him. He continued the flight without a mask. I discussed this with the Captain. The crew and I agreed he would become belligerent. We informed the Captain of such. A CSA met us at the gate and I just know she spoke with him and stated he had the mask off when she approached him. Passengers were complaining about him not wearing a mask. He does not need to fly if he cannot comply. Also, the CSA in ZZZ did not inform us/me of his previous behavior. He should not have been allowed to fly. It would have been helpful if we knew in advance.

## Synopsis

Flight Attendant reported a passenger was confrontational and refused to wear a face mask.

## Narrative: 1

A young passenger, with a chronic congested cough was seated in seat X6. He was not wearing a mask. He was traveling with his father. I asked the father that his son comply with airline policy and wear a mask. The father said he did not need to comply because he has asthma. He said his inhaler was in the overhead bin. I asked if he needed help to get

the inhaler, the father said no. He never got the young passenger the inhaler. I walked by 20 minutes later and son was still unmasked. I asked if he would please wear his mask. Passenger became angry, asked my name and said he was going to write a disparaging letter. Passenger coughed throughout the flight.

I don't have an answer. There is no provision for anyone to fly over the age of 2 to be unmasked.

## Synopsis

Flight Attendant reported a passenger did not comply with face mask policy due to medical reasons.

## Narrative: 1

Passenger in [seat] X1 on board appeared intoxicated and was non-complaint of wearing [a] face mask during the boarding process.

Passenger in X1 on board appeared intoxicated and was non-compliant of wearing mask during the boarding process. I, the Captain, was approached in the jet bridge prior to the passenger boarding that the passenger [would be assessed] if he was fit to be on board. The passenger was allowed on board, but shortly after was removed for his non-compliance of face mask after being asked multiple times to wear it. He appeared intoxicated.

## Synopsis

Air carrier Captain reported a possibly intoxicated passenger was removed from the flight for non-compliance with face mask policy.

## Narrative: 1

A passenger initially would not wear a mask. The flight attendants gave the passenger a few warnings and moved the passenger to the back and the passenger agreed to wear the mask. The flight attendants reported to me that the passenger was compliant and we were good to depart. The following day the flight attendants informed me that the passenger was possibly intoxicated and should have been removed.

Cause - Desire by the flight attendant to be lenient and not remove a passenger if not absolutely needed. Too much focus on mask compliance and forgetting about intoxication regulations.

Increase communication on cabin discrepancies to increase awareness.

## Narrative: 2

A passenger was non-compliant about wearing their mask during the boarding phase of the flight. After several warnings and moving the passenger to another section of the aircraft, the flight attendants reported the passenger was wearing their mask and we initiated the flight to ZZZ1. The following day, the flight attendants made us aware that the passenger was potentially intoxicated.

Bring concerns about the mask compliance and communication between the flight attendants and the pilots. Enhanced communication between the pilots and flight attendants during irregularities within the cabin and passengers.

## Synopsis

Air carrier flight crew reported a possibly intoxicated passenger was non-compliant with face mask policy.

## Narrative: 1

I was the flying pilot. I rolled onto Runway XL and selected TOGA by accident prior to thrust reaching 40%. Probably selected TOGA [at] approximately 25%. Very little split in thrust upon full spool up, held brake upon realizing my mistake so to prevent adverse movement of aircraft. No issues and continued normal departure.

This was my first trip to fly since month. This was an accident that I realized had taken place as soon as it took place. I need to pause and think before selecting TOGA.

## Synopsis

Air carrier First Officer reported he selected TOGA before the engines had reached 40%.

## Narrative: 1

Had been issued a block altitude clearance and been changing altitude as needed within that block (related to turbulence) for several hours. Requested deviation around weather. ATC granted 50 NM. During deviation, descended from FL370 to FL360 due to turbulence. When ATC requested that we confirm altitude, signaled that something was amiss. Reread the deviation message...both of us had previously missed the cancellation of our block clearance- we both thought we still had one. Climbed back to FL370 and flight continued normally to destination.

There were several [causes], speaking only for myself. This was my first flight after nearly X months off due to COVID. I still feel confident, but out of practice. [I] was in seat 5+ hours when event occurred, energy was waning a bit. New to the X type aircraft fleet and just consolidated prior to extended time off. Had only crossed Ocean X twice and unfamiliar with "the norms" (Didn't know that ATC tends to cancel block clearances in conjunction with another instruction/clearance over Ocean X.) Expected that an altitude clearance/cancellation would be communicated on its own, not included with weather deviation. Due to aforementioned factors, regrettably didn't register the block cancellation. Captain evidently didn't either.

I admit and sincerely apologize for the error, however; altitude clearances are critical to our safety and should be given separately from any other clearance or instruction. One CPDLC message sounds (one chime in the flight deck) - I believe it's human to expect the message to address one thing, not two. It's easier to miss the 2nd item if clearances are combined, especially after many hours sitting with low activity. My suggestion is to send the weather deviation clearance as one message (one chime) and the block altitude cancellation as a separate message (2nd chime.)

## Synopsis

Air carrier First Officer reported an altitude deviation after descending to avoid turbulence. The crew thought they were still cleared to a block altitude, but realized they were not after ATC asked them to confirm their altitude.

## Narrative: 1

I was working Local Control and Tower CIC. Aircraft Y was on final to Runway X and Aircraft X was ready to depart Runway Y. I cleared Aircraft X for takeoff and issued a right turn heading 210. The proper heading for the departure was 120, per LOA. I transposed the numbers and missed my error on the readback. After I observed Aircraft X start his turn, he began to enter a cloud layer and I switched him to departure. A few moments later, I realized my error upon watching the radar. I issued a traffic call to Aircraft Y on approach and he called Aircraft X in sight. No TCAS resolution or CA alert were issued for aircraft proximity.

I believe the only recommendations I could make to stop this sort of incident from occurring would be to develop Standard Instrument Departures at ZZZ, which I am not sure is feasible. Also, I believe the COVID-19 staffing needs to be changed, and more personnel brought back to mitigate the lack of for control positions and lack of oversight. (ZZZ is reverting to a more normal staffing schedule during Pay Period XX).

## Synopsis

Tower Controller reported inadvertently giving an incorrect heading to a departing aircraft resulting in a conflict with an aircraft on final.

## Narrative: 1

We are concluding our last week of COVID scheduling. Normal operations during this reduced staffing period involve two open sectors: Combined Sector Name X (aka, The West Side with Sector 1 and Sector 2) and [other combined Sector Y] (aka, The East Side with Sector 3 and Sector 4). The West Side is generally a little busier because it handles most airport approaches save ZZZ1. The East Side is mostly departures. Splitting up the West Side in order to diffuse traffic would require opening both [Sector 1 and Sector 2] because the "[Combined Sector name] only" traffic isn't very busy. This would require a minimum of 4 CPCs and I only have five to cover the shift.

Complexity picked up when "Controller A" was working, so I went to an unused scope to help assist where needed (make/take hand offs, update data blocks, highlight untracked VFR targets, etc.) During this time of day, the airport was reporting haze and between 4 and 5 miles of visibility. The ILS is out at ZZZ2 and we use the VOR-B which under ideal circumstances works similar to the ILS but aircraft can hang the altitude up higher all the way to the VOR. This is unusual but not unheard of in VFR situations. In fact, to my recollection, all aircraft had executed the VOR-B in a "straight in" manner which produces a sharper rate of descent. The traffic started to subside and Controller A was being relieved by Controller B. I returned to the Supervisor Desk to attend to some things there. When the controller on [Sector Y] got relieved, he alerted me to the fact that there may have been a separation error over ZZZ2 involving Aircraft X, ZZZ2 arrival on the VOR B and Aircraft Y on the ILS to ZZZ3. When I reviewed the replay, there indeed was a LoSS [Lack of Standard Separation]. Aircraft X remained at 026 until the VOR and then circled to right traffic to land, conflicting with Aircraft Y before divergence. Controller A's expectation had led him not to employ positive separation nor highlight the potential conflict to Controller B in the relief briefing. Further, Controller B never caught the development of the conflict nor issued a Traffic Alert after notified (late) by ZZZ2 Tower as to Aircraft X's intentions. I discussed this with both controller. Also, Controller A has been dealing with personal family issues. He had been given the opportunity to take as much time away from work as he needed, but indicated he wanted to work. He had not shown any outward signs of fatigue or stress in his work, but it should probably be noted.

There are no set procedures or training in how to account for this because of the dynamics of the traffic load and who has responsibility to "stagger" approaches in a manner to ensure separation. For example, a general rule of thumb might be that the [Sector 2] controller will stagger ZZZ2 arrivals for the Sector 1 controller, because the controller has more airspace to work with. But what if the majority of traffic is ZZZ2 arrivals? What if both airports have heavy inbounds? The problem is alleviated greatly when the ILS is put back in service, but when the area is experiencing IFR conditions, a "go-around" produces the same problem. Because of the airport s' proximity to one another, the mountains to the east and the ZZZ4 BRAVO to the south, there aren't other approach options available. Adding an emphasis for these scenarios in classroom training should probably be

incorporated as a "trap" to watch for, and mitigation strategies to account for it. This is a known issue, but a long term workable solution has been problematic and always seems to fall back on the controller fighting expectation bias and ensuring standard separation in a complex scenario. Perhaps a long range proximity alert system that helped a controller highlight these potential conflicts specific to this dynamic would help remind controllers that this needs careful monitoring at a minimum, advanced planning and positive separation at a maximum.

## Synopsis

TRACON Front Line Manager reported a loss of separation and cited traffic complexity and staffing as contributing factors.

## Narrative: 1

I was the FLM on duty in the Tower cab providing OJTI to a CPC at the time of the incident. I was explaining MORs (Mandatory Occurrence Report) and significant events notifications and showing the CPC where to find the contact numbers. Traffic was light and there were only two positions open as per the COVID staffing, LC1/LC2/LA were combined as CD/FD/GC were also combined. I had one other person on a break.

While giving instruction and demonstrating required activity for significant MORs to the CPC, I heard the ASDE-X alarm "Runway XR go-around" I immediately looked up and scanned Runway XR to assess the situation and determine what caused the alarm. I observed Aircraft Y, 1/2 mile final landing on Runway XR and a small GA aircraft on Taxiway [5] turning South on Taxiway [3]. I didn't observe any other targets or obstructions on the runway surface area. At that time Aircraft Y was already flaring out on the runway. I then asked the LC Controller why wasn't Aircraft Y sent around. The Controller responded, "The other aircraft cleared the runway." I then informed the Controller if the safety logic says to send someone around on a runway which the aircraft was landing it was mandatory to comply. The Controller advised me that they thought it was safer to land than send the aircraft around. I then informed the Controller that we are obligated to send the aircraft around per the JO7110.65 and if the pilot decided to land anyway then I would have a conversation with the pilot.

Remind controllers that the safety logic overrides same runway separation and that it's mandatory to comply with the safety logic instructions. I did have this conversation with my crew after the incident and was shocked to know they weren't aware of this and thought it was a discretionary decision.

## Synopsis

Tower Front Line Manager reported a runway incursion and concerns with the Local Controller not issuing a go-around instruction to an aircraft landing on the same runway.

## Narrative: 1

Aircraft X, Passenger X who was with her husband stated she was unable to wear her mask due to a medical condition and provided a letter. I explained that she was supposed to inform the gate agent. She stated, "The gate agent was rushing us through." My major concern was she wore her mask as she entered the plane the forward Flight Attendant later informed me and kept it on up until we were in flight. I politely asked her to cover her nose with the mask and that's when she handed me the letter.

In any event I know we have a procedure that passengers go through with medical and we should be notified on our departure report; nevertheless, I never want to be put in a situation like this again and my concerns are how to handle a situation like this in the near future. I was scared to insist she put her mask on because her letter never disclosed her illness and I didn't know whether her illness/es were a matter of life or death if she was to wear her mask. My other concerns are the risk she could have put my passengers and crew in.

Customer did not go through proper channels to clear medical.

## Synopsis

Flight Attendant reported a passenger did not go through proper channels to clear medical in regards to not having to wear a face mask.

## Narrative: 1

We were cleared for takeoff on [Runway] XXL in ZZZ. As pilot flying, I advanced the throttles to 40% and heard the Captain call "stable." I started hunting for the TO/GA button and was sure I found it. The autothrottle arm switch disengaged. The Captain reengaged the switch twice. It disengaged twice as I tried commanding takeoff power. We canceled takeoff clearance, taxied clear and called maintenance which resulted in an MEL for autothrottles. After all paperwork and communication was complete, the departure was normal. Once we were at altitude on the transit, I started thinking through the scenario in greater detail and realized that I may have pressed the autothrottle disengage button rather than the TO/GA button.

This flight was my first at the controls in almost two months. I have less than a year of experience on the plane. I reviewed many things prior to my first day back, but TO/GA switch selection was one that I didn't specifically think about and it caught me off guard with less than ideal muscle memory.

## Narrative: 2

FO was pilot flying. On takeoff autothrottles did not advance thrust levers when TOGA was pushed and A/T ARM switch clicked to the off position. I reset the A/T switch twice. Again the switch clicked to the down position. We then taxied clear of the runway and contacted maintenance to MEL the A/T system.

At cruise the FO realized that he probably had been pushing the A/T disengage button instead of the TOGA buttons.

## Synopsis

Air carrier flight crew reported the FO may have pressed the autothrottle disengage button rather than the TO/GA button during takeoff roll. The flight crew rejected the takeoff and cited the FO's lack of flying as a contributing factor.

## Narrative: 1

Flight was to depart at XA:00z at XA:02Z I received alert message that a MEL was added, I immediately messaged ramp agent on teams to ensure they voided the positions. I did not send the MEL to the crew as I thought I had. The crew did not [ask for it] either. Later at approximately XA:45Z I recalled that I had not sent and uplinked to the crew.

I was so concentrated on ensuring the ramp new asap as the flight was past departure time, I forgot to send the crew the MEL. I was also busy updating crews in flight with new weather.

My process is usually not to acknowledge a message until I have handled it. I did not follow that in this case. I acknowledge the message, sent the info to ZZZ ramp and forgot to send the MEL to crew as I was working other things. I will not be straying from this process again.

## Narrative: 2

After the load was complete and the door was closed the ramp agent got our attention from the ground and said Maintenance was fixing the paperwork. We told them that they had already updated the release documentation previously. We reopened the main door to get a new release documentation. We understood that Maintenance had repaired a broken cargo floor lock. It turns out that there was a broken cargo lock that required an MEL. We were never told by the load crew that there was a problem, they probably avoided the cockpit due to the COVID virus. The new release documentation had an MEL added that we should have relayed to operations before takeoff. We realized we had missed the addition of the MEL when operations sent us an ACARS message at approximately 18,000 feet. The confusion could have been cleared up with a brief conversation with either Maintenance or the ramp to be informed of the failed lock.

Confusion due to not being informed by the load crew or Maintenance of a cargo lock failure. We were initially delayed for the release documentation being rewritten and thought that was the new delay. Clear, concise communication with load crew and Maintenance on aircraft status. Also carefully reading the new release documentation for additional MEL items.

## Synopsis

Air carrier Captain and Dispatcher reported missing a document that was needed before departure. Dispatch sent the document when aircraft was airborne.

## Narrative: 1

Aircraft X was on landing roll for Runway XXR. I called LC2 (training) to give permission to cross after Aircraft X lands. LC2 had crossed Aircraft Y at taxiway [letter] prior to me calling. Inquiring after LC2 had meant to cross another aircraft for his runway. He called to the wrong aircraft. LC2 Controllers have been training all day and have not had good breaks. I was working all day heavy traffic as well with minimal breaks. We were pushing 100-150 movement hours. Staffing included 2 CPC's, 1 OS and 1 trainee for the morning, a second OS came at XA:00. We all pushed hours and took minimal or no breaks due to staffing and traffic would not stop. I told Aircraft X to turn left at Runway Y when I meant [taxiway name and number], but my mind felt like mush. I believe the trainee made an error due to fatigue as I was also very fatigued from numerous complex requests today. Training has been pushed on the trainee to "help the facility." I believe this has put undue stress on the trainee to save the facility since we only have X working CPC's on schedule currently. The pressure to work long hours maximize time on position and 6 days a week for months on end has taken its toll on us.

I recommend adequate staffing for the facility. I understand we need to push training but pressure should not be on a trainee to "save the facility," when this is an agency issue. I recommend management push for good breaks for proper cool downs so we can take on traffic with more of a sound and ready mind. Some controllers take on everything without regard for their selves due to trying to perform for the agency. This is a big safety issue.

## Synopsis

Ground Controller reported a runway incursion due to communication issues with Local Control. Reporter stated staffing issues contributed to the event.

## Narrative: 1

Passenger was being pulled off the aircraft due to non-compliance of wearing a face mask. I was in the front galley when he came forward because I had finished securing the cabin. The operations Agent and Supervisor left the aircraft, and the passenger was standing in the front galley. He was visibly frustrated on the event and started venting. This was in total public view of all other passengers on board. To help diffuse the situation, and spare the passenger from embarrassment, and to provide more of a private setting, I stepped off the aircraft with him, and stood at the bottom of the jetway with him while he vented to me. This was happening a few minutes before scheduled push time. I waited at the bottom of the jetway with the passenger for quite some time, expecting the operations Agent or Supervisor to come down, and I could direct him to them to answer questions he had. After several minutes, no one came to the plane, I made an executive decision to assist the passenger, told [Flight Attendant] A I was going to walk him to the top, and that I would be right back, since no agent was coming down. I walked him to the top of the jetway, where he was able to be properly assisted. I immediately walked back to the plane where a couple of minutes later we closed the door and pushed the flight as normal.

Since the passenger was left at the plane, and there were no ground personnel to assist us (the Supervisor and operations Agent were there, then left), I made the executive decision to deplane. I believe I made the right decision in the moment given the situation. I do not know why the Supervisor didn't stay there with the passenger to assist him. I realize fully we all have a job to do, and cannot speak for why the Supervisor and operations agent left the passenger at the plane, and did not walk him up the jetway. I am not putting blame on anyone, I am simply writing an observation. Ultimately, it was me who made the decision to deplane.

## Synopsis

Flight Attendant reported that after boarding the aircraft they exited with a passenger who did not comply with face mask policy.

## Narrative: 1

While operating Aircraft X into ZZZ on a program flight using the Company X ABC callsign we landed on Runway XXL and received the normal "Left at Taxiway 1, cross Runway YR, hold short Runway YL" instructions from Tower after landing around XA: 30Z. Upon approaching Runway YR we heard over the radio "[muffled] XXX#CA [callsign] cross-Runway YL on Taxiway 1 and Taxiway 2 to park." The PIC, who was Pilot Not Flying (PNF), hesitated with a read back because the call sign was slightly muffled due to radio static, but the instructions and cadence made sense that they were for us, since we were the only aircraft on Taxiway 1 in that position to follow the instructions. So he read them back and I the SIC and IP (acting as Pilot Flying doing training in new aircraft) continued to cross YL and continued Taxiway 2 to park.

Upon parking and getting out of the aircraft [and] the more I thought about it the more something seemed off. [I found out] Tower did use the wrong callsign, they used the Company Y CA [callsign], as Company Y CA cross YL and Taxiway 1 to park."

Contributing to this situation was the crew fatigue and us not being 100% on our game. Also, the Controller had a high workload as he appeared to be working both Tower and Ground Control positions.

Although the instructions were most likely for us as our callsign was somewhat similar this scenario brought up a lot of other important facts to point out. We as a crew should never assume a runway crossing instruction is for us unless our call sign is 100% specifically used without a question. If we had any doubts about the instruction, we should have

stopped and ask for clarification prior to proceeding.

As for the Tower Controller, he was working both Ground and Tower, which makes for a high workload, as ZZZ was experiencing a traffic push at that time and he was getting busy. His misspeaking could have caused an incident or incursion. Lucky for us Company Y CA landed 30 minutes prior to this incident taking place. It is possible the Controller had an old strip lying around or just had that specific call sign on his mind. In any case, ATC should consider increasing staffing levels and not having a single Controller work both Tower and Ground positions, except during very low traffic levels. Air traffic loads have increased significantly from the COVID lows experienced several months ago.

## Narrative: 2

[Report narrative contained no additional information.]

## Synopsis

Flight crew reported crossing a runway, taxiing to parking, while not sure if the clearance instructions were for them due to Tower muffling the callsign.

## Narrative: 1

Our flight clearance to ZZZ ended with ZZZZZ [Intersection] ZZZZZX [Arrival] which is the arrival for ZZZ landing direction. I confirmed all crossing altitudes and speeds were in the FMC. We had ATIS automatic updates and received information just prior to the start of the descent confirming ZZZ landing direction. Prior to descent, we briefed the various expected taxi routes from the possible runways, flap setting, landing assessment, and autobrakes. We held off on briefing the ILS pending the runway assignment. At some point we were cleared for the ZZZZZY Arrival but then given various headings, speeds and altitudes for spacing before clearing us direct to ZZZZZ1 [Intersection]. At that point, I believed the ZZZZZY Arrival was the name of the arrival we had in the FMC and I still expected to land direction. As we crossed ZZZZZ1, ATC told us to depart ZZZZZ2 [Intersection] heading 300. ZZZZZ2 is not on the STAR we had in the FMC. That is when we realized we did not have the ZZZZZY Arrival in the FMC. The routing prior to ZZZZZ1 is the same on both STARs. The Captain selected the STAR in the FMC and we flew the route. ATC continued to directed speed and altitude. We were never off route. I'm not certain but I don't think we were ever off altitude because ATC was assigning us incremental altitudes the entire descent.

Confirmation bias was one causal factor for me. I had a flight clearance, current ATIS, and waypoints in the FMC that coincided with the arrival clearance. After various vectors, ATC cleared us to a point that was six waypoints into the arrival, a point with the same name as the new arrival, and it didn't occur to me that the arrival had changed. My currency and recency was another causal factor. I completed IOE, but didn't consolidate before starting a six month leave of absence. The Captain was exceptionally helpful and specifically stated in the departure brief that me not speaking up for any reason was his biggest concern. I wanted to brief the approach during the initial descent to stay as far ahead as possible. He suggested we hold off since we didn't know the runway yet. I wanted to ask approach for an expected runway, but I assumed that he didn't want to do that because he flew into ZZZ enough to know when they usually give you the runway. That was a moment to speak up. Requesting the expected runway at that point would have clued us in to the change of runways and change of STARs.

I will confirm the STAR with the other pilot the same way I confirm an approach, altitude or landing runway; e.g., I heard cleared for the ZZZZZY or descent via the ZZZZZY.

## Synopsis

Air carrier First Officer reported confusion on which intersections they should be going to on the STAR during descent.

## Narrative: 1

Towed aircraft to remote Gate X. It's dark and wet out from rain/raining. I was lined up correctly on the "J-Line" for pulling in plane. When pulling in to space, wings made contact. The wing walker had lit wands, but I do not recall seeing him give me an 'X' to stop. If he had given me an X, early on, I could have stopped and re-evaluated the conditions further to explore my options, and incident would have been avoided. Now, it's night time, and raining. Remote lines are not well lit, not even reflective. Aircraft was towed to remote Gate X. Gate Y and Gate X are too close together in proximity. Gate Y shouldn't even be there, or Gate X should be moved farther down away from Gate Y, as there is lots of space on the other side of Gate X. Gate Y had the wrong kind of aircraft parked there. There wasn't supposed to be an [X type aircraft] at Gate Y. With both aircraft being [X type], this was bound to happen, as the wing tips are going to touch

(found out after the fact). Was towing this aircraft really necessary? We had 2 empty gates, the gate it was originally parked at (Gate Z), plus gate ZA. We only had 1 other aircraft to arrive for the night. In trying to save money on the rental of a gate, we now have an aircraft damage that now costs more. As far as manpower, people are flying again, flights are reinstated, and we furlough people. With business picking up, there should have been fewer furloughs. Each airline should have its own parking space in the middle, with excess, if any, as first come first served. Some stations have a designated tow team. Our station is smaller, but we could still manage to have a tow team if the manpower permitted, and when not towing or repositioning, they help out in other arrivals/departures.

## Synopsis

Tow driver reported towing an aircraft into a gate and having the towing aircraft's wing hit a parked aircraft at the adjacent gate.

## Narrative: 1

I was conducting a flight training event with my student pilot. We just returned to the airport to practice performance takeoff and landings. We had just made a full stop - taxi back. We called holding short that we were ready for touch and goes. We were told to hold short for landing traffic. Several planes land and depart. Both my student and I hear what we believe to be our abbreviated tail number being cleared for takeoff. We read back cleared for takeoff instructions, finish final items on the checklist, and take the runway. On our takeoff roll we hear Tower ask who is on the runway and I respond with our tail number. Tower then advises to either exit the runway or begin our roll. We were already on the roll, so we continued the takeoff. After our lap in the pattern we terminate the

training flight and contact the ATC number. I believe I heard our tail number and believed it was a takeoff clearance. However, due to a high volume of traffic the morning of the event due to a lengthy TFR that lasted most of the day, there was a lot of training and jet traffic. I could have heard a similar call sign and my student could have stepped on the intended recipient of the ATC instruction. I know when there is a high volume of traffic waiting to arrive and depart it could be best to use my full tail number to lessen confusion, and take extra measures to ensure all radio communications are properly received and copied.

## Narrative: 2

Aircraft X called up requesting pattern work during a high traffic volume session and was given hold short instructions, due to the fact that there was an IFR arrival jet on about a 3 or 4 mile final. Aircraft X subsequently read back his hold short instructions. I talk to 3 different aircraft before I cleared Aircraft Y for a touch and go. Apparently Aircraft X read back "Aircraft X cleared touch and go" and then subsequently got onto the runway without me catching it. Aircraft Y clarifies their touch and go clearance and I canceled the touch and go clearance and gave them a left 360. During this time inside the cab my CIC/GC/FD was trying to clarify information about a TFR that was supposed to be going into effect shortly and we had received no prior information on. This resulted in several phones ringing during this already busy time. After scanning the runway I saw an aircraft who appeared to be holding on the runway with my jet traffic now within 2 miles of the runway, since I had multiple aircraft holding short of the runway I tried to quickly identify the aircraft, so I could taxi them off the runway in a timely manner. However Aircraft X didn't identify himself by name until about the 3rd time I reached out to them. With minimum time to react I told the aircraft to taxi clear of the runway or depart immediately. Aircraft X started their departure roll and as soon as airborne I told them to offset the runway so I had sufficient spacing with my IFR aircraft on final. Immediately following my Jet traffic landing the OM entered the cab and started trying to have the CIC help him find our local weather form, so our new trainee could fill it out.

We started the day short staffed with no prior knowledge that someone would be coming in to cover for a couple hours, so the rotation wasn't going to happen as expected. When there are less people in the cab we have enough space to work without our masks and due to the fact that there were extra nonessential people in the cab I had to replace my mask, while I firmly believe mask should be required, they do interfere with the side tone which affected my ability to catch Aircraft X's incorrect readback. No one in the facility had received any information on the TFR that was supposed to be going into effect. This resulted in several miscommunications and confusion.

## Synopsis

Flight Instructor and Local Controller reported the instructor's flight departed without clearance with traffic on very short final after mistakenly taking another aircraft's clearance for takeoff.

## Narrative: 1

I had not flown since March of this year, due to all the COVID virus going on nationwide. A friend asked me to reposition a newly acquired aircraft from ZZZ1 to ZZZ2. Weather was currently and forecast to be VFR the entire route, but I filed it IFR to get myself back to speed on instruments, which I thought I did a good job of this trip. My first stop was ZZZ for fuel. Had gotten dark by then, about XA: 30pm local time. [My] clearance departing was to fly the 'ZZZZX X to ZZZZZ [Intersection], then on course'...as I heard it and understood. My next intersection, which I had filed to from the airport was ZZZZZ1 Intersection. So that is where I was attempting to navigate to after I passed ZZZZZ. So ATC calls me on radio and says I was supposed to fly on to ZZZZZ2 Intersection and then do the 15 mile arc around to ZZZZZ1. (This was not what I understood in the departure clearance.) They vectored me on towards ZZZZZ1, and I continued.

I should have asked for vectors before departing the airport, instead of the SID. The GPS in the airplane was not quick/easy to alter any data, but I was doing OK with it enroute.

## Synopsis

GA pilot reported a track deviation during departure and cited clearance confusion as a contributing factor.

## Narrative: 1

Went in to see Person Y re: possible exposure to the COVID-19 virus. No matter when the Company found out they, 1) made 1 attempt to contact me and 2) did nothing, but ask me "form" questions.

I was told to self-monitor and quarantine for 14 days from date of exposure. Really! I've worked 9 of 13 days. (Had 2 days off after being exposed which at that time could have

been a spreader.)

-Company only made 1 attempt to contact me of possible exposure.

-Repeatedly told me "my overall risk is very, very low."

The Company is dealing with one's health. I'd say they need to show a little more urgency, and watch wording i.e., self-quarantine for 14 days, when you've worked 9 of the 13 with 1 quarantine day left when being notified was a joke. Don't try to play Doctor.

## Synopsis

Flight Attendant reported concerns with company's actions relating to COVID-19 possible exposure.

## Narrative: 1

During boarding, two jumpseaters came up to the cockpit to identify themselves and ask permission to ride. The first one was originally assigned the jumpseat, but was told by the gate agent to take [seat] X1, and his coworker was assigned X2. Prior to departure, we became aware of a cargo loading issue that required both my and the FO's attention, and we both diverted most of our focus to taking care of that and getting the manifest to match where the cargo was moved. During this time, the gate agent sent the passenger numbers via auto-closeout. They indicated that there was an additional crew member listed (totaling X crew), and Y passengers in Zone X (where row X is located). I was aware that we needed to remove the additional crew member from the crew total and move him to Zone X, where [he] was actually seated, but it was my understanding that the Zone X total did not include the second jumpseater who was also assigned row X; as a result, we added two passengers to the Zone X total, making it [a count of] Z.

After this occurred, ramp re-sent our cargo numbers, and somehow in that process our passenger numbers were reset to their original, too. After this occurred, we again removed the additional crew member from the crew total and changed Zone X back to Z instead of X passengers. At this point, I asked the Flight Attendant to count the number of passengers in Zone X, just to make sure it correlated with the change we made in the ACARS. She confirmed that there were Z passengers seated in Zone X. We sent for the manifest with that load and departed for a normal flight. During our next flight, we were faced with an almost identical situation with two jumpseaters. In discussion with this gate agent, he made it clear to us that when they send the passenger count via auto-closeout, the second jumpseater is already included in the passenger count, meaning we only need to remove the additional crew member from the crew total and put them in their respective zone if they are also assigned a seat in the back. Based on this information, I then realized that on our previous flight the passenger total already included one of the jumpseaters, and by adding 2 to Zone X, we ended up sending the manifest with an incorrect passenger total, in the sense that we added in one more than there actually was. As a result, our calculated versus actual weight was off by the weight of one adult passenger. We experienced confirmation bias in me asking the Flight Attendant to count Zone X, due to the fact that we heard what we expected to hear, but likely a totally unrelated passenger had moved into Zone X without their noticing, which resulted in her telling us we had Z in Zone X.

This event was caused largely by not understanding some of the smaller details of the auto-closeout process. I do not recall personally having a situation before where we have had two jumpseaters on a not-full aircraft. It was my understanding that a jumpseater assigned a cabin seat needed to be manually placed there and wouldn't be included in the auto-closeout sent by the gate agent, the exception being if they are included in the auto-closeout crew total as an additional crew member in the actual jumpseat, but need to be moved to the correct zone if assigned a cabin seat prior to departure. That logic was incorrect, as confirmed when the next flight's gate agent mentioned that the first jumpseater is always listed as an additional crew member in the actual for auto-closeout, and any subsequent jumpseater is scanned on as any passenger would be, which would include them in the auto-closeout total. Also contributing to this was the distraction with the ramp agents and making sure that our cargo was loaded correctly. That task saturation combined with nearing departure time led to distraction and a bit of rushing that kept me from slowing down and thinking carefully about the jumpseater seating situation. Additionally, our flight attendants informed us that on this particular partner, paper sheets were no longer available, and so conducting a full passenger count didn't necessarily come to mind. Having asked them to do one likely would have us discovering that our ACARS manifest total did not match their passenger count.

In the future, especially with COVID seating restrictions that complicate accommodating jumpseaters, I will be extremely vigilant in these situations to confirm with the gate agent that if there are multiple jumpseaters, that they are accounted for in the auto-closeout already. Doing so will prevent these double counting errors and ensure greater accuracy. If there is ever any question, I'll not be shy to ask the flight attendants to conduct a passenger count to ensure the greatest and most up to date information. Finally, to prevent rushing associated with task saturation, I'll be very diligent about taking things deliberately slowly and only accomplishing one task at a time, to prevent errors like this from occurring. From a technical standpoint, it could also be helpful to include the number of jumpseaters on board in the remarks section of the auto-closeout. "Additional crew member Listed" seems to have the connotation of only one being on board, and could potentially be misinterpreted.

## Synopsis

Air carrier Captain reported a weight and balance issue due to a misunderstanding of the passenger counting process.

Narrative: 1

Passenger in [seat] X1 refused to wear a mask. Dispatch was notified. [Requested] aircraft [be met] upon arrival. Landed without further incident. I initially told Dispatch it was not a security threat level 1. I was in a busy part of the flight and did not have time to look it up. After landing, I reviewed the flight manual and realized it was a security threat level 1. Either way, all security threat level one procedures were followed.

## Synopsis

Air carrier Captain reported a passenger refused to comply with face mask policy.

## Narrative: 1

After flight I was informed that I had been exposed to COVID-19 the day prior to my 2 day trip. I called the flight operations manager and informed him of my exposure. I made sure that he knew to contact the Captain on my trip as I know that he was going to his relative's home after work and that older people are more likely to have complications. Additionally, I knew that he had a trip leaving the next day. I was called by the on call

assistant chief pilot, and told that the Captain would be contacted. I failed to mention that I had dinner with another airline crew on my layover, as I had been concentrating on getting the Captain informed quickly. Had either the flight operations manager or the assistant flight manager on call asked me about other interactions I would have listed the close contact I had with 2 other employees and been able to have them not show up to work for subsequent trips potentially exposing more crew members. Additionally, I found out that the Captain was not informed about his exposure until after his return from his next trip. I was surprised that given my reported exposure he was permitted to operate his subsequent trip.

## Synopsis

Air carrier First Officer reported being exposed to COVID-19 and cited concerns with the company not notifying other employees who may have also been exposed.

## Narrative: 1

After landing, while taxiing to park at ZZZ [airport], we forgot to contact ZZZ Ramp for entry lane assignment before entering the ramp. Threats leading to omission: Reserve pilots, reduction of flights leading to reduced proficiency/recency, limited experience at ZZZ as ZZZ1-based pilots, lack of thorough identification of requirements during arrival brief. During the arrival brief, we failed to mention an operations note to "Contact ZZZ Ramp for entry point assignment."

Due to renovations at the terminal, we should have briefed the ramp entry/exit procedures in advance and highlighted the terminal construction and area as a threat to mitigate. This was the last leg of our trip. We were assigned Gate X at the end of Terminal XX. There was no traffic in/outbound as we taxied in, and as we approached lane Y on Taxiway A heading toward Gate X it was completely clear with what appeared a direct entry to the gate. This may have contributed to us thinking our Ground Control taxi clearance was sufficient. The unusually short taxi with no traffic erroneously led us to believe our ground taxi clearance took us all the way to the gate.

## Narrative: 2

After landing, and while taxiing to the gate, in ZZZ [airport], we forgot to contact ZZZ Ramp Control before entering the ramp. Threats that led to this omission were: being on

reserve, and because of the reduction in flights, this was the first trip for both of us in many weeks, and we were both admittedly rusty in our procedures. Being ZZZ1 based, we don't fly into ZZZ often. During our arrival briefing we failed to mention the operations note that requires a call to Ramp Control. Since the renovation to the ZZZ Terminal, there have been recent changes to the procedures for exiting and entering the Ramp, and knowing this we should have briefed those new procedures in advance. This was the last leg of the trip. Our assigned Gate X; was at the very end of Terminal XX; , and appeared to be a direct access from Taxiway A, which may have contributed to us thinking that access was controlled by Ground Control, when in fact the access to the gate was through lane X, which was controlled by ZZZ ramp. After landing, we were given instructions by Ground Control, to, "Taxi to the gate via 'taxi route' with no mention of lane X, or Ramp Control, which led to our complacency in omitting their call. Also, after landing, we both remarked at how unusually empty ZZZ was of traffic, we appeared to be the only aircraft moving on the field, which allowed for an unusually short taxi to the gate at the usually crowded ZZZ, this also led us to forgetting that there was a Ramp Control around the terminal.

## Synopsis

Air Carrier flight crew did not call Ramp Control prior to entering the ramp area.

## Narrative: 1

It is becoming all-too-common to see the ground crew member fail to follow safety protocols. Today was the latest occurrence. The sprayer neglected to tell us he was starting his process even though we were both in the cockpit with the door open. This is

the second time in two weeks I've seen this. I've only been in the area two other times when spraying was underway recently.

Another issue with today's event was how the spraying was done. I haven't been trained on it, so there may have been nothing wrong, but the sprayer did little more than march rapidly down the aisle waving the spray machine back and forth like he was swatting at flies. He did not pause to spray into a single row or overhead bin.

I would like to think this is something that could be better trained on several levels.

## Synopsis

Air Carrier Captain reported ground crews are not properly spraying the inside of the aircraft.

## Narrative: 1

Passenger seated in XX5 wore [a] mask during boarding however was not wearing [a] mask after being seated. When approached by the Flight Attendant the passenger said she had a medical exemption and did not have to wear the mask. Customer Service Supervisor was called and passenger said they would comply, but continued to lift the mask off her

face stating she had difficulty breathing. As a possible solution the Flight Attendant offered the passenger an airline paper supplied mask as an alternative however the passenger's behavior became further defiant and belligerent. It is my understanding other passengers were also expressing concerns about [the] passenger not wearing [a] mask. I made the decision to have her removed from our flight. Customer service escorted both she and her companion off the aircraft. Customer Service Supervisor did a stupendous job. Extremely professional and helpful.

## Synopsis

Air carrier Captain reported a passenger was removed from the flight due to non-compliance with face mask policy.

## Narrative: 1

On date I was informed by my manager that our aircraft registration had expired on [date]. I operated one training flight as PIC on [date]. I am guilty of just ensuring that the document was onboard the aircraft while not ensuring that it was valid. A contributing factor is that the aircraft registration is addressed to our company headquarters, which is a different address than our hangar. Due to COVID related staffing, our FAA reminders were never delivered to our hangar. It is still my responsibility to ensure that the correct documentation is on the aircraft prior to flight.

We have instituted the following changes to ensure this does not happen again:

1. Added the registration expiration to our maintenance tracking software. This will flag our maintenance team when expiration is near. It will also be printed on the preflight form used by the pilots.
2. Training will occur and language will be added to our Operating Procedures and/or our expanded normal procedures document to ensure that a valid registration is on board.
3. A consultant company has been hired to automatically renew our registration and deliver it directly to our hangar.

## Narrative: 1

Our operation was just notified on Date that our aircraft registration expired. I operated two training flights as PIC. The first was [date] and the second was [date]. I am guilty of just looking to ensure that the document was on the airplane, while completely disregarding my duty to ensure that it was valid. A contributing factor to this is that the aircraft registration is addressed to our company headquarters, which is a different address than our operations base hangar. Due to COVID related staffing at our headquarters, our FAA reminder postcards were never delivered to our hangar. Again, it is my responsibility as PIC to ensure that the correct paperwork is on the aircraft prior to each flight.

We have instituted the following changes to ensure that this does not happen again: 1) Added the registration expiration to our maintenance tracking software, Flight Docs. This will flag our maintenance team when expiration is close to occurrence. This will also be printed on the preflight form that all pilots utilize. 2) Training will occur and language will be added to our manual and/or expanded normal procedures document emphasizing the action to ensure that a valid registration is onboard the aircraft. 3) A consultancy company has been hired to automatically renew our registration and deliver it directly to our hangar.

## Synopsis

Pilot reported flying twice with an out of date registration.

## Narrative: 1

I issued MEL XX-XX to Maintenance Technician Y, after he had accomplished the MEL maintenance procedures, an MEL placard was placed in the logbook. But I forgot to generate an XX-XXXX, follow-up/repetitive inspection form.

Out of Practice: Have not actually worked a desk since the X type aircraft were parked [several months ago]. Stress: Presently going through personal issues.

Provide a review/refresher class for technicians that have been idle during the pandemic. Add a step to the X procedures of all MELs that states to generate an XX-XXXX, and highlight that step.

## Synopsis

Lead Technician reported not following published maintenance procedures after being out of practice for an extended period of time.

## Narrative: 1

Cleared to "cross ZZZ at or above 14,000 feet, cleared for the ILS Z XX approach."  
Inattention to what mode the descent was in and tied with teaching on an OE, I descended to approximately 13,000 feet before realizing the error. We were in VMC conditions and had terrain in sight. ATC did not mention the error.

Performing OE for new FO and inattention to cleared altitude.

Pay more attention during training on OE.

## Narrative: 2

PM on OE and cleared to cross ZZZ at or above 14,000 feet, then cleared for the ILS Z Runway XX approach. VMC with terrain in sight, descended below 14,000 feet prior to ZZZ. Noticed the error, but ATC did not say anything. Continued the approach and landed without further incident.

Probably inexperience with the plane mostly, and also recency/currency; this was my first flight in an actual plane in about 7 months. It was a new plane (I was on OE) and an unfamiliar airport. The Check Airman and I had discussed the arrival/approach and how he was going to fly it during cruise but at the time were reviewing how to use the different descent modes to fly the approach and were momentarily distracted.

More active monitoring and attention to what the plane's programming is doing; also experience in the plane will likely help.

## Synopsis

Air Carrier flight crew descended below their cleared altitude. The crew cited distraction and the FO's lack of flying as contributing factors.

## Narrative: 1

Day 1, leg 1 of a 4 day trip from ZZZ to ZZZ1. I was the pilot monitoring on this leg. Had not flown much in the last few weeks. Captain was PF. We flew to ZZZ1 at a pretty low altitude, I believe it was 14,000 feet cruise altitude. After starting the descent, we did not realize we had passed 10,000 feet so quickly, and noticed our speed was beyond 250 knots. The Captain immediately slowed the descent rate and airspeed, in order to return to 250 knots.

We were distracted. We were on the first leg of the trip, had woken up pretty early, and the fact that we cruised at such a low altitude were possibly all factors. We did not pay enough attention in the descent.

I should have kept better monitoring skills during the descent and avoided distractions.

## Synopsis

Air Carrier First Officer reported a speed deviation below 10,000 feet during descent.

## Narrative: 1

The aircraft had been sitting for the previous 5 days. When we got to the aircraft there was a new maintenance item which they were working on and 2 items to be verified during our flight to ZZZ. This was MEL XX-XX. The APU restart was accomplished and the other was an in-flight verification of engines. We discussed and did not find an entry for monitoring engines and made no entry after everything remained within parameters. I was getting a check ride from a check airman and he offered to make the entries (including a new write up) in the logbook for me since we were now on approach to ZZZ.

Main factor was the flight plan was supposed to be locked out, so I could discuss the engine check and any entry needed with Dispatch. That didn't happen as well as on the following flight when it could have been accomplished again. Delays and distractions with the ongoing maintenance item which kept us out of our seats for 2 hours and feeling rushed to get things going quickly, having passengers already on board, once we could sit down. My complacency having a check airman there in case I missed something.

If flight plan needs to be locked out make it automatic for Dispatch, so distractions or human error don't play a part. MEL XX-XX needs to be more specific as to what items need to be accomplished. A placard in the logbook would be helpful.

## Synopsis

Air carrier Captain reported maintenance items remained open after the aircraft had not flown in 5 days.

## Narrative: 1

This was the second leg of the day. I was the First Officer on my last day of a three-day reserve pairing and was assigned a ZZZ turn from ZZZ1. I have flown with this Captain before. During the initial briefing we briefed that a lack of proficiency due to reduced hours was an additive condition and that we needed to be extra vigilant to keep each other out of trouble. In my case, it had been 40 calendar days since my last flight. We were preparing to push back from the gate in ZZZ. We were on time. I called Ground for clearance to pushback, received it and notified the Captain. He gave the standard talk to the ground crew and I was clearing the right side of the aircraft for pushback. I did not notice that the parking brake was still set. Ground Crew commenced pushback and the shear pin in the tow bar broke.

More attention to switch position, avoid expectation bias and more flying wouldn't hurt.

## Narrative: 2

We were not rushed and there were not additional threats. I just stated to the push crew that the brakes were released and cleared to push, but I must not have pushed hard enough on the brake pedals. I should have verified the red Brake Released light was out. Since the brakes were still set, the tow bar pin broke and we swapped for a different tow bar.

I just didn't verify as I should have. We are flying less, so we need to be even more attentive. Better attention to detail.

## Synopsis

Air carrier flight crew reported the parking brake was still set during pushback resulting in a broken tow bar shear pin. Both pilots referenced lack of flying as a contributing factor.

## Narrative: 1

I was working Ground 1/2, CD-FD for COVID staffing. Local Control and FLM were separate. I had an aircraft pushing off of Gate XX/YY area which is right in the intersection of Kilo and Alpha. Aircraft X exited Taxiway Tango, and had to make a hard left turn onto Taxiway B to go around towards the Alpha gates. When I gave Aircraft X the instructions, they read it back and began a slow turn of about 135 degrees to go east bound onto Taxiway B. I thought nothing unusual of it. Then to my surprise I heard Local Control cancel Aircraft Y's takeoff clearance. My first thought was that they (Local) did not remember that Aircraft X had to go left onto Bravo and was anticipating the runway separation. At the time, it was clear that Aircraft Y was not rolling, and shortly after Aircraft X cleared completely they once again cleared Aircraft Y for takeoff.

Well after the event the FLM and I were in an annual review discussion and they said that I probably did not notice it, but that I turned Aircraft X left on Bravo causing the departure delay of Aircraft Y probably saved an airborne VFR to IFR event that would have been significant. They explained to me that during this same time frame, while they were monitoring Local Control, a [group of] VFR aircrafts had called and were transitioning the airspace northwest bound. The first problem was that the UHF frequency got deselected and so when the Local Controller did not respond [the group of] VFR aircrafts returned to TRACON. While this was going on, and the frequency was subsequently selected, the Local Controller was trying to beat the Aircraft Z flight and I am guessing from the structure of the conversation that when all was said and done they told the Local Controller they should probably report the event.

I have a few pieces of input:

1. The FLM is one of the newer FLMs and extremely solid operationally, as well as very strong in communicating with people. I am not aware of how the interaction went between them and Local to get the cancellation of the takeoff clearance, as there were no words spoken above the volume only the two of them could hear.
2. The Controller working is a newer check out to the facility and a breath of fresh air operationally. I cannot say enough about them, from the perspective of being here to

learn the job and become more proficient, in the times that I have worked with them.

3. The rest of the facility could learn from this event, and chances are there may be a briefing made from it, to express the importance of awareness of operational equipment, performance expectation bias, and not rushing when we are in a COVID traffic level, where there is really no need to push anything out of the ordinary.

## Narrative: 1

I was working Ground 1 & 2, CD/FD, combined for the COVID operations. There were quite a few aircraft taxiing out with arrivals interspersed. When I heard Aircraft Y call for pushback, I had three to go behind them, so I spoke to all other aircraft before getting back to them. When I got back to them, I corrected their climb via SID since they were only filed 11,000, and the LOA is initial 10,000. I gave them pushback on A west ok K after the last in line, [behind] a second company aircraft. About this time Aircraft X was rolling out to T on Runway XX Left with Gate XX. I was planning a left turn on B to D, then A when they called. A few other calls were done first, then I observed Aircraft X taxiing straight in K to A without having called. I told them that was a bad plan since I had Aircraft Y with pushback clearance at K and A, and I would have liked to be able to exchange that traffic. I concluded that Aircraft Y had not even started to push back, and simply gave Aircraft X taxi A for Gate XX. I received nothing further from Aircraft Y.

Do not taxi clear [off] the runway further than is necessary, until instructed to do so.

## Synopsis

Tower Controller reported a ground communication issue resulting in a taxiway incursion. Controller was working multiple positions including Ground 1 & 2 along with FD/CD.

## Narrative: 1

Aircraft Y was at 2,000 feet MSL, and issued a climb to 3,000 feet to avoid converging VFR traffic who I was not talking to (squawking 1200) observed at approximately 1,700 feet MSL. Sector complexity was high due to IFR/marginal VFR conditions as well as an increase in usual volume we have seen over the past months. I was working 2 different frequencies as well. When I issued a climb to 3,000 feet to Aircraft Y, he read back 3,000 feet, and then I moved on to other priorities. The next time I observed Aircraft Y's altitude, I observed 3,400 and told him to stop his climb and issued a turn away from conflicting IFR traffic (Aircraft X at 040). I also turned Aircraft X away from Aircraft Y and issued traffic. I did not issue a Brasher warning.

This was the busiest session, both traffic and complexity wise I have worked in many months due to decreased traffic volume due to COVID-19. I feel like if I had scanned better I would have caught Aircraft Y's altitude bust before I did. If my workload increases to this level in the near future, I feel asking for a split from the departure sector, or even calling someone over to act as a coordinator, or a "2nd set of eyes" when I feel task saturation is causing my scan to break down would be beneficial. I feel that both of these actions could prevent this from occurring again.

Another important take away from this event in preventing [a] re-occurrence is to not have an expectation bias assuming a pilot will comply with your instructions, even if he reads it back correctly. A constant scan is absolutely critical at all times, (busy or slow) to ensure pilots are doing exactly what you told them and to prevent separation/deviation errors due to complacency and/or expectation bias.

Primary Problem : Staffing

## Narrative: 1

I was departing ZZZ1 and going northwest toward ZZZ2 with a slight jog to the east to avoid the ZZZ3 Class B. My plan departing uncontrolled ZZZ1 was to turn out to the south to climb above the ZZZ4 Class D and call TRACON for flight following and transition through the ZZZ Class C. I have done this dozens of times and never had any trouble getting TRACON to respond. However, I failed to consider that TRACON controllers are handling multiple sectors because of the pandemic. Presumably because of this I did not get a response from TRACON, and I hadn't properly planned for this possibility, and I flew into ZZZ's Class C without ATC communication. As [soon] as I realized that I had done so, I turned and descended to exit the Class [C] (while still avoiding the ZZZ3 Class B. Once I was sure I was clear of the ZZZ Class C, I turned back on course, and was able to establish flight following with the ZZZ5 sector of TRACON.

I was assuming that I would get a response from TRACON and thus be cleared through the Class C, because that is what has always happened before, but I failed to plan for the possibility of what actually happened.

## Synopsis

GA pilot reported being unable to contact ATC due to possible Controller under staffing resulting in a Class C airspace violation.

## Narrative: 1

I was scheduled to complete 3 takeoff and landings for currency. The flight was completed uneventfully. Today, I was contacted by a manager that it was discovered the aircraft registration had expired. Typically we would be flying this aircraft frequently, but all of the passenger flights had been cancelled the remainder of the year due to COVID concerns. Crews (myself included) are scheduled at various times to complete currency takeoff and landings. While we checked to make sure the registration was on board during our preflight, we did not notice that the date had expired. When this was just discovered by management and maintenance of the expirations, our company self-notified to the appropriate agency.

There are several factors that contributed to this. I had my own contribution to this error by not verifying the date on the registration was current. It was determined the paperwork got mailed to a central location to the company and not directly to our hangar location. With COVID causing a reduced workforce in the location of mail delivery, we never got the paperwork forwarded of renewal and it wasn't until the second notification (delayed by a several weeks) that we got the notification. We have also been shifting different service providers for flight/trip planning and never was a flag raised that we were close to expiration on this document. We also discovered this wasn't tracked specifically on a maintenance program. Lastly, we would typically fly an international trip several times a year (but haven't flown any in 2020) that the registration would also be copied and verified current. There was not just one, but several contributing factors to this error. All

these actions have already been corrected to prevent a future re occurrence. I have also learned from this that I made an assumption when checking to make sure the registration was on board that it was current, and that I didn't verify the date because I assumed it was tracked by several methods. The take away that I have from this, even if I assumed somebody else has tracked and checked some of the items that was included on our interior inspection preflight, I need to be more detailed on some of my checks. This is even more prevalent in the current times when the flight hours are drastically reduced.

## Narrative: 2

I flew an aircraft with an expired registration for landing currency. I ensured that the document was on board, but am guilty of not checking the date. It is my understanding that the registration is addressed to our corporate headquarters, not the hangar, and due to COVID restrictions limiting staff at headquarters, the reminder postcards never made it to our team. This is not an excuse for my actions, but I do believe it is a contributing factor in this event happening.

We have already implemented corrective actions to ensure this never happens again. All of our registration certificates are now being tracked on our maintenance tracking software. We hired a company to automatically renew our registrations and have them delivered directly to our hangar. Additional training and language will be added to our company manuals to emphasize the need to ensure that we have valid and current documents on board for every flight.

## Synopsis

Corporate flight crew reported flying the aircraft with the registration expired. US mail had been delayed plus a shortage of office staff due to COVID-19, were cited as factors in the procedural deviation.

## Narrative: 1

Captain didn't wear a mask throughout the airport, on the plane, in the [hotel] van, nor in the hotel. When asked by the flight attendants, he said he can't wear one. This puts us all at risk and with a higher chance of having to be pulled from the line if he tests positive for COVID.

If crews cannot wear a mask, they should not be at work.

## Synopsis

Flight Attendant reported the Captain did not wear a face mask throughout their flight pairing.

## Narrative: 1

During my compliance check I noticed Passenger X did not have a mask on. Passenger X's face was covered with a hoodie. I asked Passenger X to put a mask on and the reply was "no I will not." Passenger X was going to use the hoodie because it was a barrier. Passenger X started to shout at me and continued to tell me the hoodie would stay on. Passenger X started to go on about how a mask doesn't protect anyone, so at that point I said I would be back right back. Because he wanted to escalate the situation I went up to tell the A Flight Attendant, she came back and explained to Passenger X the company's

policy. Passenger X's wife [also] added that the mask doesn't protect anyone. In the middle of flight, he then again put a blanket on his head and the mask was completely off.

## Synopsis

Flight Attendant reported a passenger did not comply with the face mask policy.

## Narrative: 1

Upon landing on Runway XXR at ZZZ, I exited on Taxiway 1 and turned left at Taxiway 2. The Controller asked my parking spot. I replied "Company X." Controller gave me taxi instructions and I replied "Taxiway 3, Taxiway 4, cross Runway Y, into parking." At intersection of Taxiway 2 and Taxiway 3, I turned left instead of right and taxied across Runway XXL. There was Aircraft Y on departure from Runway XXR already past me. Once I realized my mistake of turning left on Taxiway 3 instead of right, I stopped and told the Ground Controller.

## Narrative: 2

Most of the 1 hr and 40 minutes I had been on position with positions combined during moderate to busy traffic. I had been held over for 2 hours and a Supervisor was working LC with Tower in-charge on a single runway, so we were not using LUAW (Line Up And Wait). Additionally Runway XXL was closed as well (which we use to offset small arrivals to allow for more departures on XXR) and all these factors were adding complexity to an already busy session.

Aircraft X exited Runway XXR and was given taxi instructions "Taxiway 2, Taxiway 3, Taxiway 4, cross Runway Y and taxi to park" (Runway Y is a closed runway in my control). The pilot read back the instructions correctly. I had other aircraft taxiing and needed a

runway crossing between the steady stream of arrivals and departures. I coordinated for the crossing with LC and after Aircraft Y went through the intersection on takeoff roll, I cleared the aircraft waiting to cross Runway XXR at Taxiway 5 to cross. I watched him cross, checked another plane taxiing to the runway, checked the printer for clearances, checked back on my crossing, and informed LC the Taxiway 5/XXR crossing was complete. At that point Aircraft X keyed up and said something like "Uh, GC? I think we took a wrong turn." I did a quick scan of the runway and didn't see him initially because one of the poles was in the way. I started to key up to ask him where he was and stepped back to re-scan and realized he was on the north side of XXR half on the runway and half off. I immediately informed LC of the situation. I turned Aircraft X around and held him short of XXR and told local I was too busy to find a hole to cross him and to just call me when he had a place for me to cross him back over. I informed the pilot of his possible pilot deviation and gave him the phone number and then moved on to other planes and clearances.

This is an intersection we have had multiple issues with for runway incursions and last I knew is identified as a hot spot on the chart. Recently the airport added wig-wags to make it clear that it is a runway intersection to help stop pilots from doing this. ZZZ needs some sort of ground radar because even with the new safety lights installed they still cross. Some sort of early warning from an ASDE would at least give us a chance to catch this sort of thing.

While the Supervisor was doing a very good job of working LC, I was still trying to keep my eye on him because of how little pro-time they need, the regular decrease in traffic from COVID slowing our skills, and the high volume of traffic he was working as well. If the traffic is regularly that volume at that time of day, it's imperative that three people be in the Tower, not two. The only way I could have caught this aircraft would have been if I was staring directly at him as he made the turn. The distance from Taxiway 2 to Runway XXR on Taxiway 3, is very short and I was focused on verifying the completion of the runway crossing Taxiway 5.

Recommend 3 people in the tower from XA-XC pm.

## Narrative: 1

Apparently I was exposed to the COVID on this flight. I received a call from Flight Attendant G that Flight Attendant A has tested positive. I wasn't too concerned at the time. My time with her was minimal. But I heard from Flight Attendant D that she too had tested positive. So I called the company to set up a test. After the testing I was informed I could not fly until I received the results. Just an FYI, we flew the aircraft with the XX-day spraying using Product X. The cleaners in ZZZ were very rushed because we arrived late. I do know they did not spray, which they didn't need to. But they also didn't wipe down any of the tray tables. I am unsure what else they did or did not do.

## Synopsis

Flight Attendant reported exposure to COVID-19 and described aircraft sanitizing concerns.

## Narrative: 1

On arrival into ZZZ, descending via on the ZZZZZ3 Arrival just before the ZZZZZ waypoint, we checked on with approach, and they responded "Company XXXX, cleared ILS X." I had programmed the ILS X for our arrival, but didn't select any transition on the approach. The ZZZZZ3 STAR has the note to cross ZZZZZ at 6,000 feet, expect ILS or LOC Runway X. On receipt of the clearance, I paused for a moment as there was a discontinuity in the box after ZZZZZ and before ZZZZZ1 [waypoint], and the remaining points on the ILS X. ATC had not given us a heading or guidance for after the last fix on the STAR, just cleared ILS X. I looked at my EFB to see what the text of the STAR said, and my Captain seeing my confusion, said "you're cleared for approach, how about direct ZZZZZ1?" He had also queued up ZZZZZ1 in the box, and was poised to execute it. I still wasn't sure, but he seemed positive.

I said "OK," he executed it and we began direct to ZZZZZ1. Within a few seconds, Approach queried us "I show you left of course, what [are you] doing?" The Captain replied, "we're direct ZZZZZ1 cleared for ILS X, is there something else you would like?" ATC responded that there was a ZZZZZ transition to the ILS X, and in future that is what he meant when he cleared us ILS X - to fly the ZZZZZ transition on the ILS from the STAR. Had I looked closer at the approach plate, and not just the STAR chart, after the issuance of the clearance, the ATC clearance intention would've become obvious to me. I let my Captain cause me to second guess my hesitation, and disregard my uncertainty over our clearance. I should have requested he ask for clarification from ATC instead of allowing him to execute a path I was unsure of. I have felt a bit slow in the cockpit lately, due to having flown very infrequent this year (light schedules/hindsight/scheduled time off) and I believe I made the false assumption I was missing something and he was correct. A simple query to ATC would have cleared up the matter.

I should have taken a moment longer to review the appropriate charts to clarify the appropriate flight course, and failing that answering my question, I should have queried ATC for clarification. When programming the approach, closer examination of the plate would have shown the available lead in transition from ZZZZZ. I should have trusted my hesitation upon receipt of the clearance and not assumed I was wrong in needing clarification.

## Synopsis

Air Carrier First Officer reported a track deviation after missing a transition waypoint during an ILS arrival.

## Narrative: 1

Day 5, while enroute to the ZZZ layover hotel I received a message from a Captain I had dinner with on Day 0. I'll put this message in context by mentioning my First Officer and I met this Captain and his First Officer for dinner that evening.

The message stated on Day 2, this particular Captain was notified by the company that the First Officer he flew with had tested positive for COVID. The First Officer had sent a message to this Captain confirming such. The ZZZ1 Chief Pilot was subsequently notified and a request was made for that office to contact my crew of this matter (I never received any communication about this event). This Captain was tested on Day 2, became symptomatic on Day 3 and obtained a positive test result on Day 5 prompting the message.

Upon reviewing the message, I contacted my First Officer and the company On-duty Manager to notify each of the situation. Per company and CDC COVID protocol both the First Officer and I have been quarantined for a 14-day period commencing Day 0. As I compose this report, I am quarantined at the hotel, unable to travel home.

The intent of this report is to question why didn't the company notify my crew of the COVID encounter? Apparently protocol wasn't followed or if it was, it should be modified to address this particular or similar scenarios. Flight crews should not be placed in a situation where they must quarantine away from home while on company business, especially if the company was previously notified to contact a crew which was exposed to a COVID positive employee. Had I not been received said message I would still be flying the line with the potential to infect others with this virus.

## Synopsis

Air carrier First Officer reported the crew was not notified by the company of exposure to a COVID-19 positive employee.

## Narrative: 1

During boarding we had a guest come on board with no mask on. The A FA was in the midst of making a PA, so I went back to talk to him. I politely asked this guest if he had a mask, if not I could provide him with one. He responded, that he indeed had one. I let him know that he had to put it on. I stood to the side while this guest put away his carry-on bags and got into seat and buckled up. At this point, I informed him that he needed to put his mask on at this time, and I walked up front to inform the A about our interaction. I went back closed some bins and saw that he still had no mask on. This time the A FA went back to this guest carrying some extra masks and asked him if he needed one. He responded to her saying he had one. So she politely asked him to put it on. In a stern and harsh voice, he told her "I heard you the first time." The A FA came forward. The Customer Service Agent (CSA) was by the boarding door, and the A informed her on what was going on and the CSA automatically knew who we were talking about. She already had a discussion with this guest about wearing a mask on the plane. He put it on in front of her, but took it off before he got on the plane. We decided that a Supervisor needed to have a talk with him. The A FA informed the Captain on the situation and he went to the back of the cabin, and noticed that this guest was still not wearing a mask.

A CSA Supervisor, came onto the plane and removed the guest who was non-compliant with the company's face mask policy.

## Narrative: 2

Passenger in XX4 boarded the aircraft last, with no mask. I was making a PA while the FA D had just started closing bins etc. I noticed he was not wearing a mask after he passed me. D FA asked him to put a mask on and if he needed one. He said he had one. She asked him to put it on and thanked him. He stowed his bag and she again asked kindly to please make sure your mask is on. He did not. The FA walked away. After waiting approximately 5 minutes and no compliance I, the A FA walked backed back to his seat bringing extra masks. I tried to hand him one. He said I have one. And I said, please put it on. He then said sternly and harshly, I heard you the first time. I walked way. He did not put a mask on. Our Captain walked by to introduce himself to the FAs in the back, the passenger still did not comply. I asked the agent about him. She said, yes I had to tell him to put it on in order to board. He complied, so I let him board. He obviously took it off after passing her. He was asked 4 times to comply. I decided giving him a warning before we closed the door was only going to escalate the situation. We decided to ask the agent to deplane him. As he deplaned with agent he still did not have a mask on nor was he trying to put one on. The crew did not feel comfortable with him going with us.

## Synopsis

Air Carrier flight attendants reported a passenger would not comply with face mask policy and was removed from the flight.

## Narrative: 1

Gate agents used block seats [on this flight] for passenger. I was unable to sit in my assigned jumpseat due to gate agents selling seats. We notified company and a Supervisor

came down and talked to agents. The Supervisor then asked me, in front of the passengers, if I wanted to have a passenger taken off [the flight]. I was given the choices of Dead Head on the flight or sit in the jumpseat. I felt pressured to take a jumpseat, sharing with another Flight Attendant.

A week later, I was notified that a crewmember working that flight had tested positive for COVID-19. I'm very upset that I was put in this position and put myself at risk. I still don't know if the Flight Attendant I sat next to on the jumpseat is the one who tested positive.

## Synopsis

Flight Attendant reported feeling pressured to sit in a cabin jumpseat near passengers assigned to company blocked seats. Flight Attendant was later informed of exposure to COVID-19.

## Narrative: 1

While traveling on board the Flight AABC I witnessed FAs setting up the break curtain in the beginning of the coach cabin. It was odd to me that the curtain would be erected given the difficulty of putting the curtain up and taking it down. My concern is mainly about the safety and security of the flight. I cannot attest to the number of people taking breaks, but breaks were taken and this has to stop. If something has changed and they are entitled to breaks then I am not aware and need to find out whether breaks are to be taken. I had not flown in a few months due to COVID-19, but knew something was not quite right with the curtain issue. Insult to injury, there were numerous stand by passengers/employees onboard that may have witnessed this, let alone regular passengers curious as to why this curtain was erected. Again my concern is about safety and security. I know for a fact that

cabin coverage would have been an issue because there were only X flight attendants if I'm not mistaken working the flight that night. Again these people need to be spoken to in regards to this matter because this could have easily turned into a catastrophic event if someone got sick and needed assistance, or worse a terrorist event. I am concerned and this again needs to be addressed immediately. Why were these flight attendants so confident that they could take a break in full view of passengers?

## Synopsis

Passenger reported the flight attendants erected a curtain in the coach cabin as a rest area during flight. Passenger expressed safety and security concerns with this incident.

## Narrative: 1

Hour into flight during beverage service, passenger in XX3 told me, that he was going to throw up and needed to go to the lavatory. People around him heard. I asked FA Z to move cart to galley for an emergency. Someone was in right door X lavatory, so the sick passenger accessed right lavatory Y and violently threw up in toilet. FA Z asked if he had a temperature or needed a doctor. He said he didn't have a temperature or possible COVID, but had too much to drink earlier prior to flight. We locked the lavatory back up.

Passenger across from him thanked me for letting him go so fast. It did not result in passengers or crew being exposed to vomit in these possible COVID situations. He did not want medical treatment upon arrival.

## Narrative: 2

FA Z and FA X advised me that during their beverage service passenger in XX3 hurried to them and told them that he was going to throw up. FAs moved beverage cart quickly to the aft galley and moved passengers in aft galley to the side of galley, lavatory X was in use with another passenger. Passenger accessed lavatory Y and was continuously throwing up for a lengthy period of time. FA Z asked passenger if he had any fever [or] COVID, and passenger said no that he just had many drinks before flight. I advised Captain of the situation. Crew utilized situational awareness and company taught skills when dealing with this situation.

## Narrative: 1

I'm having a difficult time with wearing a mask for so long everyday. A passenger came back and tattled on another passenger that his mask wasn't on. I asked if he was uncomfortable with that and he didn't reply. He just said it wasn't on. I said something like I guess I have to act as "the sheriff." I can't force someone to do something that is making me literally and physically sick myself, so I asked my flying partner to wake him up and ask him. It was done immediately. On a separate flight during this trip we had a medical situation and I realized communication was not happening with masks on. It was horrible to try and talk with a muzzle on my face. The doctor that ended up helping us explained the science on how useless these masks are. So again, I don't understand why a policy

that can end up making us sick when we weren't is still in place. After I was on a plane for 3 days full to capacity, I get on a bus that they won't fill up due to social distancing!! How insane is this to watch after flights are full and social distancing is a joke. Then we ask to deplane separately after cramming in a full flight. It is absolutely embarrassing. And obviously if it did anything, we would actually follow it. I keep praying this is over tomorrow. I have the lawyer that is saying this is crimes against humanity. I am absolutely worried about the bacteria on the mask, especially after speaking with the doctor. If I end up with strep or staph infection or anything bacteria, it will be occupational as I am forced to wear this. I barely eat or drink, cause god forbid someone takes a picture in between sips and I know already the company will not back me up. We are so fearful for our jobs, it is insane. This needs to change now. We are all feeling anxious because of this every flight.

## Synopsis

Flight Attendant reported multiple concerns with wearing a face mask.

## Narrative: 1

During boarding of the flight, the C Flight Attendant brought it to my attention that he had forgotten to brief the exit row on our previous flight. I had been distracted dealing with a mask compliance issue in the front row and I had forgotten to verify with the C Flight Attendant if his over wing had been briefed.

I need to next time take a moment to take a breath and think about all of my duties I need to accomplish.

## Synopsis

Flight Attendant In Charge reported being distracted by a face mask compliance issue and not verifying all before takeoff duties were completed.

## Narrative: 1

My position was Flight Attendant (FA) B and my jumpseat was in the aft of the aircraft. [While] performing safety demonstration, [there were] passengers in [seats] XX1 and XX2 party of 2 traveling together male and a female. The male passenger was talking on his phone, wearing his mask around his neck, when asked to put his mask he replied he was claustrophobic and could not wear his mask. I informed him it was mandatory to wear the mask and if he was not able to comply with safety instructions that it would be addressed at that time not during the flight. He cursed at me, at that time his female traveling companion told him to stop and to listen. She said he would comply with crew member instructions. I had to stop twice during the safety demonstration to tell him to put on mask and stop using his cell phone, he was [on] a phone call.

FA D's jumpseat was directly in front of row YY and XX exit row. Upon FA taking his jumpseat for takeoff the passenger in seat XX1 was not wearing his mask, took off his shoes and had his duffle bag right at his feet. FA D came to back to tell me what he was doing and that FA D was afraid to say anything to this passenger because he felt threatened by him and feared that this passenger would become violent with him. At that point FA D called the Captain and told him everything that happen since this passenger came on board the flight. FA D requested the Captain to remove this passenger from the flight. However, the Captain came on the PA made an announcement to all the passengers that there was a passenger on board that was not complying with crew instructions and for the passenger to comply with airline instructions right away [or] that he would be going back to the gate. Apparently the passenger immediately put his shoes and mask back on. FA came back to this passenger and his duffle bag was placed in overhead compartment. During takeoff he and his traveling companion pulled down their mask, this happened repeatedly throughout the flight.

## Synopsis

Flight Attendant reported a passenger did not comply with the face mask policy, nor cell phone regulations.

## Narrative: 1

On initial approach into ZZZ at first flap extension the flaps had an asymmetric condition that stopped the flaps between up and 1 degree, the LEDs (Leading Edge Devices) went to the extend position, no roll experienced. Upon noticing the FO elected to level off and follow the approach track and published missed approach. We informed ATC that we were experiencing a flight control problem and that we would be entering holding. We ran the flap trailing edge asymmetry QRH and decided not to land at ZZZ due to the short runway and degraded runway conditions. We then debated on proceeding to ZZZ1 or ZZZ2. We could not proceed to our filed alternate of ZZZ3 due to the increased fuel burn with the LEDs extended. With a quick rough calculation we decided we had enough fuel to proceed to ZZZ2 that had the longest runway. We contacted Dispatch and they concurred on proceeding to ZZZ2. We then climbed to FL190 and cruised at 220 knots IAS. We ran the ALL FLAPS UP QRH and landed at ZZZ2 uneventfully. Dispatch tried to call Operations Manager but he was dealing with another call.

[I suggest] maybe dedicating someone else to "COVID" situations that took Operations Manager away from being able to assist us. Also having tanked fuel was great because it gave us the option to go to a long runway.

## Synopsis

Air carrier Captain reported the Operations Manager was unable to help the crew during an in-flight mechanical problem due to being involved with a COVID-19 situation.

## Narrative: 1

On vectors to ZZZ ILS XXR we overshot our intercept to final, but made an immediate correction to track inbound on the localizer. PF and PM were monitoring the multiple vectors, altitudes, speeds and configuration and when cleared for the approach PF did not push and confirm approach mode on Mode Control Panel. As we saw that we were not intercepting the localizer PF corrected the heading and used approach mode to capture the localizer.

As we all work through COVID proficiency issues it's important to be vigilant at all phases of flight for errors and trap them as soon as possible.

## Narrative: 2

On vectors to ILS XXR we overshot our intercept to final, but made an immediate correction to track inbound on localizer. FO was PF and Captain was PNF. Frankly, as PNF, I did a poor job monitoring. Contributing factors were a fixation on getting down as we were a bit high on the vertical profile (that part worked out fine), distraction of broken communication with Approach Control, fatigue due to short overnight, and also pilot proficiency/recency as both of us our new to our respective seats and have not flown much of the past several months.

As PM, I should not have become so pre-occupied with the descent path as in reality we were still quite a ways out and correcting in a satisfactory manner. It would have been better to manage by big picture scan better. Had [I] been doing my job better as pilot monitor instead of micro-managing the descent path, I may have trapped this error.

## Synopsis

Air carrier flight crew reported a track heading deviation and cited lack of flying as a contributing factor.

## Narrative: 1

I made an error in not verifying that all 3 ADIRS were aligned before departure after having the preflight flow interrupted by the passenger disturbance at the gate. I tried to be deliberate and methodical in reviewing the manual after discovering the error before performing the alignment and thought I had found the only pertinent caution, the flaps/slats. The format of the manual made it appear to me that the section was complete on page X. Only suggestion would be to keep all cautions and warnings for a given section grouped together in the text, instead of having one at the start of the section and another at the end of the section (in this case on the next page).

The First Officer (FO) and I discussed the threats and errors that occurred on this morning and the opportunities that I missed to capture those errors. We additionally thoroughly reviewed the system. I take away a number of lessons learned from this morning and will be more vigilant when I recognize when my habit patterns are interrupted.

Other potential considerations:

My FO and I had briefed the entire trip that he was low time (just over 100 hours) and I had not flown in 5 weeks. While I felt rested and alert, this was day 4 of a 23 hour trip with all early morning shows which may have also contributed to a decreased capacity.

My cockpit preparation flow was interrupted when a passenger, who had refused to pay for his carry-on bag, breached the gate in ZZZ and caused a disturbance at the forward door. I got out of my seat to see what was going on and prepare to close the door should things escalate. When I returned, I thought I had finished my flow completely but after pushback and engine start realized I had not turned on IRS3 when we got an ADR3 fault caution message.

Knowing that there were warnings and conditions about aligning IRS's outside of the normal preflight I opened page X which has the ADIRS preflight information. The caution on that page said to make sure the flaps and slats were retracted before aligning, which was confirmed before I turned on IRS3. Since there was a GPS outage in our area, and we had moved in the pushback after aligning IRS1 and IRS2 I also decided to do another full alignment of those. When I selected all of the ADIRS off we got a master warning for the ADIRS 1+2+3 fail and other cautions which all resolved after I turned them on to align again.

Knowing we had gotten out of our normal flow, and recognizing that I had gotten distracted with gate issue, during the alignment the FO and I went through the preflight items and reviewed our previous work to confirm we had not missed anything else. After the alignment was complete and all systems normal we departed for an otherwise uneventful flight.

Once in cruise, I went back to review the manual and found on the next page Y a continuation of the ADIRS section with an additional second bullet point, one that said not to align the ADIRS with the engines running.

## Synopsis

Air carrier Captain reported making a procedural error during preflight and cited a distraction and lack of recent flying as contributing factors.

## Narrative: 1

Had the planned route in the FMS. When I received the CPDLC I missed the new route. I had reviewed several routes via the weather application. The route looked familiar and I

didn't notice the route change.

I have not flown in 5 months. Flight Attendants checked in while I was checking the clearance via CPDLC.

The ability to print CPDLC on the ACARS would have trapped my error.

## Narrative: 1

I am requesting the company ban "single layer neck gators." I do not want them used aboard my aircraft because the ones that I have seen, that are single layer are so thin you can see through them and I do not believe they are effective at protecting anyone. I believe they are unsafe for surrounding crew and passengers.

I had taken the time to ask questions, of a couple of passengers, regarding the "neck gators" they were wearing. They were single layer. I did tell them I was not comfortable with the "neck gators" since they were only single layer and a Gate Agent provided the masks we have, for their flight.

## Synopsis

Air carrier Captain reported requesting the company ban single layer neck gators as they do not provide adequate protection.

Narrative: 1

A part of my preflight briefing includes the request that face coverings be worn when not eating or drinking in the cockpit due to the confined space. My First Officer stated that he would not comply because he had been wearing one all day and did not want to wear one on the flight. After additional requests for compliance I stated that this was a no go item for me and elevated it to Flight Operations and the Chief Pilot.

My reasoning here is that if one pilot is COVID positive yet asymptomatic the chances of the other pilot becoming infected in this environment are very high. I feel that mask usage is a reasonable precaution that reduces the overall risk. Several hundred pilots already contract COVID and unfortunately at least one pilot has died as a result and I believe that statistically speaking this is a higher threat to us at present than all other threats. Unfortunately, there is a lack of guidance to mitigate this risk.

I believe the company should provide guidance towards the cockpit that parallels the guidance for all other areas of our operation that masks should be used at all times when not eating and drinking. When I informed the Flight Attendants of the situation they became extremely supportive and explained that they felt very unsafe when approaching cockpit crews who were not wearing face coverings. Please address this issue. My First Officer did finally agree to wear his mask after speaking to the Chief Pilot and the flight was completed.

## Synopsis

Air carrier Captain reported the First Officer would not wear a face mask in the cockpit when asked to.

## Narrative: 1

Just a busy VFR final with speed 170 until 5 miles and then a scramble to get speed set and flaps configured and landing checklist done. Seriously compounding the issue is a lack of recency in the jet (over 5 months since last flight and 8 months since having a consistent schedule).

## Synopsis

Air carrier Captain reported an unstabilized approach and cited lack of proficiency after an extended period of time off as a contributing factor.

## Narrative: 1

I was the PM. Very light aircraft takeoff weight and fairly quick initial altitude level off - 3,000 feet. I called out of 2 for 3 thousand. Climbing through 2,700 feet, I stated "watch your altitude we are leveling off at 3,000." I then called out FMA annunciation of "Speed - VNAV ALT." FO immediately began level off. Wasn't aggressive enough in level off. We climbed as high as 3,150 feet and then immediately descended back to 3,000 feet. ATC - ZZZ Departure frequency stated, I show you at 3,200 feet and you have traffic at 4,000. At that time we were level at 3,000 and I responded we were level at 3,000.

## Narrative: 2

First Officer flying miscalculated level off process. Aircraft very light and climbing rapidly. Exceeded altitude by 150 feet. Adjusted back in timely manner, but ATC called the deviation.

## Narrative: 3

On departure climb at 2,700 the Captain called out altitude, we had a light airplane and we were climbing faster than normal. I pushed the nose over to arrest the climb rate. This resulted in climbing passed the assigned altitude of 3,000 to 3,150. I immediately corrected back to 3,000.

## Synopsis

Air carrier flight crew reported an altitude overshoot due to a light aircraft.

## Narrative: 1

During initial boarding phase the Lead FA brought to my attention a threat to the safety of the flight. The threat was that she noticed several passengers were not covering their noses and mouths with a face covering. FAs counseled each passenger boarding without their masks on properly on airline's policy that all travelers are required to wear face coverings during their entire flight. As the Captain I made three PAs at the beginning, middle, and end of the boarding process explaining the airline policy.

The CSR was initially alerted to this health threat and stated that they counseled customers were traveling together in a large group of about a dozen. He stated that he made PAs in the boarding announcing the face covering policy. At the end of the boarding process the CSR again repeated airline's mask policy then closed door 1L. Prior to pushback the FAs alerted me that they again had to tell a few members of the same group to wear their mask. Later one of the FAs stated that some of the passengers from the large group were displaying eating and drinking motions while specifically staring at the FA. While on the ground, each of the multiple incidents that members of the group were told to wear their masks properly they complied. The Lead FA contacted me after initial level off for cruise flight. She requested that I make another PA about airline's face covering policy because multiple members of the same group were again not wearing their masks to cover their noses and mouths. I made a fourth PA repeating airline's policy and explained that the masks were mandatory for public health reasons. I also explained that they may be putting the safety of the flight in jeopardy. I then contacted Dispatch to alert the company of the threat to the safety of the flight. Via ACARS the Dispatcher issued instructions to mitigate the threat. The Lead FA subsequently informed me that after my fourth PA all passengers complied with the face covering policy.

## Synopsis

Air carrier Captain reported several passengers were not complying with face mask policy.

## Narrative: 1

Gate return. Pushed off the gate, started the engines when we got a call from the back that we needed to return to the gate because of an irate passenger. As we were coordinating the gate return received a second call that we needed to return. Shortly after that received a third call that we needed to return and at this point [contacted] Operations. As we coordinated with Operations, Ramp and Ground for the return Flight Attendant X and the other flight attendants did an amazing job getting the situation under control. By the time we got back to the gate Flight Attendant X said the situation was under control. I checked with the flight attendants to make sure they were okay with the situation and they said they were. Apparently we had 2 passengers sitting next to each other who got into an argument. When Flight Attendant X went back to see what was happening one of the passengers started verbally abusing her. She did an amazing job getting them calmed down, but while that was happening another passenger refused to wear his mask, and another Flight Attendant was dealing with that. I can't say enough about how well Flight Attendant X and the others handled the situation. In fact, as passengers were deplaning in ZZZ1 I overheard a number of passengers express what a good job they had done.

Many folks seem to have a short fuse, all the ugliness happening around the country, wearing masks...lots of grumpy people confined in a small aluminum tube.

## Synopsis

Air carrier pilot reported flight attendants excellently handled a passenger misconduct event during pushback.

## Narrative: 1

ATC asked us to maintain 190 [knots] to ZZZZZ, I realized that might be a little tight, but I thought it would work if configured a little early. I was referencing the radar altimeter throughout and as the speed was not coming off as I would have liked I believed it to be manageable. I thought I had an additional 300-400 feet to configure to flaps 30 for landing, when I heard the 1,000 foot call. I [immediately] executed a go-around for being unstable.

Cause - 1) Length of time between flights. 2) Long day. 3) High rate of speed to FAF.

Knowing how little I have been working, I should have been a little more aggressive in my SA (Situational Awareness) and planning.

## Synopsis

Air carrier pilot reported an unstabilized approach resulting in a go-around.

## Narrative: 1

Passenger neglected to comply with airline's mask policy, resulting in passenger being removed from the aircraft. The aircraft was still at the gate when this event took place and after the passenger was removed, the flight departed to its destination without further

incident.

Forward FA asked me (CA) to speak with non-complying passenger about our mask-policy. After speaking with the passenger, the passenger complied and agreed to properly wear the mask. After a few minutes, the FA complained again that the passenger was not complying with the policy and that the passenger was getting aggressive towards the FA. The station manager was involved in this incident and a decision was determined to remove the passenger from the flight.

## Synopsis

Captain reported a passenger was not complying with face mask policy and was eventually removed from the flight.

Narrative: 1

[I] released 50 flights in an 8 hour period. From the moment I sat down, the X area was experiencing moderate turbulence from FL280 and above. As a result, it became necessary to file the majority of my flights in this range, resulting in numerous phone calls from inquiring crews. The turbulence persisted until the time I was relieved at Xpm. Along with the numerous releases, ZZZ amended their TAF twice, leaving me to amend the release of 7 airborne flights in order to remain legal. I had one rolling maintenance generating numerous phone calls from just the one crew. In my opinion, this workload is excessive.

Cause - Managements inability to properly staff the office.

Re-evaluate the workload and [I] suggest adding more dispatchers to alleviate excessive workload.

## Synopsis

Dispatcher reported excessive workload due to staffing issues.

## Narrative: 1

The flight was cleared to line up and wait on Runway XL while Aircraft Y was on short final to [Runway] XR. A short time after stopping in position on the runway, the flight was cleared for takeoff. Takeoff was normal and the flight proceeded to climb to 500 feet and I was just about to initiate the right turn to 060 degrees as required by the ZZZZ X departure. As I looked to my right, I could see Aircraft Y, on a go-around and apparently flying the runway heading, overtaking us at our altitude and in a position that was, in my opinion, much too close and a very real threat. Just as this was happening, the tower instructed us in an urgent tone to turn left to heading 360 degrees. I immediately initiated the turn, hand flying, as the Captain dialed it in with the heading selector. With that action the threat was over; our flight turned away to the left as the Aircraft Y overtook us in both distance and altitude. The Captain and I learned through the ensuing communication between the Tower and Aircraft Y flight that it had gone around due to a strong wind gust.

I have had a considerable amount of experience flying in and out of ZZZ over the years while I was employed by with another company. It has always been customary that Tower controllers stagger the takeoffs on Runway XL with the landings on XR. I have noticed that takeoffs usually are cleared as the parallel runway aircraft are either actually landing or rolling out. This is just what I have noticed through the years and I do not have actual knowledge of Tower procedures at ZZZ. Because our flight was lined up on Runway XL, I could not see the landing traffic. When our flight was cleared for takeoff, I made the assumption that the parallel traffic was landing and not going to be a factor. However, when Aircraft Y went around, it quickly began to overtake us and could have been a real threat to our flight. With the excellent visibility at the time, I am certain that the Aircraft Y pilots could see us, but it was still very concerning that our two flights got so close. I am concerned that there was possible loss of situational awareness on the part of the Tower Controller or a deviation from standard ATC procedures. When Aircraft Y aircraft unexpectedly went around, an unsafe condition could have quickly developed. This is especially concerning because the SID procedure requires a turn across the parallel runway's extended centerline.

I have some concerns that during this COVID pandemic and the resulting slowdown in air traffic, that both flight crews and ATC are no longer operating at the highest levels of attention and situational awareness. This reinforces in my own mind that absolute adherence to standard operating procedures is so very important and is a major barrier to

safety of flight events when unexpected actions occur. I cannot say for sure, but I believe that our flight was cleared for takeoff too early and when Aircraft Y landing on the parallel runway went around, the situation developed quickly into an unanticipated loss of separation. I hope that procedures at ZZZ Tower are reviewed and adjusted so that this situation does not develop again.

## Synopsis

Air carrier First Officer reported an aircraft went around due to winds, while they were departing a parallel runway causing an airborne conflict.

## Narrative: 1

I was the pilot flying. I had never been to ZZZ. Captain was pilot monitoring. During descent, ZZZ Approach advised that the tower would be closing soon and to advise ZZZ in sight for a visual to XX. We had reviewed all applicable Jeppesen pages including Tower closed procedures. ZZZ confused us initially with the statement Tower would be closing soon, as it was a little after XA00L [local time], so we didn't know if that meant we would be getting in before they officially closed. We got the field in sight and Approach cleared us for the visual and said to contact them on the ground to close our flight plan. Focusing on flying, I don't remember them saying to switch to CTAF or XYZ.X for advisories, but I knew that was the plan and didn't see that when the Captain switched frequencies and began making call outs that he had switched to UNICOM instead of CTAF. While I haven't done a lot of flying into airports with a closed Tower, when I have, it wasn't uncommon for transmissions in the blind to go unanswered so it didn't concern me when no one responded to our calls. I followed the guidance to align with [Runway] XX and started descent on glide path. It was right around 1,000 when I called stable that I noticed yellow flashing lights in the center of the touchdown zone. I mentioned to the Captain and said I thought there might be a vehicle on the runway. We continued and just after he called out the 500 foot call I noticed the light moving down the runway and then could make out brake lights illuminate on the vehicle. I called out I was going around for a vehicle on the runway and the Captain acknowledged. I executed the go-around and we went back to approach frequency and advised them what had happened. He cleared us for another visual and we again made all the appropriate calls, although on the wrong frequency, and landed uneventfully.

Although it was clear in the company pages, we had some initial confusion as to exactly when the Tower would close. NOTAM had said XA00L, but it was after that, approximately

XA05L when approach said Tower would be closing shortly. We were only 5 minutes out so I think we both had some impression that Tower may still be open when we landed. On the Jeppesen pages UNICOM is listed right next to Tower/CTAF and I think as things were happening quickly when Tower cleared us and we realized Tower was now closed we were configuring and I believe the Captain just looked and grabbed the wrong frequency.

A more thorough discussion between both pilots to make sure we are both seeing the same information and are on the same page as to what the exact procedures we will follow in unusual operations such as a closed Tower.

## Narrative: 2

Flying with ZZZ Approach vectoring for final to Runway XX when Approach warned of the Tower closing. First Officer flying and proceeded to the outer marker and called the field in sight. ZZZ Approach advised to switch frequency, but to call back and cancel IFR after we land. I looked at the airport diagram and saw UNICOM and used that frequency to announce our position. After we were fully configured and on short final we saw a vehicle on the runway. We continued until about 300 feet then did a go-around called ZZZ Approach to advise of our situation. He offered vectors, but we had the field in sight went back to UNICOM and landed canceled IFR clearance and taxied to the gate.

First day back flying after taking extended time off. Leg 3 at night and not expecting the Tower closure. After reading the FOM the next day I realized CTAF is the correct frequency to use. Also looked at 10-9 pages and found the note about Tower closure procedures.

Having been to an uncontrolled airport once in my career and the First Officer running the radio I was unaware of the procedures. Why would UNICOM frequency be listed?

## Synopsis

Air carrier flight crew reported executing a go-around after seeing there was a vehicle on the runway. The Tower was closed at time of the event and the crew was on the wrong frequency.

## Narrative: 1

Departure clearance is not received until taxi out, close to departure end of runway. We were flight planned for one SID but given another SID when I received the clearance on taxi out. I remember looking at the SID, which has approximately 6 different SIDs on one page and did not realize the assigned SID was not on the SID page, but depicted on the runway page. Shortly after the clearance was received, there was also a distraction regarding the aircraft. I cannot remember, but it might have been a transient ECAM, this aircraft had several when we left ZZZ. I performed the takeoff and realized then that we did not have the assigned departure. The CA also did not catch the change in SID, and we queried ATC for a verbal description of the departure.

I have not flown much in the past 7 months and normally avoid Country X. Due to the language barrier, previous aircraft malfunctions, assigned SID not on SID page and another distraction I cannot specifically remember, I failed to change the SID in the FMS. This is just being reported now because there was not time between this flight and the next leg due to interview to renew customs clearance, being selected for random security check, the need to obtain food prior to flight. The next leg involved an air divert and was more on my mind than this.

All published SIDs on one page would greatly enhance situational awareness. Although we were not rushed, there are many distractions and my normal cross check procedures were not in place.

## Narrative: 2

On initial climb I quizzed the Controller as to our first point on the SID and realized we were not flying what we were cleared. He then told us to climb to 6,000 then direct ZZZZ. We did as cleared. He then questioned us as to which SID we had been cleared and I told him we believed it was the RNAV and apologized for the confusion. The rest of the departure was uneventful.

You don't get a clearance until you request taxi at which point you're told to contact

Tower. Tower gives you taxi and ATC clearance. Would have been nice to get clearance at the gate. Controller had a thick accent and we made the assumption we understood which departure we'd been cleared but were in fact mistaken.

Double check your clearance before you depart even if you think you have it correct. I had a suspicion, but didn't quiz anyone till we were airborne.

## Synopsis

Air carrier flight crew reported not flying the correct departure procedure and not realizing it until after contacting ATC.

## Narrative: 1

From the ZZZZX arrival approach gave us a clearance direct to ZZZZ on the ILS XXL approach. The PM selected the ZZZZ fix from the DIR FMS page and asked if I agree, I visually verified that direct ZZZZ was selected and replied I agree and to execute the change. The PM then stated we need to make the 176 course big, and I agreed. After the change was made I verified on PFD1 that the aircraft was in white needles with NAV captured and the fix was ZZZZ. A few moments later approach asked us if we were going direct to ZZZZ, and again I verified on PFD1 that the aircraft was in white needles, navigating to the fix ZZZZ. The PM confirmed that we were direct ZZZZ. Approach then gave us a HDG to the right of our flight path to fly. I dialed in the requested heading (I think it was 125) and selected HDG on the FCP and verified on the PFD1 that the aircraft was now in HDG mode. Trying to determine what had happened and why we need a course correction I noted the flight path on PFD2 that showed we had been tracking the last heading as an intercept for the extended LOC course outside of ZZZZ. A brief discussion of what had happened with the PM was conducted and we both agreed that we should not have entered the course, which tells the FMS that you want this heading to intercept, and that it should have been left as the course direct to ZZZZ as this was the clearance. The approach was conducted without further incident.

This was my first flight as Captain after almost X years. I had just completed IOE the previous week, which had multiple interruptions including being taken off line because my IOE Check Airmen had been exposed to COVID. I flew one turn as an FO the previous day, and this flight. I believe my concern to be open to correction caused my response to want to agree with the PM, and this was a common error I had made during training as well, not making the inbound course 'BIG' to have the FMS adjust the flight profile for an intercept as opposed to flying to a specific course. Just because I had made this error before, does not mean that I will make it again, I should have stated out loud why I did not initially ask to make the course big, because I heard the clearance as direct to the fix, not intercept, which we were primed for, due to our position in the flight. Additionally when ATC questioned if we were going direct to ZZZZ, I check PFD1 to read the status of our navigation, and seeing ZZZZ as the fix, and NAV captured and in white, believed this could only be the case. In all my time flying this type aircraft, I don't know if I have ever been aware that this shows when intercepting the course, as you would usually see HDG

mode to capture. Additionally, the slight difference in the flight path was not great as displayed on PFD2 in the map. This will definitely change the way I verify the mode the aircraft is in, to include tracing the flight path on PFD2.

## Narrative: 2

We were on descent via ZZZZZX Arrival. We were cleared Direct ZZZZZ before the last fix of ZZZZZX Arrival on the Visual back it up with (ILS) for Runway XXL. I was PM and selected ZZZZZ and placed it in Magenta line select. It was my fault for doing the procedure as if we are sequencing for the approach. So, I select making the course big on the right line select side. I did asked PF to confirm before executing the FMS. That ended up extending the centerline and the aircraft continued to fly it current heading tracking toward the extended centerline. Roughly, after 30 seconds Approach Control came on and asked if we are direct ZZZZZ. I verified the FMA as well as on the left side of the compass rose on the PFD. It [was] displaying ZZZZZ and in white FMS letter. So, I responded that we are going direct to ZZZZZ. Approach after that gave us a heading of 125 to have the aircraft position heading toward ZZZZZ. After that both PF and I talked over to see what went wrong during the execution. We both came to an agreement that it was due to my mistakes for making the intercept course big. After we heard toward, ZZZZZ Approach cleared us to join the LOC for XXL and we called for the field in sight. We were cleared for the visual for XXL. Everything and aircraft landed safely without any other issue.

My suggestion is to be more vigilant and [have] more situational awareness. Especially, if you don't fly often. As well as making sure understanding what you are selecting and understand clearance fully.

## Narrative: 1

At gate X in ZZZ, filed to ZZZ1 on the ZZZX Departure. The flight plan after the SID started at ZZZ. We requested log-on from ZZZ2 for the departure clearance 30 minutes prior to push. Flight plan (legs) verification accomplished per SOP. First Departure clearance came about 20 minutes prior to push indicating a new clearance for the ZZZZZY, ZZZZZ [Intersection], as filed. Started to update flight plan to account for this. While editing flight plan, another Departure Clearance came in for ZZZX, ZZZ [VOR], ZZZZZ [Intersection], AF. Started editing flight plan again to account for reversion to original flight plan and SID. Completed another flight plan verification from ZZZ. Completed briefing. Standard push back and taxi for [Runway] XXR. Completed before takeoff checklist, inclusive of the "runway confirm." Both the FO and myself think we both saw the correct runway on the ND during the final check, as well as the departure brief. On takeoff, very early after liftoff, switched to Departure Control. Very early in climb, "NAV" engaged, catching me off guard as it seemed like we were below 400 feet, commanding a hard right turn. I instinctively followed the flight directors initially. In the turn, still below thrust reduction altitude (1,000 feet), I realized from my briefing that the turn should have been to the left, not the hard right turn the flight directors were commanding. I started to correct back to the left. I did not see any traffic in our immediate vicinity on TCAS. ATC then assigned us a heading of 350. As we were in the turn to Heading 350 ATC mentioned that we were supposed to turn left. I believe were around a northerly heading when we hit 1,000 feet, our thrust reduction altitude. We apologized to ATC and inquired if there was a traffic conflict, which he replied "no." He handed us off. About 60-90 minutes into the flight we were notified over CPDLC of a possible pilot deviation and to call TRACON. I called TRACON and the Supervisor was very cordial. He explained what they had seen, and we also told him what had happened on our end. He told me they had been seeing this event a fair amount lately. Coincidentally, on the same aircraft yesterday for the outbound flight to ZZZ, we had to have maintenance reset the FMC's on the ground in ZZZ1 because both with, and without, a Flight plan in the FMC, as soon as the flight directors would be turned on the lateral "NAV" mode would engage and command a hard right turn. We tried resetting everything, inclusive of the ADIRS, swapping the nav data base, and the same thing kept happening. After maintenance reset the FMC's problem went away.

Caught/detected by myself (PF) below thrust reduction altitude of 1,000 feet. Correction applied.

First flight and operation into a busy complicated airport in over 6.5 months due to the COVID situation. Numerous cockpit distractions during cockpit setup. Several ATC digital clearances within a short period of time. External stresses caused by current state of affairs currently going on within our country and our company. Potential aircraft navigation technical issue, however, I cannot rule out pilot error. Possible pilot error scenarios would be; departure procedure in the FMC jarred/messed up by the second CPDLC clearance route uplink, and subsequently not caught during second flight plan verification. Potentially wrong runway set in FMC during cockpit setup. The FO and I don't believe it is the incorrect runway scenario because we did the Flight Plan verification, briefing, and final runway confirmation approaching the runway threshold as per SOP, and we believe we saw the digital representation of the runway on the ND. But I have to admit this is a possibility. At all times all SOPs were adhered to the best of our knowledge.

## Narrative: 2

It was a busy morning out of ZZZ. Our flight plan called for the ZZZX Departure. The automatic upload for the flight plan wasn't working so my Captain was manually loading the flight plan. We received our new clearance indicating the ZZZZZY, ZZZZZ [Intersection], AF. We then fixed the computer and did a flight plan verification. Then we received another clearance, ZZZX, ZZZ [VOR], ZZZZZ [Intersection], AF. We fixed it in the box, did another verification. After takeoff, it seemed very early the airplane went into nav mode, with a right turn. Before I could say anything my Captain was correcting the turn. And before that ATC told us to turn left to 350. He then mentioned we were supposed to turn left on the ZZZX not right. We apologized and continued without incidence.

Cause - Second flight on over 7 months, due to COVID. A bunch of cockpit distractions, followed by multiple different clearances, and airplane malfunctions with automatic uploads. Bottom line SOPs were followed to best of our knowledge. Verify, verify, verify.

## Narrative: 1

Prior to this flight, the Captain said he hadn't flown since June, except for a training event at the training center. I had the previous month off, with the exception of a ZZZZ turn, in which I flew one leg.

The aircraft had a complicated description of the deferred number two engine cowl valve stuck open write up. Due to this write up, the number two bleed valve was placarded. Since this was the first ETOPS flight in many months for both the Captain and myself, I handled all the pre-flight duties while the Captain questioned ZZZ station maintenance about the write up. He did this on comm 2, which I had tuned on speaker, so I could try and stay in the loop. The Captain questioned station maintenance twice as to leaving the number two bleed off for flight, and then he instructed me as such. We departed and climbed normally to cruise flight. During the climb I was busy as PM, preparing all that is required for the ETOPS segment, and was having difficulty contacting ZZZ Radio on HF (bad HF day). We eventually re-established radio contact with ZZZ [TRACON] to ask for current HF frequencies, after trying all comm frequencies on the Jepp enroute Comm section. During this time, an ACARS message came across the printer concerning the bleed configuration. I was very busy, and tore it from the printer and handed it directly to the Captain.

Once we established cruise flight and handled all the ETOPS requirements, I again reviewed the limitations section of the FM, the ACARS message, and the maintenance release. The maintenance release printed off the ACARS printer (at the gate) such that the four sections of it were not sequential. With two separate, but related write ups, this made reading the maintenance release difficult and confusing. Once I realized that we had configured the bleed system incorrectly, I immediately brought it to the Captain's attention. At first he was hesitant to reconfigure the system. When I showed him the limitation section and cross referenced it with the maintenance release, the logic of reconfiguring the system was clear, and we did so.

We continued the flight uneventfully and de-briefed per SOP.

## Narrative: 2

Upon preflight multiple maintenance placards for same system created some discussion. Communicated with Maintenance Control twice to confirm no special operations restrictions. Was assured by Maintenance Control there were none. We took off with pneumatics in ground configuration per MEL. Shortly thereafter in-flight FM investigation determined panel to be set up in normal configuration. We reset it appropriately and continued under normal operations for the remainder of the flight.

## Synopsis

Air Carrier flight crew reported they had configured the bleed air system incorrectly before takeoff.

## Narrative: 1

Flight ABBC, ZZZ-ZZZ1 was through catered from ZZZ1 via Flight ADCE ZZZ1-ZZZ. This is a normal procedure [for] this through catering. Changes in company catering/servicing has rendered it unsafe.

The pilot and first-class passenger meals for the return flight are boarded in ZZZ1 before departure. After a five-hour block time, the aircraft sits on the ground in ZZZ for about eight hours. And while the ice has mostly melted by arrival, ZZZ (or ZZZ2 or ZZZ3) would historically provide sufficient ice to keep food for the return trip cool and safe to eat. That is no longer true.

ZZZ no longer caters even ice or water. A query to the station for more ice was met with the reply, "Due to COVID, we no longer do ANY catering."

The ice and dry ice (if dry ice was ever boarded, no one knows) was long gone by the time we boarded for the return flight. Compounding the lack of proper refrigeration, the preconditioned air at the gate was hot. As it was a "terminating flight," the previous crew had followed SOP and shut down the aircraft. Only preconditioned air was available. Unfortunately, the air provided made the aircraft stuffy and uncomfortably warm.

I asked to see the crew meals for the flight. When the blue bag was opened, a horrendous stench filled the galley. The blue bags contained four crew meals, no dry ice, no dry ice packs. The putrid odor of decaying fish and something else, something really sour, was hideous and wafted throughout the forward cabin.

Due to COVID and the time of departure, no restaurants in the airport were open. The crew had no option to purchase substitute meals. The significance of this is not to be missed--because this is a red-eye flight, the crew usually sleeps just prior to report. Sleep is prioritized over foraging for food. Crew members have the reasonable expectation that the contractually provided crew meals will be on board and edible. This is not the case.

I have done several of these all-night flights now. [Every] single one of these trips had no food for the crew due to spoilage. This is egregious and unacceptable. The passenger meals are equally affected. During COVID, most restaurants in town or at the hotels are simply not open. And, even if some are, a crew member and/or passenger expecting a meal doesn't go out and buy something for the trip.

These through-catered meals are unsafe. They will poison. I worry about the passengers. They eat the meals they are served, fully expecting them to be safe. I also worry about pilots. Can you imagine both crew members getting ill at the same time? If they skip the crew meal (which most do, once they smell it) can you imagine the low blood sugar experienced having slept through one mealtime and then denied another? Shift work is hard enough. Skipping two meals is harder. There are physiological ramifications.

I can only guess how OSHA or the FDA would feel about the food we are [providing]. Employees have a right to meal breaks, and meals. A quick search on the internet reveals this: Food like meat, poultry, milk and cream should be kept out of the Danger Zone (between 4degC / 40degF to 60degC / 140degF). Anything between that range is considered dangerous and can cause pathogenic toxins to be emitted, resulting in severe illness in the consumer. Another way to keep your food from spoiling is by following a four step system: Clean, Separate, Cook, Chill. This will reduce any risks.

Company's current treatment of food is unsafe. It could cause severe illness or worse, not just in the passengers but in the crew. It's not a matter of if, but when.

## Synopsis

Air carrier Captain reported food that is provided for passengers and crew is unfit for human consumption on specific flights.

## Narrative: 1

Mother in row XX was extremely non complaint with her child wearing a face mask beginning during boarding. I asked her age, she told me 3 years old, so I told her the

policy. She immediately became rude and said how "every state is different" etc., so I reiterated our mask policy and how she signed and agreed when checking in. She said she will not force her child to wear a mask and I asked that she help us as a crew to engage with her child and let her know the rules. She proceeded to argue and say she won't force her child to do anything she doesn't want to do and let her child walk all over her. FA A then tried to discuss with the mother as I stood there. We kept reiterating our policy and that we are just doing our jobs. She proceeded to raise her voice, become hostile and rude to us-- but put a face shield on her child. FA A explained the face shield rules which only upset the mother more, but we were just doing our job. FA A informed the Captain before takeoff of the situation and we asked for a Supervisor to meet the plane to explain the rules to the mother as she continued to argue with us. The mother did not enforce or comply for her child the entire time. Supervisor met the plane and took over from there.

## Synopsis

Air carrier Flight Attendant reported a parent could not make a child comply with the face mask policy during boarding.

## Narrative: 1

The aircraft was not cleaned per COVID guidelines. Absolutely nothing was wiped down with the hospital grade cleaning solution that was in plain sight. This has been observed multiple times on all recent departures out of ZZZ. Even though there was no time constraint, this cabin crew refused to wipe down the cabin. After being asked multiple times if they would comply with this cleaning requirement, I was told, "we don't do that anymore, we don't get paid enough for that." You are telling passengers that their aircraft, seat, and tray table is being sprayed down with a hospital grade disinfectant, and this is a gross misrepresentation of what is actually happening. This flight was not properly cleaned

despite there being plenty of time to do so and despite cabin service workers having the cleaning solution in their bags. This has also been observed on the last 5 departures I have worked out of ZZZ. This is absolutely disgusting, jeopardizes the well-being of crew and passengers, and deserves immediate attention. Cabin service workers are deliberately ignoring this cleaning procedure.

Address this issue with ZZZ cabin service immediately. They should be wiping down cabin seats, tray tables, bins, and more with the hospital grade cleaning solution as you have advertised to customers as a means to gaining their confidence in flying with the airline. This is a complete false truth. These airplanes are not being cleaned per procedure and customers and crew need to be told the truth.

## Synopsis

Air carrier Flight Attendant reported unacceptable cleaning and sanitizing procedures by the cabin cleaning crew.

## Narrative: 1

COVID safety guidelines still in place limiting crew rest facility to one FA per break. This is not safe, regardless of pandemic.

1) Safety guidelines state that when fighting fires, there must be a minimum of X FAs present to fight the fire, gather needed equipment and communicate with the Flight Deck. This cannot be accomplished with only 1 FA allowed in crew rest facility per break period. If a fire were to break out, this could affect the safety of the flight itself. If the lone FA allowed to break in the crew rest facility were to have a sudden health issue, it would also

be dangerous as he/she might not be able to alert the rest of the crew in time.

2) Since being forced to take scheduled breaks in the cabin as a temporary change due to the pandemic myself and other FAs have suffered fatigue due to adverse conditions. In the cabin, we are subject to PA announcements, noise from passengers, foot traffic, and light coming into the cabin from open window shades.

This flight had two families with infants and a toddler seated in the X zone, where our current alternative break seats are located. One family seated at row X and Y had technical issues with their video system and moved seats back and forth multiple times then back to original seats-creating noise and disturbance. Toddler constantly talked very loudly (as toddlers do) to her mother, grandmother and television shows throughout the flight.

For these reasons, I myself took my scheduled contractual break in the crew rest facility (although I was not the most senior) and also allowed some FAs above the 1 currently allowed if others did not object.

However, the FAs entered the crew rest facility one at a time and closed curtains immediately after themselves, kept masks on during their breaks and used alcohol or bleach wipes on areas they touched.

## Synopsis

Air carrier Flight Attendant reported concerns with crew rest facility restrictions during the COVID-19 pandemic.

## Narrative: 1

I experienced symptoms similar to what I normally associate with a common cold or seasonal allergies while serving as a crew member on a flight, the same conditions that are normally remedied with over the counter medications. It never crossed my mind at the time that it could be COVID, until after I got home.

Since COVID symptoms vary from those of a common cold, a flu, or a total lack of symptoms altogether, non-medical personnel cannot be expected to self-diagnose. It would behoove the company to pre-screen crews prior to flight to avoid the trouble and cost incurred in situations like this. Until this is in place, and in my situation, I will call out sick rather than going to work and possibly risking the health and safety of our customers and co-workers.

## Synopsis

Flight Attendant reported experiencing symptoms similar to a cold or allergies during flight and did not think it could be COVID-19 symptoms until at home.

## Narrative: 1

It was a configuration 2 takeoff out of ZZZ and I was the PF. After passing 1,000 feet AFE, I selected climb power and the FO verified climb power. After accelerating through "Flap" speed I called for "Flaps 1," the FO selected flaps 1 and called "Flaps 1." After the flaps were at 1 and as the airspeed was accelerating to "[Clean]" speed, I engaged auto pilot 1 and stated "Autopilot 1." While confirming autopilot 1 engagement on the FMA, I heard the FO say "flaps up" while disarming the spoilers. I immediately stated "Negative, Negative!" and reset the flap lever back to Flaps 1. After accelerating through "[Clean]" speed the flaps were retracted.

I feel that saying "Autopilot 1 or 2" can be confused with a flap configuration change. I have also noticed basic mistakes occurring with pilots returning from leave. It seems to happen a short time after their return to the line when comfort levels are starting to return.

I feel that the PF should select autopilot on and use the callout "Autopilot IS on."

## Synopsis

Air carrier Captain reported a flap setting issue during climbout and stated that a callout sounding similar to the flap callout may have caused confusion.

## Narrative: 1

The issue at hand is that we as safety personnel have a very small office for all of us. Not to put out too much information on the agents that had COVID-19 and got better thank god are back in the office now. I have noticed that all the managers and Supervisor have plexiglass dividing them for each other in small areas. Also having a half door plexiglass on the outside of the front door to their office before they enter the office. We should have the same thing showing the agents that we as a unit are taking this matter serious to stop the spread.

### Narrative: 1

Not sure if this is indicative of other issues at ZZZ as there were two others that I am reporting. This report is safety related as the actions of the ZZZ ground crew could have caused damage to equipment and/or injury to Ground Personnel.

After being pushed back from XX and setting the brake, the ramp person in front of the airplane proceeded to give me the all clear (arms extended down at 45 degrees) while the tug was underneath the nose and still connected to the aircraft. I asked the ramp person on the intercom why this was and asked him to tell the ramper out front what the proper procedure was. After the tug pulled away (the person out front maintained his arms at a 45 the entire time), the tug driver tried to explain what the procedure was and it appeared the two were arguing with the person giving us incorrect instructions defending his actions.

Before we taxied away, I called ZZZ Operations on the radio to inform them of the issue as well. This was probably the most unsafe pushback/release I've seen in a very long time and could have easily gotten out of hand due to the non-SOP actions of ZZZ. Thankfully, due to me being away for two weeks and the FO being away from flying for over five weeks, we were hyper-vigilant of what was going on around us.

## Narrative: 1

Received aircraft from maintenance base in ZZZ with AFT FUEL BOOST PUMP MEL. Called and got another Dispatcher to patch Captain to Maintenance Control. Still did not get my answer about having to carry an extra 5,000 pounds of unusable fuel. Flying with a First Officer who was on different aircraft. Very little recent experience in aircraft, because of the COVID and personnel issues. Slowed pace considerably to accommodate, First Officer [was] very hard on himself and working hard on flows, but not smooth and habit like. Dark on departure, and with amber fuel pump light shining in my eye, I did not catch the switch out of place after the Before Takeoff Checklist was done and we took the runway for takeoff. Got the tattle tale message after takeoff and debriefed the situation.

## Narrative: 2

For breeze-on/reduced thrust takeoff from Runway XXL at ZZZ, we set and left L PAC switch on high position. While climbing, we received ACARS alert message for incorrect pack configuration. We immediately corrected the problem. We continued the flight then landed ZZZ1 without any incidents.

## Synopsis

Air carrier flight crew reported departing with an incorrect pack configuration.

## Narrative: 1

Planned landing in BWI on Runway 33L. We were assigned to park at Gate X. On the current ATIS, it had a NOTAM that said "Taxi F closed between Taxiway P and Taxiway T." So we had an expectation bias to exit Runway 33L at Taxiway F and that our taxi-in instructions would be to taxi to Gate X via Taxiway P, E, and T. Partly contributing to this expectation was the fact that the last time I flew a month ago, there was also construction on Taxiway T between Taxiways H and F. We also had an additive condition which I briefed at the beginning of the trip that this was my first trip back to work after not flying for 30 days.

However, after landing rollout and upon exiting Runway 33L at Taxiway F, we were given instructions by Tower to taxi to Gate X via "Taxiway P, T to T, and contact Ground." I thought the Controller had stuttered when he said "T to T." So I made the right turn from F to P, thinking he meant "P, E, T." We contacted Ground after making the right turn on to Taxiway P. Ground then told us we had turned the wrong way and should have been going the opposite direction on P, then T2, to T. We asked what Taxiway T2 is, since Taxiway T2 is not depicted anywhere on the 10-9 page. He said it is a new taxiway. I do not recall any NOTAMs saying there is a new Taxiway T2, nor where it is located. There was nothing on the ATIS about it.

We did not cause any traffic conflicts and held at our current position so that outbound aircraft could taxi out. We were then cleared to our gate without any further incident.

In the future, I will remember to stop the aircraft immediately and query ATC whenever there is any doubt or ambiguity in a taxi clearance. Also recommend that the BWI airport advise on their ATIS and their NOTAMs that there is a new Taxiway T2. Furthermore, I would recommend they use a different name for the new Taxiway, as the two different phrases 1) "T to..." and 2) "T2" can be easily misconstrued for each other in a verbal clearance.'

## Synopsis

Air Carrier Captain reported a taxiway incursion and stated Taxiway T2 which was included in their clearance is not charted.

## Narrative: 1

ATC held the flight high. Were given clearance to descend to lower altitude. Aircraft was 7,000 feet high on path. Began expedited descent to catch up to path, ATC then gave level off of FL290. Around FL320, Pilot Flying noticed traffic appear on TCAS below at FL280 and started to adjust vertical descent rate. TCAS RA was triggered for level off. Crew disconnected autopilot and autothrottles and leveled off until traffic was clear, and then continued descent to FL290. Reported RA to ATC. Crew was then notified of aircraft at FL280.

ATC was overwhelmed. Perhaps more Controllers are needed in that sector. At the very least, a heads up for aircraft at FL280 would have helped. Crew could have ignored the high on path profile and also descended slower, but that would have caused problems down the road.

## Narrative: 2

Switched to a frequency that was very busy. The Controller was overwhelmed, we were getting high on the arrival but couldn't get a word in. Finally cleared to descend, the FO who was Pilot Flying started down with the boards out, but weather ahead didn't allow us to speed up to get down. We were 9,000 feet above profile and coming down when we got a TCAS Alert caused by the descent rate. The FO got busy to alleviate it but by the time he pushed a few buttons, it started saying "Level Off!" So he disconnected everything and leveled the aircraft off. I told the Controller we were leveling off due to a TCAS conflict, but never got an acknowledgment, because [the Controller] was still constantly talking. After

the traffic passed we went to our assigned FL290 and [the Controller] asked "(Call sign) verify your level at FL290." [Controller] didn't have a clue what just happened. I confirmed **we were at FL290 and gave us "...cross ZZZZZ at 9,000 feet"** I said we'd do our best but we'd never make ZZZZZ at 9,000 feet. [The Controller] didn't even acknowledge, so we started hurrying down. When we got switched to Approach frequency I told [the Controller] we'd be high at ZZZZZ and the Controller said "I know, just do your best and descend to 6,000 feet."

With so many aircraft parked, with so many fewer aircraft flying, why is ATC so min-staffed? It seems the new normal is too few Controllers to handle the traffic that's there.

## Synopsis

Air carrier flight crew reported ATC was difficult to communicate with and suggested that staffing is a contributing factor.

## Narrative: 1

Ground Control cleared Flight AB on local IFR flight plan, Flight AB requested own navigation to VOR for full procedure at 2,000 feet. The MVA throughout most of ZZZ airspace is 2,400 feet and normal practice is to clear all IFR aircraft above the MVA. Ground Control did not coordinate the abnormal altitude with Local Control. I did not catch the altitude and due to traffic Flight AB could not get own navigation on departure. I issued a departure heading to Flight AB to avoid traffic that put Flight AB into a MVA of 2,400 feet.

Ground Control should only issue IFR aircraft altitudes at or above MVA.

## Narrative: 2

Flight AB was assigned 2,000 feet from the Clearance Delivery position on a local IFR flight plan. The request was to fly their own navigation for full VOR Runway XX circle to Runway X approach. Flight AB was assigned a 080 heading on departure that goes into a 2,400 foot MVA area. The weather at the airport was 10 miles/CLR. I climbed the aircraft to 3,000 feet to get them above the MVA and started the process of getting him on course to the VOR for their approach.

There was training on Local Control taking place and social distancing guidelines make it difficult for the OJTI to review the strip marking. The 080 heading is near 180 degrees off what the Departure Controller would expect. The Local Controller should coordinate

aircraft that are that far out range of their flight plan. Review of strips prior to sending it the approach would help all controllers be on the same page.

### Narrative: 3

I was training a Developmental on Local Control, Ground Control issued a clearance to Flight AB with an altitude assignment of 2,000 feet. This is not the normal altitude issued for IFR departures since if the aircraft is turned to the east for traffic etc. This would immediately put them into a 2,400 feet MVA. If this were to be issued I would expect verbal coordination of this altitude assignment...the SOP does not state this, however; it has been the unwritten practice if such an odd altitude is issued. I was training and assumed that 2,400 feet was issued, I should have checked the strip from my Local Control Developmental, however; honestly I am not sure if I would have caught this anyway.

Aircraft be assigned at a minimum 2,400 feet when departing (2,400 feet is our primary MVA throughout the airspace).

### Synopsis

TRACON Controllers reported social distancing, during the training period, may have contributed to an incorrect altitude assigned to the aircraft.

## Narrative: 1

I was assigned to accomplish a de-preservation of the APU on Aircraft X that has been in storage. The documentation for the aircraft stated that the aircraft had been in storage for XXX days and the APU needs to be de-preserved before XXX+1 days.

The APU will need more work accomplished if it is de-preserved after the XXX+1 day mark than if it is de-preserved before the XXX+1 day mark. The issue is that the APU had a placard attached that stated the preservation was good until date and after the APU compartment was opened there was a different tag that stated the APU preservation was valid until date+4 days. So there were two different dates documented for the APU for the

XXX+1 day mark.

The question is when is this XXX+1 day mark? The date that the APU was actually preserved or the date for the preservation / storage of the aircraft.

## Synopsis

Technician reported confusing dates relating to work that needed to be performed on an aircraft that had been in storage.

## Narrative: 1

During boarding as I was walking the cabin to do a compliance check and exit seat briefing a passenger stopped me and questioned why she was seated next to a person she did not know. I told her I would check and see if there was another seat she could move to. At this time I did not see any open row that has no other people in it. I was going to send a flight family message to alert the Gate Agent. I walked up a row or two and another lady questioned me about why her seat would not recline (she was in front of the exit row). I explained to her why her seat would not recline and told her I would check with the agent about reseating them. I then walked to the aft jump seat to send the flight family request. The agent then came down and we had a short conversation about rebooking the one lady and the other passengers who wanted a seat that reclined. There were no other seats to move the recline passenger to and the other passenger was given the option to take a later flight with no guarantee that she would have a seat by herself. I informed all passengers involved. We took off and it was not till about mid flight that I realized that I had not ok'ed my exit seats. I proceeded right away to the exit row and briefed both passengers and they both were ok to sit in an exit row. The lady passenger did say that she noticed I had not briefed them before the flight.

[The cause was] work overload.

## Synopsis

Flight Attendant reported inadvertently not briefing exit row passengers due to other passengers making special seating requests.

## Narrative: 1

After a successful CAT III landing, we had crossed the two inboard runways and were taxiing north on taxiway towards gate. The FO, who was on the first trip back after one month off, did the after landing flow and confirmed our gate with operations. I thought we

were cleared into the gate via spot, but this was not the case.

As we were rounding the corner for spot and passing Aircraft Y that was on the line just south of spot, I confirmed with the FO that we were indeed cleared in as I had been distracted switching from low vis taxi diagrams to normal taxi diagrams as the vis was very good, shutting down the Number 2 engine, in addition to the fact that the FO was a soft spoken person. I only mention this as I wasn't surprised I hadn't heard them confirm our clearance to taxi into the gate as I was busy concentrating on the other threats just discussed.

As rampers were visible from spot and were marshaling us into the gate, we pulled into the gate normally. Approximately 20 feet short of our final parking spot ground reminded us to contact ramp. We immediately contacted ramp, who was understandably very unhappy with us and we apologized for our error.

Needless to say, I take complete responsibility for this incident and am embarrassed I allowed it to happen. I have learned a couple of things from this incident- first, that I need to be extra vigilant when some crew members don't have a lot of recent experience, secondly, when we had discussed that the ground ops were our biggest threat for this CAT III approach, I need to truly take it to heart and be extra cautious to help mitigate the threats present during this segment of our flight.

## Synopsis

Air carrier Captain reported being distracted and not contacting the ramp before taxiing to the gate.

## Narrative: 1

We went around at 900 AGL due to improper configuration on an autoland. We were doing an Autoland approach and the system did not arm at GS intercept on the practice CAT III. PM was watching outside for traffic on a parallel approach. As the flying pilot I got totally sucked into my display and did [not] configure in time for a stabilized approach and decided at 900 AGL to initiate [a] go-around. Go-around was uneventful.

Having not flown a lot in the last couple months I allowed myself to get distracted with the display and lost overall situational awareness in regards to proper aircraft configuration.

## Synopsis

Air carrier Captain reported conducting a go-around due to improper aircraft configuration and cited loss of situational awareness as a contributing factor.

## Narrative: 1

After takeoff and during normal cleanup procedures, the caution light came on with an associated ECAM. The Captain pulled speed to ensure we did not over speed, a quick glance at ECAM said max speed 230, I believe. As PM, I confirmed it was not a Quick Action or ECAM exception. I assumed control of aircraft and radios, and stated ECAM Action. The Captain reviewed the ECAM and began to troubleshoot [the] problem. The ECAM had very little information, and then he referenced the QRH. I was coordinating with ATC to stop climb at 10,000 feet (safe alt in sector) and advised them of our speed and desire to hold. Captain confirmed max speed of 230 knots from QRH, so we slowed to 220 to provide a margin. The slat/flap indicator showed slats were almost up, significantly less than 1. We lowered gear to burn down gas to below max landing weight. While still in holding, we selected flaps 1 and obtained normal indications on the slats. Once all briefings, checklists and QRH procedures were complete, the Captain resumed flying duties and I requested to exit holding and obtain vectors for approach to Runway XX. Flaps and slats moved normally and the landing was uneventful and normal. Captain taxied to gate and passengers deplaned. Flaps and slats retracted normal on the ground. We discussed the need to declare an emergency, but did not initially since we were not sure of the actual problem, once flaps/slats moved normally, it seems all systems were normal.

Aircraft may have sat on the ground during the COVID flying reduction, and therefore it seemed, to me, there might have been an indication problem or squat switch problem. We did not declare an emergency because the aircraft seems to have a computer or indication problem and slats lowered normally once we started to configure. In retrospect, any flight control problem is reason to declare emergency, but not sure if we then should undeclared once all was normal. I have not flown much in the past 7 months, so I may have reverted to previously learned procedures.

Any flight control issue is an emergency, even when corrected. Better maintenance on aircraft.

## Narrative: 1

Takeoff on Runway XXR full length. At around rotation got a push to the right. Rotated safely and the airplane was climbing normally and no abnormal indications on the ECAM. There was however a heavy aircraft sitting perpendicular waiting to cross Runway XXL. Captain asked if they were cleared to cross that runway because our push to the right seemed to happen around the same time we passed them. Can't really remember what the response was from the Controller.

They need to staff the ATC facilities properly. One person handling more than one frequency, or both Ground and Tower. This is not just ZZZ. ZZZ1 is also bad when you add construction to the mix.

## Synopsis

Air carrier First Officer reported possible jet blast from a heavy aircraft crossing a parallel runway, while departing.

## Narrative: 1

I took sector X/Y/Z shortly after Aircraft X checked in from ZZZ Approach headed to ZZZ airport. I switched Aircraft X from frequency to different frequency. Usually when I switch an aircraft or they check in I would normally ask them to advise when they have the weather and issue any NOTAMs. I do not know why I did not ask this VFR aircraft if he had the weather or advise him of the PPR (Prior Permission Required). This is something very uncharacteristic of me. I did call traffic to Aircraft X twice before sending him to advisories and terminating his flight following. I generally treat VFR the same as IFR with regards to weather and NOTAMs. The aircraft apparently landed without calling into the airport and missed the trucks on the runway.

My only conclusion is that the memory jogger for the airport 10 minute PPR was not next to the airport on the scope, it was quite a bit north of the airport. We also have a lot of other things written on the scope at this time with all the TFRs in the area. I did have several other things that required coordination and switching of frequency transmitter sites at the time but traffic was not that busy. Aircraft Y was orbiting in the TFR just outside of approach and was going to be a factor with another aircraft descending into ZZZ.

I do remember being mentally exhausted from the day. We are continually forced to work combined sectors with a lot of frequency congestion, a lot of moving aircraft from frequency to frequency. Missing numerous TFRs and traffic orbiting the TFRs and listening to pilot readbacks on complex clearances. Lots of VFR aircraft with many traffic calls and aircraft not listening. We are busy in our area and keeping sectors split is not a priority. We just end up making things work and pushing through it. While this is not an excuse for why I did not do my job and issue the NOTAM I do believe it is contributing to the event in the long run.

We need to return to normal staffing. We need to have sectors split out more. Ultimately we are straining our people and causing unnecessary stress in how we are currently running the area.

## Narrative: 2

I assumed the CIC desk at XA: 47. At XA: 55 a runway incursion took place with a VFR Aircraft X who was not notified of the ten minute prior permission required for landing at ZZZ. I was unaware the incident took place until the next day. I was confident that the airspace wasn't too busy or complex for the configuration.

Prior permissions for landing at ZZZ are very commonplace. The written note on the radar scope to remind us of the closure may be causing oversight because we see it so often. Perhaps we can change our way of indicating the closure using the draw function so it stands out more in our scan.

## Narrative: 1

After completing an IFR flight with student to the ZZZ1 airport, we canceled IFR on short final and requested a Tower to Tower departure to ZZZ2 with intent to request the published hold at ZZZ VOR. The airspace was very congested with VFR training airplanes.

We were given a frequency change to ZZZ2 Tower by the ZZZ1 Tower Controller, and the student, under the hood continued his climb while I attempted to contact ZZZ2 Tower, which was extremely congested.

After several attempts, I instructed the student to turn to a heading of 150 and level off prior to 2,700 MSL to exit the local airspace and was focused outside. Due to the heavy training activity, I could not contact ZZZ2 Tower.

I looked inside and noted that the student had climbed to above 2,900 MSL which was inside the Class C shelf of ZZZ, but nearly clear to the south.

I instructed the student to level off and depart the airspace, and we returned to our home base without further incident.

In retrospect, due to the congestion, I would have landed at ZZZ1, taxied to the ramp, and amended my plan with the student. Traffic congestion since COVID has been significant, and has made training IFR training a challenge. I have begun to mitigate this by filing direct to airports as previously described with a plan to return home under VFR.

In the future, I will no longer request Tower to Tower and plan to leave and attempt holds at airports in northern ZZZ3 County.

## Narrative: 1

Passenger X, reported pain. Flight attendant asked what her pain level was on a scale of 1-10, the passenger reported a 7. Within 5 minutes, the flight attendants had called for and found an EMT on board. Passenger Y (EMT) and FA X provided oxygen, and concurrently we descended from FL310 to FL210 to reduce the cabin altitude. I asked the flight attendants and EMT if necessary to divert into ZZZ1, which we were currently flying over. The passenger said she wanted to go on to ZZZ2, and the EMT echoed that. The passenger was feeling a little better, and it would be OK to continue to ZZZ2. I then requested priority handling and relief from any speed restrictions on the arrival and assuring XL the closest runway. While she received attention on the plane the passenger stated that she had been exposed to COVID in the last three days. I passed this information on to Dispatch and operations in ZZZ2 to alert the paramedics coming aboard of the passenger's status and potential exposure.

Would like to commend my crew for doing an exceptional job. FO handled the radios and flying while I was communicating and coordinating with the flight attendants and Dispatch. The flight attendants were professional, calm, had all necessary information that needed to be disseminated. Extremely timely updates throughout the flight. Can't emphasize enough how well this crew handled the situation presented.

## Synopsis

Air carrier Captain reported a passenger reported having health issues during the flight.

## Narrative: 1

ZZZ Arrival ATIS C was current, advertising visual approaches to Runways XYL, XXL, and XXR. Prior to descent the Captain and I had thoroughly briefed visual approaches to both Runway XYL and Runway XXL. We requested Runway XXL on initial contact with ZZZ TRACON and were granted the request before ZZZZZ on the ZZZZZ2 STAR. We were vectored after ZZZZZ1 onto a left base to Runway XXL, then a turn to join final, which accompanied the visual approach clearance and change to Tower on [frequency]. I called Tower advising we were on a visual approach to Runway XXL and would be parking at gate. Tower responded with "Runway XXL, cleared to land." About a minute later, I noted that Tower instructed traffic to cross Runway XXL downfield at either Taxiway V or Taxiway R without referencing us, which I noted as strange. While on final, I noticed that a different aircraft had pulled up to the hold short line for Runway XXL at Taxiway Y10, and that I had not yet heard that crew interact with Tower. When we were on approximately a 1-mile final, the crew of the aircraft holding short called Tower advising they were ready for departure. Without referencing us, Tower stated "RNAV to ZZZZZ3, Runway XXL, cleared for takeoff." As soon as we heard this, the Captain stated to me that we would be going around, and we recited the first 3 calls we would make when that happened. I keyed up on the radio and stated "Traffic on short final, Runway XXL." By then the departing aircraft had entered the runway. Tower responded with go around instructions including a right turn to a 270 heading and a climb to 4,000. I read them back, and the Captain and I properly executed a go-around. I cleared the right side of the aircraft for any traffic landing XXR, noted there was none, and stated "Clear on the right." As we began the turn, TCAS sounded a traffic advisory. I noted the yellow target on TCAS was indicating 800 feet, and stated aloud that the traffic had just lifted off and that we could disregard the advisory, as we were turning away. Tower apologized for the mistake and sent us to approach for re-sequencing and an uneventful visual approach and landing on Runway XXR.

The crew of the departing aircraft appears to have failed to visually check the final for traffic before calling Tower for a takeoff clearance, and again prior to taxiing onto the runway for departure. The Air Traffic Controller appears to have forgotten about having cleared us to land, or appears to have been situationally unaware of our position prior to issuing the takeoff clearance. The Runway Status Lights (RWSL) on Runway XXL appear not to have worked, either because my aircraft's position on short final failed to trigger the red stop bars, because the departing aircraft ignored the RWSL red stop bars, the RWSL malfunctioned, or because the system was improperly overridden by the Controller. Another system that appears to have failed is the Controller's ASDE-X safety logic, because it appears my radio transmission was the primary reason he initiated the go-around instructions. Typically, when departing traffic crosses the hold short line with an arriving aircraft on short final, ASDE-X safety logic sounds an alarm. An additional contributing factor is the resurgence of traffic levels after a significant prolonged drop stemming from the outbreak of COVID-19, which may have led to complacency on the part of the departing crew and the Controller.

Departing crews need to diligently check the final for traffic before taxiing onto the runway for takeoff, and ideally before even calling ready for departure. Failing to do so before calling ready violates basic airmanship and sets the Controller up for failure. That said, the Controller should have had use of a memory aid or reliable automation to indicate and help him remember that Runway XXL was being used as an active arrival runway, that we had been issued a clearance to land, and that we were on short final to that runway at the time he issued the departing aircraft's takeoff clearance. Interviewing the crew of the departing aircraft would also shed light on whether the RWSL had illuminated and, if so, whether they proceeded onto the runway with the RWSL stop bars illuminated. If this is the case, retraining would mitigate this event from happening again. Interviewing the Controller would provide insight as to whether he overrode the RWSL, whether the ASDE-X safety logic worked properly, and other details about the work conditions that shift including staffing and fatigue, which, if undesirable, could be corrected to help mitigate the recurrence of this event.

## Synopsis

Air carrier First Officer reported a go-around due to ATC clearing another aircraft for takeoff while reporter's flight was on short final.

## Narrative: 1

While climbing to FL360 ZZZ Center told us we had traffic at our 1 o'clock heading toward us at FL370. We called the aircraft in sight and continued our climb to FL360. Passing FL352 we received a TA and my FO went to engage Vertical Speed, but was unable since the autopilot already engaged altitude hold. Vertical speed indicator was decreasing nicely for level off at FL360. However, we then received a RA which directed us to level off. My FO disengaged the autopilot and leveled off at FL357. Once we received clear of conflict we finished our climb to FL360 and notified ATC of RA. We never lost sight of aircraft nor exceeded FL360.

Light airplane, higher than normal vertical speed in climb, autopilot engaged altitude hold preventing FO from going to vertical speed.

Even though aircraft was in sight and aircraft was leveling at assigned altitude we should have decreased the vertical speed to 1,000 FPM or less once inside 5 miles and 2,000 feet of conflict to prevent from getting a TA followed by a RA.

## Synopsis

Air carrier Captain reported an airborne conflict while climbing to assigned altitude.

## Narrative: 1

Climbing to 7,000 feet with Aircraft Y traffic at 8,000 feet MSL. Turning from departure heading of 035 to assigned heading of 320. Received a TCAS TA and a TCAS RA at about 6,700 feet MSL to "Level Off." Complied with the RA and notified ATC. Traffic passed above and behind us.

Climbing turn near traffic with light aircraft climbing faster than normal (235,800 lbs). Shallow climb rate near traffic. We were very light with a takeoff gross weight of 235,800 lbs.

## Narrative: 2

We were climbing to our initial level off altitude of 7,000 feet on a 035 heading. Departure alerted us to traffic at our 12:00 O'clock at 8,000 feet and had us turn to 320. At approximately 6,700 feet, the TCAS alerted us to traffic and then in the turn leveling at 7,000 feet the TCAS alerted us with an RA to level off. We complied and traffic passed behind us. We alerted ATC of the RA and are filing this report.

Light aircraft (235.8 lbs) out of ZZZ maybe confused departure and we climbed to altitude faster than other airline aircraft usually do. Also busy terminal area with lots of GA traffic all could be potential causes. No one felt threatened likely in either aircraft but RA did go off.

Earlier vector from departure away from oncoming traffic despite altitude separation.

## Synopsis

Air Carrier flight crew reported over shooting an assigned altitude with a light aircraft, resulting in an airborne conflict.

## Narrative: 1

Lead FA brought to attention of flight deck crew that she had requested PPE and it was not delivered. We requested through operations that we needed PPE for FAs. Cockpit crew gave our bag of gloves to FAs while we waited. Gloves delivered to FAs, but were extra small and did not fit. Called Operations said they were all out of proper sized gloves and they were on back order. I advised Lead FA (she was upset) wanted to know name of station manager. I advised her to write [a] report and I would write report. No conflict with FA and cockpit crew.

## Narrative: 1

I was in communication with ZZZ Center; I checked in and the check in was acknowledged. With COVID I have become accustomed to long periods of silence on the radio. After a while, I think about 30 minutes, I realized it had been too long since I heard a radio communication. So I tried to raise ZZZ Center, but received no reply. I asked any aircraft on my last assigned frequency if they would ask Center what frequency I should be using. A helpful pilot relayed that frequency, and at the new frequency I was able to contact ZZZ1 Center. There were no further issues after that.

## Synopsis

GA pilot reported having communication issues with Center.

## Narrative: 1

Passenger X took his mask off when I gave him his drink orders. He was very abrupt with me asking for ice. I went by the cabin doing a walk through and he had his mask off. I asked him to please put his mask on. He then grabbed his cup took a small sip and held it. He did not put his mask on but used the perception of drinking to not wear it.

I went by again and help looked at me and again picked up his cup and held it close to his face. Again not complying.

Passenger X was very blatant in his disregard for our policy by holding a cup and pretending to take a sip each time we went by. He was a very intimidating man and I felt he was going to get very angry and cause an issue. It is very frustrating on our end dealing with passengers who use the eating or drinking to not follow COVID policy. Passenger X was non-compliant and thought holding a cup and just sipping it for hours was a reason to not wear a mask. That is not briefly or actively. I went by again and help looked at me and again picked up his cup and held it close to his face. Again not complying.

I think he needs to be banned while there is a mask policy in effect. He blatantly disregarded our policy and used holding a cup and taking tiny sips as a reason to not wear his mask/neck gator at all. He is someone who was ready to cause a scene and will bully other crews and do the same on other flights.

## Synopsis

Flight Attendant reported a passenger was non-compliant with face mask policy.

## Narrative: 1

Our passenger boarded the flight at the very end of boarding. I noticed him walk on with the gate agent who was asking him to put his mask back on. The gate agent then told me that they had been trying to get him on a flight for 3 days. I asked more about this, feeling a little concerned as to what could have caused them to deny him boarding these previous days and if it could be an issue during the flight.

They told me the previous days he had not wanted to board the plane. He had explained to them that he hadn't gotten sleep and also hadn't eaten. I'm not sure what happened those past few days but it was communicated that he had gotten enough sleep and was able to finally board the plane.

I made sure to ask clearly if they thought there might be any issue during the flight or if there was anything I should know that could cause an issue in-flight. The agent I talked to said she thought he was harmless.

During boarding a woman nearby asked if he was going to wear his mask. I looked over and he had it down at his chin. I asked him to put it on and he did. This was an ongoing issue during the flight - he kept taking it off and we had to keep asking/reminding him to put it on.

While taxiing to takeoff he got up out of his seat and moved a few rows back. I alerted the Captain but by this time he was already seated back down. We took off. I had him move back to sit in his original seat and he seemed fine the rest of the flight. Right before takeoff while we were still taxiing, [he] got up out of his seat and moved back a few rows to the exit row. I called the Captain and let him know someone was out of his seat. By this time [he] was seated a few rows back. The pilot made an announcement that everyone needed to be in their seat and then we took off.

We just continued with taking off when we were scheduled. The thing is, [he] was now seated in an exit row for takeoff and he had not been briefed to sit there. I also doubted his ability to perform the necessary exit row duties.

Once we were up in the air I did go back and confirmed that [he] was now seated in an exit row. I had him move back to his original row where he stayed for the duration of the flight.

The only other issues we had was that when I would walk by he wasn't always wearing his mask. I would remind him and he would put it on. He seemed not to be intentionally doing it but perhaps just not mentally "all there."

More communication from CSA to CSA. When we arrived in ZZZ1 I alerted the gate agent that we had a meet and assist and the D FA pointed him out to the gate agent as he deplaned.

I don't think the extent of the situation had been communicated. Then again it's not our job to babysit people.

Maybe his family should have been contacted and asked to fly with him? He seemed unfit to fly on his own.

## Narrative: 1

Right before we were about to close the boarding door the CSA agent came down to the plane and asked if I was okay letting another Flight Attendant sit by me (working FA) in X4. I was under the impression that this is not allowed but the agent said it was fine. I did recall some flight attendants talking about this same situation happening on another flight and it was not allowed. The agent put me in a situation of being the bad guy and telling me the other Flight Attendant wouldn't get on if I didn't allow this. I spoke with the A FA and she said it was fine with her. I don't mind the fact that the other Flight Attendant was sitting next to me but I do know that our union made it, so we could social distance while sitting in our jump seats. I allowed it as I didn't know the rules to this. I later came to the back the FA in the back said that this was not allowed therefore the reason for the report.

Please send out an email and/or bulletin so we know what the rule is. We need to stay consistent with information like this.

## Synopsis

Flight Attendant felt coerced into letting a non-working Flight Attendant sit in a seat that was not supposed to be used because of social distancing.

## Narrative: 1

We landed approximately 30 minutes early into ZZZ and our gate was not open. The Captain turned off the seatbelt sign and made a PA advising we would be waiting for approximately 25 minutes and the passengers could use the lavatories.

After opening the first class lavatory, I phoned the Captain and verified the duration of our

hold. Sometime had passed and from my jumpseat, I utilized an app on my phone and did not realize my actions until several minutes had passed. When I realized what I had done, I was sickened and guilt ridden. Moreover, I was stunned over how automatic and mechanical my actions were without even thinking.

In trying to make sense of what I had done, I began questioning myself and realized just how tired I have been from not being able to sleep throughout the recent nights because of stress over current events, specific to our COVID-19 world pandemic, our nation's turmoil, and our carrier's future without the cares act.

Nonetheless, with over XX years of experience in performing my duties, I expected more from myself and am extremely embarrassed over my loss of focus, thus the reason for my report. It is my sincere hope that this event may help others.

Please know, I realize my actions were wrong and I take complete and full responsibility. In addition, this event has made me realize the importance of maintaining my focus at all times while performing my duties. To say this was a humbling experience would be an understatement.

In closing, again, it is my hope that through this report, it may serve in assisting others in maintaining their focus at all times.

## Synopsis

Flight Attendant reported losing focus and using a cell phone app while parked and waiting for a gate.

## Narrative: 1

I went to the lavatory. While there, I removed my mask and placed it in my pocket. After using the lavatory and exiting, I decided to do a water service. I walked 3/4 of the cabin when I realized that I was not wearing my mask. I remained calm in the aisle and quickly finished the service. Once in the galley, I put my mask back on.

## Synopsis

Flight Attendant reported forgetting to put a mask back on prior to doing a water service.

Narrative: 1

This is the first 3 day trip in several months. Wearing a mask for 9-12 hours has been giving me severe headaches. I am concerned for my health as this continues. It is lack of oxygen to the brain. I greeted 2 flights a day. My mask was wet immediately as we need to almost shout in order for people/passenger to hear us. I feel so unsafe with this. My day started on the bus when no one recognized each other because we can't see what each other looks like. Very unsafe. Many times I have heard, "Hey, how are you? It's been so long." And just reply, "Sorry wrong person." This is obvious, as we have to take off mask when going through known crew member. The mask is wet as you try to offer First Class all the choices and no one can hear anything, so you just try and speak louder. Trying to do safety checks, no one can hear me and I can't hear them. Very concerned, I greeted XXX people and cannot tell you what one looks like. I would like to see the studies done on wearing a mask doing physical work, talking, etc. Unfortunately, we are test subjects and I choose not to be one. This has not been done. It is very unsafe for healthy people to wear masks. I have read at least 15 studies that prove this. I am also concerned with the CO2, and breathing it back in. The FDA has also said that at least 50 percent of hand sanitizers are poisonous, but will not recall them. We need to stop the wipes as well, could be poison. I know breathing in the smell, may not be good for me as well.

## Synopsis

Flight Attendant reported concerns with having to wear a face mask and the use of hand sanitizers.

## Narrative: 1

After wearing a mask for several hours, I get severe headaches. I believe in washing my hands and not touching my face. Wearing a mask and watching others, everyone touches their faces more than ever before. How is this healthy? It is just like the CDC stated in March that we should not be wearing masks because we would touch our faces too much and stuff (germs) would be on masks. It is so unhealthy for a healthy person to wear a mask. It drops off our nose and anxiety sets in because if someone sees and takes a picture, airline may fire us. Then I touch my face to move it back up. Not to mention, I have to change masks at least 10 times due to talking/shouting because no one can hear me and my mask is wet. I also feel uncomfortable not knowing who my flying partners are and especially my cockpit crew, as I cannot see their face. This is an obvious security issue. Airline needs to accommodate those who cannot wear, especially the disabled. The CDC even states that wearing a mask during the fires in California wouldn't help because the particles are too small and would get through. Guess what? Corona particles are even smaller, so therefore we are being lied to about masks, they will get through obviously as well.

## Synopsis

Flight Attendant reported several concerns with having to wear a face mask.

## Narrative: 1

PM Dispatcher received turnover from AM Dispatcher. Nice quiet day. At approximately XA:00 local time Dispatcher on desk X received phone call from Captain on Aircraft X, ZZZ-ZZZ1, looking for his release. Dispatcher desk X advised Captain that his flight was assigned to desk Y and that desk was closed. Dispatch desk Y overheard this and advised desk X that desk Z has desk Y. Desk X stated to desk Y that there were live flights still on desk Y. Dispatcher desk Z went to close desk Y and reviewed screen printer looking for any messages regarding the only in the air-not at destination gate live Aircraft Y ZZZ1-ZZZ, which now was on the ground ZZZ taxiing to gate, with negative results. Dispatcher desk Z reviewed flight history and saw only a minor SID reroute from ATC before the out time. Aircraft Y arrived at gate ZZZ without further incident. Dispatcher desk Y wrote the remaining two flights (X, Z, both ZZZ-ZZZ1).

Three flights were not on the above send move lists-  
Y ZZZ1-ZZZ  
X ZZZ-ZZZ1  
Z ZZZ-ZZZ1

Sector managers are closing dispatcher desks and then assigning/moving Dispatcher workload, but have no context of the magnitude of this powerful send move entry. They omit flights from the send move list. They have no situational awareness of the context of the dispatcher workload.

Dispatchers do have the situational awareness and the proper and correct context of this powerful send move entry and will replace the sector managers.

## Synopsis

Dispatcher reported confusion over a Dispatcher desk being closed and who was responsible for certain flights.

## Narrative: 1

During Xpm check-in there is no social distancing between passengers. There is no space for agents to move about kiosks to assist passenger check-in without tripping over passenger's bags that are everywhere in walkway and between kiosks. Security line is very long and agents and passengers have difficulty making way to kiosks. Passengers touch agents and pull them over to help them even though an agent is working with another passenger.

## Synopsis

Customer Service Representative reported COVID-19 issues relating to agents in the terminal at check in.

## Narrative: 1

I operated Aircraft X and Aircraft Y ZZZ-ZZZ1-ZZZ respectively. On both segments, the FCRF (Flight Crew Rest Facilities) did not have any pillows. We were told anecdotally, that due to COVID pillows were not being boarded. While I understand that to be a passenger comfort/safety decision, I also believe that this may be in violation of FAR 117 and Class 1

rest facility requirements.

As a result, I did not obtain the rest I expected. I felt fatigued after my rest break.

## Synopsis

Air carrier Captain reported having no pillows on flights due to COVID-19 and not being able to adequately rest.

## Narrative: 1

ZZZ-ZZZ1 turn. I was already at the cockpit loading the box when the Captain arrived and the first introduction was an accusatory, "So what's your story?" I was confused at first, but then realized Captain wanted to know how long I had been in the right seat. I explained I was a displaced Captain bumped to the right seat. [We discussed a recent change in company employment strategy.] Captain then told me [opinion of the change] and that for the remainder of the day I was only allowed to talk if it pertained to the current flight. Captain would fly both legs. I told Captain OK and did my best to be good PM on the first leg. Uneventful flight to ZZZ1. I hoped that the initial brief was an uncharacteristic frustration Captain didn't like and by the second leg we could return to a professional cockpit. Unfortunately, this was not the case. I tried again to be a good PM on the way back, but my frustration had grown to the point I was at best a First Officer trying to make sure we didn't violate any FARs. Fortunately it was a beautiful night and no issue came up. On the final post flight debrief Captain asked if I had any inputs. I told Captain [you have] a very toxic cockpit and as a professional I deserved the respect my experience brought to the flight. Captain told me that was my opinion and we parted ways.

## Synopsis

Air carrier First Officer reported the Captain of the flight created a "toxic" cockpit environment.

## Narrative: 1

VMC approach to Runway XXR at ZZZ at night, PAPI OTS. We were cleared the visual on a right base to the FAF. We flew the approach in LNAV/VNAV and showed on glidepath as we approached the turn to final. I had gear down, flaps 15 as we rolled out and was slowing to 180 knots. We both felt we were high although the PDI indicated only slightly above glideslope. We continued to configure the aircraft and called for the landing checklist. At 500, I called "stable" when we realized the flaps were at 25 not 30. The Captain selected flaps 30 and we continued the approach and landing without incident.

This was the Captain's third flight since March, I have flown more recently but it's been 3 weeks since my most recent flight.

## Narrative: 2

Visual approach night VMC to [Runway] XXR ZZZ. PAPI inop. Upon accepting the visual approach from a modified right base to XXR we elected to follow the LNAV and VNAV path to the runway in visual conditions. Upon turning final we appeared to be high visually but VNAV was showing on path. We configured the aircraft rapidly, but on speed for gear down and final flaps.

Upon reaching 500 feet both First Officer and I realized we were at flaps 25 not 30. I selected flaps 30 below 500 feet and we continued the approach and landing without incident.

## Synopsis

Air carrier flight crew reported an unstabilized approach due to a wrong flap setting.

## Narrative: 1

On ILS [Runway] XXL configured for an autoland upon hearing GPWS warning a go-around was initiated by me and successfully vectored back around for another approach to [Runway] XXR that was successful. In the debrief we both recognized the aircraft was not fully configured for landing thus the warning. Mitigating factors length of duty day, complacency due to the fact the approach was going well, maybe stress due to the current events i.e., COVID-19, and company uncertainty in today's world. Threats also included new Captain IOE and check airman flying in right seat. We all have been flying less.

## Narrative: 2

I was flying as the LCA and pilot monitoring. While conducting new Captain IOE on Aircraft X, we were setting up for an autoland on Runway XXL in ZZZ. The arrival and approach were briefed to include known and anticipated threats. We were vectored around for the approach and cleared for the ILS XXL. The approach mode was armed and the second autopilot engaged. Just prior to intercepting the glideslope, the gear was lowered and flaps 5 was selected. We were in VMC conditions with the runway in sight. The touchdown zone altitude was set as we continued the approach. The 1,000 feet call and 500 feet call were made by me acting as pilot monitoring. The response to 'set missed approach altitude cleared to land' and 'flare armed stable' were made respectively by the IOE student. After 500 feet we received GPWS alerts for 'Terrain' and as we approached the runway threshold, a 'Pull Up' warning was [received]. After observing that we were in normal landing position, I made the ill advised call to continue. As the autopilot began to enter the flare we realized we were still at flaps 5 and not configured to land. I immediately called for a Go-Around and the Go-Around procedure was executed. We advised ATC and were vectored around for a second approach for [Runway] XXR. We executed the approach and landed without further incident. Upon arriving at the gate, we debriefed our errors as well as the breakdown in CRM/TEM monitor crosscheck and SOP. We also debriefed our failure to adhere to the GPWS warning. We concluded that the combination of limited currency, outside current distractions (COVID, displacements,) and a long duty day may have created a moment where we completely lost focus. The decision to go-around saved our poor performance from becoming an accident.

## Synopsis

Air carrier flight crew reported executing a go-around due to a ground proximity warning.

## Narrative: 1

Climbing out of ZZZ enroute to ZZZ1, ATC issued a climb clearance to FL250. The aircraft prematurely leveled off at FL240. ATC again advised us to climb to FL250 before the error was caught. I asked the First Officer why the aircraft leveled off early. He stated I don't know why, but it did the same thing last week. The MCP was correctly set to 250. Later that day the aircraft again leveled off prematurely at FL360 when the MCP was set to 370. After some investigation it appears the performance data is loading the FMC with an intermediate level off altitude and not the final cruising altitude.

In our case, the flight from ZZZ-ZZZ1 was planned to level off at FL240 with a later step up to FL250. The later flight from ZZZ2-ZZZ1 was planned at FL360 to ZZZZZ, then FL390 to ZZZZZ1. I have been out on extended leave for the last 5 months and asked the Chief Pilots if there was a notification to the pilots of a software change. They were not aware of any. On my commute flight from ZZZ-ZZZ1, I advised the operating crew of the report I was writing and to let me know if it did it again. They informed me after the flight that it did it again, and that they were unable to change the cruise altitude. They had to use V/S to keep the aircraft climbing to FL 250.

Investigate if there was a software change and why it may not have been relayed to the pilots. My Pilot Monitoring should have also caught the error.

## Synopsis

Air Carrier Captain reported the aircraft leveled off 1,000 feet before assigned altitudes multiple times, and during multiple trips.

## Narrative: 1

Because of the COVID pandemic, I have not been flying very often. Additionally due to construction on the airport (ZZZ), unusual taxi patterns are in effect. This morning, I observed a construction barrier on the taxiway blocking the usual path to Runway XX which took my attention. I passed a hold point by about 50 feet at Taxiway G that the Controller had given. Other than the missed instruction, there was no danger or incident. I focused too much on the construction barrier and not the big picture and the Controller's instruction.

## Synopsis

GA pilot reported a taxiway incursion and cited construction related distraction and lack of flying as contributing factors.

## Narrative: 1

I was conducting a ferry flight with another pilot on Aircraft X. The other pilot came with me in order to begin familiarizing himself with the airplane and its systems, particularly with the G1000 system as he had no previous experience operating a glass cockpit. While enroute I was providing some instruction [of] the various aspects of the G1000, including the radio. We were operating on an IFR flight plan and maintaining assigned altitude, but at one point I realized that a significant amount of time had elapsed since I had heard from ATC. I discovered that at some point, the radio volume had been turned down. I quickly turned up the radio and reestablished radio contact. The Controller informed me that he had been trying to get a hold of me and that he had to re-route some traffic in a MOA that I had flown through. He didn't tell me whether this resulted in an actual loss of separation, but either way I ended up flying through an active MOA while on an IFR flight plan and did not hear any instructions to descend below it. While retrieving my briefing, I saw that the MOA along in my route was active beginning at 8,000 feet. I filed for 11,000 expecting the Controller to descend me below it if necessary. Obviously, that did not happen in the NORDO situation.

A lot factors played into this situation. First, I recently conducted several flights through very quiet airspace (especially after COVID) during which I would go 30 minutes or more before hearing anyone talk on the radio, whether to me or someone else. This made the silence a bit more normalized.

Second, I was expecting ATC to keep me out of any airspace I needed to avoid. During previous flights, I would normally confirm with ATC that any restricted areas along my route were cold before flying through them, even while IFR. In this situation, I think I became overly reliant on ATC to keep up my situational awareness while instructing. I also didn't give as much consideration to the MOA as I could have since flying through an active one is more common than other types of special use airspace.

Third, simply dealing with the student/pilot added to my workload. Had I not been working with the student, this probably would not have happened. I honestly can't remember now who turned down the radio, but either way, the situation would not have happened if training wasn't part of the mission on this flight.

Of course, this simply comes down to a situational awareness issue. While I'm not a brand new instructor, I recognize that I always need to continue practicing and refining the art of teaching while dealing with the challenges of operating an aircraft. I constantly teach my students to aviate, navigate, and then communicate. In this case, I simply let the instructing take away from those priorities. Still, here are some other practical steps to take to prevent this in the future:

Avoiding any special use airspace when flying with students unless the lesson specifically involves dealing with such airspace. While the primary purpose of this flight was not training, having the pilot/student on board was the primary factor contributing to the incident. While it may not have prevented the NORDO situation, everything could have been made less serious by simply filing around or below the MOA.

Prior to this flight, we had covered some ground material concerning the G1000 and Aircraft X, but we never spent any time in the airplane on the ground. When I train students on the G1000, I normally spend at least an hour going over the system while the aircraft is on the ground powered by a GPU. We didn't do that in this situation because the primary mission was ferrying, not training. In the future though, I'll familiarize the student as much as possible with the system on the ground in all situations before flying.

## Narrative: 1

When I got to work at XA:50 local, I started checking my workload and the number of flights I was going to receive from the dispatchers I was relieving. I counted 25 flights in the air, that I was supposed to inherit, at least 17 of them were medium to long hauls, departing between XG:00z and arriving before XJ:30z. When I determined the workload I immediately sent the help message, around XB:00 local, and went to talk to the Chief Dispatcher and the Duty Director, and we discussed possible mitigation to the problem, because I was refusing to take the desk in those conditions. First, it was said that a unit coordinator position was going to be closed to alleviate the workload, but that never happened. Then a sector manager came down to my colleague, Dispatcher Y, and asked him if he could take some of my flights, when Dispatcher Y had 20 flights in the air. He declined, since his plate was full already. To me that is lack of situational awareness, as

the sector manager are the ones in charge of the flight distribution. Then he continued asking around and a couple of my colleagues picked 2 flights each, so my workload went down to 19, since 2 of those were about to get to the gate, which is still over the company policy, but it was acceptable since there were no complications on the desk.

Increase mid night desks and improve the flights distribution.

## Narrative: 1

On base leg to Runway XXL at ZZZ called runway in sight and cleared for visual approach. Aircraft was on a 90 degree intercept to runway and PF was delaying turn towards airport. 2,000 feet was selected on FCU and descent continued for approach. Pilot Monitoring offered and executed direct to FAF to help with FMS sequencing and provide later guidance towards airport. After completing FMS programming 1,000 foot auto callout sounded. Since aircraft was configured gear down and flaps 3 we continued with this configuration. Since aircraft was low on profile we reduced descent to level off and intercept glide path from below.

First trip for Pilot Flying in 2 weeks. First trip back for Pilot Monitoring in 5 weeks. End of 8:30 minute flying day.

Better situational awareness concerning altitude on visual approach at night. Less heads down time for programming FMS during night visual approach.

## Synopsis

Air carrier pilot reported an unstabilized approach and cited lack of flying as a contributing factor.

## Narrative: 1

We were descending on the ZZZZZ4 arrival north of ZZZZZ when ATC issued a traffic advisory of an Aircraft Y at 12 o'clock. The FO was pilot flying and I was looking for the traffic along with the Relief Pilot. I reported the traffic in sight and meanwhile the pilot flying descended below 9,000 before reaching ZZZZZ. The Controller said maintain 9,000 and maintain visual separation with the Aircraft Y and we returned to 9,000.

If the Controller had said maintain 9,000 and then issued the traffic, I believe the error would have been prevented. Fatigue was certainly a factor.

## Narrative: 2

We were descending on the ZZZZZ4 arrival. Approaching the ZZZZZ fix we were asked to slow to 210 on the speed early. ZZZZZ shows a 210 speed at 9,000 feet. We were asked to slow at approximately 10,500 feet. As pilot flying I dialed in 210 on the speed pressed flight level change and went heads down to the FMS to insert 210 on the speed. My plan was to repress the VNAV button after inserting the 210 speed. But, as I'm heads down TCAS announces Traffic, Traffic. All three of us go heads up and out looking for the traffic. We spotted the climbing traffic as it passed in front of us. About this time ATC ask if we had traffic and to climb to 9,000. I looked and we had descended through 8,500. We

acknowledged we had the traffic in sight and immediately climbed back to 9,000 feet. We realized that I never reengaged VNAV after inserting the new 210 speed in the FMS computer thus the autopilot continued to descend toward the 6,000 foot altitude on the arrival. The rest of the arrival and approach were normal.

Our wakeup call was at XA:30 in the morning body clock time. We had been flying for approximately X hours 45 minutes with each of us having a sleep break.

This was my second pilot flying trip in over 7 months. This was the Captain's first flying trip in 7 months.

Going to flight level change while still on a descend via arrival was a mistake on my part. I feel lack of flying and fatigue both contributed to this.

The ATC early slow call very close to a fix interrupted our flow on the arrival. The TCAS Traffic call out caused all of us to look away from the inside auto flight situation.

This was my second pilot flying arrival into ZZZ. It was the Captain's first arrival.

Lack of flying because of the COVID virus really hurts our overall proficiency. Going out to the simulator more often for situational training not less would help some of this. I have heard we are going to once a year training instead of every nine months. We have also moved landing currency to 120 days from every 90 days. Both of these new policies hurt our proficiency. Otherwise this was just a situation where several small factors added up to an off altitude incident.

## Narrative: 3

On decent into ZZZ, as Relief Pilot in the jumpseat (First Officer was flying); traffic was called out at left 10:30-11:00 o'clock position, I sighted the traffic and said to the Captain (PM) and FO (PF), what the located traffic position and that it was "no factor," at that time the First Officer and Captain had noticed that [we] descended below the 8,000 (by ~300 feet), and at the same time told to climb back up to 8,000.

All 3 crew members were head's up, looking outside for traffic, and the FO mistakenly pushed Flight Level Change, instead of VNAV (6,000 was in the F/D window, set for the arrival). Fatigue, might have played a small factor, as it was at the end of a transatlantic crossing. Mostly I would say it was "target fixation" due to trying to find the traffic.

As has been said many times in the school house: "The FMC/Flight Director panel is the Bid, and the FMA is the Bid Results..." Always verify that what a pilot has intended to engage, has resulted in the desired situation. Also, altitude awareness, even whilst searching for traffic is paramount.

## Narrative: 1

APU drain mast/hydraulic reservoir vent discovered missing after engine shutdown at gate by ground crew. Upon further discovery a puncture was found in the access panel which houses the mast. No antenna was found on runway or taxiway used at ZZZ1 by airport personnel. Captain accomplished preflight walk around at departure airport. No significant defects were noted at that time.

No items were noted during preflight walk around in ZZZ. It had been over 5 months since Captain had accomplished a walk around.

Captain will leave walk around inspections to First Officer position in the future unless operational considerations dictate otherwise as Captain doesn't recall seeing any damage to the aforementioned area.

## Synopsis

Air carrier First Officer reported an APU drain mast/hydraulic reservoir vent was discovered missing by ground crew after landing.

## Narrative: 1

During preflight for a trip in Aircraft X we looked further into an MEL write up that had been in the book since month of 2020. According to the MEL write up the item was OK to be deferred for 500 hours with the current aircraft time written in the write up. It was brought to the mechanic's attention for confirmation on this preflight and was soon discovered that the aircraft was 17 hours over the allowed time frame. Maintenance did some quick investigating with other maintenance techs and aircraft manufacturer. It was realized that the MEL write up was not really required since the CAS message was not continually illuminated so the MEL write up was closed in the aircraft status book. So going forward we were in good shape, however; this does not excuse the fact that I operated the aircraft on a trip the prior week after the time would have expired. Looking back at my thought process regarding this write up was the knowledge that we had 500 hours to comply and with it being the COVID season seemed impossible that with the lack of flying we would have encroached on the 500 hour mark as soon as we did.

From now on it is very important that no matter how benign or routine a MEL item may seem, it is very important to always verify with facts that a MEL write up is still in good standing.

## Narrative: 1

A message from the Dispatch Operations was sent out about the workload distribution. The Continent X operation is being pushed to its limit. The message specified this is happening on weekday 1 and weekday 2 nights (PM and midnight shift) when the workload is actually typically over the agreed upon limit of XX flights per desk to release. On the other nights the workload is, indeed, "pushed to its limit" with Y-XX flights per desk to release.

We are currently only utilizing Continent X desks. With Y-XX flights to release that means I also have Y-XX or so already airborne to monitor. Those need to be kept apprised of current weather, turbulence, SIGMETs/FPGs, arrival issues, etc. This is if everything is "normal." In the event of a passenger or crew medical issue, gate return, or diversion another level of complexity and busyness is introduced. By having so many flights to monitor and release I can be of little help to the other desk if they experience any issues

and need help. In recurrent classes we are required to learn about the barriers put in place to maintain a safe operation. Management admits they are willfully and continually choosing to remove those barriers not only by creating a heavy workload, but also by not staffing Dispatcher Y position some nights. The Dispatcher Y is a Dispatcher whom we can go to if any issues arise; they able to help us by looking up information, making calls, etc. in the capacity of a licensed Dispatcher and they often act as the go-between for us and the Sector Managers.

Additional desks need to be opened. There is no cost to the company to open a third (or fourth) Continent X desk. X desks were bid for the year and only X-2 are being utilized currently; people are being paid to stay home. Instead of opening the desks needed for the amount of flights management continues to diminish our barriers to safety by leaving the X Dispatcher position unmanned on midnights while increasing the Continent X workload.

## Synopsis

Dispatcher reported that too many flights are being assigned to each desk, leading to heavy workload and safety concerns.

## Narrative: 1

This was a reposition flight for an aircraft that had been in storage. The mechanic made a last minute placard of the APU door status message. The problem reset properly, but the placard was left in the book to expedite our departure. I have been advised that there was

not a mechanic's signature or employee number on the balancing logbook entry.

The nature of these ferry flights and the lack of organization makes it easy [to] miss this kind of detail. Probably should have ZZZ1 tech pilots operate these flights because they operate so far from normal operations.

## Synopsis

Air carrier pilot reported that there was not a mechanic's signature or employee number on the balancing logbook entry regarding an APU door status message.

## Narrative: 1

Climbing we were assigned 10,000 feet at 7,000 FMA said ALT due to the fast climb and turbulence. Passing 8,000 feet ATC reassigned to level off at 9,000 feet, but airplane was slow to capture ALT of 9,000 feet due to high climb rate and turbulence, moderate, and after passing 9,300 feet I disconnected the A/P and A/T and stopped climb at 9,600 feet and was correcting back to 9,000 feet when ATC noticed we had passed 9,000 feet and issued climb to 10,000 feet. ATC was step climbing us due to aircraft in front. No TA or RA or ATC immediate commands were generated. Due to moderate turbulence and high v/s climb I did not feel the need to over aggressively correct the altitude back to 9,000 feet and risk injuring a FA or passenger, knowing clearly that the step climb was due to traffic ahead we were outperforming. Flight continued safely and uneventfully.

## Narrative: 2

We departed ZZZ on Runway XX climbing to 3,000 feet. The Departure Controller gave us a climb to 10,000 feet. The airplane was light 350,000 pounds and was climbing at over 3,000 FPM. Passing 7,000 feet the FMA changed to VNAV ALT to begin the level off at 10,000 feet. The Controller amended our altitude to 9,000 feet when we were passing about 7,500 feet. We input the 9,000 feet to the MCP but the Autopilot overshot 9,000 feet and I told the PF that the autopilot was not making the level off at 9,200 feet. We leveled off at 9,500 feet and started to correct to 9,000 feet. The Controller then told us to continue climb to 10,000 feet. We climbed to 10,000 feet and the rest of the flight was uneventful.

## Synopsis

Air Carrier flight crew reported over shooting an altitude during departure.

## Narrative: 1

AVIATE. NAVIGATE. COMMUNICATE. Never in my XY+ years of being a professional pilot have there been so many issues with ATC communications, and this includes Reagan firings, ATC floods and fires, facility evacuations, earthquakes, etc., etc. Controllers are working two and three frequencies, causing missed clearances due to frequency congestion and in this case today, the Tower Controller was so busy that Controller gave a very complicated taxi clearance during the landing rollout at 100 knots and during a pilot-operating change from First Officer landing to Captain taxiing on a wet runway. The reversers weren't even stowed.

## Synopsis

Air carrier Captain reported ATC gave a very complicated taxi clearance during the landing rollout at 100 knots.

## Narrative: 1

Aircraft X was on SE vectors over ZZZ in a descent from 067 to 030 for traffic (Aircraft Z) 10 SE of ZZZ, who was NW bound for a midfield crossing at 040.

Aircraft Y was inbound for ZZZ1 from the northwest, in an abnormal position for the feed from Arrival (B) to [ZZZZZ1] (D) level at 090. This actually occupied a bit more of my attention than I expected. I don't think I've ever seen anyone fed to D that stayed on the ZZZZZ2 arrival as long as Aircraft Y did, and especially not when ZZZ1 is on a XX flow.

Maybe 2 minutes go by and Aircraft X is barely out of 060 and I tell him to expedite his descent when he's 19.26 NM NW of ZZZ and I explain the Aircraft Z traffic at 040. He says he will expedite. By the time he's leaving 5, I realize we have about 10 NM to get him down the other 2,000 feet and that's just not going to happen, so I issue I think a 160/150 heading. He takes the heading, that's when Aircraft Y comes into play.

Aircraft Y is handed off after passing Aircraft X and a deal has been worked out with B for him to be descending to 030, again, he was in an uncommon placement for a handoff. I give Aircraft Y a 210 heading to sequence behind Aircraft A traffic IFR into ZZZ1. Aircraft Z and Aircraft X are not a factor at this time, due to the diverging headings, but in my mind, it sure felt like they were. I looked at arrivals ZZZ traffic and saw one at something like 1,800 feet, so that gave me the impression they probably had more traffic and I didn't want this guy cruising another 10 NM SE bound into a position he may interfere with ZZZ arrivals. I didn't do a quick-look of B traffic because I was fixated on this Aircraft X dogging it to 030, so I decided that a turn W bound might for sure give me the separation with Aircraft Z that I needed. Well, after I do that B yells out "You good with those two"? I

look and see that the Aircraft Y is now leveling at 030 and Aircraft X sure looked less than 3 NM away in his turn to heading 270.

Now when I viewed the replay I did some measurements and a lot of the time they were 15+ degrees and diverging, but I think there had to be a split second where they weren't. And yeah, if I had let Aircraft X stay on the 160/150 heading, I wouldn't be typing up this report.

My only real recommendation is to maybe have a quick run through of the traffic flow at ZZZ [TRACON] during one of our briefing days. Nothing big, but we have maps back in the classroom info packet that has arrows that shows the preferred routings through our jacked-up airspace.

I blame myself for the loss (except that funky feed got me!), but refreshers like that have kinda gone to the wayside in the past few years. Should I revisit the SOP and traffic flow through ZZZ [TRACON]? Absolutely. Will XX of XX controllers 100% not do that? Absolutely.

During COVID a lot of positions have been combined for months on end due to staffing and lower traffic load. Reopening the room is kinda like going back into training, or at least like it feels like coming back after a long vacation. Dealing with headings we haven't used in a while, procedures, and frequencies. Refresher briefings would be nice. That's not a dig at our management I just think the FAA would be wise to allot the time for it.

## Narrative: 1

After receiving our initial close out numbers we loaded them and then added Taxiway W departure on XXR. We got those performance numbers and loaded the new perf init. The perf init was slow to load.

We taxied out and at some point the perf init loaded again. I think we had ramp frequency on radio 2 so we didn't have company freq tuned in.

The taxi was quite quick and as we approached the runway we received some new close out numbers. I acknowledged them but as we ran the before takeoff check, we didn't receive any perf init data. We looked at the close out numbers and there didn't seem to be any changes apart from the ZCG of 23.1 which was a .1 change. The perf init was acting like there was a backlog which happens sometimes to make it slow and we didn't get new data.

We were somewhat quickly cleared for takeoff and we became focused on operating the aircraft and taking off. Sometime after takeoff, we noticed the perf init message on the FMC finally appeared. Above 10,000 feet we cleared the message. Dispatch contacted us via ACARS and told us that CLP had included one heavy bag and wanted to see if we had received the new close out.

[Recommend] to monitor company frequency on taxi, if possible. I usually do, but for some reason I had ramp on comm2 this time. This way we could have had the extra bag info sooner than the late revised CLP closeout on taxi, which is a distraction while taxiing at an airport like ZZZ. To always ensure the perf init data is loaded after a new closeout regardless of small or no changes...again, I know this, but the events (the slow perf init convinced us there was no perf init data coming).

Not to be rushed under the new COVID conditions on taxi out. With so little traffic, all of our usual taxi times are much shorter and quicker.

## Narrative: 2

After receiving our load closeout, we closed up and pushed from the gate in ZZZ. As we approached Runway XX we were cleared for takeoff from intersection W. As we made the turn onto the runway, the FO accepted control, set takeoff power and accelerated. Rolling, we received another set of performance numbers. We continued the takeoff and climb. Above 10,000 feet, we looked at the new numbers and didn't see any change. Dispatch then sent us an ACARS passing along the change from CLP for the minor revision to the CG because of 1 heavy bag. I acknowledged the ACARS and continued. Enroute, a company aircraft that departed ZZZ after us reached us on air-to-air frequency and told us that ZZZ operations was attempting to contact us while we were taking off. We said

thanks and left it. The correction from CLP was a change in ZCG from 23.0 to 23.1.

I am assuming this was just a last minute change by the ramp crew or CLP and was not directly the negligence of any one person. With no traffic on the airport, the taxi and takeoff was extremely quick and we had changed frequencies before anyone noticed the changes.

## Synopsis

Air carrier flight crew reported not communicating with operations and did not receive the new load out until airborne.

## Narrative: 1

When taking off from ZZZ, Runway XXL, we were cleared to climb via the ZZZZZ2 departure. Per the departure, at 1,146 feet we are to turn direct to ZZZZZ1. The departure was properly loaded and we took off in NAV mode, as is required. However, when reaching the time to turn to ZZZZZ1, we realized that the aircraft was not making the turn at the proper time and was instead continuing on runway heading. We were not immediately aware of the cause, so we asked Departure for a heading, which they gave us, as well as a "direct ZZZZZ3 when able to resume the departure." Once on the heading, we realized that the FMS's auto sequence was inhibited, which is why it didn't continue on the RNAV departure. We switched the FMS back into auto, rejoined the departure, and continued the flight without any further issues.

While not entirely aware of why the FMS was inhibited, we think that it might have been accidentally selected while wiping/cleaning the FMS.

## Synopsis

Air Carrier Captain reported a track heading deviation while on departure.

## Narrative: 1

During the flight from ZZZ1 to ZZZ, while attempting to acquire the landing data for the arrival into ZZZ, the ACARS indicated NO COMM. The PM received the ATIS information through the radios and determined the landing data numbers via the company manuals in the EFB. The ILS XX for ZZZ was subsequently placed in the FMS prior to the brief, and Runway XX was briefed as the landing runway as per ATIS. While established on the ZZZZZ 3 arrival and checking in with final approach, ATC stated to expect Runway XYL. The PM verbally stated the fixes for the XYL ZZZZZ 3 arrival. Both the PM and PF then switched to the ILS XYL approach plate on the EFB and briefed that approach. While flying the ZZZZZ 3, both the PF and the PM discussed the two different split-off points. The first split-off is for landing East or West. The second Split-off is for landing XX or XYL. I was the Pilot Flying and was established on the ZZZZZ 3 Arrival when I noticed the indicated waypoints were still for Runway XX. As I stated that we were navigating for Runway XX, Approach Control asked us to make a right turn towards the proper waypoint for the XYL arrival.

This event was caused by not verifying the correct runway was placed into the FMS after a runway change was given by ATC. Contributing factors for this event would be the initial distraction resulting from the failure of ACARS. Another contributing factor would be the lack of currency/proficiency for both the PF and the PM. This lack of currency/proficiency was briefed as the threat in the brief for both the takeoff as well as the arrival. A final contributing factor would be the lack of familiarity with ZZZ for the PF as this was the first time flying into that airport.

First and foremost, flight path management is paramount to a successful outcome to any flight. When given any changes in altitudes, airspeeds, headings, runways etc. by ATC, each pilot is responsible to confirm and verify those changes. If task saturation begins to set in, notify the other pilot and let them assist you with reducing your saturation level. Always clearly understand where you are during any aspect of a flight. Within the extremely dynamic environment we find ourselves in during any flight operation, a lack of currency or proficiency can and does have a negative effect. Under the circumstances of COVID-19, it is still incumbent on each pilot to maintain the highest level of professionalism possible.

## Narrative: 2

I was pilot monitoring, prior to descent the ACARS went NO COMM, so I was gathering weather and doing landing data manually- we had set up for and briefed for XX as that was the previous active runway on our ACARS there is a reasonably complex STAR with altitudes and speeds. On checking in with Final Approach we were given [Runway] XYL - I inadvertently verified the verbiage of the arrival on the plate and somehow didn't realize I hadn't executed the FMS. We had verbalized the fixes and were anticipating the XYL transition when we were at 4,000 feet with the final approach before Tower- the aircraft began a turn to the left on the XX transition and the PF asked if that was correct- simultaneously the controller had us turn- ultimately descending and intercepting the final approach course for XYL

As PM I was becoming task saturated in the descent and ultimately didn't execute the proper inputs for the runway change-- of note, I am returning from extended time off as was my PF -- we had briefed currency in our brief and were communicating well about the arrival and landing.

Aside from not noticing my mistake of not executing the runway change we were communicating well and except for my being task saturated with getting the ATIS and monitoring a complex arrival I believe we could have attempted a full instrument briefing- however it was VMC for a visual and we had briefed the runway including taxi etc. The change of runway at a critical phase along with our lack of recent experience at ZZZ led to my not preparing for the appropriate runway initially.

## Synopsis

Air carrier flight crew reported setting up for the incorrect runway during approach.

## Narrative: 1

I began my shift on desk X at XA:00L, and I was to relieve three dispatchers at desks Y, Z and A at XA:00L. The Chief Dispatcher sent a message to the entire floor that the midnight desk assignments had been revised. It now showed that my desk would pick up a total of 7 desks instead of the original 3. The new desks were X, Y, Z, A, B, C, and D. There was a note on the revision that there were only 14 total flights among the new desks. It appeared that they only counted the number of releases to work the next morning, because there were a total of 38 flight in the air that I would now be responsible for. Just as I finished reading this revision, I received a call from a flight in the air having issues with the number two engine. I told a fellow Dispatcher to call the bridge and advise them that I am refusing to accept this many desks and flights. The Chief Dispatcher came down to my desk and I was able to show him how many flights I would have to handle. He apologized and said that he was told that it was only 14. The Chief Dispatcher returned to the bridge, and another revision was issued to remove three desks from my workload. The workload model agreed to by the company and my union is no more than X releases per hour, and no more than XX flights in the air at one time. This would have been more than

double the allowed number of flights per desk.

The company reduced the number of domestic midnight desks beginning on this shift. This reduction in dispatchers and desks has caused a new workload issue.

Honor the workload model that has been agreed to and open the closed desks to mitigate the workload problem.

## Synopsis

Dispatcher reported an overwhelming amount of flights the Dispatcher was advised they would be working, due to staffing issues.

## Narrative: 1

After departing ZZZ Runway XX, Departure Control directed turn to 020 degrees, climb 10,000 MSL. Air Traffic Control then directed passing 11,000 MSL, cleared left turn direct ZZZ [VOR], climb and maintain FL180. Air Traffic Control then amended clearance to 14,000 MSL. With aircraft in the turn, autopilot engaged, thrust in climb power and Open Climb mode, aircraft exceeded 14,000 MSL by 275 feet during automatic level with autopilot likely due to light weight. Air Traffic Control immediately gave us right turn 360 and firmly reminded us of our assigned altitude of 14,000 MSL, then called traffic at our 11 o'clock at 15,000 MSL. Autopilot was disconnected, we initiated immediate turn to 360, manually complete the level off at 14,000 MSL. There were no TA's or RA's during this event. Aircraft never exceeded 14,300 MSL during this event.

Got altitude assignment while climbing at a high rate.

## Narrative: 2

Cause - Light weight aircraft as a result of very light passenger load.

Suggestions - Awareness on aircraft operations with non-standard weight...much lighter than standard ops weights.

## Synopsis

Air carrier flight crew reported overshooting an assigned altitude during departure and cited the rate of climb due to the aircraft being light in weight as a contributing factor.

## Narrative: 1

We were ferrying an airplane from ZZZ to ZZZ1 that had not been flown since May 2020. There was lots going on with the plane in the hangar when we arrived and we were past the scheduled time of the plane being returned to service. The plane was finally pushed back onto the ramp and the APU was left running for us. Since it had not been flown for quite a while, my FO did a walkaround clockwise and I went counter clockwise to make sure all looked normal on the outside. We then proceeded to contact Dispatch for fuel requirement and did the acceptance checklist so we could make sure everything checked out before we took the plane. I went back inside and watched them sign off the aircraft and put it back into service after talking to Maintenance in ZZZ. I talked once again to Dispatch and printed the paperwork and went back to the plane. During that time the VOR was being updated and Maintenance was still walking back and forth to the plane carrying stuff. One Maintenance worker even came on board at the end looking for a spray that another employee thought he left on the aircraft (he called the Maintenance employee from home to ask him to look for it) and the FO and myself once again did another search of the aircraft inside and out. With everything going on I unintentionally forgot to check on the logbook again and was advised the next morning that it was not on board the aircraft.

With the non-normal nature of the flight (coming out of storage), I would take the time to verify with Maintenance and the crew that the airplane is ready for return to service and ensure all required documents are on board the aircraft. Next time I will slow down and follow the checklist to mitigate this non-compliance and double check that the book is on the aircraft.

## Narrative: 2

## Narrative: 1

First aircraft inbound for ZZZ, we're on a north operation. Aircraft X comes from the SW, checks on with correct ATIS, I assign him Runway XXL tell him to expect radar vectors for a visual approach, second aircraft, Aircraft Y checks on with correct ATIS from NE I assign him radar vectors VA XX L, third aircraft checks on from SW Aircraft Z, checks on with correct ATIS tell him to expect visual approach XXL and I give him a caution wake turbulence because he'll be following Aircraft Y. Since Aircraft X was my first aircraft it's customary for me to get flight conditions, winds bases etc.

I wasn't very busy, some departures from ZZZ and nearby satellites, got one VFR for flight following. I know something had gone wrong at some point with our radar, something with ASR and I think some shout lines also OTS (Out of Service) which I believe Supervisor was working on due to phone calls in background. CIC was watching the satellite sector he seemed to be getting busy. I vector Aircraft X to the back of the box, for a straight in visual approach approximately 15 miles, I get the last of the PIREP, I clear him and switch.

I slowed Aircraft Y on downwind to follow, and I had vectored Aircraft Z towards final. Aircraft Y calls field in sight, I withhold clearance to give Aircraft X room to get off runway. Finally give a turn and clearance to Aircraft Y and switch to Tower. Then I hook Aircraft Z to join the final approach course and advise field when I notice go-around, and Aircraft Y going to XXL, I assumed FOD on runway, I immediately change the runway on Aircraft Z, tell him to plan on a VA app, and told him to stand by while I find the localizer frequency, he says he has field in sight so I clear him to XXL, at some point I switch him.

Aircraft X comes off, I start my point out with my satellite, climb him to 4,000, and turn him. I asked him if he went around due to FOD, I don't think he understood my questions, I asked him if he went around due to FOD, what was reason for go-around and he said runway was closed, he went around when he saw the flashing "X" on runway then he asked the tower controller if runway closed.

That's when I realized I had been vectoring to wrong runway and forgotten west complex [was] closed. I had been previously distracted prior to taking position from union forcing us to no longer social distance and having to train, so that had been something I was discussing with my peers and the possibility of changing schedules for a sixth time this year that had definitely been a major distraction when I came to work today. In the end it's on me, I'd like to know if ATIS was correct because I had three pilots all check in with current ATIS and no one balked at XXL. Also straight in, over 15 miles, tagged for the wrong runway, and tower didn't look at the scope or out the window and cleared for the wrong runway. Just a lot of Swiss cheese [stuff] went down.

A lot of things went wrong, involving a lot of people, maybe I should have taken sick leave today.

## Synopsis

Approach Controller reported vectoring three aircraft to a closed runway and not realizing it until the first aircraft went around.

## Narrative: 1

I have made a mistake on the Deferred in Place (DIP) for Aircraft X, Engineering Change Release Authorization (ECRA) X.

The 8110-3 is good 12 months, but mistakenly, I asked planning to contact us after 24 months for revised ECRA.

As of DATE X (2019) the aircraft had a total of 25,904 total aircraft flight cycles.

As of today the aircraft the aircraft has 26,568 total aircraft flight cycles.

The aircraft has been over flown by 664 Flight Cycles.

The aircraft is in storage at ZZZ.

We have received the revised 8110-3 for stage 2 and 3.

The initial inspection is required at 32,041 Total Aircraft Flight Hours.

As of today the aircraft the aircraft has 26,568 total aircraft flight cycles.

So we haven't skipped any required inspection.

## Synopsis

Technician reported an aircraft in storage had an inspection come due without being placed back in service.

## Narrative: 1

On taxi out the flight attendants contacted us to advise of a passenger disturbance regarding the use of face coverings. Two passengers were asked up to four times regarding the proper use of the mask and were advised that both the nose and mouth

must be covered at all times unless actively eating or drinking. They initially complied, however; they continued to pull the mask below the nose which was the cause for the several attempts by the flight attendants. Upon first contact, I made an additional announcement regarding the policy of face coverings and stated to the flight attendants that returning to the gate may be an option to remove those individuals that were non-compliant. Shortly after I was advised that the passengers were finally cooperating and we continued on to our destination and advised to keep us advised to any further issues. I contacted Dispatch in-flight and advised of the situation, I asked that an airline representative and security meet the plane to discuss further policies regarding face coverings which concluded the incident.

### Narrative: 1

Was kept fast by ATC, and while configuring for landing, inadvertently had a 5 knot flap overspeed when selecting flaps 3.

A little tired. Accepted an ATC clearance to keep our speed up too long. Recent return to flying after 6 month absence.

I will feel free to tell ATC "unable" in such scenarios in the future.

### Narrative: 2

Was kept fast and high by ATC. While configuring for landing, had an inadvertent 5 knot overspeed while selecting flaps 3.

Saw speed reducing below the threshold speed, and lowered flaps, but should have waited for speed to be 10 knots below.

Will tell ATC unable if presented with a similar scenario.

## Synopsis

Air carrier flight crew reported a flap overspeed issue on initial approach.

## Narrative: 1

I was sitting standby and had a mask on for at least 4 hours. It has been a long time since I walked into in-flight. I feel very uncomfortable and unsafe not knowing who people are because we are all covered up. There is no way to look at your ID and know that it is the same person behind a mask. Again, as I traveled home, once released from stand by, I had a headache. This is a reoccurring event due to wearing a mask, and this time I was not even on a plane. As I return to work full time, I am very concerned about not feeling comfortable being able to see my pilots' and crews' faces. I have many studies showing that healthy people should not be wearing masks. This is not a new subject, it has been studied years ago.

And I believe OSHA says that it is not safe as well. I am also very concerned about the spraying of the aircraft and would like to know the chemicals used. I take my health seriously and would never put it in the trust of anyone other than myself.

## Synopsis

Flight Attendant reported several concerns with individuals having to wear face masks.

## Narrative: 1

During cruise flight, approximately one hour and 30 minutes from landing, a call was received from the cabin regarding a passenger, who was not complying with the face covering policy and disturbing nearby passengers. I asked the A Flight Attendant if any assistance or a diversion will be required, the reply was that more information was needed. A short time later, I received a call from the cabin informing me that the situation had been diffused and that passenger was now compliant.

While on approach to landing in ZZZ, I received a call from the cabin stating that passenger was out of his seat creating a disturbance. The A Flight Attendant requested personnel meet the aircraft at the gate.

Personnel met the aircraft and escorted passenger to the terminal without further incident.

Due to the first flight attendants calm demeanor, I allowed myself to believe the incident was not an issue. From this point further, I will involve my Dispatcher as well as other available resources.

Monitoring of passengers behavior during the boarding process can sometimes identify potential problems. Whenever possible, it is better to deal with these potential problems on the ground before the flight.

## Narrative: 1

Passenger in seat X1 had an unusual device that he was wearing. FA "A" and I approached the passenger, and asked about his device. He said that it's a Powered Air Purifying Respirator. Powered Air Purifying Respirator had a hose that was attached to the face hood. We talked to gate agent and asked about the device, gate agent did not know anything that pertained to such device. FA "A" and I looked through our manual and couldn't find anything about this specific device. It's not an Air Purifier which is a prohibited on all flights, it's a respirator which is similar to MPEDs (Medical Portable Electronic Device). The passenger was very compliant, he had a face mask on and a hood shield on. Since we were not sure about this device, we talked to our pilot. Our pilot called operations, and operations said that it's OK with them if we allow passenger to have this device on flight. We allowed passenger to have the device on board.

More information needed for situations like these.

## Narrative: 2

[Report narrative contained no additional information.]

## Narrative: 1

During boarding Flight Attendant B let me know there was a passenger who was speaking on her cell phone while not wearing a mask. Flight Attendant B asked her to put the mask on and the passenger said she can't talk on the phone through a mask. Flight Attendant B insisted and the woman begrudgingly put the mask on. As I passed by the passenger she was again not wearing the mask and speaking on her phone. I stood by the seat in front of her waiting for a good break in the conversation for a time to talk with her and she wrapped up the conversation and said sorry and put the phone away. I told her it wasn't an issue with the phone, but the health and safety of those around her. She put her mask on. Shortly thereafter as we were preparing the cabin for departure I noticed her mask was below her nose. She was wearing her headphones and did not hear me, but when she saw me she pulled the mask up over her nose.

Based on the attitude she gave Flight Attendant B and the fact that the mask was off again when I came by, and then not properly worn a third time Flight Attendant B and I concurred that if we had to speak with her again it would merit a disciplinary action. We also told the flight deck this, so that they would be aware.

Throughout the flight we did have close eyes on her, as one does when a passenger has already exhibited behavior that is against the rules, but I tried not to hound on her. During service I saw her and some others wearing their mask below their nose or off in the long times between sips and I made a PA asking everyone to be compliant (in no way singling her out).

Once it came time for final compliance for landing I came back through and again her mask was fully below her nose. I stopped and kneeled down and told her that we had already spoken with her about the mask and that wearing it under the nose does not comply. During the conversation that followed she did not pull her mask over her nose until after I had walked away.

She told me that she has a medical condition that makes her light headed and that she has been doing her best with the mask. I told her that while for several months we had mask exemptions for medical cases for the last month it has been mandatory regardless of individual.

She asked me for my full name and asked if she could take a picture of my name tag. I told her I was not comfortable giving my last name but if she reached out to the company they would know who I was. She said that I was rude for hounding her and briefly said the word "Nazi" in reference to my strict adherence to the mask policy and "targeting" of her.

The specifics of timing between what was said during this conversation and what was said in the conversation after I brought disciplinary action and later during final compliance all kind of meld, but these things were said.

She said that it was wrong to single out people who have medical conditions and that they don't have to share what the condition is. I reminded her that at no point did I ask her

what her condition is and that she only shared that she had a condition at the end of the flight after things came to a head. I also explained again that regardless of condition the mask policy is for anyone who wants to fly.

Some guests in the nearby rows thanked me for sticking to the policy as they had had concerns with the passenger in question not wearing her mask throughout the flight. I did my best to thank them for their support, but also to not rile up the non-compliant passenger nor the woman across the aisle who seemed to have befriended and come to the passenger's side (however this woman never spoke up to me or in my earshot). I did not want to put passengers against each other or cause more disruption.

Passenger also said that she was not planning on flying [Airline] ever again.

We let the Captain know [of the situation] and he called ahead to have a Supervisor meet passenger. During deplaning several of the other passengers that were in surrounding seats and had spoken up again thanked me for the way I handled the situation and said they'd be writing in to the company.

## Narrative: 2

Passenger was sitting in seat XX1. When securing the cabin before door closure she was on phone and had mask looped on one ear and hanging down and I asked her to put it on she said "but I can't talk on the phone with it" and I said "I apologize but it has to be worn over your nose and mouth at all times it is our policy" then she just looked at me with an attitude and then I asked her again if she could please put it on to which she said "sssuurreeeee" and put it on. Then I informed another FA and told him to keep an eye on her and then he immediately walked through the cabin and she had it off again, not even one minute later. So he also asked her to put it on. After safety demo passenger had mask on but not covering her nose FA A asked her to pull it up and make sure it is covering both her nose and mouth.

Inflight there were times she took exaggerated time to eat and drink. As were others in the cabin so we made a PA, (overall I bet we made 20 mask policy PAs during the entire flight).

Then during descent FA A observed her with it off again. I seen him having a conversation with her so I approached and he mentioned to her the policy and the reasons and the procedure and then told her he would be back.

He said she said she knows the policy. And around that time she mentioned to him that she was trying her best but she has a medical condition. She continued to argue with him and ask for his name to file a complaint. Passengers in front of and behind her gave thanks to FA A for enforcing the policy and said he handled it well. I do believe she overheard them praising him. We notified Captain and he informed [the] arrival station.

## Narrative: 1

During taxi out, passenger wouldn't put his seatbelt on. His Mom told me to "Force him to put it on." I declined. The Dad and Mom both attempted to put seatbelt on their son, but no success. He screamed and refused all of the way out to runway. I asked the Mom "How old is your son"? She told me that he was 4 years old. I then told her that he also has to wear a face mask. Her response was, "Good luck with that." Another Flight Attendant also tried to get compliance from them, no luck as well. I called the CA to inform him. The other FA informed the Mom that we were going to have to return to gate, and remove them. We returned to gate, and [they] deplaned.

## Synopsis

Flight Attendant reported a child would not wear a seatbelt, nor a face mask and was eventually deplaned.

## Narrative: 1

During boarding a passenger came on not wearing his mandatory face mask. I asked him to put it on. Before closing the door for pushback, same passenger came to the front to use the lav. In front of the C D [flight attendants] and Ops agent I asked him to put his mask on again. He stated he was eating. I informed the Captain and Ops I told him twice now to wear his mask. The Captain made an announcement about masks and Ops talked to him. He stated he was eating and didn't have to wear the mask. During the flight he continued to eat and never wore his mask. Even to use the lav a second time or when he got into the overhead bin. I called the Captain and asked for a Supervisor to meet the plane. The passenger walked off with no mask on.

## Synopsis

Flight Attendant reported a passenger did not comply with face mask policy.

## Narrative: 1

While in climb to FL410 we were given a turn 20 degrees left for traffic. Passing through 36,600 feet Controller said a mistake had been made and descend to FL360. As we were descending Controller gave us a right turn to 110. At that time we received an RA which we followed to 35,500 before we were clear of conflict. We then climbed back to FL360 and reported our altitude and RA event to ATC. ATC stated there was confusion between two controller's plans.

The controllers [should be] on the same page. What happened today isn't a surprise to me. Since the reduction in staffing of the controllers from the COVID-19 pandemic flying has been miserable and less safe. Most controllers are controlling several frequencies and are overloaded. We have had more TA's in the last 2 months than the last 3 years.

## Synopsis

Corporate jet Captain reported a communication issue between ATC facilities resulted in an airborne conflict.

## Narrative: 1

During the ZZZZZ X Arrival, a late clearance was issued and believed to have been to "Expect ZZZZZ1 at 250 knots." That "Expect" clearance was read back by the Pilot Flying (First Officer) due to the fact that the Pilot Monitoring (Captain) was speaking to the flight attendants on the interphone. After passing ZZZZZ1, ATC asked to verify that we were at 250 knots, the First Officer/PM responded that we were awaiting the expect 250 knots clearance. The ATC Controller made reference to the fact that he was wearing a face mask and the clearance may have been miss-understood. The Captain returned from speaking with the flight attendants and the First Officer briefed him on the miss-understanding of the "expect 250 knot" clearance. The aircraft was slowed to 250 knots and the flight continued on the ZZZZZ X Arrival uneventfully.

Communication with ATC can be difficult enough. Controllers wearing face masks doesn't seem like a good idea.

## Narrative: 2

We were descending on the ZZZZZ X. I notified my First Officer that I would be off for a moment, so as to notify the flight attendants to take their seats due to the turbulence. When I notified my First Officer I was back, he informed me that ATC had told us to expect ZZZZZ1 intersection at 250 knots. Shortly after passing ZZZZZ1, ATC queried our speed. We notified ATC that we were at 280 knots but were never assigned the 250 knots at ZZZZZ1 that he told us to expect. ATC commented that he was wearing a face mask and that it was probably hard for us to understand him. We slowed to 250 knots and the remainder of flight was uneventful.

## Synopsis

Air carrier flight crew reported missing a speed restriction clearance possibly due to the Controller wearing a face mask.

## Narrative: 1

Was being vectored for the GPS XX approach at ZZZ. Was a plane ahead with a similar call sign. Controller gave me a approach clearance for the ILS XX, I was expecting the GPS XX and the position sounded off. I turned to join the approach course as I was positioned for this, but then questioned the Controller telling him I thought he meant to give the clearance to the plane ahead. He said he had but the plane ahead also stated they were given no clearance.

The Controller had given me, Aircraft X, the clearance in error. I then turned back to my assigned heading and the Controller then cleared the other plane. I never left my assigned altitude. The Controller seemed over loaded throughout the flight. The current staffing at ATC seems to be straining their capacity with controllers covering many more frequencies which means pilots tend to step on each other as we can't hear the other frequencies.

## Synopsis

GA pilot reported ATC clearance issues involving similar call signs and cited Controller workload as a contributing factor.

## Narrative: 1

We were flying to ZZZ, assigned the XX LDA starting at ZZZ1 VOR. We were instructed to cross ZZZ1 VOR at or above 15,000 and cleared for the approach. We had programmed the avionics to fly the approach and descend on the approach to the glide slope intercept altitude. During the setup we neglected to arm the VNAV. After passing ZZZ1, descending, the aircraft did not level off at 14,000. We noticed the missed level off just before the controller alerted us to a probable altitude deviation. The Captain immediately disconnected the autopilot and returned to the appropriate altitude. The flight concluded uneventfully.

I believe there were several factors that contributed to the event. Primarily, the flight crew was legally current but a little out of practice. A full procedure instrument approach in real-time in mountainous terrain is different than currency and maintenance flights in non mountainous terrain. We have a very strong safety culture, attend recurrent training more frequently than required, and have extensive backgrounds including airline and corporate jet experience but are still susceptible to being "rusty".

## Narrative: 2

[Report narrative contained no additional information]

## Synopsis

First Officer reported flight missed an altitude level off because they were a little rusty.

## Narrative: 1

Sorry to have come to you for issues pertaining to night shift but we as Aircraft Maintenance Technicians feel the need to write to you all as our requests to night shift supervisors have gone into one ear and come out the other without any interest to these issues. As you all probably know we at nights perform different checks and routine maintenance on the airplanes sitting out there on the remote pads. We have expressed our concerns to night shift supervisors about the need to add more entry door Stairs/Stand...for Aircraft X/Y types as well as Lighting Fixtures since it's completely dark at night.

Now that more airplanes are being parked, what do we have to do so that our requests/concerns are answered? Answers Supervisors like to say like "We just gotta work around these issues" are not of people with sound judgment...hence as working group we felt the need to write to you all to explore better possibilities to these specific issues. Again these are safety concerns we feel need to be address as more planes are being parked in these remote areas we need more lighting fixtures and as well as entry door stairs to better accomplish all the required work assigned.

Need management to provide us with entry door stands.

## Synopsis

Technician reported work environment concerns that aren't being taken care of by management.

## Narrative: 1

Passenger X was wearing a face shield without a mask. I noticed during boarding process. I informed him policy is to wear a face mask over his nose and mouth as well. He said for me to stop talking to him and go away. He said he had a condition. He repeated, that he wanted me to go away and stop talking to [him]. I asked him if he had talked to an agent? He said there was no one to talk to at the gate. I offered for him to talk to a gate agent. He again said for me to go away and did not want to talk to me. He appeared to be pulling a mask out of his bag, as I was offering to go get one for him. The FA C came and [offered] some masks. He told her to go away. Next time I was in the aisle about 10 minutes later, he had the mask on but below his nose and mouth. I asked him to make sure he had his mask pulled up, he was hostile and said he was not going to speak to me. Told me to "Go away, I'm not talking to you." I informed the A FA, she informed the CA. They decided to remove the passenger. An employee flying in Row XX witnessed the exchange. He was not in compliance and a safety hazard to other passengers and crew for COVID-19.

## Synopsis

Flight Attendant reported a passenger was removed from the flight due to non-compliance with face mask policy.

## Narrative: 1

The passenger in seat X1 kept pulling his mask down, he did comply but kept doing it. He was also agitated when we told him we needed his mask to cover his nose and mouth. We were kind about it too. At one point he claimed to have a health condition. It did not say anything in the paper work of mask/face covering exemptions. I informed the other Flight Attendant and she agreed to let the flight deck know. The flight deck asked if he had been verbally aggressive towards us. He had not. The flight deck had a [CSR] meet the plane. We talked to [CSR] because the passenger told them we were rude and we were not. [CSR] told us we handled it perfectly.

## Narrative: 1

Passengers blatantly refused to wear masks. Masks must be worn at all times, even while sleeping in flight. The only time the masks can be removed is while actively eating or drinking. This was the most non-compliant flight to date. There were passengers only covering their mouth and not their nose. There were many passengers who didn't have a

mask on at all. When we would ask them to put a mask on they would roll their eyes, pretend to put it on and take it off as soon as we walked away. We all have families to go home to. This is not acceptable. Every other airline firmly enforces the mask policy.

Enforce the mask wearing policy strictly for all passengers and all airline crew, including mechanics, flight attendants, grounds ops personnel and pilots.

## Narrative: 1

I am working C position on this flight. I briefed the OWWE (Over Wing Window Exit) and all were in compliance. My A FA, upon doing her final walk through for takeoff had to tell passenger seated XX2 to stow her bag back under the seat in front of her. Passenger in doing so FA A noticed she was wearing a small boot on her left foot. FA A informed the pilots we had to re-seat passenger. Pilots pulled over, passenger was resealed and we went on our way.

I do not know the exact time of day this happened, but was told we arrived 5 minutes late. But it says differently on our payroll sheet which says we arrived early. With that being said, we had a few mask situations during descent, one passenger complaining another wasn't wearing her mask, both passenger were through passenger. Announcements were made, 2 of the 4 FAs spoke to the unmasked passenger. During cleaning of aircraft a passenger informed me of the passenger not wearing her mask. I spoke to the unmasked passenger explaining why she had to wear a mask, but we ended up requesting either Operations or a Supervisor to speak to unmasked passenger because she told me the old lady needs to mind her own business. Operations agent took unmasked passenger to jetway to talk and situation was resolved. Unmasked passenger sat YY4 the complaining passenger moved fwd about row XD. Now we're boarding. One passenger tried to sit in OWWE using a seatbelt extension, passengers were letting their masks fall below their nose, a passenger received a call and took her mask off while walking through cabin, I got her attention by stepping into the aisle and put my hand in front of my face. She understood what I was getting at, she stopped, put her mask back on and was apologetic. Both the D & I had heavy mask patrol that flight. While briefing my OWWE I never noticed the boot wearing lady's foot with boot. All items were stowed.

## Synopsis

Flight Attendant reported multiple passengers did not comply with face masks policy.

## Narrative: 1

Shortly after reaching cruise, Flight Attendant let me know that a passenger's children (10 - 12 years old) were not complying with the face mask policy. That after being asked to ensure they wear their face masks the passenger (mother) threw trash at the Flight Attendant. I said I would contact Dispatch and they should contact their ops if possible. Flight Attendant said they would proceed with the necessary paperwork. I made a PA

again reminding people of the airline face mask policy. The FA let me know the passenger and children then fully complied. We continued and landed without further incident.

## Synopsis

Air carrier Captain reported Flight Attendant advised them of passengers not complying with face mask policy.

## Narrative: 1

At 11,000 feet Flight Attendant called, notified of passenger face mask non-compliance, causing a distraction with announcement location and announcement briefing. Once on course with Runway XX, approximately 2-3 miles before ZZZZZ, during flap extension to flaps 45, autopilot disconnected.

We believe the autopilot disconnected because during flap extension speed dropped off. As the First Officer was adding power and correcting, autopilot disconnected. First Officer then hand flew and we tried autopilot again. It engaged normally.

## Synopsis

Air carrier Captain reported being distracted by a Flight Attendant call and the autopilot disconnected during flap extension.

## Narrative: 1

While executing a visual approach to Runway XX ZZZ airport, I was on a proper visual glide path until approximately 1/2 - 1/4 mile final. A breakdown in my scan resulted in descending below a normal glide path, as a result we were unstable below 500 feet AGL. Neither pilot called for a go-around, though, after debrief it was agreed that a go-around would have been appropriate. I was able to correct back on profile, approximately at 1/4 mile short final. The landing was safe, on speed and uneventful.

Contributing factors included light turbulence requiring constant power adjustments. Also, lack of recent flight time due to taking leave--this was my first approach/landing in a number of weeks on top of very limited flight time in the past 6 months. Additionally, as experienced from the previous ILS approach to the same runway conducted earlier the same day, it was noticed that while on or above glide path, the PAPI's indicated well below, despite glide slope and VGSI not being coincident per the procedure. The note on the procedure indicated that the VGSI would bring the aircraft across the threshold at approximately 50 feet, however; coming across the threshold at 80 feet, the PAPI's still indicated low (one white over three red). This issue was briefed to be mitigated by referencing altitude/distance check points on descent, however; it still became an issue. The lack of proper visual guidance may have contributed to a departure from a stable glide path, however; did not contribute to the failure to call a go-around. The PAPI guidance issue was brought to the attention of the airport manager.

The potential lack of flight time/currency due to COVID is a potential universal issue. I have a luxury of flying with the X Group to maintain a scan but for those that don't, a severely reduced schedule will likely result in some loss of proficiency. A solution may be to promote those with reduced flying to take more legs/landings than normal within a given pairing. Additionally, aside from notifying the airport or ATC of malfunctioning equipment, e.g., PAPI's, there should be a means by which to relay this information to the

company for immediate communication to air crew, as there is no guarantee of a swift response or fix. (aside from NOTAMs).

## Narrative: 2

Was pilot monitoring. We were coming in to land on the visual to Runway XX in ZZZ. During the last 1/4 to 1/2 mile on the approach. The pilot flying misjudged the distance and descent rate during the approach and started to get low on the approach. Pilot flying corrected but we were unstabilized on the approach and did not execute a go-around. We landed from the approach without incident within the touchdown zone area on the runway.

The pilot flying had not been flying very much recently so lack of recent experience was a factor. A failure of the pilot monitoring to call for a go-around from an unstable approach. A failure of the pilot flying to call for a go-around from an unstabilized approach. Complacency on approach and not wanting to inconvenience passengers. Poor decision making by pilots.

As pilots we have to always remember safety is top priority. Even if it's an inconvenience to both [of] you and everyone on board. If an approach becomes unstabilized a go-around or missed approach must be executed. Even if the landing happens safely and the landing is "salvaged" it's important to remember that one day it might not be. As a pilot monitoring if you see an unstabilized approach you should speak up. Don't worry about hurt feelings. Missed connections. We can't get complacent and think that we can just continue from an unstabilized approach.

## Synopsis

Air carrier flight crew reported an unstabilized approach and landing and cited lack of flying as a contributing factor.

## Narrative: 1

I accepted the hand-off on Aircraft X from ZZZ approach and put a PVD (Plan View Display) on what I thought was ZZZ Approach LO's scope. I was very busy working three

sectors combined and simply climbed Aircraft X on check on. A few minutes later in my hurried scan I noticed that he was in ZZZ Approach low airspace climbing through 110 but the P [position symbol] was still a P not an A [position symbol]. I looked at the P and noticed why. I had put it on sector XY's scope not sector XX's. Just a mistake of being busy and being in an expect things to go as planned and hope for the best mode instead of a calm verify everything and plan for the worst mode.

There really isn't a recommendation. While we're in this skeleton crew phase there's nothing that can be done and this is just the way things are day in and day out.

## Synopsis

Center Controller reported a mistake involving handing off an aircraft to the wrong sector and cited staffing levels as a contributing factor.

## Narrative: 1

I forgot to coordinate ODO (Opposite Direction Operation) with ZZZ Tower. Their active runway in use was Runway XX and I ran Aircraft X in for a practice RNAV YY approach without ODO coordination. I had cleared the aircraft for the approach and then the satellite

sectors were split and forgot to tell the other Controller about the ODO operation.

ZZZ Tower right now is on reduced operating times due to the COVID-19 pandemic. Their Tower operation opening and closing times are out of the norm and may have been a contributing factor in forgetting that they were open and coordination was needed for the ODO operation.

ZZZ1 Tower was on a XY's operation while ZZZ Tower was on a Runway XX operation which added to the confusion of what runway was in use at ZZZ.

I just need to do a better job of remembering everything.

## Synopsis

TRACON Controller reported failing to coordinate an Opposite Direction Operation with Tower.

## Narrative: 1

I was working all RADAR positions combined in the Tower cab due to the COVID schedule. We had a priority handling aircraft land at ZZZ1 which caused multiple aircraft to be placed in holding/kept in the RADAR pattern. While this was going on I had a heavy increase in traffic volume. I based Aircraft X to a 240 heading after an extended downwind, about 15 miles out at 020 MSL. Shortly after basing the aircraft I received multiple calls from aircraft and became saturated with traffic and transmissions. I realized Aircraft X had gone through final and was headed towards a man-made obstruction with the obstruction height of 2,XXX feet. I issued a right turn to heading 050 to get them away from the obstruction. I started issuing a climb to Aircraft X when I realized I had a VFR aircraft receiving radar serve at 030 directly about him. This caused me to cancel the climb and stick with just the turn. I then tried to turn the VFR aircraft so I could climb Aircraft X but between my voice quality and the other aircraft on frequency he didn't understand my transmission. I believe Aircraft X came within 3 miles of the obstruction.

I believe working on the TDW (Tower Display Workstation) display which is smaller than our normal stars displayed caused a higher complexity of traffic. I'm not really sure what could have prevented this event other than going back to normal staffing levels and working back in the RAPCON.

## Synopsis

Tower Controller reported an aircraft missed a turn and came within less than the required separation from a tall obstruction.

## Narrative: 1

I plugged in to work Position 1 and Position 2 Low by myself.

Staffing was a major issue. The Controller-in-Charge had tried to call in overtime, but no one was available until later in the afternoon. (Our only overtime was Controller Z. He had worked the mid the previous night.

We had multiple controllers go over 2 hours on position, many without D-sides or any help.

The Controller in Charge, Controller Y, worked over almost 11 hours. This is of course well over the prescribed 10-hour shift. He was forced to work Controller A's handoff and D-side while he also worked the Controller-in-Charge position.

I was aware of the staffing situation, but at the time I was not aware that they would mandate Controller Y work more than 10 hours in a row. Thus, I was anticipating the loss of another Controller. Position 1 and Position 2 would be going red (or above the facility delineated "safe" number) in the next 45 minutes. And I knew that I would still be on position.

I called the surrounding ZZZ1 Center Sectors XX, YZ, YA, YB and advised them that we were short staffed, and I was going to be on a "red" sector. As a result, I needed 25 nm in trail to ZZZ Center International. ZZZ1 Center was extremely accommodative. The operations manager at ZZZ Center then came down to the area and began to pressure the CIC Controller Y to relieve the mile in trail restriction. With XX years' experience working arrival aircraft into ZZZ, I did not think that was a prudent decision. The Operations Manager countermanded my request and told ZZZ1 [Center] to disregard my control instructions. I was made aware of this development, and I reiterated to ZZZ1 Center that for safety, staffing and volume I would have to enforce the restriction. Keep in mind that I gave ZZZ1 at least 45 minutes lead time on this development. I was not springing anything on them. All the controllers were extremely accommodative, and I thanked them for their help. Operations Manager came up to me in an intimidating manner while I was working, and told me that I was not allowed to put in-trail restrictions on ZZZ1. I told him to call me on the line if he was going to order me to do something. I wanted any interaction recorded for self-preservation purposes. He did leave but refused to call me on a recorded line. He appeared later and told me that I was not allowed to make in-trail restrictions for my sector. I told him that if he wanted to take responsibility for the aircraft he could, but I did not think that it was safe. I refused to be intimidated. He then threatened me with an investigation and told me that I would "need a rep." I told him that I no longer felt safe working a busy sector by myself with the threat of an investigation hanging over my head. [Thankfully], CIC Controller Y assigned newly-arrived overtime Controller Z to relieve me.

Operations Manager called the X area and ordered CIC Controller Y page me back to work. I advised him that I would return shortly after using the bathroom.

Controllers should be allowed what restrictions they put in place for their sector. There is a culture of fear, intimidation and completely disregard for law, rule and regulation.

## Synopsis

Center Controller reported disagreement with Operations Manager when Controller put in aircraft flow coming into the sector reporter was working.

## Narrative: 1

I was watching a trainee in the Local Control position when ground/flight data/clearance delivery passed inbound information from ZZZ ARTCC of Aircraft X two miles south east of the airport for a visual approach to Runway XX. This was an extremely late inbound as our LOA reads center will inbound aircraft at least 10 miles out. We had several VFR aircraft in the rectangular pattern to Runway XX with aircraft on final to Runway XX with almost no time to build a hole. We coordinated with center to not descend Aircraft X below 4,000 and requested control which he was at 5,000. Center descended Aircraft X to 4,000 and cleared the aircraft for the visual approach to Runway XX and switched the aircraft to us. We had to move at least two aircraft out of Aircraft X way with little to no notice to accommodate the IFR arrival. Because we were advertising Runway XX/XY in use and Aircraft X was so high (5,000), I thought since we didn't get an inbound that center was vectoring the aircraft around potentially for spacing. Never did I think Aircraft X was going to be cleared a visual approach to Runway XX at the altitude the aircraft was at. Common practice is center inbound aircraft outside of 10 miles for the IFR approach and descends them to 3,000 feet before switching them to us. This created a dangerous situation with very little time to react or plan, especially with a trainee who was on day 4 of re-entering training after six months plus of not working local due to COVID and me not training anyone for just as long if not longer due to COVID.

Follow the LOA between ZZZ ARTCC and ZZZ Tower.

## Narrative: 2

I was training on local, which I had not worked local in about 6 months due to the COVID pandemic, it was my fourth day back into training. I had numerous aircraft in the local pattern and on final for Runway XX. ZZZ Center called flight data (FD) / Ground Control (GC) and in bounded Aircraft X, who was two miles south east of the field at five thousand feet. I coordinated with FD/GC and ZZZ Center to stop Aircraft X's descent at four thousand because I had several VFR aircraft in the pattern and lining up on final. Shortly thereafter Aircraft X calls me about one to two miles northeast of the field saying he is on a visual approach to Runway XX. I asked Aircraft X how long he would need to continue north before he would turn base in which he told me about another mile and then he would turn his base. I acknowledged him and told him to report turning base. I then started moving aircraft out of the way and sequencing aircraft behind him in order to make it work. I had very little time to plan and build a gap for Aircraft X to fit into. Per our LOA with ZZZ Center, ZZZ Center is supposed to inbound aircraft at least 10 miles out. This aircraft was not inbounded until two miles southeast of the field. Being that I had not got a position on Aircraft X when I noticed him so close to the airport on the STARS, I was under the impression that center was vectoring the aircraft for an RNAV XX approach only

to find out last minute that the aircraft was going to be doing a visual approach to XX and then I was not given any time to build a gap to fit the aircraft into.

In accordance with the LOA between ZZZ Tower and ZZZ Center, the Center is supposed to call with a position on inbound aircraft with a type of approach to expect. My recommendation is for center to follow the LOA and inbound the aircraft sooner, allowing tower time to build gaps for IFR aircraft.

## Synopsis

Tower Instructor and Developmental reported overlying Center not complying with the two facilities' LOA.

## Narrative: 1

Our helicopter's annual expired the last day of Month. The closest maintenance facility was closed for flights due to the COVID pandemic. On [date] we requested a special flight permit (SFP) to the FAA for a ferry flight to be conducted 5 days later. This was the first time I have done this type of application. The FAA takes time to process these applications and I became anxious, thinking the owner would not like [it] if we continued to delay the helicopter's maintenance. So, I made the decision to continue the flight 5 days later, although the SFP was pending. I let a non-existent external pressure influence my decision to conduct the ferry flight. The helicopter was in perfect condition, but I realized that it was a mistake and should have waited for the FAA SFP response to conduct the flight. I believe more training on CRM and aeronautical decision making and FAR knowledge will help me deter these types of situations in the future.

## Synopsis

Pilot reported being under pressure and flew a ferry flight without proper documentation.

## Narrative: 1

The event occurred on a flight between ZZZ and ZZZ1. We had been delayed multiple times at our base of operations due to mechanical issues and eventually were switched to a different aircraft that became available late in the day. Throughout the rescheduling and refiling/updating flight plans we had taken consideration of our duty time and had set a latest takeoff time from base that would allow us to complete our flights and return to base before the end of our duty time. However in all that I failed to consider night landing currency for carrying passengers. It was not until after we had picked up our passenger and were enroute to ZZZ1 and the sun had set that the FO (pilot flying) looked at me and said that he couldn't make the landing as he was not night current. Then I realized I was not night current either. At this point we realized it was too late and continued to our destination. I had the FO do the landing which in retrospect as PIC I should have shown more initiative in taking full responsibility by taking the landing instead of putting the FO in the position of making a landing out of currency.

A contributing factor is that in the past I have seldom carried passengers for my employer. Most often I am doing other type of flying with only required crew on board due to the aircraft being in the restricted category. But I have more recently been doing an occasional passenger carrying flight where I have to think about passenger carrying currency more. Also due to economic slow down there has been less opportunity to keep up currency especially night currency with our normal operations.

For corrective actions I have made a checklist for myself that goes in my knee board specifically for passenger carrying flights, because they are so infrequent, that lists the pertinent things that should be considered during pre-flight and more specifically the more pertinent things like passenger carrying currency. This will be a checklist that I see when I open my knee board prior to flight and work through at the latest, just before engine start.

## Synopsis

Corporate Captain reported neither crew member was current to make a landing on a night flight and realized it after they had departed.

## Narrative: 1

A family boarded with the 2 year old child not wearing a mask. After boarding was almost done, Flight Attendant (FA) D advised me that the child in row X is not wearing a mask. I walked to their row and asked the parents if the child had a mask or would they like one of ours. Both parents quickly stated, "He's 2 and he won't wear a mask. Good luck if you want to try." "We were told 2 is okay for no mask." "He won't wear a mask."

I decided to disengage and have the Customer Service Agent (CSA) contacted. I advised them that a CSA would be down to have a conversation with them. The Captain was advised and I asked for a CSA to come down to the aircraft. The boarding agent talked to the party and advised me that the parents were attempting to put a mask on the child.

A second CSA came down and asked me about the age and our mask policy. She advised me they had a conversation with the party prior to boarding and wrongly advised the parents of the age requirement for wearing a mask. I advised the CSA it clearly states on policy that age 2 and up must wear a mask, no exceptions. The ZZZ Station needs to retrain or re-examine the Mask Policy because it is very clear on all guest facing touch points that our policy is stated age 2 and up. Our ZZZ Station CSA's are advising guests incorrect age requirements for our mask policy. I advised both CSA's that due to the statements made by the parents that their child would not wear a mask that the FA crew wanted them removed from the flight.

As the family deplaned they yelled and blamed me for getting them kicked off this flight. I apologized but I reiterated our mask policy as they were deplaning.

## Synopsis

Flight Attendant reported a family with child were removed from the flight because of non-compliance regarding face mask policy. The family was incorrectly told by station agents, a mask was not required for the 2 year old.

## Narrative: 1

Passenger in XX2. Saw him sleeping with no mask on. An announcement kind of woke him up so I finished the job by saying Sir, that woke him up and I said I'm just going to need you to wear your mask. To which he said that he just had surgery on his nose for cancer and that the mask hurts. I told him I was sorry for his nose and then said but it is our policy. He started to get a little [bit] of an attitude and said something about our policy. At

that point I found a way to end the conversation because it was going nowhere. Then I went and explained it to the A Flight Attendant.

We both believed giving him a warning would cause a bigger scene and we only have about 40 minutes flight time left. So far no one has complained about him, but if someone does we will have to issue the warning at that point.

## Synopsis

Flight Attendant reported a passenger resisted adhering to face mask policy. No further action was taken for fear of escalating the situation.

## Narrative: 1

When working I gently remind passengers that are not compliant with face masks/coverings of our policy as they're boarding the aircraft. It is also something that's included in our announcement before departure and our welcoming/safety announcement. When working AFT I actively check for mask, bag, and seat belt compliance prior to closure of the boarding door. I also ask the flight deck to make an announcement regarding face masks and to ensure coverage of both nose and mouth is included so that we are all unified. All gate agent pre-boarding announcements and Flight Attendant announcements should be updated to specify that passengers must cover their nose and mouths throughout the full duration of flight unless actively eating or drinking.

Passenger X (X1) was the last passenger to board. The gate agent waited 10-15 minutes for this passenger. She mentioned that she reminded this passenger regarding mask compliance at the gate; however I was unaware until I saw her in passing between flights. I reminded this passenger to comply with his mask during boarding. Once the boarding door was closed the AFT FA asked the passenger to turn his phone on airplane mode and to disconnect his call. He complied until she walked passed and got directly back on the phone all through our safety demonstration. The non-revenue FA that sat in row X in front of the passenger rang the FA call button before I took my jumpseat to discreetly inform me that he was still on his cell phone. I glanced back and he was indeed holding a full conversation on his cell phone. I was unaware that the AFT FA had already asked him to end his call. He complied and I witnessed him turn his phone on airplane mode. I also asked this passenger to wear his mask properly and informed him that after I'd have to share our final warning. The non-revenue FA in row X rang me again to inform me that as soon as I took my jumpseat this passenger took another call and talked until his phone disconnected at 10,000 feet. During the duration of our flight this passenger manipulated the mask policy with food/beverages and was being completely rude towards me during the duration of our flight something the non-revenue FA witnessed also. Upon landing he positioned his mask to cover his mouth only intentionally. He became, loud, frustrated, combative, and used profanity when I kindly asked all passengers to take their seats during deplaning. He tried rushing to the aisle to exit the aircraft. He Immediately stormed off the aircraft. The non-revenue FA complimented me on how I handled everything. I also informed the flight deck.

## Synopsis

Flight Attendant reported a passenger did not adhere to the cell phone or face mask policy. FA stated the passenger was rude, loud, combative and used profanity.

## Narrative: 1

While capturing glideslope from above, flaps were possibly oversped briefly with the selection of flaps 3. Flaps were moved back to flaps 2. Aircraft was configured by the marker and stable at 1,000 feet. Should have reduced the level of automation. The aircraft captured the alerter altitude before glide path and thrust began to increase. I spun the alerter down to glideslope intercept, pulled speed and altitude as flaps 3 was selected. Selected speed was 180 knots. I disconnected autopilot and reduced the descent. Captain notified me of the over speed after landing. This was my 5th flown leg in 6 months.

## Synopsis

Air carrier First Officer reported a speed deviation and cited lack of flying as a contributing factor.

## Narrative: 1

I want to take the opportunity to express my concerns regarding pitot tubes covers and inspection requirements and that is...here at ZZZ we have airplanes that sit on ground for

more than XX hours and therefore need pitot inspections before departure as the GPM XX.XX.X states and are accomplished...our concerns rely on the fact that these same airplanes are not scheduled to depart until most of times well beyond a substantial period of time on ground and as mechanics we feel that signing the pitot inspections well before hours (i.e., 4 hours, 6 hours, 8 hours, etc.) before departure is a safety concern because these same aircrafts are sitting on remote pads of the airport without pitot covers since ZZZ has no covers available or NOT enough!! We cannot have, for safety reasons, mechanics signing pitot inspections when airplanes are not scheduled to depart for another 5 or 6 hours until departure time...what guarantees that bugs or other forms of FOD is not gonna get inside those tubes after having signed for the inspections in the AML Logbook?? We have brought this issue with ZZZ management but they tend to believe that because the GPM XX.XX.X states "Before Departure," this 2 word sentence to them means: "ANY time the Aircraft is linked in [the system]"...which we STRONGLY DISAGREE...since again departure times are well beyond the 6-8 hours before departure. We as maintenance Mechanics would be in jeopardy of putting our licenses on the line if something was to happen with pitot systems after signing for the inspection and still have aircrafts sitting on ground for another 6-8 hours uncovered. We strongly recommend the GPM XX.XX.X be revised with specifics regarding Pitot Inspections and sign offs. I want to thank the many individuals in your department for keeping us informed with updated info on issues that pertain to aircraft maintenance. We hope that this particular issue gets resolved for the sake of everyone in maintenance and our flying public.

These events are recurrent.

GPM needs to be specific about their definition of "Prior to departure." We strongly suggest the inspection be performed with aircraft on gate prior to departure (2 hours) and notate it in AML log.

## Synopsis

Mechanic reported that after pitot inspections are accomplished prior to departure, aircraft frequently sit on the ground for hours with no pitot tube covers to protect against contaminants.

## Narrative: 1

Immediately after service - guest in XX6, came to the back galley to ask for water and snacks, but was not wearing his face covering. He came very close to me and my jumpseat, and I quickly asked if he wouldn't mind taking a step back, and thanks. I asked him also to please wear his face/nose covering. He replied that he did not have one. I began to feel very uncomfortable as he was having trouble keeping his distance while also not having a face covering on. I told him if you can go get your face covering at your seat,

we'd all really appreciate it and I'll get your waters and snacks ready in the meantime. He said again he did not have one. I told him that we will provide one for you no problem. So I had Flight Attendant (FA) A go and grab one for him and he slowly and reluctantly put it on. He started saying that it doesn't make sense that he was allowed to board without one. I specifically recalled him wearing one before and during taxiing out.

He stood in the back galley and was now complying with wearing the mask and I gave him some waters and snacks. He asked for my name and badge number to file a complaint. I told him that this isn't anything personal or something to argue about, it's just our company's policy to wear a face covering and it's something that not only makes me feel comfortable but all the people around you. I also gave him my first name and the flight number. He started to tell me in an argumentative way that it is how I said for him to put his face mask on that was rude especially with asking him to take a step back when he wasn't wearing one at all. I told him that I had nicely asked him and now you're wearing one that we provided, thanks. He explained further that he thinks that I'm "one of those people on the left." I simply explained to him that I don't want to argue about this as this is simply just a policy that everyone on board must comply with, that's it! He tried to keep arguing with me and I replied that I'm not here to argue about this, or what I was asking you to do, I'm just grateful that you're now wearing your mask, so thank you. He kept insisting that the crew today is terrible and that he wants to file a complaint. He also kept mentioning that he wasn't wearing one during boarding. Something felt a little off about him, I kept insisting that this is our policy and that we appreciate his compliance. No warning was necessary because the guest complied with wearing the mask from the point when I provided one.

The guest claimed he was not wearing a face mask when boarding, even though I recall seeing him wear one. The guest maybe should have an extra reminder the next time he flies regarding the policy. I'm not sure that any action on this is necessary, as he complied.

### Narrative: 1

We were boarding the flight, I was the B Flight Attendant (FA). I went to first class to talk to the A FA and she was talking to the passenger in X6. She asked the man how old his child was, he said 2 years and X months old. FA A informed him the child is required to wear a mask. The man then said the child was under 2. The issue now was the child under 2 was seated in [his own seat]. (The father had purchased a seat for the child), I recommended that we just move the father and child to the row behind them. The couple seated in Y 1 and 3 were the grandparents so the father and child switched seats with them.

I returned to the aft of the aircraft. I was later informed by FA A that the agents told her the child was over 2 years old. Throughout the flight I was in the first class cabin and the child never had a mask on. ALSO!! When I was doing my demo the grandmother who was seated in X6 did not have her nose covered. I asked her very kindly to cover her nose and she rolled her eyes and gave a big huff but did cover her nose. I was called to guard the flight deck door and she once again did not have her nose covered. I explained that she needed to cover her nose, once again she objected but complied. Only the First Officer (FO) used the lavatory and in that short time I had to ask her at least 4 times to cover her nose. She was so rude and resistant. I finally told her that I wouldn't stand guard if she didn't keep her mask on. The FO came out of the lavatory, I explained to the FO what was going on, the woman saw me talking to the FO and put her mask over her nose. FA A finally gave the father a warning. Other than the mom and Grandpa this family was seldom, the 2 year old Child never did wear a mask, in compliance with our Mask policy. The child was 2 years that is why the father purchased a seat. Both parents lied about the age of the child when they found out the child was required to wear a mask. Which then required us to move the child from X4.

### Narrative: 2

There's a family of four adults (parents and grandparents), a 2 year old and a baby. The 2 year old did not have his face mask on during boarding. I asked the father how old the child was. He said two and two months, I said that he had to have a mask on since he [was] over two.

At that time the father said that his son was under two years old. The father grabbed his son and put him on his lap. His son was wiggling and fussing on his lap and finally he fell on the floor and screamed because of pain. He calmed down quickly, and still was sitting on dad's lap. (Later, during the flight the parents found a bleeding scratch on their son's back head and asked for First Aid antiseptic wipes.)

The son looked like he was over 2 years old. I asked the father what was the exact age of his son. He said that [he was] under Two. I had to call CSA and asked her to find out the exact age of the child. She found out that the child was over two years old. At that time I told the father that his son was not an infant, and he had to take his own seat and wear his face mask. The whole family were not happy with that, all the family members claimed

the child was under two years old. Mother worried that they had purchased a seat for him and her son had to be on dad's lap. The father attempted to put a face mask on his son and he said that he would do his best to keep a face mask on during the flight. The family swapped seats.

CSA came on board and asked if I wanted to remove the child from the flight. The father confirmed he would take all possible attempts to keep a face mask on his son. My decision was to keep the family on board.

After 10,000 feet when I was taking the orders I saw that the boy did not have a mask on. I started talking to the father and he became not cooperative and talked to me in a rude manner. He said that his son was drinking water. I reminded him that the mask must be on when not actively eating or drinking. The father responded to me that I had to stay away from them, keep social distance (I did!), do not ask them any questions and do not offer them anything. At that time he actually was trying to make his son drink the water from the bottle in front of me.

During the flight I was monitoring the child's compliance. He was watching his iPad and was not wearing a mask. I gave a warning to the father.

During the rest of the flight the boy was not compliant. Parents put a bag of crackers in front of him to pretend he was actively eating.

During the flight, with no mask on, they went to the lavatory in the aft (the forward lavatory was not operable). When they were coming back from the lavatory through the main cabin I was picking up trash and showed the father with my hands that mask must be on the child. The father ignored my request and just told me not to touch them.

I talked to the Captain, explained the situation with the family who were not compliant and tried to hide the age of their child, and asked for a CSA to meet the flight in ZZZ.

During demo and at cruising FA B had to ask grandmother to cover her nose many times.

The grandmother was rolling her eyes when asked to cover her nose before we could let the pilots take a break.

CSA met the flight in ZZZ and I reported the fact of hiding the child's age and the compliance issue to her.

## Synopsis

Flight Attendant crew reported a family did not comply with face mask policy.

## Narrative: 1

Passenger X in XX4 was non-compliant wearing his mask and following COVID-19 company/CDC mask policies. During boarding for the Passenger X was the last passenger to board. He came on with a mask in his hand. I was the A Flight Attendant (FA) and informed him of the mask requirement. I told him, "The mask must be on for boarding and

remain on the entire flight covering your nose and mouth." He put his paper mask on and asked where his seat was since he couldn't remember. I looked up his seat number and it was XX4. After he sat down he took his mask off again according to the aft flight attendants. FA1 and FA2 both instructed him to put his mask on covering his nose and mouth. He complied when asked, but then removed it again during walk through before takeoff. FA1 came forward and told me about taking his mask off again. He said he lost his mask so she brought him a new one from our kit and he put it on. After takeoff during service he again had his mask off. The aft flight attendants again told him he must cover his nose and mouth.

After discussing his non-compliance repeatedly with the COVID-19 mask policy we decided the next time he had it off we would issue a final warning. About an hour before landing in ZZZ a couple [of] passengers came forward to complain about a man not wearing his mask at all. I went back to talk to him and it was Passenger X in XX4 again. He was making those around him uncomfortable and they said he would take the mask off as soon as the flight attendants would walk away. I issued him a warning and explained to him that this was his final warning about not wearing his mask. He said he lost his mask again. I went and got him a new mask out of the flight attendant kit and explained again that it must cover his nose and mouth. I instructed him to read the policy and that if he violated the mask policy again he would be reported and banned from flying on our airline. He put on his new mask and acknowledged that he understood. During final descent as I was sitting in my jumpseat and Passenger X leaned in the aisle and removed his mask. During taxi to the gate he stood up and started walking. I got on the PA and said "Please, remain in your seat with seatbelts fastened with masks covering nose and mouth." He sat down but did not put his mask on. Passengers around him were shaking their heads.

We didn't call to the gate for him to be met because we were almost there. When we reached the gate I informed the Customer Service Agent (CSA) about the situation. The CSA asked if we wanted the police, but we decided that since we were ready to deplane it wouldn't help. The Captain pointed Passenger X out as he was deplaning with no mask. He said that Passenger X was the same passenger that was an issue on his previous flight for not wearing a mask. As Passenger X passed me during deplaning I explained that since he was not compliant to COVID-19 policies and our mask mandate he was getting reported as I warned he would during the flight. He just laughed and kept walking. He violated our COVID-19 mask policies repeatedly even with several warnings.

## Synopsis

Flight Attendant reported a passenger refused to adhere to face mask policy.

## Narrative: 1

During boarding, Flight Attendant X noticed passenger in XX4 not wearing her mask fully. He kindly informed her that her mask must completely cover her nose and mouth. She said it wasn't comfortable, that it kept slipping off her nose.

Flight Attendant X kindly offered her a new, more secure mask. She refused. Flight Attendant asked for a third time to cover her nose and mouth with either covering.

She told him that she was fine, and to leave her alone. Flight Attendant X told me about the situation. I told the Captain. He, as most Captains agree: If someone doesn't listen to these rules, they probably won't observe other rules.

The gate agent spoke to the passenger twice. Then a Customer Service Supervisor met the aircraft to escort her off the plane. The passenger then proceeded to try to speak to the Captain whilst passing through to the jet bridge. The Captain continued to support us, stating that she disrespected the crew.

As she was trying to reason with our Captain, it was past departure time.

The Customer Service Supervisor asked her 3 times to leave the plane. He reminded her that he asked her three times to deplane. She finally did, without further incident, but she caused a delay.

Arrived at aircraft on Gate X to find both center tank pumps in the ON position (GND PWR connected and fuel in the center tank) while the four main tank fuel pump switches were all positioned OFF. Called ZZZ on radio to attempt to ascertain who did this...aircraft

supposedly came out of hangar, but not sure who moved it. The rest of the switches on the overhead were in a combination of terminating checklist positions and not.

The hydraulic A quantity value was also 106% requiring a logbook entry and fix before departure. Is COVID to blame for all of this?

## Synopsis

Air Carrier Captain reported the aircraft arrived from the maintenance hangar with switches and fueling in nonstandard conditions.

## Narrative: 1

There have been 2 incidents in the last week with Maintenance and personnel that affect the security and safety of the Tower and how we are able to do our job.

Most critically, at time/date, the ASOS [Automated Surface Observing System] Display Screen (OID) [Operator Interface Device] alarmed and went blank. The ASOS OID is how the Tower gets real time weather information, SPECI's and METARs as well as how we coordinate/disseminate Tower Visibility when needed. It is how we are notified if the

weather goes below VFR minima (or returns to VFR) and of course how we know to update or change the ATIS due to changes in the weather. The ASOS OID alerts us to the changes that require notification. So it is a critical part of doing our job and part of the safe use of the NAS.

Due to reduced staffing/COVID Crew Schedule, I had recently taken all positions to give my crew partner a break (after working approximately 1.5 hrs). So I was working GC/LC and CIC/OS which increased the complexity, while the traffic was still light. I spent some time trying to reset the equipment (ASOS computer/OID) then turned it off and on and tried to reset again with no results. Then I called the Contract Weather Observer's (CWO) Office to see if their OID was affected by this or working properly and to ask them to notify the Tower of any changes to the weather (fax the METAR and SPECI's) - there was no answer. In between working the radios, I called SOC [Service Operations Center] to let them know the ASOS OID was out and to ask if they could contact the Maintenance, since it was not FAA equipment (just looking for some help since unable to get a hold of CWO). SOC said they would check and get back to me. Tried CWO office again, no answer. SOC called and stated that the coordination point for ASOS outages was FSS, also advised that the dial up to the ASOS was also not working (so at least I could conclude it likely wasn't just my display). I knew this was wrong - FSS does not handle notification for the ASOS being OTS, but I made the call to FSS anyway since SOC was so insistent. They were also confused by this.

I tried CWO office again and finally got an answer from name, the primary CWO. I told him that our ASOS OID was blank and would not reset and asked if his was also out. He said of course it is out, Maintenance is working on the ASOS. I then said, ok you will need to fax us the METAR and any Specials. He said, I always do when maintenance works on the equipment. I said I understand but we did not know that they were working on the equipment, it just went dead and I had no idea. His response was, well there had not been any changes to the weather, if the weather had changed then I would have called you! This made me very upset, because he had no clear understanding of how important the equipment was and I had to spend a lot of time and attention troubleshooting something that I should have already been notified about! I said to the CWO, that their communication was not good with this, all they had to do was call the Tower (they have the number and call us regularly if issues arise) and let us know that the equipment was being taken out for maintenance. He then started arguing about that saying he didn't need to do that, we just needed to call him to ask. Which by the way I did, but he did not answer his phone! I had to go to talk on the radio, then came back and told him I would notify as needed. I called FSS and asked them to issue a NOTAM.

Then it turns out that the CWO had to call every hour at about 53 [past the hour] and get the current wind and altimeter from the Tower (also he did not correctly convert the magnetic wind readings we gave him to true wind for the METAR). He did also give us the hourly METAR in this phone call.

Also earlier in the week the ASOS Maintenance person from the NWS [National Weather Service], just showed up at the secure door to the tower with no coordination or notification, asking the Tower to buzz him in because he had to work on the ASOS now. He had gotten an access key to the bottom secure door and the tech ops equipment room, from tech ops that morning. Tech ops had not notified us of this at all and the NWS Maintenance person had not let anyone know (including tech ops) that he would need to go into the tower cab to do some of his maintenance work. He just surprised the Tower personnel by turning up at a secure door in our stairwell asking to be let in. The CIC did the correct thing and said no, I need approval and then coordinated with the ATM. the

NWS/ASOS Maintenance specialist was put out that he was expected to check in at the Tower offices and get approval to work in the Tower cab, even though that was told to NWS personnel previously. He was badged and escorted by FAA personnel.

While the ASOS is clearly the NWS's equipment, that does not mean they have no responsibility to notify the FAA so that pertinent personnel can be notified and a NOTAM can be issued. There are safety reasons we have this equipment and use this equipment and there have to be standards that all contractors are made to comply with so that we can continue to serve the users safely. The CWO is not interested or willing to work professionally with the Tower. If the contractor doing the weather is unwilling or unable to recognize the safety critical aspects of his job and comply with critical notifications and coordinations, then maybe the best answer is for the Tower to become certified weather observers and take the weather during the hours the Tower is operational. That is the way it was done for years and it worked very smoothly and safely. Meanwhile under the current CWO, there needs to be an LOA with the CWO/NWS that outlines required notifications and processes for handling outages (not sure that calling us every hour at a specific time to read us the METAR is the most efficient thing - I would suggest faxing it to us is less distracting) as well as dissemination of Tower Visibility, and notification of corrections to METARs (the ASOS OID will alert if a SPECI or METAR is issued but does NOT alert if an observation is corrected - so we have no way to know).

## Narrative: 1

Upon arrival in ZZZ on Flight AB, fleet wanted to immediately board the aircraft without regard to social distancing. I at 1st asked them to wait and then motioned them on once there was an appropriate gap that allowed proper social distancing. Fleet wrote this up as they want to board immediately. My Supervisor sent me information advising that they need to get on immediately. This does not address the safety of our employees and guests by maintaining appropriate social distancing.

## Narrative: 1

While enroute from ZZZ to ZZZ1 and approximately 10 nm west of ZZZ2, ZZZ Center called to confirm that we were level at our assigned altitude of FL370. The autopilot and profile were engaged, but we were climbing through FL375. We disengaged the autopilot, descended back down to FL370, and reengaged the autopilot and profile. I think we reached ~ 750 high before descending.

I did not notice the aircraft start a climb.

Do not become complacent in level cruise with the autopilot engaged.

## Narrative: 2

In cruise at FL370, approximately 10 NM west of ZZZ2, approaching ZZZ2, I had been cleaning the glass of all the displays, including the altitude window on the FCP. ZZZ Center asked us to "confirm FL370," which prompted me to look at the altimeter and I discovered we were in a climb passing 37,500 feet. I disconnected the autopilot and forced the plane back down to FL370, reconnected the auto pilot, re-initiated our altitude in the FMS, and reported FL370 to ZZZ Center. Center said nothing to us again until they commanded a frequency change.

In the act of cleaning the altitude window I must have rotated the altitude select dial to a higher altitude, and the airplane being in profile did what I told it to do, which was climb.

Don't mess around on the FCP without monitoring the airplane flight path.

## Synopsis

Air carrier flight crew reported that while cleaning the cockpit displays, the altitude selector was inadvertently changed resulting in an altitude deviation.

## Narrative: 1

Due to the lack of equipment for out of service equipment (tractors) and the remote parking of supertugs, crews getting from the terminal to the other side of taxi lane [X] to man equipment is proving difficult. As well as the remote parking finding equipment and doing multiple user checks is proving a challenge causing both Dispatch and the Supervisor to ask for multiple updates on status causing an unnecessary sense of urgency. This is even after a move team employee reports looking for equipment/user check/ etc., and you will advise ready or enroute.

This combined with COVID restrictions in place is causing crews to use equipment previously driven by the others. Not only are we having to perform a 2nd, 3rd and sometimes a fourth user check we are also being forced to sanitize the equipment again due to possible cross contamination.

While obtaining a vehicle for transit back to the terminal I checked the user log. The piece of equipment I used to transit had no user check performed for several days. I have witnessed it used on multiple occasions to support moves.

## Synopsis

Ground employee reported that it is difficult to get from one area to another because of out of service equipment and the equipment that is usable is not cleaned correctly.

## Narrative: 1

I departed ZZZ in VMC and climbed runway heading to approximately 600 feet AGL and turned to heading 213 and then activated my autopilot to maintain that heading and climb to 2,000 feet and level per my IFR clearance. Shortly afterward I instantly lost my MFD [Multi-Function Display], #2 Radio, Autopilot and Transponder and could not receive and believed I could not broadcast on my remaining number one radio. Transponder was gone. I was concerned for the safety of the flight and in my mind declared an emergency. I wanted to remain in power of gliding distance from the airport if at all possible. I did a very thorough scan for traffic and turned for the closest downwind leg for Runway XY that I had just departed. I had to cross the approach path for Runway Y to accomplish this...about 10 seconds after turning downwind I spotted a jet descending for Runway Y. I chose to climb abruptly for 3 reasons.

1. To slow myself down.

2. To make myself more visible.
3. To create much needed separation between the two aircraft.

After I felt I had created sufficient vertical separation I slowed the plane down and configured the aircraft for landing Runway XY, ZZZ. On short final I spotted a solid green from the Tower and went ahead and landed safely.

Subsequently from speaking to the pilot of the jet I learned he was instructed to go-around and my crossing Runway Y's approach corridor in front of him impeded his ability to do so.

I contacted a Tower Controller, to debrief the incident and he informed me that I should have circled on the downwind leg of Runway XY and looked for a solid green before approaching for landing.

The runway was a ghost town at the time because of COVID and I had waited for nearly 15 minutes for takeoff with only one other airplane departing during that time frame.

In hind sight - I had a working hand held radio on board and a perfectly running airplane but I was worried that whatever electrical problems I was having might kill my engine, so I took the most expedient course to get my airplane on the ground safely. I had my eyes peeled for other traffic the entire time. Other than the few moment I spent trying to trouble shoot.

## Synopsis

GA pilot reported losing multiple systems and equipment during departure and opting for an immediate return to the departure airport.

## Narrative: 1

The Captain of the plane didn't wear a mask in the cabin. He walked to the back of the plane prior to boarding without a mask. As boarding began I witnessed him greet passengers while standing in the galley next to the A Flight Attendant without a mask. We need someone to have a serious talk with the pilots about keeping us all safe and wear masks.

## Narrative: 1

Passenger boarded with mask not covering nose. A FA asked her to put it over her nose and she wouldn't comply. I approached her and reminded her that the mask is now required even though she claimed a medical exemption. I also reminded her that she agreed to our mask policy when she checked in. It had been under her chin and she moved it up over her mouth but left nose exposed. She then claimed our policy was over the top and I let her know that all major airlines had the same policy. Operations agent was informed of all of this but the woman was now wearing the mask properly, so she was allowed to stay. During the flight the woman was observed many times with the mask under her nose. The decision was made to have a Supervisor meet the flight in ZZZ. The Captain was notified, but failed to call for a Supervisor. This passenger's behavior was also intimidating towards crew members and refused to adhere to safety requirements.

## Synopsis

Flight Attendant reported a passenger was non-compliant with face mask policy.

## Narrative: 1

In flight between ZZZZ-ZZZZ1, we received an ACARS message from Duty Pilot stating that there was going to be an issue with my duty time compliance. I called scheduling and Duty Pilot. He explained that the X foreign government had moved our departure slot time out of ZZZZ1 later by 90 minutes, and this would not allow me to return to ZZZZ to start my scheduled duty time compliance in time to be legal. Duty Pilot, advised me that the Operations was involved and in contact with the FAA and all were working on a solution. After about an hour I received a call back. They looked at moving the airplane to ZZZZ2 or deplaning the crew to go into rest. Both of these requests were denied by the foreign country. I was advised by Duty Pilot, that we as a crew did nothing wrong and were legal to operate ZZZZ-ZZZZ1 at the time of departure. He said my only option was to continue the flight back to ZZZZ and file a report. The return leg was uneventful and I entered my rest period less than 1 hour later than what was legal.

In doing a 7 day look back, crew scheduling had ample opportunity to better schedule my previous duty time compliance, so that a 90 minute delay would not have caused this issue. In our defense, we were not able to convince the foreign government to file a flight plan to ZZZZ2 and due to the COVID-19 pandemic, the crew was not allowed to get off the aircraft in ZZZZ1.

## Narrative: 1

After signing-in, I completed my self-brief. From the verbal briefings I received from the outgoing dispatchers, I remembered hearing that ZZZ Center would be ATC Zero for COVID cleaning. During my self-brief I saw ATC messages, and information in the written brief regarding the ATC Zero status for ZZZ Center. Because I knew my red-eye Flight ABCD, would not be affected by the ZZZ Center closure, I skimmed the messages, information in the briefing regarding the closure, and reroutes page, and did not notice that ZZZ1 Center was also going to be closed for a COVID cleaning tonight. I planned the flight on a normal routing which traversed ZZZ1 Center. Approximately 30 minutes before departure, I realized that I had missed the fact that ZZZ1 Center was also going to be closed for COVID cleaning during the time in which my flight would traverse it. I asked the crew if they received their clearance yet. They did. I asked the Captain to call me so we could talk over the details of fuel/route. I called ATC to cancel the current filing, as well as called ZZZ airport station to send out the fueller to add more fuel to the aircraft. I computed a new route in SABRE that would avoid ZZZ1 Center, and re-released/refiled the

flight to avoid ZZZ1 Center. I asked the crew to confirm the new routing with ATC. When ATC re-issued the clearance, they changed the departure routing. After confirming the new ATC route with the crew, I re-released the flight again. The flight departed 6 minutes late.

Expectation bias was a factor in me missing the ZZZ1 Center closure when originally planning the flight. Because I had remembered hearing about the ZZZ Center closure during turnover, I expected the messages and briefing information relating to ATC COVID cleaning to only contain information regarding the ZZZ Center closure. As I skimmed the messages, I expected ZZZ1 Center to read [as] ZZZ Center in the messages regarding the closures, and disregarded the messages too quickly, because I knew the ZZZ Center closure didn't affect my flight. Because I disregarded the messages, expecting it not to apply to my flight, I missed the fact that ZZZ1 Center was also impacted by the COVID cleanings, and that my flight would be need to be routed around ZZZ1 Center.

## Synopsis

Dispatcher reported not properly planning for a Center to be ATC Zero for COVID cleaning.

## Narrative: 1

Cockpit notified during pushback of a passenger who was verbally abusive to one of the flight attendants along with refusing to wear her mask. Passenger was loud and abusive and appeared to be heavily intoxicated. Captain elected to have the aircraft towed to the gate. Passenger service along with a Supervisor met the aircraft. Offending passenger was deplaned along with her traveling companion without incident. Airport police were not requested. Flight departed for ZZZ 20 minutes later uneventfully.

## Synopsis

Air carrier Captain reported that after pushback the aircraft was towed back to the gate to remove a passenger who was verbally abusive and refused to wear a face mask.

## Narrative: 1

During our cockpit set up prior to the flight, I noticed at least 11 different--but seemingly related--aircraft maintenance status messages on the aircraft Status page, which is sometimes encountered as the aircraft "boots up" after power-up. The aircraft had very recently arrived at the gate. As a crew, we were made aware that the aircraft was late inbound and that we had [to] be subsequently scheduled to depart 15 minutes later than scheduled. We had typical distractions prior to departure, which affected and interrupted our cockpit setup, such as COVID-19 wipe-down of aircraft cockpit, Flight Attendant interaction, passenger interaction and routine preflight discussions regarding possible departure runways and configurations. I also needed to leave the cockpit to conduct a walk-around inspection. After reentering the cockpit, other distractions like a very lengthy Dangerous Goods manifest and maintenance release verification took place. Finally, we briefed our departure and pushed back approximately 11 minutes later than scheduled. It was only after we departed and were climbing through approximately 27,000 feet that we discovered all 11 maintenance status messages still were present on the Status page. We quickly contacted Dispatch and Maintenance Control to disclose our issues. The aircraft had no issues whatsoever--no warning lights, no chimes, nothing. The EICAS did not indicate the word "STATUS". But, upon selecting the Status page, those status messages were still present.

## Synopsis

Air carrier First Officer reported that the aircraft had multiple maintenance status messages before departure which were inadvertently not cleared before departure due to a series of interruptions during pre-flight.

## Narrative: 1

ZZZ Class D Airspace has been operating on reduced hours since COVID-19 started. The airspace in the traffic pattern reverts to Class E once the Tower is closed and pilots make

announcements on the CTAF.

The traffic pattern was very busy at dusk as I was arriving back from ZZZ1. I was entering the pattern by flying over the field at 2,200 and then executing a teardrop entry into a 45 for left traffic Runway XX. There was Aircraft Y on Left Downwind for Runway XX as Aircraft Z approached directly from the east (in opposite traffic), at pattern altitude in what it described as a "wide entry" to join the 45 for left downwind. This entry was not wide as Aircraft Y reported that Aircraft Z had almost collided with it in the traffic pattern and reprimanded the pilot for his choice of pattern entry procedure. I was forced to abort my tear drop entry as Aircraft Z proceeded directly for my location. I executed a 360 degree holding turn and observed Aircraft Z pass approximately 800 feet below me. I sequenced in behind Aircraft Z and maintained visual contact. I extended my left downwind slightly for spacing when I observed Aircraft A transiting the airspace, NORDO, at 2,300 feet - this was the altitude I was previously at and the altitude which I had crossed midfield. While this aircraft didn't have to make any announcements, it is reckless to transit a busy airport, slightly above its traffic pattern, while NORDO. Immediately afterwards, while I was turning left base for Runway XX, an aircraft announced that it was entering "Right traffic" for Runway XX. While we are used to flying right traffic when the Tower is open, this is not the prescribed procedure while on CTAF and can create a very dangerous situation. Aircraft B on the RNAV XX approach was forced to go missed given the situation in the traffic pattern.

This temporary reduction in Class D services has created hazards for pilots flying in this busy airspace, as traffic has picked up again to levels that warrant full-time Class D service hours. This entire situation could have been avoided had ZZZ's Control Tower been in normal, pre-COVID, operational hours.

## Synopsis

GA pilot reported reduced Tower services at a Class D airport due to COVID-19 has resulted in an unsafe environment and described several conflicts occurring while the Tower was closed.

## Narrative: 1

95% of passengers had masked removed as I came through the cabin to do trash pick up and food and beverage service. Passengers were talking and eating as I walked through cabin collecting their used trash and liquids. Several spoke to me asking for items without

their masks on.

Company safety guidelines not a priority when it comes to Flight Attendant safety. Impossible to enforce 6 foot distance and masks during food and beverage service even though numerous announcements regarding wearing mask while FA are in the aisle. Protect the front line employees during this COVID-19 pandemic. Risking employee lives over a beverage/food service contradicts safety guidelines.

## Synopsis

Flight Attendant reported the majority of passengers were not complying with face mask policy.

## Narrative: 1

We were told by customer service that passengers to be seated in row XX 1 and 3 would not keep masks on in the boarding area. They had lowered their masks and B FA spoke with them when doing exit row briefing. Later, I spoke with them and asked them to wear

them. The man said, "I don't agree with wearing masks." I reminded them that they agreed when checking in and that is policy. I also told them that it was necessary to protect others sitting around them. They complied, maybe because they slept much of the flight.

In addition, many people removed masks when ordering beverages and also when eating and/or drinking. Frequent requests to wear masks except when eating and drinking occurred throughout flight by all FAs. It is stressful and feels very unsafe for FAs and passengers located nearby. I believe my safety is compromised when masks are removed and we must go to passenger seat to remind them.

## Synopsis

Flight Attendant reported multiple passengers did not comply with face mask policy.

## Narrative: 1

I was the Captain for Flight ABCD. We had a Gate Return incident due to 4 passengers that were disruptive, rude to the FA and would not comply with the ZZZ Airport Mask Policy or the airline Mask Policy. After boarding, the four passengers, seated in seats XX1/2 and XY1/2, intermittently refused to wear their face masks, that is, they would play games and pull their masks off when the FA was away, and then they would put the masks on when the FA would return near them. I was advised of this, and I noted it. I had already made my "welcome aboard" speech, in person as always, in the main cabin, to the passengers and had thanked everyone for "complying with the Mask Policy," so everyone knew the expected "standard" of behavior and compliance. After we pushed back from gate X, and were halfway to the taxi spot, when I received a call from the FA. She told me the 4 passengers were once again "playing games" and claiming they did not intend to wear their masks. I made a PA announcement stating that if the passengers did not comply and wear the face masks we would be obligated to return to the gate and deplane the offending passengers. After my PA announcement, the rear FA told me the 4 offending passengers had stated they "would comply."

We continued to taxi to Runway XXR, but just short of XXR/L, I was called again by the FA indicating the 4 passengers were not wearing their masks and were harassing her and being rude to her, calling her names, and asking why was she [was] bothering them over a simple "mask issue." I stopped the plane, had the FO call Ground and OPS in ZZZ to coordinate a Gate Return, and we were given taxi instructions to return to gate X. I also asked the Ground and OPS personnel to call the ZZZ Airport Police and have the Police and a customer service team meet my plane at gate X. After taxiing back to gate X and shutting down the engines and completing the checklists, I asked the passengers to remain in their seats while we waited on the customer service and Police team to arrive. The senior customer service manager asked me and the FAs if the situation could be "de-escalated or downgraded," and I told him this was a flight safety issue, and with the show of regulatory non-compliance, plus the verbal harassment and abuse of my aft cabin FA, I did not want those 4 passengers to remain aboard or continue on the flight, as they were probably going to continue their abuse of the FA as well as their non-compliant attitude.

I asked for the 4 passengers to be escorted off the flight, and once they were removed from the cabin, the whole remaining passenger load broke into applause for me and the crew. I apologized that we would have a delay on the flight, as we now needed to get fuel and a new release. All this was coordinated with Operations and Ramp Tower. Once we were fueled up and re-released, we proceeded to execute our assigned flight to ZZZ1 without any further incident, and in a safe manner. The FA that had been harassed and verbally abused was visibly shaken by the incident. After arriving at the ZZZ1 airport and shutting down at the gate, the passengers once again broke into applause for our crew, and as I said "good night" to them at the front of the cabin during the passenger deplanement, many of them once again thanked the crew, and me personally as the Captain, for showing such leadership and desire to protect their health and safety. Unfortunately, our arrival into ZZZ1 had been delayed about 2 hours, due to the return to gate and getting refueled for the second flight, but not one passenger complained about being late, rather they expressed thanks at our concern for their safety.

Cause: Because the four passengers seated in seats XX1/2 and XY1/2 did not want to comply with the Mask Policy and refused to wear their face masks properly, in addition to being verbally abusive and offensive to our aft Flight Attendant.

I firmly believe that we need to emphasize to our pilots, and especially our Captains, that they "are in charge" and we expect them to make the tough decisions, even if it's inconvenient or will cut into your hotel rest time. Our passengers expect no less, and our

FAs deserve no less. Flying is not about just "operating the plane" it also implies using your common sense and judgment and maturity to deal with incidents and situations that need to be dealt with, harshly at times, to prevent or avoid an unsafe situation later. I have been a pilot for over XX years, XY of those years as a Captain, and sometimes I wonder if we are still teaching our younger crews not just how to fly the nice TV screens, but how to make decisions. The FA related several prior events where young captains were not completely sure of what to do with passenger misbehavior, or if their potential action might "upset the customer." I humbly suggest that keeping the Captain firmly in charge, trained to expand his/her team by reaching outside his circle as necessary, and empowered to take whatever decisions are necessary to have a safe flight is highly important, even in this new world of highly advanced automation.

## Synopsis

Air carrier Captain reported returning to the gate to remove four passengers who were disruptive and refusing to comply with face mask policy.

## Narrative: 1

On the ZZZ5 departure as we were climbing out ATC asked us to climb to 5,000 feet, as we were leveling off, ATC asked if we had traffic at our 1 to 2 o'clock small aircraft in sight, we replied "Yes we have it in sight." As we were leveling off at 5,000, the aircraft responded with an RA, the instructions per the RA were to reduce the rate of climb. We complied and leveled off at 5,000 feet at which point we were eventually clear of conflict. We were switched over to another frequency to continue our flight. No further action was taken as a result of the RA.

Rate of climb was higher than normal due to a light aircraft weight.

## Synopsis

Air carrier Captain reported an airborne conflict with a VFR aircraft. The Captain stated their climb rate was higher than usual due to aircraft being lighter in weight.

## Narrative: 1

Artificial fragrances being pumped out of the vents at the airport are toxic, contain phthalates, can cause respiratory irritations and are known to cause cancer as well as many other issues. Everyone in the airport has to wear a face covering, and it comes with a challenge to breathe out of a face covering while wearing it all day, every day. What is the use of a false fragrance? It's irritating to employees and can cause headaches as well. We are currently being exposed to cleaning chemicals ...we do not need any additional irritants in the air for cosmetic purposes.

## Synopsis

Customer Service Representative reported that the airport is pumping artificial fragrances that are irritating and can cause headaches.

## Narrative: 1

Prior to starting our two day pairing we completed our briefing as a crew and as PIC I asked all crew members if they felt they were fit for duty. All crewmembers ascertained that they were. On the second day of our pairing we as a crew made sure that we were fit for duty. Unbeknownst to me at the time, our Flight Attendant was disguising and working through some illness. I later discovered (following our trip) that she informed the [other] Flight Attendant of back pain, weakness, headaches, and nausea. She did not make these conditions known to me or the First Officer and continued working throughout the two day pairing. Following our trip I personally came down with chest congestion and a cough. The day after my trip I was notified by the Flight Attendant that she tested positive for COVID-19. I asked if the FA contacted the company and told her to feel better. I was off duty, but felt obligated to inform my First Officer and other Flight Attendant. According to the FA, she saw a doctor before the trip because she was feeling ill, but she was misdiagnosed with a sinus infection. Yet, she still flew with the supposed sinus infection, which turned out to be COVID-19.

Lack of communication and transparency from the FA about her preexisting health condition led to the compromised safety of passengers and fellow flight crew.

If unfit for duty, do not show up for work and compromise the health of aircrew/passengers/partners by disregarding the safety protocols and applicable FAR's that outline crew-member responsibilities.

## Synopsis

Air carrier Captain reported becoming ill after working on a trip with a sick Flight Attendant who did not inform all crew members that she was feeling sick and then later tested positive for COVID-19.

## Narrative: 1

We were given takeoff clearance including climb to 7,000 and not including "RNAV (first fix)." I am accustomed to hearing "Cleared for takeoff RNAV (first fix)" at other airports with RNAV departures. I perceived the instruction, and verified with the other pilot, that we were given "fly runway heading." On takeoff, we flew runway heading until questioned by Departure. Departure gave us multiple instructions, including turn to a heading, stop the climb at 6,000, navigate to the first fix, resume the SID, and climb to 7,000. The 6,000 level off instruction came as we were rapidly approaching that altitude (Departure assigned expedite climb through 5,000), and we ascended through it to about 6,400 before starting the descent back to 6,000. This is when we were given 7,000. Once out of sterile flight deck, we started debriefing the event, and were given an altitude higher than our assigned. The aircraft was downgraded from RVSM per MEL, but we climbed into RVSM airspace before noticing and then promptly requested a return to our filed altitude.

We expected the takeoff clearance to contain "RNAV (first fix)." Lacking that, we perceived the takeoff clearance to contain "fly runway heading," though it may not have. That caused confusion which led to rapidly changing ATC instructions, busting the level off, which may have been unavoidable based on the late instruction and good climb performance, and further distraction of debriefing leading to a climb to an altitude above the aircraft's MELed RVSM limitation.

RNAV departure clearances should either always or never contain "RNAV (first fix)." Being used to hearing that, we perceived the lack of that instruction to mean fly runway heading.

## Narrative: 2

Arrived at assigned report time. Cabin fogging for COVID was not completed in time, we had to leave the plane and did not gain access to the flight deck until about 20 minutes to departure. Plane was short approximately 1,000 pounds, CA was busy in back, I called ops but no answer, so I had to go out to the ramp to find operations, PDC was not received so I sent a message code. While I built the flight plan, got weather. I noticed at about 15 minutes to departure we still did not have our PDC. I called clearance but had to wait,

once we contacted we received a clearance different from the release. Received and read back. We pushed on time, so I asked the CA if we could go over the route one more time before we taxied. Which we did. When we were cleared to take off on [Runway] XXR. The Tower did not give us RNAV takeoff instructions, I thought I heard runway heading. During initial climb the Tower told us to expedite climb to 5,000 feet, so I bugged 200 knots. We did the climb sequence and after TO check and were handed to departure. Departure asked were we going to turn south, we responded runway heading. She immediately told us to turn south direct ZZZZZ and climb to 6,000 feet, we were already at 5,500 feet expecting to level at 7,000 feet for the SID. We did not have time to level at 6,000 and leveled about 6,500 feet then Departure told us to climb to 7,000. ATC very busy. Additionally, we accepted an altitude in RVSM airspace, but were MEL no RVSM. We realized at the assigned altitude that we needed to be below RVSM airspace. We immediately requested our filed altitude of 27,000...we did receive any altitudes in our clearance.

We received fuel late, clearance late, cabin sanitizing late this forced me to compress many preflight steps into an inadequate time. I should have asked for more time to prepare and realized being late was less important than properly performing my preflight duties.

We need adequate time for COVID cleaning, I work very hard at being prepared, methodical and thorough in my duties as a FO. Recognizing that things are being rushed is very important and I need to do a better job of identifying those times.

## Synopsis

Air carrier flight crew reported track heading and altitude deviations during departure and cited confusing ATC instructions as a contributing factor.

## Narrative: 1

While descending into ZZZ on the ZZZZZZ STAR Landing North, unknown to me, the First Officer (PF) had gone to the PROG page of the FMC and typed in ZZZXXR on the UPDATE Selection line on the left side of the screen and selected it. He then called my attention for verification and I looked across and saw ZZZXXR on the right side of his FMC screen with an asterisk beside it. Although I do not normally put in the runway for a more accurate distance to the runway, it is commonly done by crew members that I work with. I am however not used to seeing an asterisk. Without knowing what typing had been done previously, I told him it was okay to select it. The FMC I believe then updated our position to ZZZXXR and all required points for the arrival were lost. I informed ZZZ Center that we had navigation degradation and requested vectors to ZZZ. We were given vectors and altitudes for the visual to Runway XXR and landed without further issues.

Cause -

- 1) It was the second leg of an a.m. out and back.
- 2) The PF had not flown as PF for quite some time and actually had picked up this trip to retain currency.
- 3) The PF made changes in the FMC without first alerting me.
- 4) I incorrectly verified that it was okay to make the selection, not knowing what entries had been made previously.
- 5) The entry of ZZZXXR should have been made on the line above where it was located with the asterisk.

Suggestions -

- 1) The PM should make all FMC entries when not in straight and level flight.
- 2) Both crew members should be aware of all FMC changes.
- 3) The runway entry is to be over top of the destination entry only.
- 4) With my being unsure about the reason for the asterisk, I should have told the PF to abandon the idea of putting in data for runway distance and leave the page.

## Narrative: 2

While descending into ZZZ on the ZZZZZ2 STAR Landing North, I went to the PROG page of the FMC and typed in ZZZXXR on the UPDATE Selection line on the left side of the screen and selected it. As soon as I selected the incorrect LSK, I asked the Captain to take a look at the FMS, however I didn't clearly explain what I'd pressed to get there. He saw ZZZXXR on the right side of his FMS screen with an asterisk beside it. We attempted to clear it, and enter ZZZXXR to place over the destination waypoint (ZZZ) at the correct LSK, however the command was not valid. I asked if I should just press the LSK (Line Select Key) with the ZZZXXR and star next to it and we agreed that should clear it. Upon activating that LSK, I believe the FMC then updated our position to ZZZXXR and all the arrival points were behind us. We got a master caution and a message on the ECAM and I disconnected the autopilot and auto-throttles and continued on heading and speed for the descent. The Captain informed ZZZ Center that we had navigation degradation and requested vectors to final for XXR. We were given vectors and altitudes for the visual to Runway XXR and landed via the visual backed up by the ILS.

Cause -

- 1) I had not flown as PF in the aircraft since June and had picked up this trip to retain currency.
- 2) I mistakenly entered the ZZZXXR waypoint under the wrong LSK.
- 3) I pressed the incorrect LSK and entered the data from the scratch-pad without confirmation from my PM and poorly communicated the nature of my error to the Captain.
- 4) We were unable to clear the entry through any means on the PROG page.
- 5) We falsely concluded that pressing the LSK with the star was our only recourse.
- 6) Noting we had begun the descent, I should have asked the PM to accomplish this task and focus on my PF duties.

Suggestions -

- 1) The PM should make all FMS inputs when not straight and level.
- 2) Both crew members should be aware of all FMS entries to include the scratch pad.
- 3) I continued to review FOM/FM/FTM during the several months on reserve while out of the cockpit and was primarily concerned with my proficiency at landing. I should have gone to the training center to brush up on my FMS proficiency in addition to knowledge review.
- 4) I should have been more aggressive about maintaining flying proficiency, and have learned of more options that will allow me to do so in the future.

## Synopsis

Air carrier flight crew reported an entry error while loading the STAR into the FMC/FMS.

## Narrative: 1

This was day one of resuming training for both myself as instructor, and for the trainee, since the COVID-19 schedule began. The radar positions were previously de-combined, but were combined up just before beginning training. Shortly after, traffic and complexity increased rapidly. As it was getting more difficult to complete a timely and accurate scan, Aircraft X was descending on a vector to the airport, and was on a converging course with an un-identified VFR tag at 7,500 feet indicated. Before realizing this conflict, Aircraft X reported traffic up ahead. The trainee issued traffic and a heading away, but not a traffic alert. Aircraft X then informed us he was executing a TCAS RA, at which point we issued a traffic alert and to advise when complete. He finished the RA, and continued on vectors to the airport.

Traffic throughout the airspace has increased to a point in which multiple positions should have been used, both identified, controlled traffic, as well as VFR traffic saturating the airspace. In addition to the traffic factors, the Supervisor position had just been switched over to a Controller, so the Controller in charge of the TRACON was fulfilling several duties at that time while the Supervisor was doing other duties. This led to a lack of overall awareness throughout the TRACON, with more traffic at hand than controllers and supervision present.

I recommend that supervisory personnel and controllers alike, myself included, be more vigilant of rapidly increasing traffic, and take action to de-combine positions in a more timely manner. I also suggest that it be noted to be more vigilant when it is the very first day back in a training environment, as controllers could be rusty in a training environment. It was also the first day back from X days off due to COVID-19, and these extending absences should be taken into account when managing workload for controllers. As an OJTI and Controller, I need to be more aware of these things, and be better prepared to handle any traffic presented, but this was a very difficult task to accomplish given all of the factors mentioned above, specifically workload, complexity, training, and overall saturation.

## Narrative: 2

On approach to ZZZ we were on vectors for a right downwind for Runway XXL at 10,000 feet. ATC issued us a descent clearance to 6,000 feet. The frequency was extremely saturated with aircraft and radio transmissions and it appeared as if ATC was training (there were two controllers working the frequency together). As my first officer was descending through about 9,000 feet I noticed an aircraft on our TCAS display that appeared to be climbing quickly towards us on a trajectory for our flight path. We began to shallow our descent and I queried ATC about the traffic. We received a TCAS TA "Traffic, Traffic." The Controller issued us a turn towards the east and told us to continue our descent to 6,000 feet. At this point we received a TCAS RA "Monitor Vertical Speed" and shallowed out descent to level. I told ATC about that we were responding to a TCAS RA, and they asked us to report clear of conflict and resume the descent at that point.

ZZZ TRACON was extremely saturated with traffic while we were on approach and had a layer of broken clouds at about 4,000-6,500 feet. I think this was potentially a VFR aircraft at 7,500 feet that was not talking to TRACON. TRACON seemed unaware of their position relative to our flight path.

Good thing we have TCAS...ATC was completely unaware of this aircraft and continuously asked us to continue the descent even after we queried them about the traffic. We ignored them and followed the commands of the TCAS RA and avoided the conflict.

## Synopsis

TRACON Controller and air carrier Captain reported an airborne conflict situation between the Captain's commercial aircraft and an unknown VFR aircraft.

ACN: 1761957

## Narrative: 1

At cruise amber alert R forward window heat. Completed checklist. The outer window pane shattered. Called Dispatch and Maintenance. Diverted to ZZZ. Picked up another aircraft and continued to ZZZZ.

Cause: window heat failure.

## Narrative: 2

I was the Relief Pilot on break when I was asked to go to the cockpit by the A FA. He had received this request from the cockpit. The right front outer windshield pane was cracked/shattered. The Captain and First Officer coordinated with Dispatch and we continued to ZZZ where we landed on Runway XXR without incident. The passengers and crew disembarked the aircraft without incident and proceeded to an adjacent gate from which the flight to destination was continued.

Possible maintenance issue as the airplane was recently in storage (parked) at I believe ZZZ1.

Ensure aircraft storage is performed at a base where inclement weather - especially heavy rain - is unlikely to occur.

## Synopsis

Air carrier flight crew reported that an outer windshield pane shattered during cruise following a window heat failure.

## Narrative: 1

Momentarily exceeded flap speed for flaps one due to turbulent air in the area.

While descending and slowing shortly after a moderate turbulence event the flaps one speed was briefly exceeded.

Give more of an airspeed buffer in turbulent weather.

## Narrative: 2

FO was flying pilot. While descending into ZZZZ and deviating around convective activity, FO checked airspeed and called for flaps 1. Shortly thereafter, speed increased into the zipper. Maybe 5 knots but no more than 10.

FO had not flown in a long time, lacked confidence and called for flaps way too early in an effort to get down and slow down.

FO needs to fly more.

## Narrative: 3

We were slowing for arrival into ZZZZ. FO called for flaps 1. I verified airspeed and selected flaps 1. Immediately after flap selection we encountered moderate turbulence with strong up and down drafts. We had a momentary overspeed of approximately 3-5 knots. Duration was less than 5 seconds.

Overspeed was caused by a strong updraft.

I don't believe this could have been prevented.

## Synopsis

Air carrier flight crew reported turbulence and a flap overspeed. One crew member reported the flying pilot had not flown for an extended period of time.

## Narrative: 1

I continued to land after still stabilizing an unstable visual approach below 500 feet AGL.  
Causes - Complacency, poor descent planning, minimal currency (I haven't been flying much recently).

Lesson - Use multiple descent planning tools and techniques to improve vertical situational awareness and solidity feedback from other pilot on an approach.

## Synopsis

Air Carrier Captain reported an unstable approach due to poor CRM and lack of flying.

## Narrative: 1

I was the First Officer and PF ZZZ1-ZZZ. This was my first flight after not flying for over two months. The majority of the flight went fine, but as we approached ZZZ, ATC left us high (11,000 feet) very close to the airport. I was about to ask for lower when ATC gave us a descent. I thought we had just enough time to successfully descend and slow down, but when we were around 4,000 feet, ATC gave us a turn that made it clear they were directing us straight to the FAF. This was not what I was expecting, and left us high and fast and greatly increased our workload. I used the flight spoilers to slow down and then forgot to stow them after slowing enough to add flaps. Our workload was still quite high at this point, so we didn't realize the flight spoilers were still deployed until the spoiler caution message at 500 feet. At this point, the Captain immediately stowed them and we continued the landing.

Because ATC left us high and then turned us directly to the FAF, our workload greatly increased. I deployed the spoilers in order to slow down, and then forgot to stow them because I was distracted by other things in the flight deck (arming the approach, making sure we intercepted the localizer and glideslope, making sure we were on speed and deployed our flaps and gear at the appropriate time, etc.). I was expecting something different from ATC and had a good plan in my head, but was thrown off when ATC gave us something I didn't expect. This was also my first leg after not flying for over 2 months, which I think could have contributed as well, because I was a bit rusty and a little bit slower than I normally am in the flight deck.

We could have easily prevented this from happening by asking ATC for a longer downwind. I was planning a longer downwind in my head and when ATC gave us a turn directly to the FAF, we should have asked to stay on downwind instead. There wasn't anyone else out there to cause traffic issues, and it would have given us extra time to slow down and descend so that we weren't rushed. In the heat of the moment, I didn't think of this (though I used to remind my students of this option all the time when I was a flight instructor!), but I should have. When we stowed the spoilers, I decreased thrust and pitched down a little bit, which kept us on speed and caused only a slight deviation from the glideslope, which I was able to correct. Because of this, we made a completely normal landing. However, a go-around would also have been a good choice here, especially if we became unstable after retracting the spoilers.

## Synopsis

Air carrier First Officer reported an unstable approach and stated this was the first flight in 2 months.

## Narrative: 1

This flight was planned on a route that went through ZZZZ. In my pre-flight planning process, I checked the enroute NOTAMs by loading all the enroute FIR boundaries and then using "control-F" and searching the enroute NOTAMs for applicable airways. Today, there were no such hits when performing this NOTAM checking method. Unfortunately, there was a NOTAM for ZZZZ that had been issued just before I arrived for work:

...DUE TO COVID-19...ATS WILL NOT BE AVAILABLE. ATS CONTINGENCY PLAN (AIC A11/18) FOR ZZZZ1 FIR ACT.

The flight had been airborne for some time, but was still in ZZZZ2 airspace when the crew advised me that they were being re-routed out of ZZZZ airspace - the re-route was minimal and after considerable effort (due to non-existent or out-of-date info in AIR for ZZZZ and ZZZZ3) I was finally able to speak with ZZZZ3 ATC and obtain an expected route through their airspace, and then I was able to advise the crew of the routing.

The amount of en-route FIR boundary NOTAMs is daunting - impossible to read these for every international flight --- therefore using the "Control-F" to search for applicable airways allows the Dispatcher to quickly determine if there are any en-route implications to the flight. Of course, if there are no associated airways with a NOTAM as in the case of the situation affecting this flight, then pertinent closures can be missed. In addition, since the crews do not receive a copy of the FIR boundary NOTAMs, this scenario leaves the Dispatcher as the single point of failure.

Be smarter when it comes to FIR boundary NOTAMs. Utilize a resource like "SmartNotam" to weed through all the FIR boundary NOTAMs and then provide both the crew and the dispatcher a condensed list of applicable FIR boundary NOTAMs to read and decipher.

## Synopsis

Dispatcher reported the flight was re-routed because ATC was closed due to COVID-19.

## Narrative: 1

While we were instructed to join the Runway XXC localizer ZZZ, Approach Controller handed us over to Tower Frequency. As soon as we joined the localizer, flying conditions started to deteriorate and became turbulent. Airspeed was fluctuating at 1,400 feet AGL. As a result of this, I had started to get focused on stable approach criteria, and work load gradually increased for both pilots. Over emphasis on stable approach criteria caused a distraction and both PF and PM forgot to obtain the landing clearance. Aircraft landed without any further incidents exited the runway and hold short of XXL. Since we did not hear anything from the Tower, both pilots became aware of the event and switched to Tower Frequency. Flight was completed without further incidents.

Tunnel vision on stable approach parameters and Airspeed variations caused distraction. Since COVID-19 breakout, I was not flying as frequently as before. I believe this was factored into this incident.

Give some extra time to double check all the required tasks are completed. As we are not flying as frequently as before, configure the aircraft early and passing 500 feet AGL, both pilots verbally verify one last time "Cleared to Land."

## Synopsis

Air Carrier First Officer reported landing without a clearance and stated lack of flying was a contributing factor.

## Narrative: 1

I was conducting an initial Operating Experience with a First Officer (FO) who is new to the aircraft. As we started our takeoff roll the Flight Deck door swung open. A Flight Attendant immediately closed the door and it was indicating locked. I was positive I checked the Flight Deck door "OPEN" light during the After Start Checklist and it was out. I believe the door became unlocked during an electrical power transfer issue caused by me.

When I called for the After Start Checklist, I was momentarily distracted while watching the FO perform his flows. I neglected to turn on the engine generators at the beginning of the flow. When the FO turned off the APU, we momentarily lost power (I immediately caught the mistake right when he was turning off the APU). I believe this may have electrically unlocked the door.

Contributing factors:

Not much sleep the night before.

This was our first flight together.

I flew 2 days last week after not flying for 6 months.

It was right at dawn and I had the lights on dim just as the sun was starting to shine into the cockpit. I may have seen the blue Generator OFF BUS lights if the switch was on bright.

## Synopsis

Air carrier Check Airman reported not following the published checklist due to fatigue and not having flown in the last 6 months.

## Narrative: 1

I made a delayed turn from base to final approach while conducting the ILS XXR into ZZZ. The reason for the delayed turn was a momentary lapse in CRM skills. I was the flying pilot, my copilot was the monitoring pilot. We were on a base leg when the Controller gave us a turn towards the final approach. I remember dialing in the correct heading, but forgot to press heading select. About ten seconds or so elapsed before the Controller asked if we were turning. I realized my error and immediately pressed heading select. The Controller gave us a new heading and an approach clearance. We turned onto final with a slight overshoot and above the glide slope. We configured for landing and used vertical speed mode to intercept the glide slope from above. We were on speed and altitude well before the 1,500 foot gate. Other than the late turn and the high glide slope intercept, there was no other incident or error.

The fact is the I/we made an error by not following through with Verbalize Verify and Monitor. I know that we both verbalized the heading change, I recall we both Verified setting the heading, we both, however, forgot to monitor the FMAs for the change. I think that we realized the something wasn't right a split second before the controller queried us.

There were many threats preceding this error. This is an all-night flight with an early morning low visibility arrival. The airspace is quite congested and there were many aircraft with similar sounding call signs. We had a runway change while on the arrival and the Controller kept us little higher and gave us a turn a little earlier than we had expected. I had a scheduling change in the middle of this pairing which reduced my rest time a day before this leg. Do to the current global pandemic and the reduced airline schedules, neither of us had flown very much in the past six months. I know I felt a bit rusty and tired.

To mitigate this I gave what I thought was a good approach brief before top of descent, and we briefed the changed approach during the arrival. We still failed to monitor the FMA change at a crucial moment. It was an error I hope I/we don't repeat.

## Synopsis

Air Carrier Captain reported a track deviation during approach and cited fatigue and low flight time during the pandemic as contributing factors.

## Narrative: 1

On approach into ZZZ on ILS XR we had been asked to keep our speed up until the marker. We complied with the request. The weather was very gusty winds and both myself and the pilot flying communicated as to what the V-ref target speeds should be. Sometime before 1000 feet the pilot flying was trying to control his speed and configure at the last minute in order to comply with the Tower's request. We had traffic about 3 1/2 miles in front of us. With the gusty winds and both of us pilots being relatively new to the aircraft and because this aircraft was an X type aircraft I had relayed to the pilot flying that we didn't want to have a tail strike with such gusty winds, so I suggested that at any time either one of us felt that we weren't going to land in the touchdown zone or we didn't feel we weren't going to make a normal landing then we needed to "go-around." About 1200 feet we got another gusty wind report from the Tower that caused me to readjust the target speed with my head being down and losing situational awareness (SA). We never got too fast for our configuration but I called the "1000 feet" call at approximately 930 feet. I had already configured the aircraft for the landing checklist except for final flaps. I feel the pilot flying got distracted by me changing the target speeds that he lost his SA and forgot to call for flaps 30/landing checklist. I initiated the checklist and realized we were hadn't gone to flaps 30 and he hadn't called for the checklist. I selected final flaps and finished the checklist. I called 500 feet and he responded stable and we landed uneventfully.

## Narrative: 2

On arrival into ZZZ I was configured flaps 15, 180 knots until the marker. About the time I was going to call flaps 30 we received a new gusting wind report from tower that required an adjustment to our target speed. We discussed the wind and adjusted for about a 15 knot add over flaps 30 ref of about 148 target speed. Upon completing landing checklist which at this point was also delayed and we discovered that the flaps were not positioned yet to 30. We immediately positioned the flaps to 30 and landed. The flaps 15 speed I was flying was very close to the new target speed and the aircraft was stable with respect to

airspeed altitude and course. Contributing factors can include my new position as a requalification on the aircraft with only about 4 landings this year.

## Synopsis

Air Carrier flight crew reported an unstable approach in gusty wind conditions. First Officer (PF) cited having minimal flight time this year.

## Narrative: 1

Flight was from ZZZ-ZZZ1 IFR clearance in VMC albeit some smoke.

Flight was cleared to 14,000 feet then changed to 13,000 after passing 12,000. Looking directly into the sun through smoky haze I did not get it level at 13,000 and busted. ATC made no comment, perhaps due late change. No traffic in the area and no conflicts.

This was the second flight in the airplane in 6 months due to COVID shutdown. I attribute this to my fault with a little help from late altitude change and general overall COVID-19 rust.

## Synopsis

Corporate pilot reported an altitude deviation and cited lack of recent flying as a contributing factor.

### Narrative: 1

During an ILS approach to Runway XXR, the PF failed to slow early enough on final approach. PF configured later than desired considering the situation (fast due to earlier ATC request) resulting in the aircraft becoming high on glide path while slowing to configure for landing. PF needed to use a sink rate higher than desired to return to glide slope. We met the published parameters at all of our approach gates, but the first portion of the approach was unstable. We landed safely on XXR and proceeded routinely to the gate.

The main lesson learned was to slow earlier on final approach to allow a more stable approach. We accomplished all checklists and procedures and landed safely, but the crew would have been more able to look for potential threats if the PF had flown a more stable approach during the first portion of the approach. PNF was just back from several months off - take away for PNF was to address a rapidly evolving situation sooner and prompt the PF to configure sooner.

### Narrative: 2

[Narrative contained no additional information.]

## Synopsis

Air carrier flight crew reported that the first portion of the approach was unstable due to not slowing early enough on final approach.

## Narrative: 1

I was on an IFR Flight Plan from ZZZ to ZZZ1. I had poor speed control on the approach. I was legally IFR current, but, as it turned out, I was clearly not proficient. The COVID-19 prevented me from flying with a (COVID safe) safety pilot and getting recent practice. I was scheduled for simulator training for the following week.

I flew VFR out to ZZZ for two days. The weather was predicted VMC for the next several days. The day after we arrived, the wind shifted and blew in severe smoke from forest fires. We considered staying for a few more days, but there was no available lodging and the smoke was getting worse. I reviewed an IFR plan to go back to ZZZ1 and when the destination weather improved enough, I filed IFR, got my clearance, and departed. The departure, on route, and vectors to final were smooth and uneventful.

There was an aircraft ahead that was going slower and ATC requested that I slow to 90 knots, which is what I should have already been slowing to. I agreed and reduced power. The autopilot was holding the altitude coming up to the IAF and I inadvertently pulled off too much power. I was coming up on the IAF and descent and I was verifying that everything (else) was ready to go, when I noticed that the speed was rapidly reducing. The autopilot (AP) was trimming nose up to maintain altitude. I hit control wheel steering, nosed down, and added power. I had to do a lot of trimming to get the nose back down and I over shot the altitude and rapidly picked up speed. I got the nose back up, on altitude, and thought that the AP would acquire the glide slope. Nope, in the excitement, I missed arming the approach and flew right through it. Now I dove for the GS and picked up more speed again. Now I'm on the GS and check to see if the AP would acquire it and no it started another excursion and so I shut it off and hand flew the rest of the way. It was stabilized at this point, so I continued the approach and landed.

Mistake 1. I should have already been planning and reducing speed approaching IAF.

Mistake 2. I should have paid more attention to my speed reduction technique.

Mistake 3. I should have requested ATC to bring me around again to have time to set up properly.

Mistake 4. I should have done what I normally do and that is to turn off the AP and hand fly anytime things get weird.

My takeaway is that my IFR currency should be done more often, even if it is done in a simulator.

## Narrative: 1

After boarding was completed, I had the opportunity to listen to our Flight Attendant's safety briefing through my headset by selecting the "CAB" button on my Audio Management Panel (AMP). Our FA's are competent, safety oriented professionals and my hat is off to them in terms of all that they put up with from the traveling public and an airline that is sometimes tone deaf to their needs. In listening the FA safety briefing, I realized that our passengers are NOT being given any procedural guidance to remove their masks / face shields / PPE in the event of a rapid decompression - the portion of the briefing dealing with the use of oxygen masks in the event of a loss of cabin pressure remains unchanged.

This is particularly troubling given that our airline and most other US airlines have adopted a "zero tolerance" policy regarding the use of facial masks during the pandemic. Not only has our airline adopted this zero tolerance policy, it is even "banning" customers from our airline for failure to comply. So in this draconian world of absolute zero tolerance for failure to wear a mask, where exactly is the procedural guidance in what to do with that snot and drool infested petri dish of nastiness once the oxygen masks drop during a real emergency?

## Synopsis

Air carrier First Officer reported that the Flight Attendant safety briefing did not include procedural guidance on how passengers should remove face masks and don oxygen masks in the event of an emergency.

## Narrative: 1

Flight ABCD from ZZZZ to ZZZ I was the position C. After we landed in ZZZ, and taxiing of the aircraft was complete Flight Attendant A announced to the flight attendants to prepare the cabins for departure. I went to my forward service door and pulled the girt bar from the bracket and inserted back into the mount where it was disarmed then put the red flag back up. I turned around to cross check with FA A who I saw bend down to disarm the door. I then started talking to a first class passenger seated in X5. I heard FA A call the aft cabin via inter phone to verify their doors were disarmed. Then we waited till the agent came to knock on the forward entry door. I saw FA A give the thumbs up after the agent knocked and the agent starting opening the door. All of a sudden FA A said, "stop" and I saw the slide peeping from the compartment after she moved to the side. FA A notified the flight deck of the situation and they called for a mechanic. Two mechanics came quickly and moved the slide out of the housing. We then began to deplane from the front entry door. Managers X and Y came to talk to me and FA A on the aircraft after all the passengers deplaned and was told by her to fill out a report as a partial inadvertent slide deployment.

## Narrative: 2

It was a routine flight, upon arrival at gate in ZZZ I did a P.A. for Flight Attendants to verify and disarm. I bent down to disarm the 1L door left side girt bar bracket and I was thinking what I had to do next: (turn on lights for passengers, all-call the back). For some reason I stood up to turn on the lights. That's not like me, I always focus and follow through on my doors when arming and disarming. The C [FA] had just beat me to the lights, then I did all-call to the back, then C mentions passengers are actually sitting down after health PA to stay seated, because they never listen and crowd the aisle. Then there were 2 knocks on the door from the agent, I gave them thumbs up and looked down and saw the girt bar attached, at same time the agent was gently cracking the door I said stop, the door had opened maybe 1 foot? and the agent and I were face to face, I said stop. The slide partially fell out of housing intact. The mechanics were called, they came fast, they held the bottom portion of the intact slide and they opened the door, and we started deplaning.

When I got home my heart was pounding and body shaking from lack of sleep, low blood sugar, and wearing mask. Was a bad combination.

### Suggestions:

- \*SLEEP- Circadian rhythm. Lack of sleep 4 nights in a row, early morning sign-ins.
- \*FOOD- PLEASE on flights where you can't bring your food into other countries, or you can't bring your own food from the USA back into USA customs does not allow it, if it's too early or too late to get any food, places are closed or nothing is open, or lines are too long to make boarding. PLEASE have a little something for us to eat so our blood sugar does not drop so safety related accidents don't happen.
- \*MASK- Sometimes feel headaches, feel suffocation, can't breathe, lack of oxygen.

All of the above create fatigue which decreases the body's ability to focus, and decreased attention.

## Narrative: 1

Passenger X was sitting in XXC. His relative, Passenger Y, was sitting across the aisle at XXD. They decided to upgrade themselves to better seats. We told them that they were welcomed to upgrade, but they would have to pay the extra fee. After much ado, they decided to move further back in the cabin. Then Passenger X decides that he doesn't need to wear his mask. We asked countless times for him to wear his mask. Many

announcements were made. Every time, after we walked away, he took his mask off. Once I awakened him, asking him to put his mask back on. He said that he was eating. I said, "Sir, you were sleeping." He was putting all other passengers on board at risk.

## Narrative: 1

I am not in this department but I would like to know what is a "Typical" time frame to clean an aircraft with one person doing the job. We came in from ZZZ1 with XX people and 1 jump seat. The personnel came on after everyone except the X throughs. I was busy helping a customer and about 5 minutes later the "Cleaner" came off. I told ops which in turned called for a Supervisor. The Supervisor came and I asked how long does it take to clean seats and trays. He said there is no time frame. I told him this employee wasn't on the plane 5 minutes. He asked if I wanted another cleaning crew to come. I said no, I just want to know he did ALL trays. I have through customers on board and they watch us. I was just making sure we are KEEPING OUR PROMISE to the customers. I thought they are supposed to do ALL tables? The cleaners don't know where people sat.

## Synopsis

Flight Attendant reported concerns with cleaners sanitizing the aircraft too quickly.

## Narrative: 1

We were cleared for takeoff on Runway XR in ZZZ. Both myself and the other pilot heard the phrase from the Controller "Runway XR cleared for takeoff." We did not hear any other instructions. We were on the ZZZZZ 2 departure. It states to fly heading 011 until reaching 820 feet then heading 340 or assigned by ATC. We started our turn at 820 feet and a few seconds later the Controller told us to immediately turn and fly runway heading. No other problems came about from this situation. It seems like there was some miscommunication between the pilots and ATC. We were flying the appropriate procedures and did not hear ATC tell us to fly runway heading you're cleared for takeoff Runway XR. Both pilots only heard "Runway XR cleared for takeoff."

## Narrative: 2

Departing Runway XR we were cleared for takeoff. We followed the SID heading of 340 when ATC told us runway heading. After correcting to runway heading we discussed the departure and both of us were sure that we were just cleared for takeoff with no other instructions. We were both mistaken - he did issue runway heading on the takeoff clearance. Having been unfamiliar with this airports procedures I may have had some expectation bias towards just flying the SID and clearly missed the runway clearance, not to mention having not flown since April [and] a bit of tunnel vision during the before takeoff.

## Narrative: 1

At the gate in ZZZ, almost ready for door closure and gate departure when we get a Lavatory Smoke warning. I called back to the aft cabin flight attendants and they tell me a passenger just exited one of the aft lavs and a cloud of smoke followed him. When confronted, the passenger denied smoking or vaping, and claimed the smoke was present before he entered the lavatory.

I called for a customer service manager to come remove the passenger, and the manager, after talking with the passenger, informed me that he still denied smoking and that he was refusing to leave the airplane.

After conferring with the manager and his supervisor, and confirming events with the aft cabin flight attendants, I decided to have the entire plane disembark and re-board without the offending passenger.

As passengers were deplaning, the suspected smoker stopped at the L1 door and demanded his money back. From the cockpit, I instructed this gentleman to leave my airplane. He refused and was belligerent. I closed the cockpit door and called for law enforcement.

After everyone deplaned, we re-boarded and left for ZZZ1.

In the current economic/pandemic environment, the airline has been forced to offer really low fares. I feel this means some of our passengers are not frequent flyers and may not understand what's expected of them.

I feel like the customer service manager initially was reluctant to have the passenger removed, due to the passenger claiming he hadn't smoked in the lavatory. The aft cabin flight attendants saw him step in the lavatory just prior to the smoke alarm being triggered. After I continued to advocate for his removal, the customer service team did as I requested. I'm not sure what was initially said to the suspected smoker, but when safety is involved, there shouldn't be an option of letting the passenger remain onboard.

## Synopsis

Air carrier Captain reported that prior to gate departure a lavatory smoke warning occurred. The passenger allegedly smoking in the lav refused to leave and was ordered off by the Captain.

## Narrative: 1

I was contacted by Supervisor. He called to notify me that I had come into contact with a coworker who tested positive for COVID-19. He told me I was to stay home from work date 1 and date 2 (next day) and that someone from the company would contact me later and tell me how long my self-quarantine would be. On date 1 my General Manager contacted me. He informed me that I was to report back to my regular shift starting on date 2. He said, because I had tested positive recently there was no reason for me to self-quarantine. I was told I couldn't test positive again for 90 days from the time I tested positive two months earlier. The company chose to quarantine only those employees who hadn't tested positive. I contracted COVID-19 from a co-worker who brought the virus to work. I was confirmed positive. From [month] I was out of work because of COVID-19. Having been affected directly by the virus changes how you see things. I had a doctor's appointment with my primary. I asked her if I was safe from contracting the virus for 90 days? Her response was to smile. She went on to explain, yes the chances of getting the

virus were less of a risk, but that you could still get it again in those 90 days. I AM NOT IMMUNE FROM GETTING COVID-19 AGAIN. Company claims safety is their number 1 priority. The decision by the company to pick and choose who is quarantined is very troubling. I've been employed with the company for almost XX years. I'm extremely disappointed with the actions the company has taken. In my opinion safety was not the number 1 priority.

## Synopsis

Ground employee reported being in contact with a coworker who tested positive for COVID-19 and asked to report to work the next day.

## Narrative: 1

Management did briefings on how everyone should wear a mask but yet I still feel like management isn't really watching and making sure that we are indeed compliant with wearing our mask at any time we can't achieve six feet of space. At the same time it looks like Department X management team has reinforced the actions of one who doesn't wear a mask. It looks like all Department X employees are wearing a mask now whenever they can't achieve the six feet of space.

I was working a flight with others who didn't have on a mask and I watched someone apart of the management team look at us within six feet of space and continue walking. With something like that happening it makes me just want to walk off the flight. I don't feel safe coming into work because it seems like only a few of us in ZZZ are taking COVID-19 as serious as it should be taken.

## Synopsis

Ground employee reported concerns with others not wearing face masks, nor taking COVID-19 seriously.

## Narrative: 1

Departed ZZZZ Runway X Center on the SID. During the takeoff briefing I brought it up to the Captain (PF) and briefed the 220 knot restriction at [fix] on the SID. After takeoff PF called for flaps 1 a few miles prior to the turn during acceleration. I asked to verify that he wanted that. After delaying slightly, I thought we were close enough to the turn that it would not be a problem, and set the flaps to 1. We were at flaps 1 for approximately 30 seconds before the speed bug advanced and we began accelerating again. The PF should not have called for, and I never should have positioned the flap lever out of position 5 until after the turn was complete and we were accelerating again. Additionally, the Relief Officer should have spoken up and brought the error to our attention as well. We thoroughly debriefed the error during cruise and again after the flight. Recency of experience was a contributing factor as all of us had not been flying as much due to COVID-19.

## Narrative: 2

Departing [Runway] X Center ZZZZZ on the SID. The departure was briefed by the PF with input from the PM at the gate to include that it would be a Flaps 5 T.O. and with the low speed at fix of 220 knots the need to delay flap retraction from 5 to 1 until passing ZZZZZ1 [fix].

After takeoff, climbing out we were accelerating and the PF called for Flaps 1 and the PM raised the flaps from 5 to 1 with a minimum flaps 1 speed of around 230 knots. When the call was made we were accelerating but we were about 2 miles from the fix with a speed of 220 knots. The PF had to stop the acceleration at 220 knots (10 knots below flaps 1 speed) for less than 30 sec before he could continue to accelerate to the flaps 1 min speed.

## Synopsis

Air carrier flight crew reported a flap configuration problem on departure resulting in a speed deviation. First Officer made reference to lack of flying as a contributing factor.

### Narrative: 1

Flight attendants said passengers in seats XX 1 and 2 would not keep their masks on. We called customer service. After a discussion, the flight attendants and customer service said they were OK to leave the passengers on board and closed the cabin door. Once the door was closed, the passengers insulted one of the flight attendants. The flight attendants said they wanted the 2 passengers removed. Customer service came on board again and the passengers deplaned peacefully.

### Synopsis

Flight Attendant reported two passenger were removed from flight due to non-compliance with face mask policy and insulting a flight attendant.

High over ZZZZZ [fix]. It was the last leg of a three-day. No HGS (Head-up Guidance System) and had to fly like I did as an FO without HUD (Heads-up Display). Just fell a little behind; probably from being tired, not eating much since airport selections are minimal, and not having flown an approach without a HUD in over a year.

[Suggestion] Take meals with me because of the COVID impact on airport food. Fly without the HUD periodically. I did great on that approach and was stabilized at 1,000 feet in the end.

## Narrative: 1

Our FBO at ZZZ airport has no face covering policy in effect for workers, visitors, pilots or passengers.

My understanding is that all/most US 121 carriers require face coverings on board (with few or zero exemptions). This is likely to reduce virus transmission inside a shared HVAC space.

Our FBO has had passengers with active, symptomatic COVID infections traveling without masks. I'd recommend the FAA require a temporary face covering policy inside all interior

buildings which serve 121 and 135 crew and passengers. This should be a temporary federal mandate.

Failure to have such a national policy could negatively impact the NAS (if pilots, ramp and fuel personnel have to quarantine at home due to unprotected workplace exposure.)

## Synopsis

Air carrier Captain recommended the FAA require a temporary face covering policy inside all interior buildings which serve 121 and 135 crew and passengers.

## Narrative: 1

On return to base after successful completion of mission, was advised of a possible overflight of a required maintenance inspection. Due to operations tempo (COVID-19) and a last minute change of aircraft request by the crew, there was an inadvertent oversight of the available flight time on this aircraft.

Aircraft was approaching a 150 hour inspection on a progressive maintenance plan. High utilization (due to COVID-19 transports, among other factors) ran successive inspections very close together. I was acutely aware of a 50 hour inspection completed 48 hrs before completion of this flight. I was under the impression that the subsequent inspection was several hours away, but I neglected to check the time remaining in the maintenance logbook simply because I got in a hurry. Compounding the confusion was a lack of timely updates which provide a second check on maintenance due actions. On arrival back at the base and calculation of flight times accumulated on my night shift, I determined that it is probable that I overflowed this required inspection.

In summary, I got rushed by a last minute change of aircraft and the press of mission accomplishment and neglected to calculate the time remaining on the aircraft.

## Synopsis

Pilot reported being advised of a possible overflight of a required maintenance inspection.

## Narrative: 1

I had not flown for two and half months so it was time to refresh. I was flying with a safety pilot, practicing instrument approaches and takeoffs and landings at ZZZ1 and ZZZ2. At the time of the flight I did not realize this until after I sat down in the evening to relax at home. I recall after startup that I set my audio panel incorrectly and was then transmitting on my number one communication radio which was set to ZZZ Center and my number two radio set to CTAF. The mike button set for comm 1 and the speaker set to comm 2. So I was cross-channeling my transmissions. During this time we did not have the need to speak with any other pilots in the area and therefore I did not check my audio panel. I see that I was out of my element and rusty because usually I am checking squelch and verifying my transmissions with the radios when keying the push to talk button with the radio that I am using. I guess also when the Controller notifies a pilot of a communication error, we pilots tend to use them as a crutch to our errors and then make the correction. But we need to verify proper radios on our own before transmitting.

## Synopsis

Pilot reported cross-channeling transmissions between Comm 1 and 2 radios.

Narrative: 1

During boarding time Passenger X boarded without face covering. I approached him and politely requested he comply. He ignored me and proceeded going down the aisle. He began placing his two roller bags in the overhead bin. I waited, he sat and settled in his seat and again I requested he comply and told him he needed to put his face covering, this time he did and quickly slid it down to his chin and began making a phone call. I approached him and told him he needed to wear it properly. At that time I saw another passenger who was wearing it under his chin as well. I then proceeded to make a PA announcement regarding the requirements of face coverings. FA B approach both gentleman and requested they comply and asked them to wear their mask. Passenger X again refused, at that time I notified the Captain about the problem and he went ahead and made another PA covering the face covering requirements. The Captain told me to wait 2 minutes for him to comply. Gate agent was coming on board. Upon being told by the gate agent he put it on. During demo Passenger X was still talking on his phone and again removed his face cover. Again I told him to put it on and requested he place his phone in airplane mode, he ignored me. I finished the safety demo and told him to put the cell phone in airplane mode. We waited until he finished his conversation and he placed his covering and we began the taxing for takeoff. He put his phone down, upon me sitting in my jump seat he began writing and using his browser. As he saw me looking at him he began playing with his covering putting it on and taking off.

Flight was held up but not delayed. Fogging was done and just before boarding I noticed the seats and armrest were soaked. It was excessive and we had to hold the passengers in bridge-way while I took paper towels to dry them off. I was going to try to fan them

originally and realized they were too wet. I had to quickly dry every seat and armrest prior to allowing passengers on board.

## Synopsis

Flight Attendant reported the aircraft being wet after cleaning crew fogged the interior.

## Narrative: 1

Passenger [in] seat XX1 was removed. Asked passenger to lift mask above nose during boarding process. While doing demo noticed mask still below nose. After demo once again

asked to put mask above bridge of nose. Passenger nodded yes. He lifted mask above nose, as I walked away I turned back and he took mask off nose. I returned and asked him again to wear mask above nose. At this point I informed crew of problem with passenger. I walked back to passenger and told him this will be your final notice about our policy wearing masks. I went back up front told crew what happened and we decided to have him removed. FA A called Captain who returned plane back to gate. As passenger was being deplaned he said, "My mask won't stay up because it is too loose." I replied, "You could have tightened it or ask for one from us."

## Narrative: 1

Passenger had to be told several times to properly wear his mask while he was not eating or drinking before he finally tied the upper portion of his mask above his mouth, but below his nose. I told him his nose should also be covered, so he begrudgingly pulled it up but left the bottom untied and ate and drank with his mask "on" but not secured.

I have personally interpreted our mask policy would deem wearing a mask in this manner as inappropriate, but I allowed this behavior as I was exhausted from constantly reminding

people they needed to properly wear their masks.

Is this an appropriate/effective way to wear a mask? Show photos of appropriate vs inappropriate masks before passengers board.

## Narrative: 1

Now that we have brought back more service in the main cabin on our flight to ZZZ1 we were in the aisle for an extended period. Having to ask each person if they wanted ice as well as cream or sugar for coffee made each interaction extended and many passengers took their mask off when ordering. Having to hand someone ice in a cup then a can, and coffee and cream and sugar I noticed many people touched my hand during the exchange. Then with the hand the passenger just touched I touched the ice scoop or the next passenger's items. This put me at risk as well with touching. I felt this is a safety risk for

myself and other customers getting cross contamination. When I was able wear gloves during service it at least cut down my personal risk but people would still get the cross contamination. When it was just cans it I was easier to give it quickly and without getting touched by people's bare hands. I didn't have to lean down close to find out how many creams or sugars and ice or no ice. Many people asked for multiple items that slowed us down as well. Don't do coffee right now or have sealed cream and sugar so we can hand them one sealed package with both. Also we need to just not do ice. We are putting our safety as well as the guest at risk by putting service over safety.

## Synopsis

Flight Attendant reported cross-contamination concerns with the increase in food and beverage services provided to passengers during flights.

## Narrative: 1

Captain was in cabin with Flight Attendant (FA) on board; he did not wear his mask. Flight Attendant reminded/requested the Captain to please wear your face mask. He did not put one on. He continued to hang around door and the cabin, and throughout without a mask on talking to FAs less than 6 feet away from them. I left the area where the Captain hung out to chat. When our standby reserve FA replaced our missing FA, we were ready to close the door. Captain did not brief the Flight Attendant, Captain continued to talk to catering [about] additional pilot cups; customer agents, FA without a mask. We closed the door, Captain, and passengers did not wear a mask when the aircraft door closed. I walked to cabin and saw the cockpit door open and Lead Flight Attendant made the announcement to wear your mask over your nose and mouth throughout the ferry flight.

Sometime midflight, when I walked to door where all the crew meals are boarded, passenger X zone, I saw the Captain asleep without his mask, passenger did not wear his mask. Three vans were available to take the whole crew from ZZZ airport to Hotel. I believe three flight attendants and I were in the third van, we all discussed we would refuse to share the van with the two company people [mentioned], if they did not wear their mask. So I asked "Would you gentlemen please wear your mask over your nose and mouth in such close space with us?" They put on their mask; I recall person replied "I don't want 3 nagging mothers directing...to me..." I said, "Sir our goal is to communicate safety requirements that are put out by CDC, we [are] in a close space, and since we don't know about each other's health and family situation, we just want to be safe."

Boarding, 2 company members did not wear their mask as they worked diligently; even after we boarded the personnel. I repeatedly reminded crew members "mask mask mask please." Even when company member was in GA with the military officer and his assistant, whom wore a face mask throughout their time on the aircraft. Crew member did not wear his mask. Crew member was resting in seat X and had a blanket over his face. I said, "Sir the blanket is not a proper covering, you must wear your face mask." I hear person shout "#@\$". I walked away and did not speak to him again for the rest of the flight.

## Narrative: 2

Captain and the passengers on our ferry flight refused to wear [a] mask or wear them properly. Through the entire pairing, different flight attendants had to repeatedly ask the Captain to put on mask while walking around and taking crew rest break in the cabin. Captain indicated that they do not need the mask if no revenue passengers on board. FA Y asked to see in print and the Captain couldn't provide it. We also had to repeatedly ask the mechanics to put on mask properly even riding the shuttle to the hotel in ZZZ. I feel very unsafe having to deal with our fellow employees throughout this trip. They would put on the mask. After an hour or 2, the mask is either below nose or off.

## Synopsis

Flight attendants reported issues with crew members not complying with face mask policy.

## Narrative: 1

Utilized TAF that Dispatch used to prepare flight release. (Closest to top of release). Did not see later TAF that had been changed to require alternate airport for landing. (Towards bottom of release). Departed ZZZ without required Alternate.

OE Training, no flying for last 6 months (COVID-19).

Information overload. Too much material to read before a flight. Flight release is available to pilots so close to departure time that with all other tasks required, there is limited time available to study flight release, weather, NOTAMs and all available information.  
Suggestion: Make flight info available to pilots 15 minutes earlier.

## Narrative: 2

At the time the task was initially completed, the flight (ETA XA: 25Z) did not call for an alternate per the following TAF. WSI RPM tool did not suggest that CIGS or VIS would lower. System was not fully operational with the 8-hour FCST unavailable. The METAR was trending with low CIGS and visibility between 6SM and 10SM with light winds and a 2-3 degree temp/dewpoint split.

The updated TAF was not observed prior to the flight departing. I do not recall an "Alternate Verification Alert" being received. I believe that it was my intention to add a precautionary alternate with the current FOB the aircraft. I feel that there may have been some confusion and I "lost my place" in my workflow process while juggling flight following, answering phone calls and working the assigned dispatch releases.

## Synopsis

Air carrier pilot and Dispatcher reported a required alternate airport was not filed prior to departure.

## Narrative: 1

My role for the leg was Relief Pilot. [Runway] XR was assigned during taxi. The runway was listed on the TPS for TO1 Max and after a short discussion all 4 crew members in the cockpit agreed it was acceptable. We would be using a departure to the north of ZZZ so this runway would save some time. The CA requested the FO pull new numbers since our weight came in 4,000 lbs light in the hope of improving our numbers. After they confirmed that XR was requested on a new TPS through ACARS, the number data downloaded. After departure, the crew realized [Runway] YYL numbers had been sent, accepted and downloaded. The takeoff appeared normal throughout the roll and rotation was also at what appeared to be a "normal" distance down the runway and from the end.

As Relief Pilot, during taxi I'm assigned the Jumpseat behind the FO seat. The view of all that's going on "up front" can be difficult at times and requires being very proactive in getting out of the seat for a better view.

Getting up from the seat to verify the takeoff data is necessary and appropriate.

## Narrative: 2

During takeoff roll ECIAS message alerted crew of incorrect runway selection. CA elected to continue takeoff.

During taxi out ATC asked if [Runway] XR was possible and crew advised it was due to light weight and TPS data. After close out CA asked for TO 1 TPS data and FO requested through FMC. FO accepted data but none of crew caught that [Runway] YYL was now the FMC loaded runway. A delayed close out and number 1 for departure made the confirmation of the data reviewed quick and none of us caught the incorrect runway in the upload.

Due to lack of flying and a runway that was the 5th on the TPS made all of the crew slow in our ability to trap complexities of runway and power changes. Better flow and more currency will prevent this type of event.

### Narrative: 3

When cleared to taxi, we were asked if we could accept [Runway] XR for takeoff at ZZZ. Our weight was acceptable and we had the TPS for TO2 dry and max power. I instructed FO to accept the runway (I have used it on occasion) and felt it was fine. I asked FO to try and get a TO1 TPS and see if it would improve our numbers a bit. He requested the TPS as instructed and I watched him enter XR and 1 for the thrust. We later determined that when he requested both the TPS and the FMC uplink, it had sent the [Runway] YYL numbers again. We believe this was because of the fact that XR was the "fifth" runway on the original TPS. We inadvertently took off with the wrong data loaded in the FMC. Our takeoff roll looked and felt normal and we rotated at what seemed to be an acceptable distance down the runway. All crew missed the fact that we had loaded the wrong runway.

The biggest reason for this error was complacency. I pride myself on TPS knowledge and, looking back, I should have caught several red flags. This crew was all familiar with the others. We have all flown together and I let my familiarity with the others lower my guard. Secondary was the fact that relief pilots both had not flown much recently, due to COVID-19 reduction of schedules.

I am going to change a couple of techniques to trap the errors better on runway changes. While on this layover I thoroughly reviewed the FMC and found that I had a couple of misconceptions about the aircraft that I brought from other aircraft.

### Synopsis

Air carrier flight crew reported they inadvertently took off with the wrong data loaded in the FMC.

## Narrative: 1

After receiving a last minute MEL for a deferred FO reading light, we departed without the appropriate DTG (Date Time Group) from Dispatch. The book had been completed and closed correctly. All procedures of the MEL were complied with and verified. Climbing through 10,000 feet we realized my error.

After not flying for approximately 5 weeks my normal rhythm in the cockpit was off. A high workload environment along with receiving the Maintenance book and the close out at the same time just prior to push caused me to be distracted and miss the step of notifying Dispatch of the new MEL. I cross referenced the close out revision number with the signed release. They matched. I believe somehow in my mind that because I received the close out that I had signed an updated release.

This event is my responsibility and the error rests on my shoulders. The only slight suggestion I could recommend would be to prevent a weight and balance close out from being sent if maintenance is on board. While it remains my responsibility this could help trap this type of error. I verify the close out revision number against the flight plan. They matched. I gave myself a false impression that my paperwork was in order.

## Synopsis

Air carrier Captain reported departing without correct paperwork and cited lack of flying as a contributing factor.

## Narrative: 1

I was providing OJTI for the first time since the COVID lockdown. My trainee was on his first day back training. Aircraft X was doing practice approaches at ZZZ. When they were done, they came off [Runway] XXR heading. My trainee gave them their clearance to ZZZ1. Aircraft X read back all correctly except for the altitudes which my trainee promptly reissued. At that time, I had to turn Aircraft Y onto final at ZZZ2 as my trainee did not do in a timely manner. We then had a call from ZZZ3 and a request from another aircraft back to back. I failed to realize that Aircraft X did not enter their new squawk code and thus did not tag up in STARS. They ended up flying for 98 miles without a handoff or point out to other sectors at 12,000 feet. This can only be attributed to not having provided OJTI for the past 6 months. Otherwise if I had been working the position by myself this probably would not have happened.

I would recommend a redoubling of effort to scanning while providing OJTI or while performing CIC duties for OJTI.

## Synopsis

TRACON instructor reported an aircraft departing and not squawking, flying close to 100 miles through various different airspace at 12,000 feet.

## Narrative: 1

As I was approaching from the northwest to an airport with parallel runways, intending to land on the eastern of the two runways. The Tower closed early because of COVID-19, and traffic was using Runways XXL and XXR. I elected to fly a left downwind to land on Runway XXR, partially because there was traffic to the east of the field that was planning to fly a right downwind to XXR, and I did not have visual contact it. I landed uneventfully, but in hindsight, it would have been better to follow the proper pattern by overflying the field, and descending to join the right downwind for XXR.

## Synopsis

GA pilot reported flying the incorrect pattern after the Tower closed.

## Narrative: 1

Had passenger board and was complaining that he was sitting next to another passenger and what was I going to do about it. Then proceeded to tell me he would not wear his mask the whole flight because he has asthma. I told him he needs to wear the mask at all times. The lady sitting next to him was asked if she was [ok] sitting by him as we had no open rows, she said she was fine. I then was putting her bag in the overhead for her as

the man tells me to grab his suit jacket as he didn't want her bag near it. I had the CA call customer service to help the situation, customer service comes and he says he has no problem complying.

He was rude in flight, tried to take mask down again and I asked him to put it on, he did. We land and he cuts the lady off to grab his stuff from the overhead and get off, has his mask off as he is getting off the plane.

## Synopsis

Flight Attendant reported a passenger complained about sitting next to another passenger and did not comply with face mask policy.

Passenger [would] not wear the mask over his nose. He was asked multiple times and then said he can't breathe with it on. I explained our policy, told him the consequences and he said - "Call the Captain, I don't care I can't breathe." I came back, asked him one more time and he said it's not my fault and I said I realize that, but when you agreed to fly you agreed to our mask policy.

Fine whatever, was his response. The passenger in seat XX first called it to my attention

during takeoff then again when I walked by a second time. He was not combative in any way, but refused to comply.

## Narrative: 1

Passenger walking back as FA B and [I] saw her not wearing her mask and asked her to put it on. While FA A was walking back to the front she saw she was not wearing her mask and asked her to put her mask on to which she said she would not. I called the Captain and explained how I asked once and FA A asked a second time and there was a refusal. He said he would call ops and we would return to the gate.

After the gate agent came on I was told by FA A that the passenger was basically saying she was going to eat and drink the whole duration of the flight which is still not complying. FA A said that still made her uncomfortable and I agree because she is going against compliance and stating that she is going to go around the rules. Also, apparently she is saying that she was never told to put on a mask but she was told two times once by both of us. The second time when I asked if she was not going to put it on she was already showing an increased attitude.

A Supervisor [came] on board to escort her off the plane. From what I learned in the back we [deplaned] the entire plane because she refused to get off the plane.

## Synopsis

Flight Attendant reported a passenger was removed from flight due to not complying with face mask policy.

## Narrative: 1

This event was undoubtedly the most humbling and perhaps a first in my almost XX years with (airline) and going on X years as Captain. While there will always be a first, it will certainly serve as a professional learning opportunity for me personally. I take full accountability as Captain for not directing a go-around sooner. The ZZZ1-ZZZ flight was leg three on a three day pairing. We were approaching an 8 hour flight block and over 10 hour duty on our flight to ZZZ. Flight paperwork review prior to departure indicated weather conditions which ended up being inconsistent with what we encountered in ZZZ. Due to an ATIS outage that had spanned several hours, we were only able to retrieve hourly METAR reports for ZZZ. The last hourly report indicated significant changes with respect to gusty crosswinds from the East with smoke slightly lowering visibility. As it came close to time to brief, I sent a message to Dispatch inquiring about ZZZ ATIS. The message we received back indicated there indeed was an outage. Unfortunately we were out of range to obtain the VHF ATIS prior to our briefing, but later obtained ATIS information over VHF in our descent. Prior to TOD, we briefed the approach that we anticipated in ZZZ, the visual backed up by the ILS for [Runway] XYR. We discussed relevant threats of gusty crosswinds, night, fatigue and potential for arrival changes and runway re-assignment. I set up with the VSD to be able to monitor flight path. On initial hand off to ZZZ Approach, we were assigned Runway XYL. As PM, I loaded the approach for the ILS XYL in the FMC, set new baro minimums, entered the new runway data, and set up the NAV frequency/course for XYL, briefed the changes, and then ran the change triangle Descent checklist. Approach Control directed us to go direct ZZZZZ on the approach, maintain 4,000 until ZZZZZ, and were subsequently cleared for the approach. My FO as PF attempted to mitigate the threat of being high on path maintaining higher speed as directed previously by ATC (delete speed restrictions on the arrival) and I monitored using the VSD.

As we joined final, it was evident from wind data on the PFD, that the winds on approach were strong challenging gusty crosswinds from the East. After joining final for XYL, my FO struggled with maintaining the LOC course and GP with the gusty dynamic crosswinds. With LOC and GP deviation call outs as PM, my FO did an outstanding job re-establishing proper path and we were able to achieve what we thought was stable criteria. In the time frame of attempting to get better alignment established on final and simultaneously run the landing checklist, I inadvertently missed the final flap 30 selection, and we both missed the flap misconfiguration on the checklist. While we ran the landing checklist, our attention was diverted enough to not note the flaps 25 configuration. Cumulative fatigue from a long flying day with challenging weather contributed to the inadvertent omission. It wasn't until the GPWS Flaps alert that we noted the misconfiguration. Out of concern for speed due to gusty winds, I selected flaps 30 just as I directed the go-around due to unstable landing criteria. While I normally look at flap configuration at the 500 feet gate as an additional check, the cumulative fatigue and dynamic wind conditions had my attention more focused on monitoring winds and flight path. After having time to reflect on the encounter, the wisdom it has imparted is the absolute importance of an early go-around if conditions are not coming together as planned for an early stable approach. A go-around at 1,000, due to challenges with flight path would have afforded an easier go-around scenario with dynamic gusty winds after 8 hours of cumulative flying for the day.

While we both had no currency issues and had sufficient recent experience, it's undeniable that pairing constructions that culminate in 8-9 hours of block time landing close to midnight on day three of a trip that consisted of two to three legs every day with aircraft swaps only add to fatigue. In this new era of COVID, there are added stresses which only serve to raise the overall underlying level of surge fatigue that exists from operating on the front lines and dealing with constant change. While I take full accountability for my actions and omissions, I have concerns over the impact of future pairing construction given my recent encounters.

With respect to lessons learned, our encounter highlights the importance of an early go-around in dynamic weather conditions when the approach is not coming together as planned. As mentioned in the narrative, it's undeniable that pairing constructions that culminate in 8-9 hours of block time landing close to midnight on day three of a trip that consisted of two to three legs every day with aircraft swaps only add to cumulative fatigue. We are operating in a new normal, and pairing design and construction should consider the added underlying level of fatigue and operational stress that cannot be easily mitigated. Pairings with a 3-2-3 leg-day design with multiple aircraft swaps should be strongly avoided so as to not be conducive to creating conditions ripe for encounters such as the one described above.

## Synopsis

Air carrier Captain reported a flap misconfiguration leading to an unstablized approach and go-around.

## Narrative: 1

Captain - PM. FO - PF (First PF leg in nearly 2 months - briefed as a threat during the brief).

Weather conditions - Turbulent air and smoke causing low visibility and low level wind shear up to short final. Reported calm winds on the ground.

ZZZ traffic was moderate and spacing was tight.

ATC had given a clearance of 250 KIAS and a descent to 6,000 feet shortly after departing ZZZZZ on the ZZZZ4 arrival to join up for the ILS for [Runway] XXL.

Inside of 15 DME from ZZZZZ1 ATC clearance was to slow to 170 KIAS and at or above 4,000 feet.

Approaching the 90 degree turn at ZZZZZ1 ATC apologized for the late turn clearance and asked if we could still join the localizer for XXL, in which we responded we thought we could.

Autopilot was engaged as the aircraft was approaching 4,000 feet while the PF turned heading to intercept the inbound course. The clearance was inbound course only yet the PF reached to engage both autopilots and arm approach mode. Instead of engaging the second autopilot the PF inadvertently depressed autopilot 2 button disengaging the autopilot all together. PF announced "autopilot disengaged, I have control." This happened while in the turn and the aircraft was leveling. In the brief confusion of the autopilot disengagement as the crew sought to arm the LOC the PF allowed the aircraft to dip below 4,000 feet. The PM announced the altitude and the PF began to correct. The speed brakes had been out during this time to assist with the 170KIAS request and at this time LS was creeping up. There was a lag in the auto thrust to re-spool the engines for dipping below 4,000 feet so the PF went to TOGA thrust momentarily to initiate the spool up which sequenced the go-around function. Once LS and VS reversal was accomplished the PF moved the thrust levers to idle which disengaged the auto thrust and degrading automation even further. The PF announced that the auto thrust was disengaged. With the initial increase of power the aircraft climbed to roughly 4,500 feet. All this took place in about 10-15 seconds. This created a high level of initial confusion as the PM worked to reload the arrival and approach as well as respond to ATC to further slow to 160 KIAS and cleared ILS XXL. The crew worked together to rebuild the automation, silence the altitude aural warning, and re-engage the autopilot and autothrust systems while configuring the aircraft. All this was completed well before the FAF and even with shifting winds on final the remainder of the approach and landing was uneventful.

Even though there wasn't a deviation from regulations and in fact ATC thanked us for our

"help" with the late intercept clearance and tight spacing there is plenty to learn from here.

Key take-always:

Fatigue played a factor - prior to departing from ZZZ1 there was a ground delay for roughly 40 minutes while passengers were on the aircraft. Weather departing ZZZ1 continued to play a factor with low level wind shear with thunderstorms in the vicinity. The flight was a 5 hour leg to ZZZ.

Lacking proficiency played a factor - this was the first leg in which the FO was the PF since July.

Responding reactively to ATC's requests which caused the crew to be rushed.

Instinctively degrading automation instead of using automation to reduce work load by the PF. Lack of proficiency in rebuilding the automation by the PM. However, good leadership by the Captain and good CRM by both crew members allowed for a successful outcome and a good learning.

## Narrative: 1

I was informed yesterday, by Chief Pilot, that I am expected to fly when I am fatigued, if I expect to be paid. I experienced a fatigue event back on date, during which I didn't feel adequately rested to fly. I was unable to get an appropriate amount of sleep at home due to various issues and was not comfortable trying to fly 4 legs, in and out of 3 different airports, during an XX 1/2 hour duty day, on a little over 2 hours of sleep. Evidently, my XY+ hours in the Captain's seat is not enough time for me to determine whether or not I'm sufficiently rested enough to fly.

I'm not a "morning person," and I don't typically fly trips that sign-in before XF:00 AM. But, because my original sequence was canceled due to COVID-19, I was assigned a trip that signed in at XC:00 AM. I went to bed early the night before, but awoke after a couple of hours of sleep and was unable to go back to sleep. While getting ready for the trip, I recognized that I was not adequately rested and I called in fatigued at approximately XA:30 AM.

I believe that if the company is going to assign trips, there should be some consideration given to circadian rhythm and preferences of the Pilot being assigned.

## Synopsis

Air carrier Captain reported calling in fatigued and being told months later they are expected to fly fatigued.

## Narrative: 1

I am writing this narrative in regards to a possible pilot deviation from earlier today date at ZZZ around XA:45 local time. My ZZZ1 based First Officer (FO) and I (ZZZ2 based Captain) were working Aircraft X to ZZZ3 and were cleared to depart Runway XX L with a climb via the ZZZZZ2. This SID has an initial heading of 356 and a slight right turn to 013 before reaching the first fix of ZZZZZ1. With that said, the event went as follows: we were cleared to takeoff, RNAV to ZZZZZ1, FO executed a standard ALT-To takeoff and rotated at VR. At acceleration altitude, (around 1,400 feet MSL or 800 AGL), I was given a frequency change to departure and we entered IMC 100 feet later at 900 AGL. I switched, but the wrong frequency was programmed in so I went back to my chart to locate the proper one. I also completed the after takeoff flow and noticed a drift to the right of the course. The Departure Controller was talking to another airplane and then started to call our call sign instructing us to fly a heading of north. First Officer was still hand flying and complied. The Controller stated that we were within a few miles of Aircraft Y climbing off Runway XY at ZZZ4. Neither of us got an RA but we did get a TA. The rest of the departure was uneventful and we landed just under an hour later in ZZZ3. My FO was following the flight director. I did verify that the correct runway and SID was programmed in the FMS. I believe FO started to drift and when the flight director made the right turn for the SID FO overreacted not fully realizing we were already to the right of the course. According to the track log, we got to a heading of 085 at 2300 feet MSL (1,600 AGL) before we started correcting back to the north. This entire event lasted under 45 seconds from takeoff.

My FO is trying to complete hours for consolidation, was the pilot flying. FO was hired last year but didn't fly enough to consolidate, plus COVID hit and the base was closed for several months. FO had flown three legs prior in the sequence and FO's flying was up to standards. This was [the] FO's first real encounter with IMC conditions below a couple thousand feet. I think everything was moving faster than FO expected and just started to drift then over shot the turn due to the flight director's abrupt movement.

It's my opinion that FO should really focus on maintaining the directions on the SID and to double check before making turns when hand flying a SID.

## Narrative: 2

I was pilot flying, this was the second leg of the day and also my second leg of pilot flying for the day. Everything had been programmed, verified, and confirmed for the ZZZZZ 2 RNAV departure off of Runway XXL. As we were climbing out I knew to expect a right hand turn to 013. Meanwhile, the Captain was heads down programming the Departure Frequency. The profile was flown correctly and as I called for the after takeoff checklist, the flight director started to make the right hand turn, I followed the flight director and then realized that I was going off course to the right and was on a heading of 050 and needed to correct to the left, and as I was going to ask the Captain to verify that I needed to not follow the flight director, ATC called to give us a heading of 360. I immediately complied with that heading and then we received a traffic advisory within 5 miles and 1,000 feet. I believe it was 1,000 feet below. This all happened in a matter of 30 to 45 seconds in Instrument Meteorological Conditions. After the heading of 360 we complied with the next heading of 085 and then direct to a fix. Even after the event we went back to verify, once again, that the correct departure was in with the correct sequencing and courses and it was. I am a low time pilot. I only have XYZ hours in the aircraft and XX hours towards the second round of consolidation at the completion of this day. I was released from IOE on date. I then sat airport standby for almost 2 months straight with little actual flying. I was scheduled for consolidation flying in March and with approximately XX hours in the airframe flew with a crewmember who tested positive for COVID-19. I was then removed from duty to quarantine for 14 days. I was unable to complete consolidation and was sent to recurrent/retraining training in May. Due to the COVID-19 pandemic I did not fly an aircraft again until July. Since then I have just over XX more hours in the airframe and seat.

I believe the cause is lack of flying time, and over reliance on automation. I was flying the flight director but it was giving erroneous readings.

Suggestions for erroneous flight director guidance in simulator scenarios.

## Synopsis

Air carrier flight crew reported a track heading deviation and cited First Officer's lack of flying as a contributing factor.

## Narrative: 1

ZZZZ-ZZZ 14.40 duty day operated Aircraft X with XXX souls on board with 3 working lavatories. Cockpit informed us we would operate all lavs in order to depart but not have running water in the other lavatories. Captain's decision. Cockpit had 1400 sanitary wipes boarded. FA's not comfortable with non COVID procedures so it was agreed to lock other lavs off and operate only 3 lavs with running water. Please note ZZZZ has increased their COVID protocol due to increased COVID numbers.

Under no circumstance should an aircraft operate without the ability to wash your hands especially on long range flying. As a situation arises during a pandemic, even though a policy has not been updated to reflect COVID procedures, it is imperative a Captain make a decision based on the health and safety of the crew. We had 3 working LAVs. That's not acceptable during COVID. CDC recommends hand washing.

## Synopsis

Flight Attendant reported there were only 3 fully operational lavatories during a long haul flight.

## Narrative: 1

While A [Flight Attendant] was doing her final walk through prior to takeoff, she noticed a child seat behind the exit row. I was C, and could not see the seat from where I was standing in the exit row, and did not notice the passengers placing it during boarding. I was busy greeting passengers as they walked through, and telling people who sat in the exit row that they were seated in the exit row, and verifying they were willing to sit there. One woman was not responding to me, and I realized she could not hear me. She said her ears were blocked from the last landing, and they had not cleared. Since she was unable to hear or respond to my questions, I told her I would have to re-seat her. A gentleman in the exit row loudly said she was sick, and should not be allowed on the plane. I asked her if she was sick, and she said no. She appeared to be congested, which is likely the reason her ears blocked on landing. I had her trade seats with another passenger, briefed the exit row and secured the forward cabin from the exit row forward. When I got to the front, I informed A the exit row was briefed and the forward cabin was secure. I did not hear a PA that the aft cabin was secure. I informed the A that the woman I moved from the exit row could not hear, that she was congested but said she was not sick. The A said she did not appear sick or have any COVID symptoms when she boarded. I said congestion could be a COVID symptom, and A seemed surprised, and said she never heard that. By then operations was in front with us, and he and A said all I was required to do was ask if they are sick, and if the response is no, then we leave it alone. I did not know if the passenger had allergies, a cold, or something more serious.

The A was doing her final walk through prior to takeoff, and noticed a child seat directly behind the exit row. Someone notified the Captain, and A and D quickly had passengers change rows. The captain rang, I answered, and he asked if they were finished. I said I was C in front, and they were not quite done. He asked to be notified, and a few seconds later I let him know the exchange was complete.

## Synopsis

Flight Attendant reported a passenger that sat in the exit row had hearing problems and was displaying symptoms of possibly being sick.
