

**ASRS Database Report Set**

**COVID-19 Related Events**

---

Report Set Description.....Reports from flight crews, flight attendants, controllers, mechanics, dispatchers, ground personnel and others regarding COVID-19 related issues.

Update Number.....4

Date of Update .....January 7, 2022

Number of Records in Report Set.....1,957

Records within this Report Set have been screened to assure their relevance to the topic.

National Aeronautics and  
Space Administration

**Ames Research Center**  
Moffett Field, CA 94035-1000

TH: 262-7

**MEMORANDUM FOR: Recipients of Aviation Safety Reporting System Data**

**SUBJECT: Data Derived from ASRS Reports**

The attached material is furnished pursuant to a request for data from the NASA Aviation Safety Reporting System (ASRS). Recipients of this material are reminded when evaluating these data of the following points.

ASRS reports are submitted voluntarily. Such incidents are independently submitted and are not corroborated by NASA, the FAA or NTSB. The existence in the ASRS database of reports concerning a specific topic cannot, therefore, be used to infer the prevalence of that problem within the National Airspace System.

Information contained in reports submitted to ASRS may be clarified by further contact with the individual who submitted them, but the information provided by the reporter is not investigated further. Such information represents the perspective of the specific individual who is describing their experience and perception of a safety related event.

After preliminary processing, all ASRS reports are de-identified and the identity of the individual who submitted the report is permanently eliminated. All ASRS report processing systems are designed to protect identifying information submitted by reporters; including names, company affiliations, and specific times of incident occurrence. After a report has been de-identified, any verification of information submitted to ASRS would be limited.

The National Aeronautics and Space Administration and its ASRS current contractor, Booz Allen Hamilton, specifically disclaim any responsibility for any interpretation which may be made by others of any material or data furnished by NASA in response to queries of the ASRS database and related materials.

A handwritten signature in cursive script that reads "B. Hooey".

Becky L. Hooey, Director  
NASA Aviation Safety Reporting System

## CAVEAT REGARDING USE OF ASRS DATA

Certain caveats apply to the use of ASRS data. All ASRS reports are voluntarily submitted, and thus cannot be considered a measured random sample of the full population of like events. For example, we receive several thousand altitude deviation reports each year. This number may comprise over half of all the altitude deviations that occur, or it may be just a small fraction of total occurrences.

Moreover, not all pilots, controllers, mechanics, flight attendants, dispatchers or other participants in the aviation system are equally aware of the ASRS or may be equally willing to report. Thus, the data can reflect **reporting biases**. These biases, which are not fully known or measurable, may influence ASRS information. A safety problem such as near midair collisions (NMACs) may appear to be more highly concentrated in area “A” than area “B” simply because the airmen who operate in area “A” are more aware of the ASRS program and more inclined to report should an NMAC occur. Any type of subjective, voluntary reporting will have these limitations related to quantitative statistical analysis.

One thing that can be known from ASRS data is that the number of reports received concerning specific event types represents the **lower measure** of the true number of such events that are occurring. For example, if ASRS receives 881 reports of track deviations in 2010 (this number is purely hypothetical), then it can be known with some certainty that at least 881 such events have occurred in 2010. With these statistical limitations in mind, we believe that the **real power** of ASRS data is the **qualitative information** contained in **report narratives**. The pilots, controllers, and others who report tell us about aviation safety incidents and situations in detail – explaining what happened, and more importantly, **why** it happened. Using report narratives effectively requires an extra measure of study, but the knowledge derived is well worth the added effort.

# Report Synopses

ACN	Synopsis
1845121	Air carrier Captain reported that pilots and flight attendants are experiencing stress and reduced quality of life due to the upcoming deadline to either get the COVID-19 vaccination or be terminated from employment. Reportedly, this contributes to reduced margins of safety during flight operations.
1845110	Pilot reported safety concerns related to inadequate staffing that could result if employees take leave in order to not comply with the company's vaccine mandate.
1844831	Air carrier Captain reported an altitude deviation during descent and cited distraction due to the vaccine mandate being a contributing factor.
1843945	Ramp employee reported that pushback ramp crew members have expressed concern about being distracted due to the company's vaccine mandate which could lead to unsafe conditions.
1843434	Flight Attendant reported the company attendance procedure could result in flight attendants who are COVID-19 positive reporting for work instead of calling in sick.
1841178	GA Single Pilot reported an NMAC event with departure traffic while entering landing pattern. The temporary Tower without radar access was a contributing factor.
1840165	Pilot reported confusion during taxi for takeoff and lined up on the wrong runway for departure from STS airport. ATC notified pilot and the pilot taxied to the correct runway.
1839448	Air carrier First Officer reporter getting a distracting message during taxi into the gate regarding a company requirement to report vaccination status. Reporter stated the distraction caused them to deviate from their flow.
1838957	Air carrier First Officer reported RCTP airport customs COVID-19 procedure requires people being sprayed with a 75% alcohol mixture, yet the bottle label reads Chlorine Dioxide.
1838144	Captain reported passengers refused to obey the face mask policy in flight, which was a safety concern because of the distraction created during critical phases of flight.
1838059	A321 First Officer reported descending below minimum altitude on approach and receiving a GPWS obstacle alert. Reporter stated lack of recent experience and practice using the various navigation equipment contributed to the event.
1837600	Air carrier First Officer reported failing to notice the final weights had not been sent and inadvertently used old data. The reporter stated they were distracted by company communications regarding vaccination requirements.
1836981	TRACON Controller reported an airborne conflict and possible descent below minimum altitude occurred when the controller became distracted with the data position, social distancing requirements and supervising a trainee.
1833778	Air Carrier Captain reported a delay followed by a cancelled flight due to a discrepancy between the Captain's and First Officer's altimeters on a previous flight which lead to maintenance action.
1832870	Flight Attendant reported fatigue and being unable to perform duties due to multiple return to gate incidents and plane swaps.
1832401	B737-800 Flight Attendant reported a fumes event described as a musty odor during initial climbout. Reporter stated face masks hindered the crew communication and ability to smell.
1832269	Air carrier First Officer reported experiencing stress and anxiety resulting from working while being unvaccinated and the company requiring employees to be vaccinated.
1832225	ATC Controller reported during a position change with another controller, two aircraft entered into an airborne conflict situation. The conflict was not immediately noticed because the ATC personnel were social distancing.
1828650	Captain reported long delay due to fuel imbalance and thrust reversers inhibited caused by human factors during return to service from long term storage.
1828418	Air Carrier Captain reported observing a critical ground conflict at ORD airport when Runway 22R was being used as a taxiway.
1827915	Flight Attendant reported an increase in mask non-compliance during flight operations and requested additional guidance.
1827469	TRACON Controller working busy combined arrival sectors descended an aircraft from 6,000 feet to 5,000 feet which caused a conflict with another aircraft.
1824040	Air carrier Captain reported an overweight landing at destination airport caused by failure to monitor fuel burn during flight. Captain cited rusty pilot skills caused by COVID inactivity as a contributing factor.
1823508	CRJ-900 Captain reported that during arrival with an inoperative APU, the fueler hooked up and began his upload prior to the engine being shut down or gate power applied, causing the Captain to secure the engine and order the fueler to discontinue fueling. He further stated that COVID had impacted the currency of training and compliance with procedures.
1823021	Air carrier Flight Attendant reported passenger misconduct related to COVID-19 mask requirements.
1822478	A Tower controller and flight crew reported the flight crew departed an airport with a closed tower without approval for release from the ARTCC. The Tower Controller reported they failed to advise the flight crew to hold for release after issuing their clearance prior to Tower closing.
1821087	Air Carrier Flight Attendant crew reported a fume event during flight which resulted in physiological symptoms.
1820895	First Officer reported a rejected take off after mishearing a take off clearance as theirs, that was meant for another aircraft.

ACN	Synopsis
1819894	TRACON Controller reported they issued a 360 degree vector for sequencing to an aircraft and failed to notice that it put the aircraft into conflict with traffic at the adjacent sector. The Controller noted a lack of proficiency at working busy periods due to the recent reduced air traffic due to COVID-19.
1818631	Flight Instructor reported mistakenly taking off without clearance which led to an NMAC event with another aircraft taking off.
1818078	B-757 Captain reported aircraft being returned to service from long term storage suffered an auto throttle malfunction on climb out and subsequently learned that later flights had the same problem.
1818033	A TRACON Controller reported they forgot to handoff an aircraft to Departure Controller.
1817315	Air Carrier Flight Attendant reported electrostatic cleaning fumes linger on to preflight and boarding of subsequent flight.
1817229	B737-800 flight crew reported a clearance deviation due to automation mismanagement and CRM issues.
1816701	Small aircraft instructor and student reported momentary incursion of ORD Class B airspace, citing lack of recent flying experience as contributing factor.
1815953	A Single Light Aircraft Pilot, with low flight time because of the pandemic, reported a NMAC turning final after getting confused because of similar call signs. The Tower controller separated the aircraft and a normal landing was accomplished.
1815931	Technician reported a coworker struggled with a main wheel brake change and made errors during installation, even with help, possible due to lingering COVID issues.
1815340	CRJ-200 flight crew reported failing to include the jumpseater in the weight and balance calculations.
1815317	Captain reported passing the hold short lines on a taxiway due to distractions from helping his First Officer with tasks.
1814641	Light aircraft pilot reported a runway incursion during taxi and cited lack of current flying experience due to COVID restrictions as a contributing factor.
1814273	Air Carrier flight crew reported incorrect taxi clearance was issued by ATC and cited possible staffing issues at the controlling facility as a contributing factor.
1813720	Air Carrier Flight Attendant reported a fume event while waiting to board passengers resulting in physiological symptoms.
1812538	Air carrier flight crew reported turbulence and weak aircraft familiarity, resulted in airspeed mismanagement and confusion.
1811045	Air carrier flight crew on short final to LAS reported a go-around due to a TCAS/RA Alert for a VFR helicopter.
1811010	Fractional jet crew reported their HF Radio did not work during a flight through non radar airspace so they relayed required position reports through other aircraft.
1810679	Air carrier Captain reported numerous interruptions caused distractions during pre-departure checks and caused concern over following published procedures.
1810630	ZJX Center Controller reported an aircraft started a climb due to incorrect readback/hearback which resulted in a loss of standard separation.
1810171	Air carrier flight crew reported an airborne conflict resulting in a TCAS RA.
1809981	Air carrier flight crew reported deviations from standard practices due to distractions in the cabin, causing check list omissions.
1809587	Air Carrier Dispatcher reported a communication breakdown with Maintenance regarding Thermal Containment Bag replacement.
1809572	Air Carrier pilot reported excessive frequency congestion at EWR airport due to VFR transitioning aircraft using the same Tower frequency as arrival and departure traffic. The reporter stated these operations used to have separate frequencies to alleviate the congestion.
1809171	A319 Captain Check Airman re-qualifying another Captain reported the Captain failed to comply with a crossing restriction issued by ATC during approach.
1809013	A Center Controller reported they assumed adjacent sectors were combined but they were not, which resulted in an airspace violation and two aircraft on conflicting routes entering the next facility sector.
1808926	Technician reported confusion in signing off items when returning an aircraft to service after storage.
1808495	B737-700 flight crew reported confusion and communications problems during push back and taxi.
1808147	Private Pilot reported runway incursion occurred during taxi and cited being new to the airport as a contributing factor.
1808027	Air carrier flight crew reported an unstabilized approach due to lack of recent flying experience, weather, and ATC instructions.
1807842	Single Private Pilot reported, after a year away from flying due to COVID-19, not following proper IFR communication procedures after departure.
1806767	Air carrier flight crew reported being advised the aircraft had a reported tail strike that they had not noticed, and distractions from wearing masks to do required checks.
1806496	Center Controller reported not being able to talk to an aircraft and the prior sector was having difficulties which left the aircraft high at a crossing restriction.
1806206	Air carrier Captain reported being high on a STAR and asking ATC for relief.
1805938	Captain reported a Flight Attendant distracted the flight deck crew during the landing rollout to inform them a passenger was not conforming to face mask policy.

ACN	Synopsis
1805820	GA pilot and ATC Tower personnel reported the pilot departed from a taxiway resulting in a conflict. Pilot cited lack of flying as a contributing factor.
1805497	Air Carrier Ramp Agent reported concerns with having to wear a face mask outside when the weather is getting hot making it difficult to breathe.
1805450	TRACON Controller reported a loss of separation between an air carrier and a small aircraft and cited staffing issues as a contributing factor.
1805270	Air carrier Captain reported the PF overshot the assigned altitude during arrival and attributed it to fatigue, workload and the PF had not flown in a year.
1805214	Corporate aircraft Captain reported overshooting assigned altitude during departure due to a late ATC Clearance. Captain also cited lack of flying as a contributing factor.
1805208	Small Transport aircraft pilot reported not making a crossing restriction during approach due to numerous distractions.
1805069	Air carrier flight crew reported a speed deviation under Class Bravo and then overshooting assigned altitude. The Captain cited lack of flying as a contributing factor.
1804991	Air carrier Captain and a Flight Attendant reported a Flight Attendant was still standing during takeoff roll due having to deal with a passenger not complying with face mask policy.
1804290	Air Carrier Captain reported the crew was to conduct an in-flight check of an aircraft that had been parked during the pandemic for an extended period of time. The type of maintenance check was written unclearly.
1803706	Air carrier flight crew reported a taxiway incursion and cited communication problems with ATC as a contributing factor. Reportedly, the Controller's instructions sounded muffled due to wearing a face mask.
1803545	Lead Ramp Serviceman reported lack of equipment sanitation due to on-time departure pressure and working with different personnel throughout the airport.
1803488	GA pilot reported violating a Class C airspace while dealing with a flap malfunction.
1802841	Air Carrier flight crew reported a speed deviation occurred during the SID procedure and stated that a prolonged period of time off for both pilots was the main cause.
1802831	A321 Captain reported a flight attendant notified them the ovens were turned off due to odor in forward galley.
1802729	Air carrier flight crew reported an altitude deviation caused by lack of recent flight experience, fatigue and three clearance changes before departure.
1802697	Air carrier First Officer reported the lack of recent experience caused the improper use of SOP's during a takeoff configuration irregularity.
1802516	Captain reported an altitude deviation during departure.
1802440	Air carrier Captain reported a track heading deviation during cruise after instituting a 2 mile right offset as a SLOP while still under radar contact. Captain cited lack of flying as a contributing factor.
1802425	Air carrier Captain reported not performing the Before Taxi Checklist and subsequently had not set the flaps to the takeoff setting prior to moving the aircraft. Reporter cited distraction from dealing with face mask issues in the cabin area may have contributed to the event.
1802319	Air carrier flight crew reported an altitude and track heading deviation during approach to an international airport. The crew stated this sequence of flights, since the COVID-19 pandemic started, are very long and fatiguing which may have been a factor in the event.
1801802	Air carrier Captain and a Flight Attendant reported a passenger's child was resisting wearing a face mask. After this problem started the parent then stated the child was under 2 and did not need to wear the face mask.
1801646	B737 MAX Captain reported that the CAT III Placard was not visible to the flight crew due to the cockpit displays not configured properly by Maintenance.
1801444	Technician reported being advised of signing off for work that was not completed. Technician cited COVID-19 pandemic related worry and distraction as contributing factors.
1801390	Flight Attendant reported health concerns for the crew and passengers having to wear face masks after the APU was inoperative and the cabin temperature was hot.
1801314	Air Carrier flight crew reported selecting the incorrect flap setting during a go-around maneuver. The Captain stated lack of flying was a contributing factor.
1801086	Air carrier flight crew reported an altitude overshoot during departure and cited the aircraft being light and lack of flying as contributing factors.
1801034	Center Controller working combined position reported communication issues with an aircraft after being distracted by a nearby manager having a loud conversation.
1801032	Ground Controller reported safety concerns with working combined positions, being overworked and under staffed especially in weather conditions.
1800917	Air Carrier First Officer reported an altitude deviation during approach caused by possible fatigue, a late runway change and lack of recent flying experience during the pandemic.
1800908	Air carrier Captain reported final configuration was not accomplished until 700 feet which is not in accordance with the manual.
1800902	Air carrier flight crew and a Flight Attendant reported a minimum crew issue prior to boarding of deadheading flight attendants and pilots.
1800896	Pilot reported the ATC Tower at POU airport closed mid-afternoon during the COVID-19 pandemic, but unbeknownst to the reporter; the Tower had returned to normal hours of operation during this flight. Reportedly, there was no notice or NOTAM advising of the change.

ACN	Synopsis
1800795	Pilot reported communication issues with ATC left them too high near their destination and stated the Controller was overworked and understaffed.
1800683	Air Carrier Captain reported over-speeding the aircraft and cited lack of flying as a contributing factor.
1800391	Center Controller reported an unsafe shift due to weather and lack of staffing resulting in handoff and separations issues.
1800382	Private pilot reported a taxiway incursion and cited lack of flying and being distracted dealing with a flooded engine as contributing factors.
1800325	Maintenance Technician reported one of their aircraft was found to have wiring issues causing the ADS-B to malfunction. The aircraft had been in storage for an extended time period.
1800229	Air carrier First Officer reported safety related concerns with flying into and out of a challenging foreign airport. Reporter cited lack of flying, training and fatigue inducing scheduling all increase the risk of flying into this location.
1800220	Air carrier Captain reported that a foreign airport under COVID-19 closure scheduling does not allow for proper pre-flight procedures.
1800194	Air carrier First Officer reported safety and health concerns with personnel having to wear face masks.
1800138	Air carrier flight crew reported the First Officer inadvertently turned off the number one engine rather than engine number 2 during taxi-in resulting in a momentary EGT spike. Both crew members cited lack of flying as a contributing factor.
1800041	Center Controller reported safety concerns with having to wear face masks while on position. Controller referenced the face mask is distracting and make instructions difficult for pilots to understand.
1800020	Center Controller reported that due to COVID-19 cleaning, four separate data input keyboards were not functioning properly.
1800010	Center Controller reported that the ZZZ Center Contingency Plan was not followed for COVID -19 ATC cleaning of an underlying Approach facility.
1799974	GA pilot reported not being able to activate an IFR Flight plan due to ATC not having it on file. An adjacent ATC facility could not provide help either. Pilot also reported entering Class Bravo airspace unintentionally after misreading the aircraft's new GPS system.
1799715	Air Carrier First Officer reported not following company communication procedures and cited lack of flight time between training and actual OE flight as a contributing factor.
1799711	Air Carrier Captain reported a track deviation and cited lack of flying by both pilots contributed to the event.
1799646	Air Carrier Captain reported an altitude deviation during arrival. Captain cited the First Officer's lack of flying and being distracted by a PA as contributing factors.
1799488	Corporate pilot reported a track heading deviation after misprogramming the FMS resulting in two fixes being dropped from the route. Pilot cited time pressure and lack of recent flying as contributing factors.
1799448	Air carrier Captain reported finding out a FAA facility was going to close via personal sources rather than through the flight release information.
1799300	Flight Instructor reported a student flew a cross country flight without having the correct solo endorsement.
1799163	Air carrier flight crew reported not filing correct paperwork for a tow bar that broke during pushback. The Captain stated lack of flying contributed to the oversight.
1799131	Air carrier Captain reported a ramp incursion resulting in a conflict and cited lack of flying as a contributing factor.
1799109	Center Operations person reported procedural confusion when they took over the operations of a TRACON facility that went ATC Zero due to COVID-19 cleaning.
1799099	Controller reported similar calls signs may have contributed to an aircraft taking another aircraft's assigned altitude. Controller also cited staffing issues as a contributing factor.
1799076	GA pilot reported a conflict after being told to cross a runway, and while crossing observed an aircraft on short final. Pilot cited distraction and ATC staffing as contributing factors.
1799059	Pilot reported having to ask Controller several times if they were cleared to land during approach. Reporter stated the Controller was probably overwhelmed working three positions/frequencies at the same time.
1799039	Ramp employee reported that passenger counts and baggage are increasing, but there are not enough piers open to safely accommodate baggage handling.
1798864	Air Carrier Captain reported a father with two children were non-compliant with face mask policy during the flight.
1798851	ATC Ground Controller reported giving incorrect taxi instructions to a crew resulting in a ground conflict. Controller reported the crews had not flown into their airport in a while due the COVID-19 pandemic, which may have contributed to the event.
1798850	ATC TRACON Controller reported an airborne conflict and cited short staffing levels due to COVID-19 scheduling as a contributing factor.
1798768	Flight Attendant reported after the aircraft had been sanitized a strong odor remained for a lengthy period of time resulting in throat and eye irritation.
1798714	Air Carrier Captain reported confusion regarding medical certification expiration date in reference to the COVID-19 extension.
1798389	GA pilot reported a loss of communication with the ATC Center resulting in an ADS-B traffic alert. Reporter cited possible COVID-19 related ATC staffing issues may have contributed to the event.

ACN	Synopsis
1798303	Air Carrier Dispatcher reported the aircraft returned to the gate to load a shipment of vaccine that was initially forgotten.
1798292	Air Carrier flight crew reported entering incorrect performance data and cited being rushed for takeoff and FO's lack of flying as contributing factors.
1798250	Air carrier flight crew reported an unstable approach and a hard landing. Both pilots reported lack of flying as a contributing factor.
1798043	Center Controller reported trying to move sector positions to help accommodate COVID-19 cleaners but ran into problems with the voice switches and frequencies not being configured correctly.
1798025	Local Controller who was in the 2 minute relief window observed a runway incursion that resulted in a ground conflict and cited COVID-19 related taxi procedure as a contributing factor. A Captain of one the the aircraft also reported the event and stated communication issues with ATC a factor.
1797439	Flight Attendant reported the aircraft cleaners were slipping onboard to clean the aircraft before the passengers were completely off. One last passenger, resembling a cleaner, remained intermixed with crew and cleaners during the crew's exit.
1797291	Air Carrier jumpseat pilot reported the First Officer on this flight insisted the jumpseater wear a face mask throughout the flight. Reporter described safety related concerns with having to wear the face mask including fogging of glasses, communication problems, and issues associated with putting on the O2 mask in case of a rapid decompression.
1796771	Flight Instructor reported being unaware of the 48 hour no fly rule and instructing the day after being vaccinated for COVID-19.
1796483	Air Carrier First Officer reported fatigue related concerns with the scheduling of particular international flights since the COVID-19 pandemic began.
1796448	Air Carrier First Officer reported a flap overspeed during visual approach. It was the First Officer's first flight after being out due to furloughs.
1796399	Center Controller reported an aircraft was in severe turbulence and was descended out of the altitude for safety. Reported stated it was a difficult situation to deal with due to COVID scheduling/staffing and working a combined position.
1796383	TRACON Controller reported having to make a configuration change but the data tags did not change to the correct airport configuration, making the reporter move quickly to a close by position and sharing the scope.
1796375	Center Controller reported having a loss of separation after assuming a busy sector from a training team.
1796374	TRACON Controller reported the facility went to ATC Zero after someone tested positive for COVID-19. Controller stated they were moved to the Local Tower and worked from there. Reporter advised the move could have been delayed to a non-busy time due to everyone already being exposed.
1796147	Corporate Captain reported an altitude deviation during approach and cited lack of flying as a contributing factor.
1796133	Single pilot reported unable to understand the Controller's instruction clearly due to the pilot's face mask interfering with the over ear headset.
1796125	Air Carrier Captain reported difficulty understanding Center controllers and believes the problem maybe the controllers are wearing face masks.
1796107	Corporate Captain reported an altitude deviation that caused an airborne conflict (TA) and cites Controller/Pilot communication and the First Officer's (PF) lack of flying as contributing factors.
1795928	Air Carrier Administration Office employee reported a pilot's FAA Medical Certificate was erroneously marked as expired during the COVID-19 extension period.
1795884	Air carrier flight crew reported missing re-setting the auto-brake system before takeoff and cited dealing with a passenger not complying with face mask policy as a contributing factor.
1795543	TRACON Controller reported having an aircraft that wanted one approach, but the tower was closed and the approaches were set up for the opposite direction. Controller reported possibly confusing pilot with clearances.
1795514	Air taxi First Officer reported an altitude deviation during arrival and cited short staffing, fatigue and stress due to the COVID-19 pandemic as contributing factors.
1795437	Flight Attendant reported the Captain did not give a crew briefing after the Flight Attendant asked for social distancing.
1795393	Air Carrier flight crew reported a track heading deviation during approach due to communication issues with ATC. The First Officer cited the Captain wearing a face mask on the flight deck may have contributed to the communication problems with ATC and between them.
1795292	Two air carrier captains reported delays due to incorrect MEL procedures performed by maintenance and a passenger not complying with face mask policy.
1795238	Corporate Captain reported the Controller was working 6 frequencies at once and issued an incorrect altitude clearance.
1795121	Air carrier First Officer reported a failure to notify the Captain that the aircraft's speed was exceeding the clearance limit during climbout. First Officer cited lack of flying as a contributing factor.
1795019	Air Carrier Captain reported an altitude deviation and explained the PF had been on reserve and flown little in the last two months which may have contributed to the event.

ACN	Synopsis
1794882	Air Carrier First Officer reported a track heading deviation and an altitude deviation during approach resulting in an RA event and cited lack of flying contributed to the event.
1794877	Air Carrier First Officer reported an altitude deviation and cited the Captain being new to the aircraft and both pilots' lack of flying contributed to the event.
1794806	TRACON Controller reported being distracted by attempting to put on a mask and did not issue important traffic to an air carrier on final. Tower Controller reported issuing traffic to an arrival about an unknown aircraft that was pointed out to the TRACON, but the TRACON Controller never advised the Tower Controller.
1794733	Flight Attendant reported after almost an entire year of being on extended leave of absence during COVID-19 schedule reductions, the disruption of routine led the FA to forget the safety briefing for the exit row passengers.
1794666	Air Carrier flight crew reported not following SOPs during the takeoff and departure phase and forgetting to select VNAV mode resulting in a delayed flap retraction. Captain stated lack of flying contributed to the event.
1794548	ATC Controllers reported an airborne traffic conflict due to changes to the base altitude of the restricted airspace. A Controller stated it is difficult to keep informed of changes and stay proficient because controllers are working several different positions for short periods.
1794546	Center Controller reported having difficulty communicating with pilots while wearing a face mask and stated that the requirement to wear face masks causes distractions and limits the ability to safely conduct air traffic control procedures.
1794436	Air Carrier Captain reported during pre-flight duties the crew noticed dusting in the air and believed it to be spray for COVID. Captain was told by Maintenance to shut down and vacate the aircraft.
1794252	Flight Attendant reported it is too early to expand the inflight service. There are too many passengers with face masks down, talking with masks down, and social distancing issues during the inflight service.
1794232	Air Carrier Captain reported an error regarding passenger seating location and took off with an incorrect passenger count.
1794158	Air carrier flight crew reported a track heading deviation during approach and cited lack of flying as a contributing factor.
1794131	Corporate Jet Captain reported exceeding the 250 knot speed restriction below 10,000 feet and cited lack of flying as a contributing factor.
1793995	Air Carrier First Officer reported an unstabilized approach and cited not using SOPs and missing call outs from the Captain as contributing factors.
1793982	Air carrier Captain reported the ATC Center Controller was difficult to understand because the individual was wearing a required face mask.
1793963	Air carrier flying pilot reported an altitude deviation during arrival and cited lack of flying as a contributing factor.
1793950	Air Carrier Captain reported passengers not conforming with face mask policy during flight and had personnel meet the aircraft on arrival.
1793948	Air carrier flight crew reported an altitude deviation during departure and cited lack of flying as a contributing factor.
1793482	Air carrier Captain reported a hazardous material documentation issue while attempting to transport a vaccine.
1793425	Pilot reported overshooting an altitude on departure and attributed the event to lack of recent flying and poor use of HUD.
1793420	Air Carrier flight crew reported a critical ground conflict occurred during taxi out and stated they were not advised by Ground Control of the approaching aircraft.
1793331	TRACON Controller reported a pilot questioned a heading clearance and cited a possible muffled transmission due to wearing a face mask as a factor.
1793301	Pilot reported not having flown in a while, having difficulty finding an airport, and having issues with ATC.
1793152	Air Carrier flight crew reported an altitude deviation due to a misunderstanding of ATC instructions. The crew cited lack of flying as a contributing factor.
1793055	Flight Attendant reported the aircraft cleaners are not adhering to the social distancing policy.
1792823	Air carrier Captain reported entering the ramp without contacting ramp control and cited as contributing a confusing clearance and non-standard operations at airports where ramp control is frequently out of service due to COVID-19.
1792640	Center Controller reported an airborne conflict and cited staffing issues due to COVID-19 as a contributing factor.
1792566	Flight Attendant reported forgetting to brief the exit row and cited not flying for five months as a contributing factor.
1792508	Air carrier First Officer reported the ATC Approach Controller seemed overloaded with arriving aircraft and gave the heading change for localizer intercept too late.
1792417	Air carrier Captain reported landing after an unstable approach when they should have gone around.
1792375	Air carrier First Officer reported not being able to communicate with ATC due to Controller working Tower and Ground Control combined at HOU airport.
1792085	Air Carrier flight crew reported they did not follow SOP's for an existing aircraft condition and continued the takeoff.
1792083	Air Carrier flight crew reported the Right Bleed Trip Off light illuminated during takeoff roll resulting in a rejected takeoff.

ACN	Synopsis
1791930	Air carrier flight crew reported not checking a cargo door that had a MEL on it due to a distraction before departing resulting in a divert.
1791906	Air carrier First Officer reported exceeding the maximum altitude at an intersection during climbout.
1791799	TRACON Controller reported numerous issues while working traffic and problems associated with the workload and staffing.
1791669	Air carrier flight crew reported not making a crossing restriction during arrival.
1791396	TRACON Controller reported wearing an FAA mandated face mask is fogging up the Controller's glasses. Reporter cannot remove glasses due to FAA Physical requirements.
1791392	TRACON Controller reported having to repeat transmissions to pilots because they could not understand the instructions, due to reporter wearing a face mask.
1791338	Flight Attendant reported being distracted by a disruptive passenger and forgetting to advise the flight crew the cabin was secure and they were ready to depart.
1791196	GA pilot reported thinking the Tower was closed, started to taxi to the runway and was stopped by an airport vehicle who pointed to the radios. The pilot contacted the Tower before takeoff.
1791182	GA pilot reported the ATC Controller was busy, rushed and hard to understand possibly due to speaking through a face mask and the facility being short staffed.
1791134	Flight Attendant reported concern regarding the face mask policy as it covers a passenger's identity and creates a possible way to hide unwanted items under the mask.
1791133	Flight Attendant reported concern for passenger health regarding the face mask policy when the aircraft is on the ground with little or no air circulation and the cabin is hot.
1791058	Air carrier Captain reported the First Officer advanced thrust levers to TOGA without releasing the parking brake.
1790962	Air Carrier flight crew reported a track deviation due to the First Officer's confusion with the FMC. Reportedly, the First Officer has changed aircraft during the pandemic several times which may have contributed to the event.
1790944	Air carrier flight crew reported the First Officer (PM) read back the wrong clearance to ATC during departure causing confusion. The First Officer cited lack of flying contributed to the event.
1790884	TRACON Controller reported safety related issues with having to wear face masks while on position.
1790835	Tower Controller reported a taxiway incursion due to the aircraft flight crew not following clearance instructions.
1790803	TRACON Controller reported an airspace violation and cited not being sure if another sector was open or not open as a contributing factor.
1790791	TRACON Controller reported communication problems with an aircraft while the facility was being cleaned/disinfected.
1790781	TRACON Controller reported having to repeat multiple transmissions due to clarity issues while having to wear a face mask.
1790756	Center Controller reported multiple read back errors while wearing a mandated face mask.
1790751	Center Controller reported communication issues with pilots while wearing a face mask.
1790734	Controllers reported an aircraft that they were not talking to was on an IFR flight plan, below the MVA and NORDO.
1790733	TRACON Controller reported communication issues with pilots due to having to wear a mask which is exacerbated when new procedural changes are introduced.
1790636	GA pilot reported flying without proper certification.
1790572	Flight Attendant reported passengers were boarded before the pilots arrived at the aircraft. No air conditioning was available and passengers began removing their face masks.
1790248	Pilot reported a Class B airspace violation and cited ATC communication issues and the co-pilot's lack of recent flying as contributing factors.
1790157	Air carrier First Officer reported a return to gate after Dispatch told them they had an improperly signed maintenance item. The aircraft had several maintenance items that needed to be addressed before the flight due to it just coming out of long term storage.
1789892	Air carrier Captain reported a track heading deviation. Captain stated when the clearance was sent to the FMC with the new routing the FO was not aware of the LOAD FMC prompt so the new routing was never loaded.
1789362	Air Carrier Captain reported a change in airport procedures, due to COVID-19, caused the flight crew to miss the required signing of the Flight Release.
1789361	Air Carrier flight crew reported they had an agreement between themselves regarding face mask policy on the flight deck and may have violated FAR/SOP policy.
1789111	Air Carrier flight crew reported the aircraft was carrying a pre-COVID passenger load and they were not prepared for the higher flap speeds required for a stable approach.
1788803	Air Carrier Captain reported the aircraft database was a few revisions 'out of date' and suspects the aircraft was 'parked' during the pandemic for an extended period of time.
1788776	Student pilot reported taking a flight lesson prior to the 48 hour waiting period after receiving a COVID-19 vaccine.

ACN	Synopsis
1788734	Flight Attendant reported, after gate arrival, the oncoming cleaning crew was interfering with passenger deplaning and social distance policy.
1788520	Air carrier Captain reported passengers were unruly and not complying with face mask policy despite multiple warnings by the crew resulting in a diversion, and removal of the passengers.
1788038	Air carrier First Officer reported exceeding 250 knots below 10,000 feet due to a reduced passenger load on climbout.
1787908	Air Carrier Captain reported an altitude deviation during descent and cited being distracted due having a conversation about COVID-19 and job security.
1787885	Flight Attendant reported there was no social distancing by the aircraft cleaners during deplaning and also stated the Gate Agent was not wearing a face mask.
1787877	Air Carrier flight crew reported an airspeed and altitude deviation due to weather, hand flying and having an aircraft with a light passenger load.
1787396	Corporate pilot reported flying without a current medical.
1787389	Pilot reported a possible landing without a clearance and cited lack of flying as a contributing factor.
1787174	GA pilot reported entering Class B airspace without a clearance.
1787156	GA pilot reported receiving the COVID-19 vaccine and flying before the 48 hour wait period requirement. Pilot did not read the FAA circular regarding the vaccine and developed a headache during the flight.
1786996	Air Carrier flight crew reported a communication misunderstanding between the pilots resulted in conflict during approach. The Captain stated they were both wearing face masks and that it may have contributed to the miscommunication as their voices were muffled.
1786905	GA pilot reported entering Class C airspace without clearance.
1786873	Instructor pilot reported a track heading deviation during a training flight with a student.
1786858	Air carrier Captain reported observing a cleaning crew onboard an aircraft not wearing face masks correctly. Pilot also reported people in terminal not wearing face masks correctly.
1786767	Air Carrier Captain reported the unannounced closure of a TRACON that was possibly due to an 'ATC Zero' event caused a divert for fuel. Captain reported there was only one ATC Controller working multiple positions.
1786572	Air Carrier Captain reported an unstable approach.
1786543	GA pilot reported not contacting ATC at the required DME due to lack a of flying time during the pandemic.
1786524	GA pilot reported an altitude deviation during departure and cited lack of flying as a contributing factor.
1786502	Maintenance Technician reported safety concerns related to the having to wear a face mask while performing job duties on airport property and suggested the requirement guidelines should be revisited.
1786435	Air carrier First Officer reported an altitude overshoot and cited loss of pilot/ATC communication proficiency due to lack of flying as a contributing factor.
1786330	Dispatcher reported receiving an ATC Zero event notice too late, the flight was already taxiing for takeoff, and then having to notify the crew to return to the gate for a several hour ATC delay.
1786187	Air Carrier flight crew reported a taxiway/runway incursion and cited being rushed to beat an ATC Zero time contributed to the event.
1786115	Flight Attendant reported concerns regarding face mask policy and how passengers would react in the event of a rapid depressurization.
1786082	Dispatcher reported the information regarding an ATC Zero event was not received in time to change the aircraft's fuel load and prevent a diversion.
1785965	Center Controller reported an airspace deviation and cited confusion due to another Center going ATC Zero contributed to the event.
1785903	Flight Attendant reported possible exposure to COVID-19 and cited no action on the part of the company. Flight Attendant also stated a reported slide bustle maintenance issue was also ignored.
1785691	Air Taxi flight crew reported not hearing ATC for a while during cruise. Reportedly, they had not been properly handed off to the next Center.
1785690	Flight Instructor reported an altitude overshoot due to unfamiliarity with aircraft equipment.
1785649	Embraer Legacy First Officer reported altitude and heading discrepancies and cited distraction from an AT disconnect as a contributing factor.
1785616	Captain reported being advised that a passenger told the Flight Attendant they may have been exposed to COVID-19.
1785418	Pilots reported equipment issues on a flight due to the aircraft having been in storage for several months.
1785337	Center Controller reported an understaffed shift and multiple sessions on position resulted in mental fatigue leading to an airborne conflict.
1785324	Tower Controller reported low staffing levels during periods of complex traffic combined with undue outside pressures have created an unsafe situation.
1785268	Flight Attendant reported concerns with the close proximity of occupied jump seats during takeoff and landing.
1785235	Air Carrier pilot reported the aircraft was boarded without minimum FA crew because the FAs were late completing COVID-19 declaration form.
1785167	Ground employee reported concerns about being sent to a random clinic for screening during the COVID-19 pandemic.

ACN	Synopsis
1785122	Center Controller reported an understaffed shift with high traffic volume and offered recommendations to remedy the situation.
1785104	GA pilot reported becoming NORDO enroute and thinking because of the COVID-19 pandemic the radio just had less communication traffic.
1784993	B737-800 First Officer reported a GPS-L annunciation on departure which distracted flight crew from calling flaps up at the appropriate speed.
1784955	Air Carrier Captain reported the van driver from the hotel to the airport would not wear a face mask.
1784953	Air Carrier First Officer reported poor CRM with the Lead FA regarding the company face mask policy on the Flight Deck.
1784952	Air carrier Captain deadheading on a company flight reported a passenger would not conform to the face mask policy and was hostile, aggressive, belligerent towards the flight attendants.
1784943	Air carrier First Officer reported the Captain chose not to wear a mask for safety of flight concerns while wearing glasses.
1784925	Center Controller reported thinking it was later then it was and did not transfer communication to underlying TRACON, assuming the Center already had their airspace.
1784889	Maintenance Instructor and Trainee reported a training mistake during a training session and both cited being off for an extended time contributed to the event.
1784887	Technician reported the maintenance crew was advised the aircraft had not been disinfected after the inspection and repairs were already in progress.
1784841	Air Carrier Captain reported a taxiway/runway incursion and cited ATC staffing, local ATC procedure change and confusion over a NOTAM contributed to the deviation.
1784801	Air Carrier First Officer reported an RA event and blocked ATC communications due to possible COVID-19 ATC staffing issues.
1784779	Air Carrier Captain reported telling the Lead Flight Attendant that he would not be wearing a face mask in the flight deck due to safety of flight reason as his glasses fog up when wearing a face mask.
1784771	Air Carrier Captain reported concerns with airlines possibly making it mandatory for employees to get the COVID-19 vaccine.
1784579	Air Carrier First Officer reported the pilot crew realized, in cruise, the weight and balance data were incorrect. The pilots did not question the small passenger load, which is common during the COVID-19 pandemic, before takeoff.
1784426	TRACON Controller reported clearance communication issues with an aircraft resulted in a conflict which was saved by another attentive Controller who offered a different heading to avoid further separation issues.
1784382	GA pilot reported CTAF communication challenges at an airport that normally would have a working Tower facility, but was closed due to COVID-19.
1784362	Flight crew reported a Class Bravo airspace violation due to the Tower being closed for COVID-19 issues.
1784281	Flight Attendant reported after flying an all-nighter, they had to wait 3 hours in the crew lounge to make an additional two hour flight.
1784263	Air carrier Captain reported a lack of recency flying and a reliance on the muscle memory/normal after start flows contributed to an error in turning the APU off prematurely.
1784258	Air carrier Captain reported a Flight Attendant stated they would not enter the cockpit for pilot break unless pilots were wearing a face mask. Captain described some the communication issues related to wearing a face mask.
1784222	Air carrier Captain reported COVID-19 screening in foreign country contributes to fatigue, physiological, and psychological concerns.
1784065	Air carrier Captain reported forgetting to do the pre-takeoff checklist due to being distracted by a passenger being boarded without permission and another passenger not complying with face mask policy.
1783995	Air carrier flight crew reported receiving a message from Dispatch during climbout that destination TRACON was closing before arrival. Dispatch told crew to return to departure airport.
1783972	Customer service representative reported that a kiosk was used by an employee whose wife had COVID. Reporter was advised the kiosk was cleaned, but another employee stated the kiosk was never cleaned.
1783879	GA pilot reported inadvertently flying without a current medical.
1783856	Flight Attendant reported a passenger boarded the aircraft with a mask that had holes.
1783846	Corporate Captain reported a speed deviation during climbout. Captain referenced distraction while trying to communicate with a busy ATC and lack of flying contributed to the event.
1783828	Air carrier flight crew reported executing a go-around due to ATC spacing with another aircraft on final. The flight crew overshot their altitude during the go-around and cited the aircraft light weight as a contributing factor.
1783812	Air carrier Captain reported a track heading deviation during departure. Captain cited distraction dealing with an ECAM alert and lack of flying contributed to the event.
1783784	Ground employee reported co-workers are not complying with face mask policy and supervisors are ignoring the issue.
1783735	Corporate Captain reported an incorrect read back for altitude which caused their aircraft to climb an additional 2,000 feet resulting in an airborne conflict with another aircraft.
1783713	Reporter reported possibly flying commercially with a third class physical several years ago.

ACN	Synopsis
1783607	Ground employee reported plastic shields should be added to the tables in a break room.
1783578	Air carrier flight crew reported loading the wrong approach in the FMC and received clearance to land on the selected runway because of light traffic due to COVID.
1783505	Flight Attendant reported a passenger was not compliant with face mask policy.
1783497	Flight Attendant reported a child was not wearing a face mask on the flight and questioned how flight attendants could enforce a child to wear a mask.
1783480	Dispatcher forgot to include Non-Tower Operations worksheet with the aircraft paperwork.
1783453	Air carrier Captain reported experiencing wind shear on final resulting in a go-around. Captain made reference to the First Officer's lack of flying as a contributing factor.
1783422	Air carrier Captain reported taxiing into a gate with the use of a Marshall, while the self-parking guidance system was indicating STOP.
1783417	Air carrier Captain reported they were not allowed into a foreign country due to not having proof of negative COVID-19 test results, nor proof of having been vaccinated.
1783416	Air carrier Captain reported a passenger was not compliant with face mask policy.
1783348	Private Pilot reported the cause of the deviation was not flying for 2 months during the pandemic and was rusty and needed practice.
1783290	GA pilot reported a track heading deviation after entering incorrect information in the GPS and cited lack of flying as a contributing factor.
1783226	Flight Attendant reported a passenger was non-compliant with face mask policy and interfered with FA crew duties.
1783197	Flight Attendant reported a passenger was not complaint with face mask policy.
1783191	Flight Attendant reported concerns regarding the assigned jump-seat and its location near passenger seats.
1783190	Flight Attendant reported a passenger was seated in the company social distancing blocked seat.
1783189	Flight Attendant reported concern after a passenger stated he and his wife had recently recovered from COVID-19.
1783182	Flight Attendants reported a passenger was moved to a seat, against company policy, near their jump seat by the Gate Agent.
1783179	Flight Attendant reported being assigned to a passenger seat next to a customer that continually removed their face mask.
1783170	Flight Attendant reported a passenger was required to remove a mesh face mask, while the Gate Agent did not agree, and use a company supplied mask before departure.
1783169	Flight Attendant reported a passenger was not compliant with face mask policy.
1783166	Flight Attendant reported forgetting to wear a face mask during descent while performing safety duties and collecting passenger trash.
1783165	Flight Attendant reported feeling the company is not doing enough to protect the frontline employees during the pandemic.
1783161	Flight Attendant reported concerns with many passengers not wearing face masks in the gate area at airport.
1783139	Dispatcher reported being distracted by ATC Zero events, airspace closures due to COVID and forgetting to inform a flight crew that HF radio communication would be necessary.
1783091	Air Carrier flight crew reported a heading deviation caused by not following SOP's and a change to the crew's normal procedures due to the pandemic.
1783019	Air carrier flight crew reported returning to the gate after receiving notification a Flight Attendant onboard had been exposed to COVID-19.
1783017	Air carrier First Officer reported a long landing possibly outside of the landing zone. Reporter attributed discrepancy to possible company policy of adding speed to straight in landings and the aircraft being light in weight.
1782990	Air carrier flight crew reported an overshoot of altitude on departure and made reference to the aircraft being light in weight.
1782950	Air carrier Flight Captain reported being ready to push an aircraft that was planned for a reposition, when the cabin door opened, and a cleaning crew came aboard.
1782877	Air carrier Captain reported a passenger was not complaint with face mask policy during flight.
1782864	Air carrier First Officer reported a flight pairing where they had no proper food available and minimal sleep leaving them fatigued and hungry during flights.
1782848	Air carrier First Officer reported confusion with ATC's clearance resulted in a missed approach.
1782817	Air carrier First Officer reported an unstable approach and stated they should have executed a go-around.
1782783	Ground employee reported difficulty moving aircraft off a specific gate due to reduced clearance.
1782770	Air carrier Captain reported problems associated with the HF equipment on specific oceanic flights.
1782763	Air carrier Captain reported the airspeed indicator failed on the Captain's side during takeoff roll resulting in a rejected takeoff.
1782759	Air carrier Captain reported entertainment and power systems failed during flight and had to use flight attendants to record data so the affected passengers would receive some type of reimbursement.
1782752	Air carrier pilot reported people not wearing a mask while inside the flight operations crew lounge.

ACN	Synopsis
1782749	Air carrier First Officer reported that the planned route to avoid ATC Zero airspace became unavailable and ATC provided a new route which resulted in the flight being in a non-radar environment. First Officer stated that they were later informed by company that they were not allowed to accept such a route.
1782742	Air carrier Captain reported not knowing if they were legal to fly in domestic Class A airspace in an uncontrolled environment after a Center had gone ATC zero.
1782728	Center Controller reported safety concerns with another Center facility going to ATC Zero during peak traffic times and the confusion/stress this causes the controllers.
1782724	TRACON Controller reported missing a readback which resulted in the aircraft being below the Minimum Vectoring Altitude.
1782686	Corporate flight crew reported communication issues with ATC resulting in a minimum fuel situation due to a Center going ATC Zero.
1782653	Two Flight Attendants reported two separate passengers were not compliant with face mask policy.
1782650	Flight Attendant reported that after a long flight, they were told one of the crew members had tested positive for COVID-19, yet they were asked to fly the next morning with only 4 hours of rest. Flight Attendant expressed concerns with company's handling of being exposed to COVID-19 and scheduling.
1782619	Dispatcher reported planning a flight through HF required airspace on a non-HF equipped aircraft.
1782559	Ground employee reported that during COVID-19 customer service agents should not use the airplane phones to make announcements.
1782538	Air carrier First Officer reported concerns with having to wear a face mask in the cockpit especially in a rapid decompression situation.
1782533	Air carrier First Officer reported failing to get temperature taken at screening point.
1782525	Air carrier First Officer reported receiving an amended clearance due to a ATC Center going ATC Zero and questioned if they had violated an FAR by flying in uncontrolled airspace.
1782522	Air carrier Captain reported having to receive a re-route due to a Center going ATC Zero.
1782509	Technician reported missing a step to unplug the pressure switch while working on the engine anti-ice valve to be locked open.
1782476	Air taxi Captain reported an airspace violation after having to divert from original route due to a TRACON facility going ATC Zero.
1782448	Flight Attendant reported that a passenger had to be reminded four times to wear a face mask. Flight Attendant stated that the passenger and his wife were coughing without covering their cough.
1782445	Flight Attendant reported two passengers were not compliant with face mask policy.
1782444	Flight attendant reported a passenger was not compliant with face mask policy.
1782395	Air carrier Captain reported having to divert due to ATC COVID-19 issues at landing Center facility.
1782327	Pilot reported the Chart Supplement still shows pre-pandemic hours for SUS Tower. Reporter stated there are no NOTAMs addressing this issue either.
1782320	Flight Attendant reported a passenger was not compliant with face mask policy and talking on the phone when not allowed.
1782318	Flight attendant reported a deadheading Captain and a passenger were non-compliant with face mask policy.
1782312	Flight Attendant reported the hand sanitizer holder is in the way of evacuating passengers on the aircraft.
1782302	Air carrier Captain reported having to divert due to fuel issues related to ATC Zero Center closure and re-routes.
1782281	Air carrier Captain reported forgetting to complete the COVID-19 assessment before the flight due to a distraction.
1782167	Small aircraft pilot reported inadvertently entering an MOA.
1782146	Flight Attendants reported a passenger was not compliant with face mask policy.
1782144	Flight Attendant reported a group of passenger were no compliant with face mask policy during flight.
1782133	Flight Attendant reported a passenger was non-compliant with face mask policy during flight.
1782122	Flight Attendant reported a group of passengers did not comply with face mask policy throughout the flight.
1782019	Ground employee reported wanting to know why the airline is using aircraft that do not have a functioning Auxiliary Power Unit.
1782001	Air carrier flight crew reported not making a crossing restriction on a visual approach.
1781968	Air carrier flight crew reported communication issues with ATC regarding their taxi to runway clearance.
1781944	Front Line ATC Manager reported an airborne conflict and cited staffing levels as a contributing factor.
1781854	Air taxi Captain reported not reviewing a modified route until after being airborne, which was too far off shore, and possibly running out of duty time. This was due to an ATC Center closing down for COVID-19 cleaning.
1781839	Pilot reported flying an aircraft without the proper documentation and correct maintenance records.
1781777	Air carrier flight crew reported departing without the Aircraft Maintenance Logbook (AML) onboard.
1781739	Air carrier Captain reported no ground crew was available to sanitize the aircraft resulting in the crew having to clean the aircraft prior to departure.
1781714	Air carrier Captain reported an unstable approach and cited it was difficult to understand the controllers at this foreign location.
1781711	Air carrier Captain reported not making a crossing restriction after realizing they had overflown the top of descent.

ACN	Synopsis
1781646	Air carrier Captain reported Air Traffic Controller was working Local, Ground, and Clearance Delivery on one frequency resulting in communication issues and a delayed hand-off to Departure Control.
1781639	Dispatcher reported not adding an alternate to a flight.
1781565	Air carrier Captain reported not releasing the brakes before pushback resulting in a broken tow bar. The Captain cited multiple distractions and lack of flying as contributing factors.
1781562	Air carrier Captain reported that during boarding a family was not compliant with face mask policy. After other passengers expressed concern, the Captain had the family removed from the flight.
1781545	TRACON Controller reported an unsafe operation between an IFR carrier and a VFR aircraft resulting in an airborne conflict.
1781496	GA pilot reported communication issues with ATC while attempting to receive a Class Bravo clearance.
1781468	Flight Attendant reported concerns with completing safety checks while passengers are boarding.
1781392	Customer Service Representative reported health related concerns with wearing face masks at work for extended periods of time.
1781313	Flight Attendant reported briefly forgetting to put the face mask back on after departing the lavatory.
1781308	Flight Attendant reported standing in the aisle talking with a non-compliant passenger regarding face mask policy when the aircraft began the takeoff roll.
1781301	Flight Attendant reported several passengers would not comply with the face mask policy during boarding.
1781200	Air Carrier Captain reported a passenger became ill during the flight and the crew was concerned it could be COVID-19.
1781190	Air Carrier Captain reported a passenger would not comply with face mask policy.
1781176	Air carrier flight crew reported an altitude overshoot deviation due to the aircraft's light gross weight and high climb rate.
1781172	ATC Tower Controller reported an aircraft landed on the wrong runway and cited social distancing distraction during a janitorial service in the Tower as a contributing factor.
1781110	Flight Attendant reported a passenger would not comply with face mask policy and was met at the arrival gate by supervisors.
1781107	Flight Attendant reported the FA crew were unwilling to enter the flight deck because the First Officer would not wear a face mask.
1781102	Flight Attendant reported experiencing health issues since the wearing of a face mask began and the use of sanitizing spray in the aircraft.
1781085	Air carrier Captain reported an altitude deviation during climbout and cited communication problems with a Center Controller due to the Controller possibly wearing a face mask.
1781064	Air carrier flight crew reported a passenger misconduct incident during flight that initiated due to non-compliance with face mask policy.
1781021	Air Taxi Captain reported calling off a flight due to fatigue from a grueling schedule they had for a couple of days.
1780940	Air carrier Captain reported not signing the flight release prior to departure.
1780932	Air carrier Captain reported passenger was not compliant with face mask policy during flight.
1780908	Air carrier Captain reported using the wrong gate number when requesting push and cited last minute gate changes, weather delays, and time pressure as contributing factors.
1780881	Center Controller reported an airspace violation and cited COVID-19 staffing and work environment configurations as contributing factors.
1780871	Five Center controllers and two air carrier captains (different flights) reported safety concerns relating to the closure of an ATC Center during the middle of the day for COVID-19 cleaning.
1780803	Flight Attendant reported a family was non-compliant with face mask policy throughout the flight.
1780793	Flight Attendant reported quick turnarounds on full flights make it difficult to social distance, complete safety checks, and for cleaning crews to properly sanitize the aircraft.
1780784	Flight Attendant reported a passenger was not compliant with face mask policy while boarding.
1780770	Flight Attendant reported another Flight Attendant and a passenger were not compliant with face mask policy.
1780757	Air carrier First Officer reported not making a crossing restriction during descent.
1780605	Air carrier Captain reported a passenger was removed from flight after exhibiting COVID-19 like symptoms. Post flight, the crew found out the passenger did have asthma.
1780604	Air carrier flight crew reported a pressurization problem during climbout resulting in a return to the departure airport.
1780559	Air carrier Captain reported an unsafe environment at HOU with the Ground and Local Control positions being combined into one frequency.
1780553	Center Controller reported a loss of separation and attributed it to being overworked, and short staffed at the Center.
1780552	Center Controller reported a possible loss of separation and having difficulties to attain the required non-RADAR separation due to another Center going ATC zero for COVID-19 cleaning.
1780537	Air taxi Captain reported a training flight session extended well beyond the original time planned due to a divert caused by an ATC Zero at an enroute Center.

ACN	Synopsis
1780531	GA pilot reported the SNA airport Tower was closed possibly due to COVID-19 resulting in difficulty closing the IFR flight plan.
1780476	GA pilot with a safety pilot reported an altitude deviation during climbout. The pilot cited distraction from goggles fogging up and turbulence was a contributing factor.
1780417	Flight Attendant reported that a passenger brought and consumed their own alcohol during the flight. Flight Attendant reported that the passenger was not compliant with face mask policy.
1780415	Flight Attendant reported that a passenger was reminded several times to wear a face mask, but would have the mask down and put it back on only when a flight attendant walked by.
1780414	Flight Attendant reported that a passenger kept ordering drinks in order to not have to wear a face mask while actively drinking.
1780412	Flight Attendant reported that two passengers were non-compliant with face mask policy, despite multiple requests from other flight attendants. Flight Attendant reported one of those passengers became argumentative and used profanity.
1780393	Flight Attendant reported that although the medical kit was sealed, it did not have all required contents.
1780389	Air Carrier Flight Attendant reported a possible FAR violation due to an insufficient number of FAs on board while passengers were aboard. The Flight Attendant cited long lasting symptoms from COVID-19 that may have contributed to the event.
1780360	Air carrier First Officer reported being called in to fly because the previous Captain had called in sick with a fever. Reporter suggested the aircraft cockpit should be sterilized after a sick crew member leaves the aircraft.
1780314	Ground employee reported the break-room is not cleaned properly.
1780282	Air carrier flight crew reported that a passenger count and weight and balance error occurred at the diversion airport because the count could not be uploaded through ACARS. The crew stated the flight had to divert due to an ATC Zero Center closure.
1780276	Air Carrier Captain reported several operational errors occurring after a long ground delay long due to an 'ATC Zero' event.
1780264	Air carrier flight crew reported an altitude deviation due to failed crew communication and the Captain's recent extended time off.
1780260	Air carrier Captain reported exceeding 250 knots below 10,000 feet during descent. Captain cited fatigue and lack of flying as contributing factors.
1780218	First Officer reported a crossing restriction overshoot during departure.
1780188	Air carrier Captain reported that the flight crew count on a trip pairing had been reduced and cited multiple issues associated with the reduction.
1780135	Air carrier flight crew reported an over speed during departure and cited lack of flying as a contributing factor.
1780134	Air carrier First Officer reported flying into an airport with the Tower closed due to COVID-19 and described the associated issues flying in the same environment with inexperienced general aviation pilots.
1780105	Air carrier Captain reported that duty time may have been exceeded due to the flight having to divert when an ATC Center closed.
1780098	Air carrier Captain reported that several intoxicated passengers were being disruptive and not complying with face mask policy. The Captain stated that while one passenger was being removed from the aircraft, he became angry at the Captain and used profanity.
1780096	Air carrier Captain reported that two passengers who were possibly inebriated were acting belligerently and not complying with face mask policy.
1780084	Air carrier First Officer reported being two hours late due to ATC COVID Center Closure and going over daily allowed work hours.
1780073	Tower Controller reported an airborne conflict resulting in an aircraft having to execute a go-around. Controller cited staffing and traffic volume as a contributing factors.
1780062	Center Controller reported descending an aircraft into another Controller's airspace, thinking the D-Side had pointed the aircraft out.
1780055	Flight Attendant reported two passengers refused to wear masks, brought their own alcohol on board the flight and interfered with flight attendant duties.
1780049	Air Taxi Captain reported flying an RNAV Approach which was not authorized at night.
1780043	Pilot reported not being sure of General Aviation Compliance regulation deadlines.
1780029	GA pilot reported losing GPS connection on tablet resulting in a Class B airspace incursion.
1780003	Flight Attendant reported being notified by company 10 days after another Flight Attendant tested positive for COVID-19.
1779972	Air carrier Captain reported an unstabilized approach leading to a go-around, which then resulted in an altitude deviation. The Captain cited lack of flying as a contributing factor.
1779910	Air carrier flight crew reported an unstablized approach and cited fatigue, time pressure and reduced flying as contributing factors.
1779822	Center Controller reported an adjacent Center going to ATC Zero due to COVID-19 cleaning and having aircraft that were not allowed on filed routes.
1779649	Customer Service Representative reported crowding and social distancing issues near company provided kiosks in the terminal area.

ACN	Synopsis
1779645	Ground employee reported the break-room is not properly being cleaned.
1779621	Air Carrier First Officer reported an altitude deviation during descent and cited lack of recent flight experience as a contributing factor.
1779552	Pilot reported the flight was not accepted by TPA Approach Control due to staffing/workload issues. The Captain circumnavigated the area and proceeded VFR.
1779519	Flight Attendant reported concerns with the placement of the hand sanitizer installed on the aircraft.
1779516	Flight Attendant reported a cleaning crew had to be reminded to properly sanitize the aircraft prior to passenger boarding.
1779512	Flight Attendant reported forgetting to brief the exit row passengers due to distraction from having to remind boarding passengers of the face mask policy.
1779483	Air Carrier First Officer reported a heading deviation and cited lack of recent flight experience and task saturation as contributing factors.
1779463	Air carrier First officer reported an unstablized approach and an altitude deviation during a go-around. First Officer cited lack of flying as a contributing factor.
1779455	Air Carrier First Officer reported having a status as flying on a special wavier that was not reported by the company to the Captain before the flight.
1779446	Air carrier flight crew reported an altitude deviation and cited the First Officer's lack of flying as a contributing factor.
1779401	Air Carrier Captain reported a TOO LOW FLAPS warning and an Unstabilized Approach.
1779352	Air carrier flight crew reported an unsafe landing gear indication. ATC communications were also reported possibly due to a COVID-19 ATC Zero event.
1779342	Air carrier Captain reported that after the flight the Flight Attendant stated that a passenger had been non-compliant with mask policy during the flight and that other passengers had been complaining.
1779266	First Officer reported a speed and altitude deviation during departure and cited fatigue from a lengthy ATC COVID-19 related delay as contributing factor.
1779160	Flight Attendant reported issues with a family of four who had a 2 year old who did not want to wear a face mask.
1779152	Flight Attendant reported a passenger was not compliant with face mask policy.
1779138	Air carrier Captain reported a weight and balance change was not cross-checked due to COVID-19 company guidelines as cited by the Load Master.
1779094	Air Carrier Captain reported landing without a clearance and attributes the event to lack of flying and complacency while flying with another Captain as the First Officer in this flight.
1779080	Air carrier Captain reported a disabled aircraft on intended landing runway resulted in their flight being vectored away from their approach path. The additional vectoring caused them to be concerned with their fuel state and made a request to be cleared as soon as possible. The crew was cleared for another approach and landing and reported being unstable/high before safely landing the aircraft.
1779072	Air carrier flight crew reported a passenger who had tested positive for COVID-19 was on the flight.
1778846	Tower Controller reported a loss of separation between two departures and cited aircraft performance differences as a possible contributing factor.
1778839	Tower Controller reported a ground conflict and cited reduced staffing due to COVID-19 and training at combined positions as contributing factors.
1778837	Maintenance Inspector reported concerns with company signing off of annual inspections of aircraft with several known maintenance issues and discrepancies.
1778792	Flight Attendant reported another Flight Attendant was ill during the flight and not able to wear the face mask at all times, especially when coughing.
1778699	Air carrier flight crew reported a track deviation occurred due to misreading a changed departure clearance.
1778688	Ground employee reported a fellow co-worker is not complying with face mask policy nor properly social distancing when around other personnel.
1778682	Air carrier First Officer reported being assigned to fly with a Captain whose previous First Officer co-pilot called in sick with COVID-19 symptoms. Reporter described concerns with management's handling of the situation stating it goes against all the guidelines delineated by the company.
1778586	Flight attendant reported two passengers were coughing throughout the flight and not adhering to face mask policy.
1778454	Air carrier Captain expressed a need for a concrete directive about face mask usage in the cockpit.
1778418	High Performance Aircraft Single pilot reported receiving confusing instructions from the Controller and believes COVID-19 ATC staffing issues were a factor.
1778369	GA pilot reported flying with a passenger while not being passenger current for single-engine aircraft.
1778341	Flight Attendant reported that they forgot to brief the exit row because the passengers were not compliant with face mask policy and a Supervisor had to speak to them.
1778276	Air carrier flight crew and Dispatcher reported missing a NOTAM alerting that the destination ATC Tower was closed due to COVID-19.
1778201	Ground employee reported that the addition of a temperature check station nearby an equipment room creates congestion, making it difficult to social distance during busy times when many people are in the hallway.

ACN	Synopsis
1778193	Customer Service employee reported there is a lack of proper staffing in the lobby, which makes it difficult to follow CDC social distancing recommendations as passengers bunch up in groups while waiting in line.
1778180	Air carrier Relief Pilot reported removing himself from a flight due to a disagreement with the Captain about wearing masks in the flight deck.
1778177	Air carrier Relief Pilot reported the Captain and flying First Officer were not climbing as instructed by ATC due to inadvertently being in altitude hold during departure.
1778160	Air Carrier Captain reported maintenance and ground personnel with no experience on specific aircraft types are being utilized due to staffing cutbacks.
1778159	Air Carrier Captain reported the requirement of wearing a face mask with a Flight Attendant on the Flight Deck is a safety concern, especially if there is an event such as a rapid decompression.
1778147	Air carrier Captain reported an altitude and airspeed deviation during arrival. Captain cited the First Officer's lack of flying time in the last several months as a contributing factor.
1778144	Air Carrier Captain reported an altitude deviation.
1778141	Air carrier flight crew reported a track deviation on the mid-approach segment due to a high workload environment coupled with the First Officer's extended period of time off.
1778131	Air Carrier Captain reported returning to the gate to remove an ill passenger from the flight.
1777953	Small aircraft flight Instructor reported encountering wake turbulence from a departing air carrier that passed below them as they were executing a practice missed approach. Reporter stated Tower was closed at the time because of staffing issues.
177767	Air Carrier Captain reported a delay due to weather at an international location resulted in crew rest issues. The Captain also stated they decided to not deplane the aircraft during the delay due to the requirement of having to take a COVID-19 test if they left the aircraft.
177766	Air carrier First Officer reported that a ground delay caused by fueling imbalance resulted in the crew approaching duty time limits. Due to the foreign country's COVID-19 restrictions and company procedures, the crew had to remain on the aircraft for required rest.
177765	Air carrier flight crew reported an altitude deviation after the altitude selector knob was inadvertently moved. The flight crew stated the use of disinfectant wipes on the control panel may have been a contributing factor.
177761	Air carrier flight crew reported that they had to get their required rest on the aircraft instead of at a hotel. The flight crew stated that although they had agreed to take a COVID-19 test to stay at the hotel, the foreign country's immigration service did not allow them to leave the aircraft.
177754	MD11 Captain reported that at approximately 110 knots a loss occurred of both ADC computer/inputs below 300 feet.
177706	Air Carrier flight crew reported failing to complete the security sheet due to pre-flight work overload that now includes the added task of ensuring the aircraft was sanitized.
1777663	Flight Attendant reported a passenger would not comply with face mask policy throughout flight.
1777619	Air carrier flight crew reported not setting the flaps resulting in a takeoff configuration warning on takeoff roll.
1777614	First Officer reported LNAV was not engaged during departure resulting in a track heading deviation.
1777570	Air carrier Captain reported a TA/RA on initial approach and believes ATC staffing may have contributed to the event.
1777563	Center Controller reported underlying TRACON went ATC Zero for COVID cleaning, and described the problems associated with getting an aircraft to a diversionary airport without TRACON services.
1777561	Center Developmental Controller reported a Tower went ATC Limited and the confusion that ensued with determining how to handle the situation. Controller cited lack of planning, explanation and preparation as contributing factors.
1777558	Center Controller reported multiple airspace violations resulting from hand-off issues with adjacent sector controllers.
1777548	Controller working Ground and Local combined reported a conflict resulting in an aircraft having to go-around. Reporter stated Tower does not need to be departing westbound aircraft off the east side of the airport.
1777484	Air carrier Captain reported a taxiway incursion and cited fatigue, weather and signage issues as contributing factors.
1777460	Air carrier Captain reported performing an aborted takeoff after getting takeoff clearance cancelled during the initial roll.
1777423	Air carrier Captain reported a passenger was not compliant with mask policy and being disruptive. Captain reported multiple interruptions during the flight in order to communicate with company about the situation.
1777396	Air carrier Captain reported having a passenger removed from a flight due to non-compliance with face mask policy and passenger misconduct.
1777306	Air carrier flight crew reported airspace, heading, and altitude deviations during approach. The Captain stated a late runway change and Controller workload were contributing factors.
1777230	Air carrier Captain reported the APU was inoperative and attempted to have maintenance repair it.
1777222	Air carrier Captain reported a family ate and drank during the entire flight to avoid having to wear face masks.
1777170	Pilot reported taking the COVID vaccine and was unaware that it was unapproved for general use and a possible FAR violation.
1777169	Private pilot reported acting as Pilot In Command beyond required flight review date.

ACN	Synopsis
1777151	Flight Attendant reported a passenger that had a valve on their mask was asked to replace the mask or cover the valve.
1777142	Flight Attendant reported there is not enough room to social distance between the FA jump-seat and passenger seats.
1777141	Flight Attendant reported there should be a change to the in-flight beverage/snack service to limit exposure time to Flight Attendants while passengers have their masks off.
1777115	Air Carrier Captain reported a passenger was not complying with face mask policy during flight while sleeping.
1777055	Ground wing-walker reported ramp safety concerns because of the unusual aircraft parking areas needed during the COVID-19 reductions.
1777033	Air Carrier Captain reported a passenger would not comply with face mask policy and was removed from the flight.
1777006	Corporate flight crew reported an altitude deviation during departure and cited lack of flying as a contributing factor.
1776974	Maintenance Technician reported wording in maintenance instructions needs to be changed to accommodate for COVID-19 policy.
1776961	Gate Agent reported the electronic boarding pass readers at the gate need to be sanitized after each flight.
1776958	Air Carrier Flight Attendant reported a family was removed from the flight because their 3 year old child would not wear a face mask.
1776920	Air carrier Captain reported the aircraft security check may have been improperly conducted and cited confusion between the wording in two manuals as a contributing factor.
1776838	Customer Service employee reported lack of sanitizing spray in the airport lobby.
1776836	Ground employee reported that COVID-19 policies are not being enforced in the breakroom.
1776806	Air Carrier Captain reported during passenger boarding one of the flight attendants received a call from a physician reporting a positive COVID-19 test result.
1776669	Flight Attendant reported a cabin fumes event during departure and again during descent resulting in health issues. Flight Attendant described the odor as 'chemical/burning plastic.'
1776648	Flight Attendant reported that the Captain did not wear a face mask while flight attendants were in the cockpit and was non-compliant with face mask policy.
1776622	Air carrier Captain reported having an aircraft that was fueled incorrectly for a ferry flight.
1776608	Corporate flight crew reported a track heading deviation due to loading an incorrect transition fix in the FMS.
1776589	Air carrier Captain reported having a passenger who was coughing throughout the flight.
1776574	Dispatcher and flight crew reported a night landing without runway lighting.
1776562	Air carrier Captain reported a passenger was not compliant with face mask policy.
1776557	Air carrier First Officer reported becoming distracted and not getting a valid load close out.
1776554	Air carrier First Officer reported that the first four rows of the aircraft were to be left unoccupied for weight and balance reasons, but found out when airborne some of the seats were occupied.
1776515	Air carrier pilot reported asymmetrical thrust on start of takeoff roll resulting in a rejected takeoff.
1776390	Center Controllers reported an aircraft landed on a closed runway due to snow removal equipment and not being able to identify the correct NOTAM for the runway closure..
1776326	Flight Attendant reported a passenger circumvented having to wear a mask by eating and drinking throughout the entire flight.
1776299	Air Carrier Captain reported a ill passenger was removed from the flight before departure.
1776224	Air Carrier Captain reported a Flight Attendant on the crew became ill and there was concern regarding exposure to COVID-19.
1776188	Customer Service employees reported social distancing concerns at the airport lobby due to it being overcrowded.
1776162	Air Carrier Captain reported concerns regarding company COVID-19 related plans pertaining to sick leave, vaccinations, training schedules, etc.
1776144	Helicopter pilot reported a communication issue with ATC resulted in a landing without a clearance. Pilot stated the Tower Controller was working multiple frequencies, which may have contributed to the event.
1776099	Flight Attendant reported three passengers would not comply with face mask policy.
1776098	Flight Attendant reported a passenger would not comply with face mask policy.
1776093	Flight Attendant reported a hand sanitizing dispenser is necessary when the temperature check system with a touch pad is used.
1776065	Flight Attendant reported possible COVID-19 exposure from an ill passenger and expressed concern the company did not have a plan for the exposed working crew.
1776025	Air carrier First Officer reported they did not perform the Before Takeoff Checklist.
1775962	Center Controller reported an ATC Zero event at another Center facility resulted in communication issues and an airspace violation.
1775936	Air Carrier flight instructor reported the 'no touch exemption' as written for O2 masks, headsets, etc., does not cover all types of training and checking periods.
1775924	Corporate First Officer reported an unstable approach occurred and cited lack of flying as a contributing factor.

ACN	Synopsis
1775906	Maintenance Technician reported reduced bus schedules are causing overcrowded buses and increasing the possibility of catching COVID-19.
1775879	Flight Attendant reported two passengers would not initially comply with face mask policy. Both passengers complied after another passenger began complaining about them.
1775877	Flight Attendant reported a passenger would not comply with face mask policy.
1775865	Flight Attendant reported a passenger complained about another passenger coughing and sneezing on the flight and not wearing a face mask.
1775764	Air carrier flight crew reported an altitude excursion during climbout.
1775759	Air carrier pilot reported problems flying into a specific country relating to COVID-19.
1775697	Gate Agent reported concerns with social distancing and lack of manpower in their work environment.
1775688	Ground employee reported concerns with the number of people getting on an elevator.
1775636	First Officer who was deadheading reported a disagreement with a Flight Attendant regarding interpretation of mask policy.
1775620	Air carrier Captain reported weather and associated planning issues at many airports and in particular one that was an alternate for the flight.
1775363	Flight Attendant reported that the company provided tablet would not retain the charge and stated it had not been used for some time due to lack of flying.
1775343	Air carrier First Officer reported that a person checked their temperature after landing with an ear thermometer and did not replace the tip between checks.
1775338	Air carrier First Officer reported overshooting an assigned altitude during departure.
1775210	Air carrier flight crew reported inadvertently departing with one less Flight Attendant than required for the flight.
1775147	Tower Controller reported communication issues with an aircraft resulted in a wrong runway landing.
1775039	Air carrier Captain reported an unstabilized approach and stated they should have executed a go-around.
1775027	Air carrier First Officer reported not setting the correct altimeter and leveling off below their assigned altitude.
1775013	Air carrier Captain reported miscommunication with ATC resulted in a taxiway incursion during taxi-out.
1774963	Ground employee reported social distancing concerns during peak times at the airport.
1774947	Air carrier First Officer reported communication difficulties with the Tower Controller due to the Controller wearing a mask which possibly muffled the transmission.
1774946	Air carrier Captain reported a near ground collision due to communication issues with ATC. Captain stated that Tower staffing levels may have contributed to the event.
1774923	Air carrier flight crew reported a clearance misunderstanding resulted in an altitude deviation and an airborne conflict during departure. First Officer cited ATC staffing levels due to COVID-19 as a possible contributing factor in the miscommunication.
1774916	Center Controller reported communication issue with a TRACON that was ATC Zero involving an aircraft inbound to an airport with a non-NOTAMed closed runway.
1774861	Flight Attendant reported concerns regarding the COVID-19 pre-takeoff PA instructing passengers to give the FAs trash during the safety compliance check. Flight Attendant believes this detracts from the main reason for the safety check.
1774853	Corporate flight crew reported flying with an open maintenance write-up. The Captain stated COVID-19 concerns were a distraction.
1774772	Helicopter pilot reported not having the correct documents to transport a COVID-19 patient.
1774741	Tower Controller reported an aircraft got off the ground that was in a ground stop due to its destination airport being closed for COVID-19 cleaning.
1774687	Flight Attendant reported having a headache, elevated temperature, nausea and feeling fatigued during the flight. The crew was concerned it could be COVID-19 symptoms, so the Flight Attendant called in sick for the next flight.
1774686	Flight Attendant reported a mother and young daughter would not comply with face mask policy.
1774678	Flight Attendant reported the flight crew did not wear face masks on the flight deck while the Flight Attendant was assisting with lavatory breaks.
1774673	First Officer reported the flight exceeded the 10,000 foot FAR speed restriction. Task saturation and time off during COVID-19 were cited as contributing factors.
1774668	Air carrier pilot reported a ramp incursion and cited lack of flying as a contributing factor.
1774644	Air Carrier Captain reported blocking off the entire lavatory from use due to the potable water in the lavatory being placarded inoperative. Captain decided to block the entire lavatory for COVID-19 precautions.
1774636	Air Carrier First Officer reported the pilot crew failed to set the correct altimeter setting causing an altitude deviation. Pre-flight distractions, including the current pandemic situation, were cited for the error.
1774578	Air Carrier Captain reported a passenger became verbally abusive and would not comply with face mask policy.
1774498	Flight Attendant reported a passenger did not comply with face mask policy throughout the flight.
1774496	Flight Attendant reported a passenger refused to wear a proper face mask citing a medical condition as the reason for not wearing it.
1774490	Flight attendant reported two passengers had to be reminded several times about face mask policy.

ACN	Synopsis
1774486	Flight attendant reported lack of cooperation from pilots when it comes to wearing masks while flight attendants are performing their duties in the cockpit area.
1774471	Flight Attendant reported a passenger not complying with face mask policy.
1774362	Tow vehicle driver reported making contact with a pushback tractor while towing an aircraft to a gate.
1774342	Air carrier Captain reported an unstabilized approach. The First Officer's lack of recent flying was cited as a contributing factor.
1774233	Pilot reported the P50 TRACON controllers appear to be working unreasonably large areas and expressed concern over COVID-19 related cutbacks in ATC staffing.
1774182	GA Pilot reported an airborne conflict after confusion identifying the correct runway for a night visual landing at BED airport. Reporter cited lack of flying due to the COVID-19 pandemic was a contributing factor.
1774172	Corporate Captain reported the original First Officer (FO) was replaced because of COVID-19 and the replacement FO was still in FAR rest period when the flight took off.
1774160	Helicopter pilot reported a sporting event TFR violation.
1774130	Flight attendant reported a passenger was not compliant with face mask policy.
1774126	Flight attendants reported smelling a burning odor during boarding and experiencing health issues.
1774109	Flight Attendant reported several passengers were removed from the flight because they would not comply with face mask policy and were interfering with cabin crew duties.
1774107	Flight Attendant reported a family would not comply with face mask policy.
1774104	Flight Attendant reported a passenger would not comply with face mask policy.
1774103	Flight Attendant reported passengers in 2 separate parties would not initially comply with face mask policy until given a warning.
1774101	Flight Attendant reported a passenger would not comply with face mask policy.
1774093	Flight Attendant reported a passenger would not comply with face mask policy.
1774086	Flight Attendant reported the gate agents tried to board the passengers right after the aircraft was sanitized, disregarding the mandatory wait time.
1774071	Air Carrier First Officer reported not following SOP's during a missed approach and stated that an extended period of time off was a contributing factor.
1774011	Air carrier Captain reported concerns with security checks in the terminal area that do not allow for proper social distancing.
1773963	Air carrier flight crew reported a runway incursion.
1773937	Captain reported the First Officer mistakenly deleted the route in legs 1.
1773899	Air carrier Captain reported an altitude deviation during climbout.
1773891	Air carrier Captain reported concerns with being in close contact with a Flight Attendant that had called in sick the day before for COVID-19 like symptoms.
1773888	Air carrier Captain reported many passengers refuse to wear face masks during flights to a specific international destination.
1773879	Center Controller reported having an aircraft below the Minimum IFR Altitude.
1773865	Center Controller reported an airspace violation due aircraft hand-off issues with a TRACON facility.
1773859	GA student pilot reported frequency communications issues while flying to an airport whose Tower services were not in use.
1773777	Technician reported social distancing concerns in overcrowded buses.
1773776	Technician reported concerns with company procedures related to notification of possible exposure to other employees who have tested positive for COVID-19.
1773770	Flight Attendant reported two passengers traveling together were wearing non-compliant face masks and initially refused to wear company supplied compliant face masks.
1773757	Flight Attendant reported the phone by a jumpseat was missing and requested the aircraft be swapped due possible communication issues in case of an emergency.
1773755	Flight Attendant reported having to explain to a passenger that there were no exemptions to having to wear a face mask. Passenger and two others traveling with him were not compliant during the flight.
1773754	Flight Attendant reported concerns relating to health and oxygen levels in the body due to constantly wearing a face mask while working.
1773750	Flight Attendant reported a passenger was not compliant with face mask policy and also moved to a better seat without asking FAs.
1773747	Flight Attendant reported concerns with another Flight Attendant showing up for work after a family member had tested positive for COVID-19 the day before.
1773715	Air carrier flight crew reported an unstabilized approach into an unfamiliar airport.
1773641	Ground employee wrote that maintenance failed to complete a barrier between employees to help prevent the spread of COVID-19.
1773638	Air carrier First Officer reported a full bus of people on the employee bus which put everyone at risk of COVID-19 and increased risk for injury on the bus ride.
1773635	Air carrier First Officer reported not being able to find information on a treated fuel related MEL. First Officer stated the aircraft had just come out of storage.

ACN	Synopsis
1773620	Air carrier Captain reported having a passenger removed from flight due to non-compliance with face mask policy.
1773615	Air carrier Captain reported multiple ground delays and lack of proper sleep resulted in physical degradation/fatigue and decided to remove himself from the flight.
1773581	Pilot reported not being able to contact a Center Control due to aircraft radio communication issues and frequency saturation.
1773509	Air carrier flight crew reported a turn inside the Final Approach Fix, an altitude excursion and having to make two attempts to land.
1773491	Air carrier Captain reported an unstabilized approach resulting in a go-around. The Captain cited crew fatigue and lack of flying contributed to the event.
1773484	Air carrier flight crew reported the FMS not flying correctly during departure and having to manually turn the aircraft to avoid a possible airspace violation.
1773468	Ramp Agent reported issues with temperature check procedures at work and the company's lack of communication regarding employees that may have contracted COVID-19.
1773454	Air carrier Captain reported a Flight Attendant did not agree with the Captain not wearing a mask in the cockpit.
1773426	ATC TRACON instructor reported miscommunication with trainee resulted in an airborne conflict during a training session.
1773379	Flight Attendant reported that a passenger became upset when asked to wear her face mask properly.
1773378	Flight Attendant reported that several passengers had seat location issues and another passenger was not wearing a proper face mask.
1773377	Flight Attendant reported that many passengers, including a commuting pilot, were not compliant with the face mask policy.
1773357	Flight Attendant reported that communication with a passenger regarding exit row seating may have been misheard due to speaking through a face mask.
1773352	Flight Attendant reported sitting in the incorrect jump seat.
1773349	Flight Attendant reported experiencing physiological issues after wearing a face mask for prolonged periods.
1773320	Air carrier Captain reported momentarily exceeding the aircraft's maximum operating limit speed on descent. The Captain cited lack of flying as a contributing factor.
1773317	Air carrier Captain reported receiving a flap aural warning message due to having an incorrect flap setting on final approach.
1773249	Air Carrier Captain reported not completing the climb checklist resulted in an altitude deviation during departure. The Captain cited the decision to brief the arrival and approach earlier than expected caused a routine checklist to not be performed at the normal time.
1773222	Air Carrier office employee reported the office area for work would benefit from the installation of a higher-grade air filter to combat COVID-19.
1773213	Ground employee reported COVID-19 related concerns in their work environment.
1773201	Air Carrier First Officer reported not obtaining an ATC departure clearance prior to pushback, and cited a nonstandard pre-flight briefing given by the Captain and lack of flying as contributing factors.
1773190	Air carrier Captain reported that a large number of passengers waiting to board at several adjacent gates were standing so close together that social distancing was not possible. The Captain suggested that the gates in use be spaced out.
1773187	Air Carrier First Officer reported being uncomfortable and frustrated because many other pilots choose not to wear a face mask in the flight deck.
1773176	Air carrier First Officer reported multiple concerns with the COVID-19 sanitizing protocols used at the layover airport and hotel in a foreign country.
1773038	Flight Instructor and student reported conducting a circle to land approach to a runway which resulted in crossing over the extended centerline of the parallel runway. The crew stated the Tower was closed for COVID-19 cleaning.
1773034	GA pilot reported having an airspace incursion while on an instrument currency flight and cited lack of recent flying due to COVID-19 and unfamiliarity with the airspace as contributing factors.
1773000	Center Controller reported becoming fatigued due to working heavy traffic for an extended period of time and cited low staffing levels as a contributing factor.
1772985	Maintenance employee reported that employee buses are full and social distancing on them is not being properly addressed.
1772984	Technician reported requesting to know the company policy that governs the safe removal and disposal of HEPA filters and used PPE. Technician is also unsure of what qualifications are needed to perform those tasks.
1772982	Maintenance employee reported that social distancing on the bus is not possible due to lack of spacing.
1772967	Flight Attendant reported refusing to be in the cockpit to provide break relief because the First Officer would not wear a face mask. The Flight Attendant reported that the Captain asked for other flight attendants who would be willing to provide break relief under those conditions.
1772963	Flight Attendant reported that a passenger who had tested positive for COVID-19 was removed from the aircraft; however, other passengers were not deplaned and the aircraft was not sanitized.

ACN	Synopsis
1772846	Air Carrier flight crew reported obtaining an IFR clearance before Tower closed; however, they departed after Tower closed and did not obtain an IFR release for departure.
1772793	Ground employee reported concerns regarding the lack of social distancing in the airport lobby area.
1772792	Ground employee reported two ramp employees entered the breakroom without wearing a mask.
1772790	Ground employee reported concerns regarding the unfiltered air that employees are breathing in breakrooms and offices and recommends filters be installed to mitigate COVID-19 exposure.
1772774	Air Carrier First Officer reported an altitude deviation during departure and cited poor CRM and lack of flying as contributing factors.
1772766	Air Carrier flight crew reported a ramp incursion and cited lack of flying as a contributing factor.
1772754	Air Carrier Captain refused the aircraft due to a specific equipment MELed inoperative, which is reportedly used to reduce COVID exposure.
1772750	Air Carrier Captain reported the time required for the COVID-19 test delayed the departure of their flight.
1772737	Center Controller reported a near loss of separation and cited fogged up glasses due to wearing a face mask and poor coordination during a controller switch contributed to the event.
1772679	Flight Attendant reported not removing the face mask during the safety demonstration due to the close proximity of a passenger with face mask off while eating.
1772669	Flight Attendant reported possible COVID-19 exposure from a passenger on the inbound flight. The crew used the same aircraft outbound after being notified of the positive test.
1772628	Air Carrier First Officer reported 3 passengers would not comply with the face mask policy during flight and became belligerent toward the flight attendants.
1772599	TRACON Controller reported a loss of separation.
1772596	TRACON Controller reported a loss of separation and cited traffic volume and staffing issues as contributing factors.
1772532	Flight Attendant reported the requirement to wear a mask during flights is resulting in having low blood oxygen levels and associated headaches.
1772527	Flight Attendant reported a passenger with a dog was seated in the exit row; however, the flight attendant did not recognize this due to being distracted with the passenger's face mask non-compliance.
1772450	Ground employee reported the employee bus is overcrowded with all seats taken and passengers standing making social distancing impossible.
1772445	Ground employee reported individuals are not properly social distancing, nor adhering to face mask policy in the airport lobby environment.
1772439	Air Carrier First Officer reported pilots are not adhering to face mask policy in the crew lounge area.
1772421	Center Controller reported a hand off issue with adjacent airspace resulting in an airspace violation.
1772417	Center Controller reported confusion with taking over a TRACON's airspace and difficulty with coordination with Tower on how to handle some flights.
1772411	Center Controller reported a possible loss of separation and cited COVID-19 related staffing issues as a contributing factor.
1772351	Flight Attendant reported social distancing problems/concerns involving passengers, crew and maintenance personnel during boarding on a quick turn flight.
1772336	Air Carrier First Officer reported not following Standard Operating Procedures in a wind shear situation during departure and cited fatigue, weather, and low flight time in the last several months as contributing factors.
1772307	Air Carrier flight crew reported receiving a TCAS RA during departure. The TCAS RA was reportedly due to the aircraft's high rate of climb as a result of having a light gross takeoff weight.
1772232	Ground employees reported concerns regarding social distancing protections in their work environment.
1772225	Air carrier First Officer reported that the crew landed without a clearance after forgetting to contact Tower. The First Officer cited poor workload management and lack of recent flying as contributing factors.
1772192	Center Controller reported there was no official FAA guidance regarding how to handle traffic in the airspace when the facility went ATC zero for COVID-19 cleaning.
1772159	GA pilot reported an altitude excursion during approach and cited lack of recent flying as a contributing factor.
1772140	Technician reported not having enough air stairs and having to wait to accomplish a task.
1772117	Flight Attendant reported a passenger stated that another passenger had not been wearing a mask.
1772112	Flight Attendant reported a passenger was not compliant with face mask policy.
1772104	Flight Attendant reported having ear blockage problems during flight and questioned if it had to do with one Pack being 'out.'
1771985	Air carrier flight crew reported an altitude deviation during departure.
1771977	Ground employee reported concerns with COVID-19 sick leave related policies.
1771963	Air carrier Captain reported social distancing concerns during TSA screening.
1771961	Air carrier First Officer reported not being able to get a temperature check at the departure gate.
1771957	Air carrier First Officer reported not contacting the ramp before entering and cited as contributing factors a lack of recent flying and ATC not instructing them to contact ramp.
1771951	Air carrier Captain reported two passengers were not complaint with face mask policy during flight.
1771924	Air carrier flight crew reported a speed violation below 10,000 feet.

ACN	Synopsis
1771879	TRACON Developmental reported a loss of separation and cited lack of training in high traffic volume as a contributing factor.
1771799	GA pilot reported flying with a passenger, but not being current for takeoffs and landings to do so.
1771710	Air carrier Captain reported an air return was made after the First Officer was notified of exposure to someone who had tested positive for COVID-19.
1771706	Air carrier Relief Pilot and Captain reported forgetting to do the pre-flight walkaround and cited communication, distraction and lack of recent flying as contributing factors.
1771587	Air carrier Captain reported forgetting to submit the COVID assessment form prior to the first leg.
1771507	Air carrier Captain reported removing the face mask to drink coffee after completing pre-flight.
1771497	Air carrier Captain reported the First Officer did not want to wear a mask in the cockpit. The Captain decided due to concerns about exposure to COVID-19, to take the only option given of dropping the trip.
1771483	Air carrier pilot reported that many employees in the pilot lounge do not comply with company face mask policy.
1771477	Tower Controller reported safety concerns while transitioning to a temporary contingency tower while the permanent tower underwent COVID-19 cleaning procedures during a busy traffic time of day.
1771437	Corporate pilot reported the company lost or misplaced SFAR (Special Federal Aviation Regulation) records of the pilot's completed check ride during this pandemic period.
1771408	Flight Attendant reported a passenger was not compliant with face mask policy during flight.
1771400	Flight Attendant reported concerns over pilots and flight attendants not adhering to company face mask policy.
1771397	Corporate Captain reported an altitude deviation during climb and cited lack of flying as a contributing factor.
1771278	Dispatcher reported incorrect fuel burn numbers were given to a flight crew and cited workload, COVID related cleaning interruptions and ATC closures as contributing factors.
1771263	Dispatcher reported concerns with current staffing levels, especially when workload is increased due to weather divers, last minute ATC closures for sanitizing and international plus domestic re-routes.
1771103	Ramp employee reported COVID-19 related concerns regarding used gloves and paper towels repeatedly left in aircraft pits.
1771094	Air Carrier Captain reported a passenger may have had an allergic reaction to the sanitizing agent used on the aircraft.
1770996	Flight Attendant reported an aircraft cleaner employee would not comply with face mask policy.
1770986	Flight Attendant reported having to inform a passenger about the no vent mask policy and questioned whether the policy is still being adhered to.
1770983	Flight Attendant reported concerns with storing a bottle of sanitizing agent aboard the aircraft.
1770980	Flight Attendant reported several passengers were non-compliant with face mask policy.
1770979	Air Carrier flight attendants reported a uniformed passenger company employee was non-compliant with face mask policy.
1770978	Air Carrier Flight Attendant reported being uncertain of door arming/disarming procedures after being off for several months.
1770971	Air Carrier Flight Attendant reported not following COVID-19 seat policy in order to assist a passenger.
1770969	Air Carrier Flight Attendant reported a passenger was using a face mask with vents. The passenger had taped over the vents and Flight Attendant stated policy did not specifically address the taping of the vents.
1770962	Air Carrier flight attendants reported a few ceiling panels fell and hit a flight attendant and a passenger. Flight attendants stated the aircraft had been parked in the desert.
1770930	Helicopter Captain reported flying with an overdue engine power check inspection. Reporter cited being distracted after being informed that the crew from the previous shift was COVID-19 positive.
1770928	Helicopter Captain reported getting distracted and losing situational awareness resulting in a TFR incursion.
1770886	Air Carrier First Officer reported a flap over-speed due to a rapid climb rate, resulting from a light passenger load.
1770881	Air Carrier Captain reported an altitude overshoot resulting in an RA. The Captain stated the aircraft was very light in weight, which contributed to the event.
1770843	Air Carrier flight crew reported an RA while on approach. The Captain reported the Tower at this location was closed earlier than expected and this contributed to the event.
1770840	Air Carrier flight crew reported a false localizer capture, they were slow to react to the event and a track deviation occurred. The pilots stated an extended period of time off was a factor in their reaction time.
1770811	Ground employee reported a concern regarding social distancing on the employee bus.
1770770	ATC Controllers reported after 'ATC Zero' was enacted in their building there were no procedures to assist controllers to safely close sectors.
1770703	Flight Attendant reported a group of passengers would not comply with face mask policy.
1770698	Flight Attendant reported a passenger would not comply with face mask policy during flight.
1770691	Flight Attendant reported concern regarding the station's lack of aircraft sanitizing procedures.
1770603	Airport Ground Agent reported the employee bus is very crowded and is concerned social distancing is not being enforced.

ACN	Synopsis
1770592	Air carrier Captain reported that the cabin crew for the flight had been on an earlier flight that had passengers who had tested positive for COVID-19. Due to low exposure risk, it was decided the cabin crew could work the current flight.
1770555	Air carrier flight crew reported a ground conflict. The Captain stated fatigue and months without flying contributed to the event.
1770541	Air carrier flight crew reported a track and altitude deviation during departure. Flight crew cited task saturation and lack of flying were contributing factors.
1770520	Air carrier Captain reported returning to gate because a child passenger would not conform to face mask policy and the passenger's father was confrontational with the flight attendants.
1770493	Air Carrier flight crew reported loading the incorrect departure runway in the FMS but no track deviation occurred due to the flight path being the same. The First Officer reported distraction and COVID-19 job related concerns contributed to the event.
1770360	Helicopter Pilot reported a possible sporting event TFR violation. Pilot states the times of these active TFRs appear to change with little notice because COVID-19 is causing many changes to event schedules.
1770347	Corporate Captain reported poor judgment resulted in flying VFR into IMC. Captain reported outside pressures to depart contributed to the event.
1770331	Air Carrier Flight Attendant reported the flight was over capacity per social distancing policy and reported one passenger was uncooperative regarding social distancing during the flight.
1770309	Air carrier flight crew reported descending below charted altitudes while on approach and cited lack of recent flying as a contributing factor.
1770288	Air carrier First Officer reported confusion about being current under the company's policy as compared to the FAA currency exemptions.
1770269	Air Carrier Captain reported company procedures were not followed during a mechanical irregularity. Captain stated outside issues, including pressure to maintain schedule, disrupted the normal flow of crew duties.
1770055	Air Carrier Captain reported a track deviation and cited task saturation, hunger and lack of flying as contributing factors.
1770033	Ramp Agent reported incorrectly operating the cargo loader and made reference to being off of work due to a leave of absence for COVID-19.
1769995	Corporate Captain reported nonstandard procedures were used causing an attitude deviation. Captain stated lack of flying due to the COVID-19 pandemic was a contributing factor.
1769925	Air Carrier First Officer reported an important CG related bulletin for this aircraft was issued during a period of time when many crew members were not flying, and contributed to an unstabilized approach.
1769887	Air Carrier flight crew reported they forgot to receive clearance to land. First Officer reported this was the first flight after an extended period of time off.
1769884	Captain reported pilots are being exposed to COVID-19 because the company requires the use of specific headsets on the flight deck.
1769836	ATC Developmental and Instructor reported an aircraft that did not depart as anticipated with an arrival on final.
1769832	Air carrier First Officer reported flying without a current Airmen Certificate.
1769785	Flight Attendant reported wanting to know the results of a First Officer's COVID-19 test before upcoming trips due to concern about exposure.
1769771	Air Carrier Captain reported being pulled back to the gate to receive 3 passengers who were not on the flight yet due to being transported in a different bus for COVID-19 distancing.
1769759	Dispatcher reported excessive workload and lack of relief is causing safety of flight issues and work rule violations due to COVID related staffing cuts.
1769731	Airline office employee reported scanners were moved into their small room creating social distancing concerns as multiple people walk in their area to pick up the scanners.
1769653	Flight Attendant reported a passenger was non-compliant with face mask policy.
1769652	Flight Attendant reported concerns with communication and possible health issues resulting from wearing a face mask for so long.
1769610	Air Carrier flight crew reported thinking they were cleared for takeoff, but were only cleared to line up and wait.
1769592	Helicopter pilot reported being distracted during preflight due to concern about avoiding COVID-19 and left the chocks at the departure heliport.
1769529	Air carrier flight crew reported ATC requested they descend back to their cleared altitude of 14,000 during departure. The flight crew stated they never heard ATC cleared them to 14,000 feet and cited frequency congestion as a contributing factor.
1769514	TRACON Controller reported assuming a position to act as CIC because in reporter's mind the Supervisor CIC was not properly monitoring.
1769502	Corporate Captain reported a track heading deviation during departure and cited ATC workload as a contributing factor.
1769492	GA pilot reported a Class B airspace violation.
1769383	Technician reported the aircraft was parked and the parking orders never updated requiring a further maintenance delay.
1769363	Flight Attendant reported staff shortage and poor customer service due to the COVID-19 pandemic contributed to some passengers not being able to deplane in a timely manner.

ACN	Synopsis
1769359	Flight Attendant reported two passengers who were not complying with face mask policy did not want to remain seated while the cockpit door was open.
1769357	Flight Attendant reported that by providing passengers several food services allowed passengers to eat constantly and not have to comply with the face mask policy.
1769347	Flight Attendant reported the blocked seat in front of the FA jumpseat was assigned to a passenger. The CSA would not reassign the passenger per social distancing policy.
1769329	Air Carrier First Officer reported unable to land and entered holding due to the shortened hours of Approach Control at the destination. The destination Approach Control had failed to release the airspace before closing.
1769137	Captain reported concerns about safety of flight issues due to ATC controllers being under staffed and overworked while having to work multiple frequencies.
1769120	ATC Controller reported fatigue and safety concerns due to 6 day a week shifts and short staffing related to the COVID-19 pandemic.
1769115	GA pilot reported that, due to deteriorating weather, an overnight at a location other than the destination would have been a better idea than continuing the flight. But the COVID pandemic made the intermediate stop unappealing.
1769100	Corporate Captain reported a speed deviation and cited lack of flying during the COVID-19 pandemic as a contributing factor.
1769082	Technician reported making contact with an aircraft after moving a lift in the wrong direction.
1769072	Flight Attendant reported a passenger, whom had acted erratically and refused to wear a face mask on a previous flight, was allowed to board the flight.
1769070	Flight Attendant reported a passenger would not comply with the face mask policy.
1769064	Air carrier Flight Attendant in Charge reported a passenger became belligerent about the face mask policy and was removed from the flight.
1769038	Air carrier First Officer reported the flight's IFR flight plan was canceled near the destination airport because the ATC Center had airspace closures due to COVID-19.
1768858	Air carrier Captain reported a passenger would not comply with face mask policy and became belligerent with the Flight Attendant in Charge.
1768832	Center Controller reported a facility Supervisor continually does not follow state and NATCA guidelines regarding face mask policy.
1768777	Technician reported being distracted by cleaning crew on board which led to non-compliance with an overhaul due date.
1768765	Flight Attendant reported having a disagreement with the Captain and First Officer regarding their compliance with wearing face masks.
1768670	Air carrier flight crew reported the aircraft did not start the turn as expected because they had not activated heading select.
1768576	Captain reported a passenger was non-compliant about wearing a mask.
1768539	Air carrier flight crew reported a hard landing after the aircraft did not flare during a CAT 3 approach.
1768538	Air carrier flight crew reported a runway change prior to departure and departing without the correct load closeout.
1768471	Captain reported CSR was not aware of the need for them to be present when aircraft landed due to a family not complying with face mask policy during flight.
1768469	Air carrier flight crew reported that the Captain's airspeed and altitude became unreliable and they did not notify ATC prior to entering RSVM airspace.
1768458	Air carrier Captain reported undesirable pairing assignment along with operational fatigue.
1768455	Air carrier flight crew reported encountering multiple delays as passengers and crew members deplaned and went through a foreign country's required COVID-19 protocols. Crew also reported concerns with the layover accommodations.
1768450	Air carrier flight crew reported an overweight landing.
1768441	Air carrier Captain reported wanting to remove a passenger for not complying with face mask policy, but was over ruled by supervisors. The passenger intimidated the Purser during flight and was still non-compliant with face mask policy.
1768437	Air carrier Captain reported concerns relating to a quick turn of an aircraft and the flight being delayed due to scratches found on a door requiring a new maintenance release.
1768435	Air carrier First Officer reported requesting a warm up simulation prior to a re-qualification simulation and was denied.
1768393	Air carrier flight crew reported turning the wrong way on taxiway due to not clearly understanding Controller instructions. FO stated controllers wearing face masks could have contributed to them not clearly understanding the clearance.
1768391	TRACON Controller reported an airborne conflict and cited distraction caused by having to wear a face mask.
1768383	Pilot reported flying an aircraft without current registration.
1768327	Air carrier First Officer reported departing without the correct flight load closeout paperwork.
1768283	Air taxi First Officer reported a track heading deviation during departure.
1768272	GA pilot reported an altitude excursion and cited lack of flying as a contributing factor.

ACN	Synopsis
1768223	Flight Attendant reported being distracted and not arming two assigned doors.
1768219	Flight Attendant reported concerns with having to wear a face mask for so long throughout trips.
1768208	Corporate flight crew reported an unstabilized approach resulting in a missed approach/go-around.
1768195	Air carrier Captain reported failing to push the thrust levers into the TOGA detent before takeoff.
1768161	Air carrier flight crew reported an altitude deviation during departure.
1768082	Dispatcher reported late notice for a Center to be closed for COVID cleaning, which resulted in a divert.
1768056	Air carrier flight crew reported being distracted prior to departure and neglected to receive an amended release for an MEL item.
1768032	Air carrier Captain reported taking off with the pneumatics panel misconfigured and the left pack in Auto.
1768014	Air carrier Captain reported they overshot an assigned altitude during departure.
1768000	Air carrier Captain reported a Flight Attendant was not wearing a face mask and walking down the aisle of the aircraft with through passengers on board during a stop.
1767981	Flight Attendant reported numerous passengers did not complying with face policy during flight.
1767928	Flight Attendant reported a mother leaving a baby in the car seat and sitting in the row behind the infant. Mother refused to wear a face mask and return to row where infant was.
1767922	Flight Attendant reported not being sure if a commuting Flight Attendant is allowed to sit in a specific seat when another Flight Attendant is sitting in adjacent seat.
1767905	Flight Attendant reported a passenger was confrontational and refused to wear a face mask.
1767899	Flight Attendant reported being called out by a passenger when the mask covering the Flight Attendant slipped and revealed part of the nose.
1767894	Flight Attendant reported a passenger did not comply with face mask policy due to medical reasons.
1767838	Air carrier Captain reported a possibly intoxicated passenger was removed from the flight for non-compliance with face mask policy.
1767832	Air carrier flight crew reported a possibly intoxicated passenger was non-compliant with face mask policy.
1767818	Air carrier First Officer reported he selected TOGA before the engines had reached 40%.
1767811	Air carrier First Officer reported an altitude deviation after descending to avoid turbulence. The crew thought they were still cleared to a block altitude, but realized they were not after ATC asked them to confirm their altitude.
1767761	Tower Controller reported inadvertently giving an incorrect heading to a departing aircraft resulting in a conflict with an aircraft on final.
1767758	TRACON Front Line Manager reported a loss of separation and cited traffic complexity and staffing as contributing factors.
1767753	Tower Front Line Manager reported a runway incursion and concerns with the Local Controller not issuing a go-around instruction to an aircraft landing on the same runway.
1767704	Flight Attendant reported a passenger did not go through proper channels to clear medical in regards to not having to wear a face mask.
1767688	Air carrier flight crew reported the FO may have pressed the autothrottle disengage button rather than the TO/GA button during takeoff roll. The flight crew rejected the takeoff and cited the FO's lack of flying as a contributing factor.
1767674	Air carrier Captain and Dispatcher reported missing a document that was needed before departure. Dispatch sent the document when aircraft was airborne.
1767595	Ground Controller reported a runway incursion due to communication issues with Local Control. Reporter stated staffing issues contributed to the event.
1767532	Flight Attendant reported that after boarding the aircraft they exited with a passenger who did not comply with face mask policy.
1767507	Flight crew reported crossing a runway, taxiing to parking, while not sure if the clearance instructions were for them due to Tower muffling the callsign.
1767490	Air carrier First Officer reported confusion on which intersections they should be going to on the STAR during descent.
1767455	Tow driver reported towing an aircraft into a gate and having the towing aircraft's wing hit a parked aircraft at the adjacent gate.
1767378	Flight Instructor and Local Controller reported the instructor's flight departed without clearance with traffic on very short final after mistakenly taking another aircraft's clearance for takeoff.
1767373	GA pilot reported a track deviation during departure and cited clearance confusion as a contributing factor.
1767354	Flight Attendant reported concerns with company's actions relating to COVID-19 possible exposure.
1767306	Air carrier Captain reported a weight and balance issue due to a misunderstanding of the passenger counting process.
1767223	Air carrier Captain reported a passenger refused to comply with face mask policy.
1767217	Air carrier First Officer reported being exposed to COVID-19 and cited concerns with the company not notifying other employees who may have also been exposed.
1767202	Air carrier First Officer reported forgetting to get screened for COVID-19 prior to reaching the aircraft.
1767200	Air Carrier flight crew did not call Ramp Control prior to entering the ramp area.
1767198	Air Carrier Captain reported ground crews are not properly spraying the inside of the aircraft.

ACN	Synopsis
1767196	Air carrier Captain reported a passenger was removed from the flight due to non-compliance with face mask policy.
1767155	Center Controller reported an airborne conflict.
1767131	Pilot reported flying an aircraft with an out of date registration.
1767073	Pilot reported flying without proper registration.
1767016	Pilot reported flying twice with an out of date registration.
1767001	Lead Technician reported not following published maintenance procedures after being out of practice for an extended period of time.
1766916	Air Carrier flight crew descended below their cleared altitude. The crew cited distraction and the FO's lack of flying as contributing factors.
1766874	Air Carrier First Officer reported a speed deviation below 10,000 feet during descent.
1766837	Air carrier Captain reported maintenance items remained open after the aircraft had not flown in 5 days.
1766786	Air carrier flight crew reported the parking brake was still set during pushback resulting in a broken tow bar shear pin. Both pilots referenced lack of flying as a contributing factor.
1766783	Ground Controller reported a procedural error that resulted in delaying a departing aircraft.
1766762	Tower Controller reported a ground communication issue resulting in a taxiway incursion. Controller was working multiple positions including Ground 1 & 2 along with FD/CD.
1766761	TRACON Controller reported an aircraft overshoot an altitude clearance resulting in a conflict.
1766750	GA pilot reported being unable to contact ATC due to possible Controller under staffing resulting in a Class C airspace violation.
1766737	Corporate flight crew reported flying the aircraft with the registration expired. US mail had been delayed plus a shortage of office staff due to COVID-19, were cited as factors in the procedural deviation.
1766713	Flight Attendant reported the Captain did not wear a face mask throughout their flight pairing.
1766707	Flight Attendant reported a passenger did not comply with the face mask policy.
1766564	Pilot and Controller reported a runway incursion due to the pilot misunderstanding of ATC's clearance.
1766540	Flight Attendant reported exposure to COVID-19 and described aircraft sanitizing concerns.
1766439	Air Carrier First Officer reported a track deviation after missing a transition waypoint during an ILS arrival.
1766276	Air carrier First Officer reported the crew was not notified by the company of exposure to a COVID-19 positive employee.
1766062	Air Carrier flight attendants reported a passenger would not comply with face mask policy and was removed from the flight.
1766051	Flight Attendant reported feeling pressured to sit in a cabin jumpseat near passengers assigned to company blocked seats. Flight Attendant was later informed of exposure to COVID-19.
1766049	Passenger reported the flight attendants erected a curtain in the coach cabin as a rest area during flight. Passenger expressed safety and security concerns with this incident.
1766047	Flight attendants reported dealing with a sick passenger during flight.
1766046	Flight Attendant reported experiencing burning eyes and throat as well as headaches upon boarding aircraft. Flight Attendant referenced the sanitizing agent used to clean the aircraft as a possible cause.
1766041	Flight Attendant reported multiple concerns with wearing a face mask.
1766037	Flight Attendant In Charge reported being distracted by a face mask compliance issue and not verifying all before takeoff duties were completed.
1766025	Flight Attendant reported a passenger did not comply with the face mask policy, nor cell phone regulations.
1766001	Air carrier Captain reported the Operations Manager was unable to help the crew during an in-flight mechanical problem due to being involved with a COVID-19 situation.
1765999	Air carrier flight crew reported a track heading deviation and cited lack of flying as a contributing factor.
1765996	Air carrier Captain reported making a procedural error during preflight and cited a distraction and lack of recent flying as contributing factors.
1765957	Air carrier pilot reported a track heading deviation during climbout. Pilot cited distraction and lack of flying as a contributing factors.
1765903	Air carrier Captain reported requesting the company ban single layer neck gators as they do not provide adequate protection.
1765901	Air carrier Captain reported the First Officer would not wear a face mask in the cockpit when asked to.
1765884	Air carrier Captain reported an unstabilized approach and cited lack of proficiency after an extended period of time off as a contributing factor.
1765880	Air carrier flight crew reported an altitude overshoot due to a light aircraft.
1765877	Air carrier Captain reported several passengers were not complying with face mask policy.
1765801	Air carrier pilot reported flight attendants excellently handled a passenger misconduct event during pushback.
1765758	Air carrier pilot reported an unstabilized approach resulting in a go-around.
1765719	Captain reported a passenger was not complying with face mask policy and was eventually removed from the flight.
1765691	Dispatcher reported excessive workload due to staffing issues.
1765686	Air carrier First Officer reported an aircraft went around due to winds, while they were departing a parallel runway causing an airborne conflict.

ACN	Synopsis
1765676	Air carrier flight crew reported executing a go-around after seeing there was a vehicle on the runway. The Tower was closed at time of the event and the crew was on the wrong frequency.
1765673	Air carrier flight crew reported not flying the correct departure procedure and not realizing it until after contacting ATC.
1765666	Air carrier flight crew reported a track heading deviation during arrival and both pilots cited lack of flying as a contributing factor.
1765651	Air carrier flight crew reported turning right instead of left on departure. Both pilots referenced lack of flying as a contributing factor.
1765647	Air carrier First Officer reported that despite multiple PAs, passengers would not comply with face mask policy.
1765646	Air carrier First Officer reported seeing pilots in the lounge not wearing face masks.
1765643	Air Carrier flight crew reported they had configured the bleed air system incorrectly before takeoff.
1765641	Air carrier Captain reported food that is provided for passengers and crew is unfit for human consumption on specific flights.
1765512	Air carrier Flight Attendant reported a parent could not make a child comply with the face mask policy during boarding.
1765510	Air carrier Flight Attendant reported unacceptable cleaning and sanitizing procedures by the cabin cleaning crew.
1765509	Air carrier Flight Attendant reported concerns with crew rest facility restrictions during the COVID-19 pandemic.
1765503	Flight Attendant reported experiencing symptoms similar to a cold or allergies during flight and did not think it could be COVID-19 symptoms until at home.
1765465	Air carrier Captain reported a flap setting issue during climbout and stated that a callout sounding similar to the flap callout may have caused confusion.
1765414	Air carrier ground employee reported concerns with management not taking the steps necessary to stop the spread of COVID-19 in their work environment.
1765412	Air Carrier Captain reported experiencing an unsafe push-back from the gate.
1765395	Air carrier flight crew reported departing with an incorrect pack configuration.
1765375	Air Carrier Captain reported a taxiway incursion and stated Taxiway T2 which was included in their clearance is not charted.
1765370	Air carrier flight crew reported ATC was difficult to communicate with and suggested that staffing is a contributing factor.
1765357	TRACON Controllers reported social distancing, during the training period, may have contributed to an incorrect altitude assigned to the aircraft.
1765292	Technician reported confusing dates relating to work that needed to be performed on an aircraft that had been in storage.
1765287	Flight Attendant reported inadvertently not briefing exit row passengers due to other passengers making special seating requests.
1765278	Air carrier Captain reported being distracted and not contacting the ramp before taxiing to the gate.
1765261	Air carrier Captain reported conducting a go-around due to improper aircraft configuration and cited loss of situational awareness as a contributing factor.
1765222	Air carrier First Officer reported a slat/flap indication problem on departure resulting in a return to departure airport.
1765217	Air carrier First Officer reported possible jet blast from a heavy aircraft crossing a parallel runway, while departing.
1765168	Center Controllers reported an aircraft landing at an airport where the runway was closed.
1765150	Flight Instructor reported a Class C airspace incursion.
1765120	Flight Attendant reported the Captain advised the crew that he would not be wearing a mask in the cockpit.
1765090	Air carrier Captain reported a passenger reported having health issues during the flight.
1765081	Air carrier First Officer reported a go-around due to ATC clearing another aircraft for takeoff while reporter's flight was on short final.
1765071	Air carrier Captain reported an airborne conflict while climbing to assigned altitude.
1765070	Air Carrier flight crew reported over shooting an assigned altitude with a light aircraft, resulting in an airborne conflict.
1765035	Air carrier Captain reported flight attendants did not have correct sizes of Personal Protection Equipment to work safely.
1764979	GA pilot reported having communication issues with Center.
1764948	Flight Attendant reported a passenger was non-compliant with face mask policy.
1764941	Flight Attendant reported a passenger kept switching seats and did not comply with face mask policy during flight.
1764938	Flight Attendant felt coerced into letting a non-working Flight Attendant sit in a seat that was not supposed to be used because of social distancing.
1764935	Flight Attendant reported losing focus and using a cell phone app while parked and waiting for a gate.

ACN	Synopsis
1764934	Flight Attendant reported forgetting to put a mask back on prior to doing a water service.
1764931	Flight Attendant reported concerns with having to wear a face mask and the use of hand sanitizers.
1764930	Flight Attendant reported several concerns with having to wear a face mask.
1764890	Dispatcher reported confusion over a Dispatcher desk being closed and who was responsible for certain flights.
1764855	Customer Service Representative reported COVID-19 issues relating to agents in the terminal at check in.
1764847	Customer Service Representative reported a crowded and unsafe area in the lobby, which did not allow for proper social distancing.
1764805	Air carrier Captain reported having no pillows on flights due to COVID-19 and not being able to adequately rest.
1764798	Air carrier First Officer reported the Captain of the flight created a 'toxic' cockpit environment.
1764796	Air carrier flight crew reported an unstabilized approach due to a wrong flap setting.
1764793	Air carrier flight crew reported executing a go-around due to a ground proximity warning.
1764789	Air Carrier Captain reported the aircraft leveled off 1,000 feet before assigned altitudes multiple times, and during multiple trips.
1764752	GA pilot reported a taxiway incursion and cited construction related distraction and lack of flying as contributing factors.
1764719	GA pilot reported becoming NORDO and flying through an MOA.
1764597	Dispatcher reported having to work too many flights during shift.
1764595	Dispatcher reported improper turnover of flights during shift.
1764594	Dispatcher reported having to work too many aircraft due to staffing related issues after several dispatchers called in sick.
1764542	Air carrier pilot reported an unstabilized approach and cited lack of flying as a contributing factor.
1764540	Air carrier flight crew reported an altitude deviation during arrival resulting in an airborne conflict.
1764536	Air carrier First Officer reported an APU drain mast/hydraulic reservoir vent was discovered missing by ground crew after landing.
1764522	Pilot reported flying an aircraft with an MEL deferral that had expired its allowed 500 hours.
1764496	Dispatcher reported that too many flights are being assigned to each desk, leading to heavy workload and safety concerns.
1764491	Air carrier pilot reported that there was not a mechanic's signature or employee number on the balancing logbook entry regarding an APU door status message.
1764442	Air Carrier flight crew reported over shooting an altitude during departure.
1764432	Air carrier Captain reported ATC gave a very complicated taxi clearance during the landing rollout at 100 knots.
1764412	TRACON Controller reported an airborne conflict.
1764316	Air carrier flight crew reported not communicating with operations and did not receive the new load out until airborne.
1764309	Air Carrier Captain reported a track heading deviation while on departure.
1764304	Air carrier flight crew reported setting up for the incorrect runway during approach.
1764293	Dispatcher reported an overwhelming amount of flights the Dispatcher was advised they would be working, due to staffing issues.
1764286	Air carrier flight crew reported overshooting an assigned altitude during departure and cited the rate of climb due to the aircraft being light in weight as a contributing factor.
1764277	Air carrier flight crew reported being distracted during preflight and the flight departed without the logbook on board.
1764220	Approach Controller reported vectoring three aircraft to a closed runway and not realizing it until the first aircraft went around.
1764168	Technician reported an aircraft in storage had an inspection come due without being placed back in service.
1764157	Air carrier pilot reported being advised by flight attendants during taxi out that passengers were not complying with face mask policy.
1764063	Air carrier Captain reported a Flight Attendant advised that a passenger was non-compliant with face mask policy.
1764062	Air carrier flight crew reported a flap overspeed issue on initial approach.
1763953	Flight Attendant reported several concerns with individuals having to wear face masks.
1763892	Air carrier pilot reported an in-flight passenger misconduct event.
1763764	Flight attendants reported a passenger boarded wearing a powered air purifier respirator during the flight and they were not sure if it was allowed.
1763762	Flight attendants reported a passenger did not comply with face mask policy during flight.
1763759	Flight Attendant reported a child would not wear a seatbelt, nor a face mask and was eventually deplaned.
1763742	Flight Attendant reported a passenger did not comply with face mask policy.
1763723	Corporate jet Captain reported a communication issue between ATC facilities resulted in an airborne conflict.
1763584	Air carrier flight crew reported missing a speed restriction clearance possibly due to the Controller wearing a face mask.

ACN	Synopsis
1763547	GA pilot reported ATC clearance issues involving similar call signs and cited Controller workload as a contributing factor.
1763430	First Officer reported flight missed an altitude level off because they were a little rusty.
1763410	Technician reported work environment concerns that aren't being taken care of by management.
1763404	Flight Attendant reported a passenger was removed from the flight due to non-compliance with face mask policy.
1763397	Flight Attendant reported a passenger did not comply with face mask policy.
1763387	Flight Attendant reported several passengers did not complying with face mask policy during flight.
1763385	Flight Attendant reported jumpseat social distancing concerns due to specific seats being made available by an Agent.
1763379	Flight Attendant reported a confrontational passenger who did not want to comply with face mask policy.
1763378	Flight Attendant reported multiple passengers did not comply with face masks policy.
1763342	Air carrier Captain reported Flight Attendant advised them of passengers not complying with face mask policy.
1763321	Air carrier Captain reported being distracted by a Flight Attendant call and the autopilot disconnected during flap extension.
1763319	Air carrier flight crew reported an unstablized approach and landing and cited lack of flying as a contributing factor.
1763209	Center Controller reported a mistake involving handing off an aircraft to the wrong sector and cited staffing levels as a contributing factor.
1763195	TRACON Controller reported failing to coordinate an Opposite Direction Operation with Tower.
1763194	Tower Controller reported an aircraft missed a turn and came within less than the required separation from a tall obstruction.
1763192	Center Controller reported disagreement with Operations Manager when Controller put in aircraft flow coming into the sector reporter was working.
1763191	Tower Instructor and Developmental reported overlying Center not complying with the two facilities' LOA.
1763155	Pilot reported being under pressure and flew a ferry flight without proper documentation.
1763147	Corporate Captain reported neither crew member was current to make a landing on a night flight and realized it after they had departed.
1763137	Flight Attendant reported a family with child were removed from the flight because of non-compliance regarding face mask policy. The family was incorrectly told by station agents, a mask was not required for the 2 year old.
1763134	Flight Attendant reported a passenger resisted adhering to face mask policy. No further action was taken for fear of escalating the situation.
1763133	Flight Attendant reported having to remind two passengers about the face mask policy. FA backed off for fear the situation would escalate.
1763132	Flight Attendant reported a passenger did not adhere to the cell phone or face mask policy. FA stated the passenger was rude, loud, combative and used profanity.
1763130	Flight Attendant reported having difficulty maintaining social distancing while at the jumpseat.
1763117	Air carrier First Officer reported a speed deviation and cited lack of flying as a contributing factor.
1762974	Mechanic reported that after pitot inspections are accomplished prior to departure, aircraft frequently sit on the ground for hours with no pitot tube covers to protect against contaminants.
1762964	Flight Attendant reported a family, part of a traveling group, were not compliant with face mask policy.
1762961	Flight Attendant reported a passenger was argumentative about wearing a face mask during the flight and also would not adhere to social distancing.
1762960	Flight Attendant reported most passengers drop their face mask before they are offered the beverage service.
1762958	Flight Attendant crew reported a family did not comply with face mask policy.
1762954	Flight Attendant reported the disinfecting spray is making individuals nauseous.
1762952	Flight Attendant reported that many passengers were not wearing face masks properly.
1762948	Flight Attendant reported the disinfecting spray used for sanitizing aircraft is irritating to eyes and nasal passages.
1762945	Flight Attendant reported a passenger refused to adhere to face mask policy.
1762934	Flight Attendant reported a passenger was removed from the flight due to refusing to adhere to face mask policy.
1762933	Flight Attendant reported that when flight attendants are in the flight deck, pilots do not wear face masks.
1762852	Air Carrier Captain reported the aircraft arrived from the maintenance hangar with switches and fueling in nonstandard conditions.
1762829	Tower Front Line Manager reported problems with the ASOS failure and notification from the Contract Weather Observer.
1762776	Flight Attendant reported boarding and deplaning issues related to social distancing concerns.
1762740	Air carrier flight crew reported that while cleaning the cockpit displays, the altitude selector was inadvertently changed resulting in an altitude deviation.
1762700	Ground employee reported that it is difficult to get from one area to another because of out of service equipment and the equipment that is usable is not cleaned correctly.

ACN	Synopsis
1762642	GA pilot reported losing multiple systems and equipment during departure and opting for an immediate return to the departure airport.
1762607	Flight Attendant reported a Captain did not comply with face mask policy.
1762602	Flight Attendant reported a passenger was non-compliant with face mask policy.
1762536	Air carrier First Officer reported an issue relating to duty time compliance.
1762502	Dispatcher reported not properly planning for a Center to be ATC Zero for COVID cleaning.
1762499	Air carrier Captain reported that after pushback the aircraft was towed back to the gate to remove a passenger who was verbally abusive and refused to wear a face mask.
1762482	Air carrier First Officer reported that the aircraft had multiple maintenance status messages before departure which were inadvertently not cleared before departure due to a series of interruptions during pre-flight.
1762318	GA pilot reported reduced Tower services at a Class D airport due to COVID-19 has resulted in an unsafe environment and described several conflicts occurring while the Tower was closed.
1762281	Flight Attendant reported the majority of passengers were not complying with face mask policy.
1762269	Flight Attendant reported multiple passengers did not comply with face mask policy.
1762256	Air carrier Captain reported returning to the gate to remove four passengers who were disruptive and refusing to comply with face mask policy.
1762254	Air carrier Captain reported an airborne conflict with a VFR aircraft. The Captain stated their climb rate was higher than usual due to aircraft being lighter in weight.
1762201	Customer Service Representative reported that the airport is pumping artificial fragrances that are irritating and can cause headaches.
1762188	Air carrier Captain reported becoming ill after working on a trip with a sick Flight Attendant who did not inform all crew members that she was feeling sick and then later tested positive for COVID-19.
1762187	Air carrier flight crew reported track heading and altitude deviations during departure and cited confusing ATC instructions as a contributing factor.
1762179	Air carrier flight crew reported an entry error while loading the STAR into the FMC/FMS.
1762064	TRACON Controller and air carrier Captain reported an airborne conflict situation between the Captain's commercial aircraft and an unknown VFR aircraft.
1761957	Air carrier flight crew reported that an outer windshield pane shattered during cruise following a window heat failure.
1761950	Air carrier flight crew reported turbulence and a flap overspeed. One crew member reported the flying pilot had not flown for an extended period of time.
1761850	Air Carrier Captain reported an unstable approach due to poor CRM and lack of flying.
1761842	Air carrier First Officer reported an unstable approach and stated this was the first flight in 2 months.
1761831	Dispatcher reported the flight was re-routed because ATC was closed due to COVID-19.
1761811	Air Carrier First Officer reported landing without a clearance and stated lack of flying was a contributing factor.
1761777	Air carrier Check Airman reported not following the published checklist due to fatigue and not having flown in the last 6 months.
1761773	Air Carrier Captain reported a track deviation during approach and cited fatigue and low flight time during the pandemic as contributing factors.
1761764	Air Carrier flight crew reported an unstable approach in gusty wind conditions. First Officer (PF) cited having minimal flight time this year.
1761732	Corporate pilot reported an altitude deviation and cited lack of recent flying as a contributing factor.
1761665	Air carrier flight crew reported that the first portion of the approach was unstable due to not slowing early enough on final approach.
1761579	Pilot reported conducting an unstable instrument approach and cited lack of proficiency due to difficulty finding a safety pilot for practice during the COVID-19 pandemic.
1761560	Air carrier First Officer reported that the Flight Attendant safety briefing did not include procedural guidance on how passengers should remove face masks and don oxygen masks in the event of an emergency.
1761530	Technician reported that task cards for servicing the APU of aircraft in storage do not have the correct reference number.
1761528	Flight Attendant reported that a passenger was wearing only a face shield and was asked to wear a face mask to be in compliance.
1761522	Flight attendants reported a partial slide deployment while opening the cabin door due to the door inadvertently not being disarmed.
1761517	Flight Attendant reported a passenger did not comply with face mask policy during flight.
1761506	Flight Attendant reported concerns with cleaners sanitizing the aircraft too quickly.
1761490	Air carrier flight crew reported a track heading deviation.
1761435	Air carrier Captain reported that prior to gate departure a lavatory smoke warning occurred. The passenger allegedly smoking in the lav refused to leave and was ordered off by the Captain.
1761410	Ramp employee reported company is spraying the break-rooms and other areas while personnel are still in the area.
1761407	Ground employee reported being in contact with a coworker who tested positive for COVID-19 and asked to report to work the next day.

ACN	Synopsis
1761398	Ground employee reported concerns with others not wearing face masks, nor taking COVID-19 seriously.
1761379	Air carrier flight crew reported a flap configuration problem on departure resulting in a speed deviation. First Officer made reference to lack of flying as a contributing factor.
1761371	Flight Attendant reported two passenger were removed from flight due to non-compliance with face mask policy and insulting a flight attendant.
1761319	Air carrier Captain reported an altitude deviation during approach.
1761275	Air carrier Captain recommended the FAA require a temporary face covering policy inside all interior buildings which serve 121 and 135 crew and passengers.
1761269	Pilot reported being advised of a possible overflight of a required maintenance inspection.
1761180	Pilot reported cross-channeling transmissions between Comm 1 and 2 radios.
1761167	Flight Attendant reported a passenger did not comply with face mask policy.
1761165	Flight Attendant reported the aircraft being wet after cleaning crew fogged the interior.
1761160	Flight Attendant reported a passenger was removed from the flight for non-compliance with face mask policy.
1761157	Flight Attendant reported a passenger did not comply with face mask policy during flight.
1761153	Flight Attendant reported cross-contamination concerns with the increase in food and beverage services provided to passengers during flights.
1761146	Flight attendants reported issues with crew members not complying with face mask policy.
1761013	Air carrier pilot and Dispatcher reported a required alternate airport was not filed prior to departure.
1761012	Air carrier flight crew reported they inadvertently took off with the wrong data loaded in the FMC.
1760997	Air carrier Captain reported departing without correct paperwork and cited lack of flying as a contributing factor.
1760988	Ramp employee reported receiving conflicting information as to when to go back to work after being exposed to COVID-19.
1760972	Tower Controller reported that after clearing an aircraft for takeoff it did not have enough in trail distance from another aircraft departing the same runway.
1760963	TRACON instructor reported an aircraft departing and not squawking, flying close to 100 miles through various different airspace at 12,000 feet.
1760916	GA pilot reported flying the incorrect pattern after the Tower closed.
1760902	Flight Attendant reported a passenger complained about sitting next to another passenger and did not comply with face mask policy.
1760901	Flight Attendant reported a passenger did not comply with face mask policy during flight.
1760899	Flight Attendant reported a passenger was removed from flight due to not complying with face mask policy.
1760875	Air carrier Captain reported a flap misconfiguration leading to an unstablized approach and go-around.
1760864	Air carrier flight crew reported an altitude deviation and cited fatigue and lack of flying as contributing factors.
1760833	Air carrier Captain reported calling in fatigued and being told months later they are expected to fly fatigued.
1760818	Air carrier flight crew reported a track heading deviation and cited First Officer's lack of flying as a contributing factor.
1760738	Flight Attendant reported there were only 3 fully operational lavatories during a long haul flight.
1760736	Flight Attendant reported a passenger that sat in the exit row had hearing problems and was displaying symptoms of possibly being sick.
1760679	Air carrier pilot reported being distracted by the Tower Controller working Ground and Local Control.
1760619	Corporate pilot reported overshooting assigned altitude on departure.
1760614	Pilot reported flying nearby an area of smoke and was unable to find an associated TFR. After the flight, pilot confirmed a TFR was active but did not post in time on EFB software.
1760576	Maintenance Lead Inspector reported a step was being skipped during lavatory faucet sanitation procedures.
1760562	Flight Attendant reported cleaners did not sanitize the aircraft per company standards/policy.
1760561	Flight Attendant reported passengers wearing non-approved face masks.
1760560	Flight Attendant reported failing to conduct a required briefing after many distractions during deplaning/boarding including cleaners entering while passengers were deplaning.
1760544	Flight Attendant reported a passenger was removed due to non-compliance with face mask policy.
1760539	Flight Attendant reported a passenger did not comply with face mask policy.
1760536	Flight Attendant reported observing multiple events of non-compliance with face mask wearing among passengers and crew members, and cited a lack of policy enforcement as a contributing factor.
1760463	Air carrier flight crew reported experiencing an RA inbound to Newark and cited Controller workload as a contributing factor.
1760452	Air carrier pilot reported a passenger was removed due to non-compliance with face mask policy.
1760437	Air carrier First Officer reported an unstablized approach resulting in a go-around.
1760411	Customer Service Agent reported that agents are doing baggage handling during the COVID-19 pandemic and may get hurt lifting so many bags per shift.
1760403	Air carrier Captain reported an air cooling machine issue during taxi out resulting in excessive heat in the rear of the aircraft and a return to gate. Maintenance reportedly wanted to defer the issue, but the crew and Dispatch decided against it and opted for an aircraft swap.
1760374	Air carrier First Officer reported not making the second crossing restriction on arrival.

ACN	Synopsis
1760348	Air carrier Captain reported a group of passengers appeared to be intoxicated during boarding. One of the passengers was removed from the flight, the others were reportedly not compliant with face mask policy during the flight.
1760313	Corporate Captain reported a slow and manageable cabin decompression event.
1760308	Pilot reported violating a sporting event TFR during the COVID-19 pandemic.
1760306	Pilot reported concerns with some flight schools not requiring face mask to be worn during flights.
1760296	Pilot reported an airspace violation due to a fast climbing, lighter than usual aircraft.
1760237	Flight instructor reported difficulty talking to passenger while wearing a face mask and had an airspace violation while attempting to fix the communication issue.
1760218	Pilot reported ATC being too busy to communicate with them while attempting to request a clearance to descend.
1760152	Part 121 pilot reported not being sure if he was current to fly a Part 91 flight.
1760111	Flight Attendant reported that cleaners were barging onboard and 'swimming' upstream while passengers were trying to deplane.
1760105	Flight Attendant reported social distancing concerns with seat assignments.
1760104	Flight Attendant reported gate agent issued seats that according to company policy were not supposed to be used.
1760103	Flight Attendant reported a row that is typically blocked for Flight Attendant use was released for passenger seating.
1760102	Flight Attendant reported that agents filled seats that, per social distancing guidelines, should have remained empty.
1760099	Flight Attendant reported a Gate Agent filled seats that were not supposed to be filled.
1760097	Flight Attendant reported that another Flight Attendant who reportedly had not flown for over 5 months, sat in the wrong seat for takeoff and did not follow procedures for opening a door.
1760017	First Officer reported not realizing that they did not receive a re-release.
1759947	Air carrier First Officer reported that flight dispatchers are filing flight plans that use the wrong arrival into an airport, causing problems for flight crews during arrival.
1759940	Air carrier Captain reported a passenger was removed for non-compliance with face mask policy.
1759827	Ground worker reported not being informed by management that a co-worker tested positive for COVID-19. The ground worker had worked with the co-worker and then visited family, resulting in possible exposure.
1759824	Ramp worker reported that an inadequate number of conveyor belts at a terminal resulted in ramp crew hand-carrying baggage up jet bridge stairs repeatedly, exposing them to multiple safety risks.
1759820	Ramp worker reported that a co-worker tested positive for COVID-19. The ramp worker was not notified by management and continued to work.
1759810	Center Controller reported an airborne conflict while working combined sectors and cited handoff related issues contributed to the event.
1759807	Center Controller reported that during a controller de-brief/switch an airborne conflict occurred due to the distraction.
1759796	Tower Controller reported not being sure if a landing clearance was given to an arrival aircraft.
1759781	Tower Controller reported an aircraft lined up for the wrong runway during approach.
1759780	ZFW Center Controller working combined sectors reported an airborne conflict and cited workload and staffing issues as contributing factors.
1759745	GA pilot reported a NMAC on final to SMO airport. Tower closure was cited as a contributing factor.
1759720	Flight Attendant reported forgetting to disarm the R1 door and cited lack of flying in this specific aircraft type as a contributing factor.
1759718	Flight attendants reported two passengers were not compliant with face mask policies.
1759709	Air carrier flight crew reported not notifying the Dispatcher of a navigation light that was out of service.
1759658	Air carrier Captain reported checking in and hearing the Controller tell everybody to stand by. They continued on assigned heading and altitude, finally being told they were on the wrong frequency. Controller reportedly was working multiple frequencies.
1759647	Air carrier flight crew reported going over 250 knots below 10,000 feet. Pilot flying made reference to lack of flying as a contributing factor.
1759574	Ground Controller reported inadvertently taxiing an aircraft into a restricted area.
1759543	Small Transport aircraft pilot reported not contacting Departure Control and stayed with Tower until switching to Center Control.
1759522	Flight attendant reported a passenger was wearing a vented face mask which is not in compliance with policy.
1759518	Flight attendant reported a passenger was non-complaint with face mask policy during the flight.
1759515	Flight Attendant reported a passenger boarding was wearing a vented face mask which is not in compliance with policy.
1759498	Flight Attendant reported concerns with having to fly with a Flight Attendant that had been in contact with another Flight Attendant that had tested positive for COVID-19.
1759478	Air carrier Captain reported a passenger appeared intoxicated during boarding, but was allowed to fly. During the flight the passenger was non-compliant with face mask policy.

ACN	Synopsis
1759411	Air carrier First Officer reported altitude deviation on a departure and cited lack of flying as a contributing factor.
1759362	Air Carrier Captain reported setting and taking off with an incorrect flap position.
1759319	Air Carrier Flight Attendant reported that a Flight Attendant did not use correct procedures arming and disarming the aircraft door. In addition, the Flight Attendant did not follow face mask policy.
1759313	Flight Attendant reported that having to wear a face mask could affect the FA's ability to perform certain safety functions, especially in the case of an emergency situation.
1759282	Air Carrier flight crew reported taking off without an ATC clearance. Captain reported having not flown in 6 months.
1759279	Air Carrier Captain reported taking an ATC clearance for a similar sounding aircraft on the same frequency. The Captain reported the Controller was working multiple sectors at the time.
1759256	Air carrier pilot reported the Captain's windshield cracked in cruise and the flight diverted successfully. Pilot surmised that the plane's lengthy time being parked contributed to the event.
1759213	Ramp Agent reported damaging the aircraft during cargo loading because the agent's eye glasses were fogging up due to the face mask.
1759211	Ramp worker reported that a tailstand was not available to support the plane while passengers were deplaned from the front of the aircraft.
1759187	Air carrier First Officer reported the flight departed with incorrect release documentation. The First Officer referenced not having flown in the last 6 months due to the COVID-19 pandemic.
1759162	Air carrier Captain reported a passenger was removed from flight due to non compliance with face mask policy.
1759113	TRACON Controllers reported a loss of separation while working combined positions due to staffing and handoff/communication issues. The First Officer of one of the aircrafts involved also reported the conflict and made reference to the miss-communication between controllers.
1759034	Flight Attendant reported a passenger was not compliant with seat belt, carry on placement and face mask policies.
1759026	Flight Attendant reported not briefing an exit row passenger due to the late arrival of the passenger.
1759020	Dispatcher reported being overwhelmed with aircraft due to staffing shortages and computer system difficulties.
1758920	Air carrier flight crew reported a Flight Attendant was not seated for departure due to having to deal with passengers not properly wearing face masks.
1758916	Air carrier flight crew reported numerous changes to the arrival resulted in a crossing restriction altitude overshoot.
1758904	Pilot reported being out of communication with ATC in Class A due to inadvertently changing frequencies and not noticing it until some time later.
1758752	Air Carrier flight crew reported reoccurring altimeter and airspeed maintenance problems on an aircraft that had been in and out of service several times during the 'economic downturn.'
1758738	Air Carrier Captain reported an airborne conflict followed by TCAS RA instructions which they adhered to by leveling off. The Captain made reference that the aircraft was light in weight for this flight.
1758726	Air Carrier Captain reported failure to enter a maintenance discrepancy in log book. Captain was distracted due to an extended briefing with the Flight Attendants regarding the personal impact of the COVID-19 pandemic.
1758703	Air Carrier flight crew reported flying an unstabilized approach. First Officer was the Pilot Flying and had not flown in 30 days.
1758641	Air Carrier First Officer reported missing an altitude constraint during arrival and cited workload, fatigue and lack of flight currency as contributing factors.
1758627	Air carrier flight crew reported diverting due to an impassable line of thunderstorms. Crew stated that Dispatch was pressuring them to continue on planned routing to destination.
1758598	Tower Controller reported being distracted with sanitizing the work area while operations were still going on resulting in an aircraft being cleared to taxi on to the runway while another aircraft was landing on an intersecting runway.
1758535	Flight Attendant reported a passenger boarded the aircraft with a non compliant type of face mask. Flight Attendant questioned how customer service missed the passenger wearing the non compliant face mask.
1758529	Flight Attendant reported a passenger refused to comply with the face mask policy during flight.
1758518	Flight Attendant reported safety concerns with having to follow COVID-19 procedures regarding the use of the crew rest area.
1758517	Flight Attendant reported a commuting Captain was non compliant with face mask policy.
1758500	Air carrier Captain reported a speed deviation on landing and attributes the error to being distracted as they looked for birds pointed out by ATC.
1758486	Air Carrier First Officer reported that after having to divert they were unable to disembark the aircraft due to COVID-19 restrictions at that airport. The crew decided to refuel and return to the origin airport.
1758478	Air carrier Captain reported several passengers were not complying with the face mask policy.
1758439	Air carrier First Officer reported ingesting aerosol fumes in the flight deck from cleaners that were on board sanitizing the aircraft without making sure it was empty.

ACN	Synopsis
1758347	Flight Attendant reported a passenger was non compliant with face mask policy and also changing seats while in turbulence and on final approach.
1758346	Flight Attendant reported a passenger was non compliant with face mask policy during flight. Reporter stated the passenger said he had a medical condition, but it was not noted in the crew's records.
1758344	Flight Attendant reported allowing a child to fly without wearing a face mask. The child had refused to wear it.
1758342	Flight Attendant reported problems associated with passengers wearing face masks improperly.
1758326	Air carrier Captain reported experiencing a stick shaker at 10 feet on final and cited a low Vref due to the aircraft being light in weight as a contributing factor.
1758276	Air carrier Captain reported a family was removed from a flight during boarding due non compliance with face mask policy.
1758247	Air carrier First Officer reported a maintenance delay combined with COVID-19 procedures resulted in being unfit to fly due to fatigue.
1758229	Air carrier First Officer reported being high and fast on an approach and cited lack of flying as a contributing factor.
1758133	Pilot reported a possible airspace violation and states the reason was due to the lack of flying time in the last 6 months due to the COVID-19 pandemic.
1758116	Flight Attendant reported a non-revenue passenger was allowed to ride on the flight and not required to wear a face mask.
1758114	Flight Attendant reported being displaced from the seats assigned due to COVID-19 changes, by passengers assigned to the seats.
1758109	Flight Attendant reported being told by a ground person that one of the deplaning passengers was wearing a face mask that did not meet regulations.
1758059	Air carrier Captain reported experiencing unreliable airspeed and altitude indications. Captain stated that due to not reviewing the logbook before the flight and an improper preflight, the potential pitot-static system issue was not identified prior to the flight.
1758054	Air carrier Captain reported not entering required verbiage onto a form and said that lack of recent flying contributed to the oversight.
1758029	Ground employee cited several reasons why face masks should be optional.
1758027	Customer Service employee reported having to catch the plexi-glass sheet from the podium after it became loose from it being touched by a toddler in the arms of an adult.
1757915	Flight Attendant reported a passenger who had previously violated the face mask policy was allowed to board this flight.
1757912	Flight Attendant reported non-revenue passenger refused to comply with the company's face mask policy.
1757910	Flight attendants reported a passenger was not complying with wearing a face mask and had to be told three times to wear it correctly.
1757908	Flight Attendant reported having to tell one passenger to wear a face mask while another passenger spoke up to the Flight Attendant.
1757905	Flight Attendant stated a door strap would not fully retract.
1757904	Flight Attendant reported aircraft being hot during boarding and that the aircraft did not cool off until the engines were started.
1757896	Flight Attendant reported that an old version of the safety demo was presented due to being rushed.
1757829	Ground employee reported concerns about peers not wearing face masks.
1757798	Dispatcher reported confusion in city pairing used for a Part 91 Ferry Permit, which resulted in the aircraft flying to a different destination airport.
1757783	Air carrier pilot stated hotel was not keeping crews separate from each other on crew transportation from the hotel.
1757761	Air carrier flight crew reported ATC gave them a clearance meant for another company flight.
1757736	Tower Controller working combined positions reported an aircraft did not call Ramp Tower as expected.
1757700	Air carrier First Officer reported not calling Ground Control after clearing the runway.
1757667	GA pilot reported entering a sporting TFR and wasn't sure if these type of TFRs are still in place during the COVID-19 pandemic.
1757607	Corporate pilot reported not being current for a night flight.
1757590	A321 Flight Attendant crew reported a "dirty socks" fumes event of varying intensity during initial climb and lasting until arrival at destination gate.
1757583	Flight attendants reported a customer service agent advised them a passenger was not complying with face mask policy.
1757580	Flight attendant reported passengers did not comply with the face mask policy during flight.
1757569	Flight Attendant reported family boarded with a child not wearing a face mask. The family refused to comply with the mask policy, but was allowed to remain on the flight.
1757565	Flight attendant reported a deadheading pilot and a non-revenue pilot refused to follow face mask policy.
1757563	Flight Attendant reported a passenger was not complying with the face mask policy.
1757505	Air carrier Captain reported concerns regarding the products used to disinfect the cabin.
1757493	Air carrier First Officer reported overshooting the assigned altitude due to high speeds.

ACN	Synopsis
1757478	Airline Pilots reported an unstable approach. The Captain had not flown for an extended time.
1757452	Air carrier Captain reported the oil quantity fluctuated during a flight on an aircraft that had been stationary for a long time.
1757412	Air carrier Captain reported a speed deviation during departure.
1757407	Air carrier Captain reported a passenger did not comply with wearing a face mask during the flight.
1757389	Air carrier Captain reported taking off and being very light and realizing they did not arm the LNAV/VNAV for departure.
1757341	Tower Controller reported an airborne conflict and cited fatigue from being understaffed as contributing factor.
1757328	Pilot reported Controller was overworked and unable to respond to many frequency transmissions.
1757266	Flight Attendant reported a passenger had to be told to wear a mask while on board.
1757262	Flight Attendant reported passengers boarded with face masks that had vents.
1757253	Flight Attendant reported a family would not comply with the face mask policy and that it was disturbing to other passengers.
1757249	Flight Attendant reported passenger refused to comply with the face mask policy.
1757188	Air carrier flight crew reported they were informed by ATC of a possible altitude deviation.
1757152	Air Carrier First Officer reported calling in fatigued due to chronic and acute fatigue.
1757035	Flight Attendant reported not being seated during landing due to having to deal with a non-compliant passenger regarding the face mask policy.
1757033	Flight Attendant reported a passenger was non-compliant with face mask policy.
1757028	Flight Attendant crew reported parents with small children were having problems with the children complying with the face mask policy.
1757013	Dispatcher reported erroneously giving permission for a flight to depart early.
1756995	Air carrier flight crew reported a miscommunication during initial climb in a lightly-loaded aircraft resulted in retracting the flaps prematurely.
1756901	Maintenance Technician reported inadvertently not installing a backup battery while complying with a return to service task card.
1756894	Flight Attendant reported that a passenger was not being compliant with wearing a face mask during the flight.
1756841	Air carrier Captain reported the crew did not send an additional text message regarding a fuel door.
1756839	Air carrier flight crew reported inadvertently crossing the runway hold short line while attempting to turn onto a taxiway.
1756730	Maintenance Technician reported an aircraft sanitizing vendor started spraying the aircraft while maintenance personnel were still on board. Technician reports one mechanic became ill.
1756721	Flight Attendant reported deciding to serve only sealed snack and beverage items to customers due to COVID-19 safety concerns.
1756715	Flight Attendant reported experiencing headaches and allergic reactions after wearing a face mask during flight. The effects reportedly subside once the face mask is removed.
1756714	Flight Attendant reported that allowing passengers to sit in seats that are directly opposite flight attendant jumpseats could jeopardize flight attendant health.
1756713	Flight Attendant reported the main door Flight Attendant is distracted during passenger boarding from their safety duties because of having to hand out sanitizing wipes to passengers.
1756708	Flight Attendant reported it was necessary to move passengers for social distancing issues, and one passenger was non-compliant regarding the face mask policy.
1756706	Flight Attendant reported the aircraft cleaners are proceeding onto the aircraft before all passengers are deplaned which does not conform with social distancing.
1756705	Flight Attendant reported the Captain's face mask probably did not conform to policy and in the FA's opinion did little to prevent the spread of COVID-19.
1756682	Air carrier Captain reported the lack of flying was a factor in experiencing an unstabilized approach.
1756672	Air carrier flight crew reported an altitude deviation due to distraction. The pilot crew was listening to a Flight Attendant describe details of a non-compliant passenger regarding the face mask policy.
1756647	Air carrier flight crew reported experiencing a runway incursion.
1756645	Air carrier Captain reported that a passenger refused to comply with face mask policy and was removed from the flight before departure.
1756601	Air carrier First Officer reported that re-qualification training was inadequate.
1756593	Air carrier Captain reported a track heading deviation during arrival and cited communication issues with ATC as a contributing factor.
1756587	Air carrier First Officer reported there was no food available at the hotel and food was not boarded for crew to consume during the flight. COVID-19 related time constraints were cited as contributing factors.
1756550	Air carrier Captain reported not being able to talk to ATC due to Controller working multiple frequencies and being task overloaded.
1756534	Air carrier Captain reported during pre-flight a passenger erected a personal tent bubble after sitting in the cabin area. Captain described the safety implications of having a tent over your body in an emergency situation.
1756524	Center Controller reported an airborne conflict and cited staffing levels as a contributing factor.

ACN	Synopsis
1756521	Center Controller did not point out an aircraft and violated airspace within another center's airspace.
1756502	Pilot reported the Tower closed due to COVID-19 staffing, and was not sure as to what they should be squawking.
1756481	Pilot reported a sporting TFR airspace incursion due to not having it selected on the app being used.
1756465	Pilot reported thinking they were cleared for a touch and go, but were given a clearance to land.
1756419	Flight Instructor reported a student flew solo without a student pilot license.
1756372	Flight Attendant reported a group of passengers not wearing face masks during flight.
1756370	Flight Attendant reported a family was not wearing face masks and had to be reminded often during flight.
1756365	Flight attendants reported that a child was unable to wear a face mask due to crying, resulting in a stressful situation. The child and parent were resealed and the situation was resolved.
1756345	Air carrier Captain reported filing the wrong destination and not realizing it until the FO advised they were going to the wrong airport.
1756299	Captain reported that the Flight Attendant told them that passengers in a specific row were not wearing face masks and were instructed to do so.
1756290	Captain reported cleaning crew came onto plane after passengers left, but most did not wear face masks as per company instructions.
1756247	Air carrier flight crew reported an altitude deviation due to the aircraft going into vertical speed mode for the descent after deviating for weather.
1756218	Air Carrier flight crew reported uneventfully landing from an unstable approach, whereas per SOP, a go-around should have been executed.
1756077	Pilot reported flying in possible violation of FAR 61.57 attributed to COVID-19 related disruptions.
1756074	Single pilot reported becoming confused with ATC's instructions because the Controller was using nonstandard COVID induced workload shortcuts at this location.
1756030	Flight Attendant reported passenger was non-compliant with face mask policy.
1755997	Air carrier Captain reported the aircraft was very light weight. The pilots were unprepared for the quick low altitude level off and deviated from the clearance.
1755987	Air carrier flight crew reported a deviation from the ramp taxi procedure and cited lack of flying as a contributing factor.
1755971	Ground Agent reported that a passenger had tested positive for COVID-19; however, agents in the terminal were not notified of this until 24 hours after the flight had departed.
1755913	Single pilot reported an airspace deviation occurred while attempting to get an IFR clearance. Pilot was unable to get an IFR clearance due to ATC workload and told to try again in 30 minutes.
1755891	Flight Attendant reported a passenger did not comply with the face mask policy.
1755878	Flight Attendant reported a passenger refused to comply with the face mask policy.
1755856	Air carrier flight crew reported that they did not get the fuel service form before departing due to significant delays and late receipt of paperwork.
1755850	Air carrier First Officer reported an altitude deviation was the result of too much time away from work because of COVID-19 lack of flying.
1755816	Customer Service Agent reported concerns with the daily under staffing in the airport lobby and the difficulties it is creating during the COVID-19 pandemic.
1755801	Air carrier flight crew reported landing without a clearance.
1755798	Air carrier flight crew reported the Captain mistakenly shut the cockpit door before a Flight Attendant went into the cockpit during a bathroom break.
1755789	TRACON Controller working combined positions reported an airborne conflict that could have been worse, but was saved by another Controller.
1755787	Pilot and Controller reported an airborne conflict on departure.
1755722	Maintenance Technician reported that a cleaning employee began spraying disinfectant inside the aircraft while the Technician was still inside performing work. The Technician experienced adverse physiological reaction as a result.
1755703	Flight Attendant reported differences between pilot resting areas and those of the flight attendants.
1755701	Flight Attendant reported that a passenger refused to wear a face mask. When customer service came on board the passenger agreed to wear the face mask.
1755695	Flight Attendant reported that a passenger did not comply with wearing a face mask during flight.
1755634	Air carrier flight crew reported exceeding an airspeed restriction during departure. The crew cited several factors as contributing, including lack of recent flying, and multiple delays and distractions.
1755611	Air carrier Captain reported flying the wrong transition on a STAR due to a possible FMS entry error.
1755590	Air carrier First Officer reported programming the FMC incorrectly for the SID, which resulted in a track deviation. Reporter noted several delays that contributed to rushing through cockpit set up.
1755564	Air carrier Captain and First Officer reported that while sanitizing the MCP during crew change, the ALT knob may have been inadvertently bumped.
1755525	Air carrier Captain reported that while waiting to depart, they were locked for 2 hours in a small bus with not enough seats for everyone and no bathroom.
1755522	Air carrier flight crew reported having to use bedding and pillows during crew rest that were previously used.

ACN	Synopsis
1755521	Air carrier flight crew reported experiencing a speed deviation during departure.
1755520	Air carrier flight crew reported an SOP error by not informing Load Planning and Dispatch of the actual FOB.
1755423	Flight Attendant reported a passenger was wearing face shield, but no face mask.
1755420	Flight Attendant reported a passenger was non-compliant about wearing a face mask.
1755418	Flight Attendant reported passengers were not compliant with wearing a face mask.
1755355	First Officer reported a near miss during approach with GA traffic.
1755324	Air carrier flight crew reported they departed with an inoperative lavatory sink.
1755317	Air carrier First Officer reported difficulty receiving a revised clearance for weather deviation because ATC was saturated with traffic.
1755316	Air carrier Captain self reported not following the latest update regarding face mask policy.
1755283	TRACON Controller reported an airspace violation occurred after rearranging altitudes in the ATC system to accommodate arriving aircraft in his sector due to another ATC site closing for COVID-19 sanitation.
1755243	Pilot reported confusion on whether a sporting TFR is in effect during the COVID-19 Pandemic when spectators are not allowed at the game.
1755169	Flight attendant reported a child who refused to wear a face mask was allowed to board the aircraft causing a delay.
1755162	Flight attendants reported a passenger was allowed to fly without wearing a face mask due to a self-reported medical condition.
1755153	Flight Attendant reported that a call was made that the cleaners were off the aircraft when they actually were not. Passengers were allowed on and had to duck into rows to allow the cleaning crew off the aircraft.
1755144	Flight attendant reported several passengers not properly wearing face masks.
1755142	Flight Attendant reported a passenger refused to wear a face mask during flight.
1755037	Air carrier flight crew reported not filling out Fuel Door verification paperwork because they thought it wasn't necessary.
1755020	Air carrier Captain reported making a wrong turn on an arrival, but corrected soon after Approach Control pointed out the error.
1755002	Air carrier Captain reported turning right instead of left on departure. ATC and First Officer immediately pointed out the error and heading was corrected.
1755001	Air carrier First Officer reported landing without a clearance.
1754998	Air carrier flight crew reported a rejected takeoff due to a thrust setting caution advisory.
1754995	Air carrier flight crew reported being high and fast as they were 'leading the pack' during a visual approach. The crew cited lack of flying and pressure to maintain their speed to not hold up other aircraft behind as contributing factors.
1754918	Small aircraft pilot reported an airspace violation due to rusty flying skills after a long absence from flying during COVID-19.
1754889	Aircraft mechanic reported not completing an operations check due to distractions from other tasks.
1754883	Flight Attendant reported a passenger would not comply with the face mask policy even though the passenger had a special exemption to take it off for periods at a time.
1754841	Dispatcher reported using an illegal airport as an alternate. The Dispatcher reported another operations center was closed for COVID-19 sanitizing. This had increased the workload for the Dispatcher and contributed to the event.
1754828	Air carrier Captain reported landing without a landing clearance.
1754821	Air carrier First Officer reported missing a logbook entry involving a new procedure. Lack of flying was cited as a contributing factor.
1754761	Tower Controller working combined positions described safety of flight concerns due to added workload issues.
1754722	GA pilot reported, after not flying in the last several months due to COVID-19, unintentionally landed and departed on a Displaced Threshold at the destination airport. Pilot reported rusty preflight procedures, runway markings that have not been maintained and are difficult to see contributed to the event.
1754706	Flight Attendant reported the misconduct of a group of passengers during the flight regarding compliance with face mask policy.
1754702	Flight Attendant reported communication and procedural issues experienced with another Flight Attendant.
1754699	Flight Attendant reported changing seats during takeoff and landing in order to stay a safe distance from a passenger who appeared ill.
1754697	Flight Attendant reported a passenger was asked several times to comply with the face mask policy during the flight. The passenger did not comply and was met on arrival by a Customer Service Supervisor.
1754589	Tower Controller reported a flight crew had to go-around after being high and fast due to a reported flap problem.
1754588	Tower Controller reported an airborne conflict between an IFR arrival and a VFR aircraft while working combined Local positions.
1754544	Pilot reported flying an aircraft with an expired medical certificate.
1754520	Technician reported the FAA questioned why pitot covers were now installed on probes and sensors with the aircraft being in a hanger.

ACN	Synopsis
1754513	Technician reported not completing the correct paperwork for a ferry flight.
1754511	Flight Attendant reported cleaners came on board before passengers were off and started spraying the aircraft with a reportedly toxic product.
1754509	Flight Attendant reported a passenger was non-compliant with wearing a face mask during flight.
1754507	Flight Attendant reported having a compliance issue with a family that had to be continuously reminded to wear their face masks.
1754506	Flight Attendant reported a passenger came on board the aircraft with a non approved face mask. A proper face mask was provided to the passenger.
1754500	Flight Attendant reported a passenger misconduct incident.
1754497	Flight Attendant reported a passenger moved into the exit row after the briefing. Passenger was asked to move back to original seat.
1754496	Flight Attendant reported that a passenger refused to wear a face mask during the flight.
1754493	Flight Attendant reported a deadheading pilot pushed his way past her while doing the safety demonstration to use the lavatory and coughed profusely.
1754485	Flight Attendant reported that passengers were boarded onto an aircraft that was too hot.
1754416	Captain reported a GA aircraft departed in opposite direction while they were on the runway ready for takeoff. The Tower was closed at the time of the event.
1754413	Air carrier Captain reported not making a crossing restriction during arrival and cited lack of flying as a contributing factor.
1754408	Air carrier Captain reported being issued a crossing restriction that was not in the FMS. Post flight the crew found out the fix was in the FMS and may have been accidentally deleted it during the flight.
1754357	Air carrier flight crew reported landing without a clearance.
1754315	Air carrier Captain reported being high on the approach and not making a crossing restriction.
1754275	Air carrier flight crew reported being high on the approach due to task saturation, communications errors and focusing outside for traffic.
1754257	Air carrier Captain reported a Flight Attendant became ill during flight.
1754202	Air carrier First Officer reported flying after the deadline for completing Consolidation of Knowledge (FAR 121.43) had expired.
1754142	Tower Controller reported a busy session working three combined positions and having to delay an aircraft for 15 minutes due to traffic.
1754140	Local Controller reported an airborne conflict between two air carriers.
1754119	Flight instructor reported a new student to him did not have a student pilot solo certificate as the student had said.
1754091	Flight Attendant reported not giving the exit row briefing because they were dealing with face mask issues.
1754089	Flight Attendant reported a passenger did not comply with wearing a face mask during flight and exhibited other non-compliant behavior.
1754084	Flight Attendant reported the Captain did not have a face mask on while exiting the cockpit numerous times.
1754082	Flight Attendant reported another Flight Attendant locked the bathroom door and put an out of order sign on it, so he would not have to get close to people.
1754081	Purser reported multiple issues and difficulties during the boarding process and cited not having enough flight attendants to properly staff the flight as a contributing factor.
1754079	Flight Attendant reported aircraft cleaners got onboard before passengers deplaned affecting social distancing efforts.
1754076	Flight Attendant reported a blocked jumpseat was subsequently used possibly violating FAR rules.
1754035	Ground employee reported pushing an aircraft into a parked aircraft while maneuvering through a congested parking area.
1754032	Ground employee reported being told to return to work after completing a 14-day quarantine. Reporter stated that they had not been previously told to self-quarantine nor had they been notified they had been exposed to a co-worker who tested positive for COVID-19.
1754019	Air carrier Captain reported a passenger vomited multiple times during push back. Captain elected to return to gate and have passenger removed.
1754018	Air carrier Captain reported that the flight attendants were not comfortable coming into the flight deck while the pilot was on a restroom break, until the remaining pilot was wearing a face mask. Reporter described safety concerns with having to wear a face mask in the cockpit.
1754011	Air carrier Captain reported that an ill passenger boarded and was not wearing a face mask. Captain decided to have passenger removed from flight due to length of the flight and passenger's condition.
1754009	Air carrier First Officer reported experiencing an unstabilized approach and lining up for the incorrect runway.
1753972	Air carrier Captain reported not descending via the STAR due to selecting LVL Change Pitch instead of VNAV on the MCP.
1753867	Pilot reported experiencing a Class B airspace violation.
1753847	Pilot reported an NMAC at a closed towered airport.
1753819	Pilot reported a runway incursion and cited lack of flying and unfamiliarity with the airport as contributing factors.

ACN	Synopsis
1753812	Flight Attendant reported confusion whether a non-rev passenger could sit in a specific jump seat.
1753811	Flight attendants reported a passenger needed to be continuously reminded about having to wear a face mask.
1753809	Flight Attendant reported that two passengers were observed spitting, and wiping their saliva and blood over their entire seating area.
1753783	Air carrier flight crew reported inadvertently using an unauthorized departure route for their aircraft type.
1753757	Air carrier flight crew reported experiencing an altitude deviation during departure. Flight crew did not hear the 1,000 feet altitude alert.
1753753	Pilot suggested putting a hand sanitizing dispenser at the bottom of the jet bridges to allow people to clean their hands before getting on the aircraft.
1753747	Center Controller reported an airspace violation and cited having to take approach control's airspace as a contributing factor.
1753746	Tower Controller reported the Front Line Manager was inundated with VFR and IFR traffic while working a combined position.
1753742	Tower Controller reported being delayed by the TRACON due to the TRACON not releasing an aircraft resulting in an airspace incursion.
1753741	Tower Controller working 3 Local positions reported an airborne conflict between two departures.
1753735	TRACON Controller reported an airborne conflict and cited traffic volume being very high for one Controller.
1753682	Technician reported an aircraft battery had to be replaced due to incorrect storage procedure.
1753680	Flight Attendant reported a passenger did not comply with wearing a face mask.
1753676	Flight Attendant reported a passenger could not breathe, so oxygen was administered until passenger felt well.
1753673	Flight Attendant reported moving to an unassigned jumpseat for social distancing purposes. The move conflicted with FAR regulations.
1753672	Flight Attendant reported concerns with aircraft cleaning and sanitizing procedures.
1753653	First Officer reported receiving an RA and overshooting the assigned altitude by 500 feet due to a light load.
1753593	First Officer reported a passenger was not complying with wearing a face mask pre-departure and was ultimately allowed to fly without having to wear it.
1753581	Center Controller reported an airspace violation and cited an unusual sector airspace configuration contributed to the event.
1753572	Instructor pilot reported a NMAC with an aircraft on final at an airport with the Tower closed at the time of the event.
1753517	Flight Attendant reported two passengers were not compliant wearing face masks during the flight. Another passenger was uncomfortable with them not wearing the face masks and confronted the crew.
1753516	Flight Attendant reported only serving sealed drinks and no coffee during flight. Flight Attendant did not feel safe serving coffee.
1753514	Flight Attendant reported passengers taking off their face masks to order coffee or tea and then waiting for it to cool off, without face masks on.
1753512	Flight Attendant reported a non-revenue passenger was not wearing a face mask and had to be told to comply with the policy.
1753511	Flight Attendant reported having trouble with a mother and two young children wearing face masks on the flight.
1753507	Flight Attendant reported that a child was not wearing a face mask and was coughing. Parents attempted to put mask on the child, but were not successful.
1753506	Flight attendants reported that a deadheading pilot did not follow face mask policy during the flight.
1753488	Flight Attendant reported that during takeoff the galley trash door opened but the trash bin did not move.
1753367	Ground employee reported there is a lack of cleaning supplies in the ramp break room.
1753364	Ground employee reported that some personnel are allowed to bypass the temperature check.
1753361	Ground employee reported large numbers of aircraft are being moved in and out of storage without proper procedures in place.
1753360	Air carrier Captain reported two passengers became verbally abusive to the flight attendants when they were asked to follow face mask policy.
1753326	Air carrier Captain reported difficulty understanding ATC instructions possibly due to the Controller wearing a face mask.
1753255	Air carrier Captain reported departing with an inoperative safety item that should have been inspected by maintenance prior to departure.
1753211	Pilot reported VFR transponder certification went overdue due to COVID-19 lockdown.
1753200	Pilot reported flying the approach traffic pattern in the wrong direction after Tower had closed.
1753198	Pilot reported entering restricted airspace and referenced lack of flying as a contributing factor.
1753173	Flight Attendant reported issues relating to non-revs and where to seat them.
1753172	Flight Attendant reported that when passengers were ordering their drinks, most of them took their face masks off, even though an announcement was made to leave masks on.
1753163	Flight Attendant reported seating issues and concerns with the close proximity of passengers when boarding the flight.

ACN	Synopsis
1753148	Flight Attendant reported a passenger became argumentative when told they could not switch seats due to social distancing.
1753103	Air carrier Captain reported having non-compliant passenger.
1753101	Air carrier pilot reported being advised about a possible non-compliant passenger regarding mask wear.
1753069	Center Controller reported an altitude excursion and referenced wearing a mask may have muffled the transmission.
1753022	Air carrier pilot reported experiencing a ground conflict and cited reduced level of awareness due to the COVID-19 pandemic.
1753000	Flight Attendant was told by an unaccompanied minor that the child's mother had COVID-19 and the child was on the way to stay with family.
1752999	Flight Attendant reported a passenger complained because other passengers were not wearing a mask while they were eating a snack.
1752991	Flight attendants reported a passenger not wearing a mask due to a reported medical condition.
1752989	Flight attendants reported 3 guests were unhappy with seating arrangements.
1752986	Flight Attendant reported a passenger had to be continuously reminded to wear a mask.
1752978	Flight Attendant reported that announcements regarding the safety demonstration changes were not made and that passengers were not advised to remove face coverings and masks in the event of decompression.
1752942	Air carrier flight crew reported being on final to a Class Bravo airport and having to go-around due to a small aircraft that was not talking to Tower, which caused the airborne conflict.
1752939	Pilot reported questionable maintenance procedures regarding the temporary repair of delamination in the area of the ADG door.
1752858	Air carrier Captain reported two passengers were abusive to flight attendants after they were reminded of mask requirements.
1752839	Center Controller reported an aircraft descended below what the Controller thought was the assigned altitude.
1752803	Pilot reported flying over a sporting event during a game and wondered if they had violated a TFR.
1752733	Maintenance Technician reported problems with other technicians not following the correct company policy for aircraft checks.
1752718	Flight attendant reported a passenger had to be continuously reminded to wear a mask.
1752712	Flight Attendant reported another flight attendant did not sit in the assigned jumpseat.
1752706	Flight attendant reported they asked a passenger to move to an upgraded seat for social distancing purposes, but the passenger refused.
1752705	Flight attendant reported a passenger was not wearing a COVID-19 mask because he stated that he had a medical condition, but was unable to provide any documentation.
1752694	Flight Attendant reported that another Flight Attendant assigned a non-rev to a seat that was against current policy for social distancing.
1752691	Flight Attendant reported confusion about airline policy relating to the face mask policy.
1752685	Flight Attendant reported two passengers not wearing COVID-19 masks during the flight.
1752679	Flight Attendant reported confusion about airline policy relating to the face mask policy.
1752678	Flight Attendant reported being advised about a troublesome passenger before the flight and stated the passenger refused to wear a mask claiming a medical condition.
1752668	Dispatcher reported release issues relating to flights that are not assigned to Dispatcher in a timely manner. Reporter stated this has been a problem since the onset of the COVID-19 pandemic.
1752664	Air carrier Captain reported that during their takeoff roll, FWA ATC Tower gave a full clearance routing to another aircraft. The Captain described concerns with the high level of distraction created during a critical phase.
1752590	Air carrier Captain reported a recent trend of being dispatched with minimum fuel loads.
1752579	Air carrier flight crew reported a communication issues with TRACON Control during arrival. TRACON was working departures and arrivals on two frequencies. ATC informed the crew they were short staffed due to COVID-19.
1752555	Air carrier First Officer reported an aircraft issue during cruise resulted in a diversion. First Officer stated they did not have the correct charts onboard the aircraft due to possible cost saving measures by the airline during the COVID-19 pandemic.
1752546	Air carrier First Officer reported overshooting the assigned altitude during climbout. The pilot described the aircraft's weight as very light due to the small passenger count.
1752533	Air carrier First Officer reported taking off with the flight attendants not seated citing a possible misunderstanding because the FA was speaking through a protective mask.
1752471	Airline Ground Agent reported the breakroom is not being sanitized properly for COVID-19.
1752406	Pilot reported a NMAC with another aircraft while attempting to land at an airport where the tower was closed due to COVID-19 staffing.
1752391	Flight Attendant reported moving a passenger due to a dirty seat and for social distancing.
1752390	Flight Attendant reported a possibly intoxicated person was removed from flight.
1752385	Flight Attendant reported a passenger being confrontational about wearing a face mask.

ACN	Synopsis
1752380	Flight Attendants reported a passenger complained that another passenger did not wear a face mask during the flight.
1752373	Flight Attendant reported a passenger refused to wear a face mask during the flight.
1752371	Flight Attendant reported a gate agent put a passenger in a seat which they shouldn't have.
1752204	Pilot reported contacting ATC on guard and being advised they were NORDO for 150 miles.
1752166	Flight Attendant reported communication issues related to wearing a face mask.
1752042	Air carrier First Officer reported missing the IFR release time due to general aviation traffic in the pattern and the Tower being closed.
1751993	Air carrier Captain reported a flap overspeed on departure climbout.
1751900	Flight Attendant reported a passenger did not comply with wearing a face mask.
1751880	Dispatcher reported working an overloaded desk and overall staffing issues.
1751874	Flight crew reported entering an expected fix in the FMS before it was issued by ATC but forgot to hit execute, leaving the aircraft high and not making the crossing restriction.
1751866	Air carrier Captain reported COVID-19 related cleaning supplies are not being provided by company and having to use personal supplies.
1751859	Air carrier flight crew reported experiencing a stick shaker event after executing a go-around due to windshear.
1751804	Air carrier Captain reported executing a CAT II confidence check approach which was not authorized.
1751800	Ground employees reported supertug parking aircraft issues and combining separate parking crews, which undermines current COVID-19 policies.
1751701	Technician reported problems with job cards not being signed off correctly.
1751692	Flight Attendant reported a passenger using the restroom numerous times, coughing and having to constantly be reminded to wear a mask.
1751668	Air carrier flight crew reported taxiing to the gate at LGA airport without contacting Ramp Control. The crew cited as contributing factors a confusing ramp diagram and the expectation that Ramp Control was closed due to the pandemic situation.
1751666	Air carrier Captain reported that continual, significant changes in crew schedules over the past months are causing cumulative fatigue.
1751661	Air carrier First Officer reported they taxied to the ramp as cleared by EWR Tower and did not contact Ramp Control because it appeared to be closed. First Officer stated that due to the changing responsibilities of controllers, it was difficult to know what the correct procedures were.
1751647	Air carrier Captain reported the First Officer made a sudden steep turn on departure while following command bars. The Captain took control of the aircraft and noted that the FO was very tired and had not done a takeoff or landing in over a year.
1751639	Air carrier Captain reported a 30 minute delay in response from Dispatch regarding a deviation for weather. Dispatcher cited reductions in staffing due to COVID-19 as contributing.
1751611	Air carrier Captain reported concern about the airline's policy of dispatching flights with very low fuel reserve.
1751585	Air carrier Captain reported noticing during preflight that electronic charts for his destination were not loaded in his tablet computer.
1751573	Air carrier Captain reported departing without proper takeoff data, citing high workload and career uncertainties related to COVID-19 cutbacks as contributing.
1751568	Air carrier First Officer reported they had numbers for a full runway takeoff, but were given and executed an intersection takeoff.
1751543	Air carrier flight crew reported a taxiway incursion. Captain cited lack of recent flying.
1751531	ZAB ARTCC Controller reported staffing issues, TMU lack of airspace knowledge and social distancing concerns.
1751509	Pilot reported that during taxi another aircraft was blocking entry into the parking area and that parking options were limited due to many parked aircraft since COVID-19 started.
1751433	Air carrier flight crew reported landing without a clearance.
1751417	Flight Attendant reported having mild symptoms of being ill, but decided to take another two day trip. Flight Attendant continued to feel ill after the two day trip warranting a COVID test, which was positive.
1751372	Air carrier flight attendant reported a passenger was upset with being told to comply with regulations regarding their child seat. Flight Attendant suggested many passengers seem more stressed than usual because of COVID-19 pandemic procedures.
1751362	Flight Attendant reported a passenger was upset with the airline's COVID-19 policies when observing other passengers removing their masks to eat and drink.
1751348	Flight Attendant reported a passenger refused to comply with COVID-19 mask requirements in flight.
1751330	Air carrier Captain reported failure to call for the Before Push checklist, then also failing to call for the Before Taxi checklist, citing lack of flying due to COVID-19 cutbacks as contributing.
1751324	Air carrier First Officer reported landing without a clearance, citing fatigue and scarcity of other aircraft operating due to COVID-19 reductions as contributing.
1751315	Air carrier First Officer reported difficulty communicating with the tug driver during pushback because the tug driver was wearing a mask in compliance with COVID-19 procedures. Reporter suggested the mask was not necessary when the driver was alone in the tug.

ACN	Synopsis
1751299	Air carrier Captain reported the difficulties experienced with Dispatch and Clearance Delivery as they requested an alternate route to avoid thunderstorms.
1751290	Air carrier First Officer reported inadvertently moving the pack switches to off instead of high flow causing a cabin depressurization during climbout.
1751272	Air carrier First Officer reported missing an altitude crossing restriction while on arrival.
1751266	Air carrier First Officer reported a 'Slow Airspeed Warning' situation during a weather related go-around event and cited lack of flying time as a contributing factor.
1751209	Air carrier Captain reported company policy was not followed regarding Personal Protective Equipment (PPE) when the pilot crew arrived at the gate.
1751150	Air carrier Captain reported an altitude deviation citing distraction and not working for several months as contributing factors.
1751143	Air carrier First Officer reported an unstable approach while on flight to maintain landing currency.
1751136	Air carrier flight crew experienced an altitude deviation while descending on approach and attempting to slow the aircraft. Crew stated that loss of situational awareness and Captain's lack of recent flying contributed to the event.
1751123	Air carrier flight crew reported taking off without a clearance and stated that being distracted by the COVID-19 pandemic and the state of the airline contributed to the event.
1751121	Air carrier flight crew reported retracting the flaps during climb before the appropriate airspeed and stated that fatigue, hunger, and excessive heat in the aircraft contributed to the event, and the COVID-19 mask was a distraction.
1751102	Technician completing a routine check on stored aircraft reported finding torn speed tape in the Pack 1 and 2 inlets and exhaust. Reporter could not visually verify if the tape had entered the system due to the duct bends.
1751096	Air carrier flight crew reported landing without a clearance from Tower and stated that fatigue and lack of recent flying contributed to the event.
1751094	Air carrier Captain reported they are not being provided with proper disinfectant wipes and PPE.
1751065	Air carrier flight crew reported the flight was left high by ATC on arrival which contributed to missing step down altitudes and receiving a low altitude alert as the flight descended.
1751042	Air carrier flight crew reported experiencing a taxiway incursion and stated that Ground Control did not issue direction of turn instructions as they typically do and appeared to be overworked.
1751027	Air carrier flight crew reported they left an engine running after parking at the gate. They cited as contributing factors the failure to complete a checklist due to distraction.
1750965	Technician reported installing a new PBE on an aircraft without informing, nor training the flight crew on how to use it.
1750962	Flight Attendant reported being distracted with having to verify that a passenger had a medical condition and therefore did not have to wear a mask. During the distraction the Flight Attendant missed the Captain's PA 'prepare for takeoff' and was not seated as the flight departed.
1750943	Air carrier flight crew reported experiencing an unstabilized approach resulting in a go-around. The crew also stated they overshot their altitude during the go-around.
1750923	Air carrier First Officer reported experiencing a speed deviation during departure and stated lack of flying contributed to the event.
1750887	Air carrier Captain reported concerns with lack of flying and the possibility of being paired with a First Officer who has also not flown in months.
1750882	Air carrier Captain reported non functional PAPI lights at airport for a specific runway and the safety hazards it could pose in weather conditions, especially when crews are not flying as often due to the COVID-19 pandemic.
1750876	Air carrier flight crew reported a taxiway incursion and stated distraction from COVID-19 pre-flight related procedures contributed to the event.
1750804	Flight Attendant reported that upon arrival at destination, a COVID-19 positive passenger on board as well as the crew, had to be medically assessed before being allowed to leave the aircraft.
1750718	Center Controller reported a Supervisor who had tested positive for COVID-19 had interacted with controllers. Controller suggested allowing only essential workers in the building.
1750709	Corporate pilot reported having to execute a missed approach after a delayed approach clearance left the flight too high to conduct a stabilized approach. The pilot stated that the Controller was very busy working multiple frequencies and asked flights to stand by for call backs.
1750708	Flight Instructor reported experiencing an electrical and avionics failure while conducting a training flight. While attempting to speak to the student without using a headset, the instructor noted it was difficult to communicate because the COVID-19 mask muffled the voice.
1750671	Air carrier maintenance technicians reported that the rudder was inadvertently damaged while preparing to perform rudder lube on an aircraft that was being returned to service from storage.
1750666	Flight attendant reported that there are two types of CPR devices available on board, however flight attendants are qualified to use only one, which requires removal of the personal protective mask in order to use. Reporter requests training on the other device to keep everyone safe in a COVID-19 environment.
1750656	Air carrier flight crew reported a runway incursion which resulted from a call sign misunderstanding. A contributing factor was that the Tower Controller was managing multiple frequencies and runways.

ACN	Synopsis
1750649	Air carrier First Officer reported that while attempting to lose altitude on an unstable approach the Captain exceeded a 45-degree bank angle and a flap overspeed occurred. A second overspeed occurred during the subsequent go-around.
1750645	Air carrier First Officer reported the aircraft was not properly configured for approach per company procedures. Reporter cited the need to fly more frequently.
1750637	Air carrier Captain reported they executed three go-arounds before successfully landing on the fourth attempt. Captain cited gusty conditions, lack of recent flying and unfamiliarity with airport as contributing factors.
1750618	Air carrier flight crew reported experiencing an unstabilized approach and flaps not at final setting before 1,000 feet AGL. Captain stated he should have commanded the First Officer to go-around and cited lack of recent flying as a contributing factor.
1750617	First Officer reported being instructed to secure the number two engine for a single engine taxi to the gate, but accidentally shut off both engines.
1750436	Air carrier First Officer reported concerns with the LGA ILS 4 approach identified as 'Autopilot Coupled approach not authorized.'
1750396	Air carrier Captain reported a taxiway incursion in a foreign country citing language barrier and unfamiliarity with the airport as contributing factors.
1750367	Air carrier Captain reported taking off with a deferred item resulting in the autothrottle arm switch to be in the 'OFF' position. The deferral requires the crew to look up the EPR climb settings before takeoff, which they failed to do.
1750354	Air carrier First Officer reported crews are not wearing COVID-19 mask in briefing rooms.
1750335	Air carrier First Officer reported a rejected takeoff after the master caution illuminated and subsequently noticing a non functional airspeed indication on the First Officer's Primary Flight Display.
1750245	Pilot reported feeling sleepy while flying and suspected that it was the COVID-19 mask that was causing the problem. The pilot removed the mask and felt fine afterward.
1750203	Flight Attendant reported the Captain did not wear a COVID-19 type mask during the flight.
1750171	Air carrier Captain reported a speed deviation and flap overspeed on final.
1750150	Air carrier First Officer reported experiencing a track heading deviation after missing an intersection on the routing received from the PDC.
1750118	Air carrier flight crew reported a speed deviation and flap overspeed while executing a go-around.
1750112	Air carrier First Officer reported they were given multiple runway changes resulting in an unstabilized approach and go-around.
1750102	Air carrier Captain reported missing a crossing restriction during departure and referenced lack of flying as a contributing factor.
1750062	Air carrier First Officer reported not realizing that Dispatch did not add an MEL to the dispatch release until they were airborne.
1750056	Air Carrier Captain reported a rejected takeoff due to mechanical issues with an aircraft that had been sitting for a couple of months.
1750049	Air carrier flight crew reported flying an incorrect departure transition that had a similar sounding name as the clearance transition. The crew stated that lack of recent flying was a contributing factor.
1750044	Air carrier pilot reported losing the green hydraulic system while on arrival.
1750016	Air carrier flight crew reported a taxiway incursion after receiving a non-standard taxi instruction.
1750008	Air carrier First Officer reported experiencing an unstabilized approach and electing to go-a round.
1749997	Ground employee reported there is not enough alcohol gel available in the office for employees to use during the COVID-19 pandemic.
1749983	Tower Controller reported an operational error while working five positions at once.
1749931	Pilot reported flying a trip with the aircraft being over due on the CFR 135.185 weighing requirement.
1749915	Supervising Maintenance Technician reported signing off work without verifying it had been completed.
1749913	Maintenance Technician reported flight crew generated a write up when they found the circuit breakers for the pitot system with CB collars installed. The aircraft had been sitting for three days.
1749902	Flight Attendant was interrupted during the briefing by a passenger who was concerned about the seating arrangement due to COVID-19 reasons. Flight Attendant was not sure if the briefing was completed.
1749900	Flight Attendant reported a passenger refused to wear a mask during the flight.
1749794	Dispatcher reported a flight departed early into a Flow Constrained Area (FCA) and questioned company procedures that allowed this to occur.
1749793	Captain reported experiencing a speed deviation below 10,000 feet and stated First Officer's lack of flying contributed to the event.
1749775	Air carrier Captain reported an ATC reroute was received via ACARS, however it went unnoticed, resulting in a course deviation. Captain cited not having flown recently as a contributing factor.
1749747	Ground crew reported a wing-tip collision occurred while they were towing an aircraft to a made-up parking spot that was created due to the COVID-19 pandemic. The crew stated there were no markings to guide the aircraft to the spot.
1749727	Air carrier flight crew reported experiencing an altitude deviation while crossing an arrival fix.

ACN	Synopsis
1749718	ZMP Center Controller reported an airspace deviation while working combined sectors. COVID-19 staffing levels contributed to the event.
1749688	Instructor pilot reported not checking the fuel status before departure resulting in a temporary loss of power due to fuel starvation in one of the tanks.
1749683	Pilot reported incorrectly reading back their landing sequence number and turning in front of another aircraft on final approach. The pilot of the other aircraft reported taking immediate evasive action to avoid a collision. Both pilots reported the traffic pattern was busy and the Controller was handling both Ground and Tower operations.
1749672	Mechanic reported being unknowingly exposed to a COVID-19 positive employee and not being notified of the exposure by company management.
1749667	Flight Attendant reported that during taxi out a passenger refused several times to wear a COVID-19 protective mask and also mocked the flight attendant when he was reminded to wear the mask. The flight taxied back to the gate and the passenger was removed from the flight.
1749615	Air carrier Captain reported experiencing a flap overspeed during initial climb and cited distraction while talking to ATC and recency of experience as contributing factors.
1749607	Air carrier flight crew reported an uneventful landing from an unstable approach instead of executing go-around per standard procedures.
1749603	Air carrier flight crew reported being notified in flight that the destination city required a COVID-19 test upon arrival. Based on multiple concerns with the testing process, the crew elected to return to their departure airport.
1749509	Technician reported that the residue film left from fogging the aircraft for COVID-19 may affect temperature sensors.
1749502	Flight Attendant reported that several passengers boarded without wearing COVID-19 protective masks and had to retrieve them from carry-on luggage.
1749479	Flight Attendant reported asking a passenger multiple times to wear a COVID-19 protective mask and to not sit in the emergency exit row before the passenger complied.
1749470	Air carrier Captain reported the aircraft started to level off at the incorrect altitude resulting in a speed deviation while trouble shooting.
1749437	Air carrier First Officer reported experiencing a taxiway incursion after receiving complex taxi instructions. The FO cited as contributing factors a lack of recent flight experience and having not been to the airport in several years.
1749435	Air carrier Captain reported experiencing an airspeed deviation and cited fatigue and lack of recent flying experience as contributing factors.
1749387	Customer Service Representative reported that management is not enforcing the COVID-19 mask policy.
1749386	Ground employee reported that co-workers are not adhering to quarantine rules and are not wearing COVID-19 protective masks.
1749383	Ground employee reported that gate agents are not wearing COVID-19 protective masks in the work and common areas.
1749377	Ground employee expressed concern that the aircraft pits are not being sanitized, potentially exposing workers to COVID-19.
1749369	Air carrier First Officer reported the crew experienced an altitude deviation while the Captain was hand-flying the approach.
1749269	Corporate pilot reported leveling off at the wrong altitude while being distracted with the cowl flaps.
1749195	Air carrier First Officer reported momentarily overspeeding the flaps while configuring for approach.
1749194	Air carrier First Officer reported a fuel imbalance in flight required the fuel crossfeed valve to be cycled twice before balancing took place. FO noted that aircraft had been in storage for several months.
1749124	Controller reported an operations vehicle that was allowed onto a runway caused landing traffic to go-around.
1749114	Technician reported a Captain was confrontational when he entered the flight deck. Reportedly, the Captain had dealt with passengers not wanting to wear their COVID-19 masks.
1749032	Corporate flight crew reported flying the incorrect pattern to a landing.
1749024	Air taxi flight crew reported landing at an airport and being advised that the runway was closed.
1748954	Flight Attendant reported that a flight attendant had come in contact with neighbors who were positive for COVID-19 and wanted guidance on whether she should continue with the trip or not.
1748952	Flight Attendant reported a passenger did not comply with COVID-19 mask wearing requirements during the flight.
1748941	Flight Attendant reported feeling hot, sweaty and nearly fainting while having to wear a COVID-19 mask during flight.
1748940	Flight Attendant reported a passenger was feeling uncomfortable sitting so close to two other passengers and was allowed to move to a different seat.
1748935	Dead heading Flight Attendant reported issues with a passenger who was not wearing a COVID-19 mask at all times on the flight.
1748927	Flight Attendants reported COVID-19 seating related issues involving flight attendant pre-assigned seats.
1748889	Air carrier Captain reported communication issues with Departure Control and made reference to Controller possibly being overworked or stressed out due to COVID-19 staffing levels.

ACN	Synopsis
1748818	Air carrier Captain reported communication issues with Center and attributed it to COVID-19 ATC staffing of facilities.
1748780	Air carrier flight crew reported they may have landed passed the touchdown zone. First Officer stated lack of flying contributed to the event.
1748771	Air carrier flight crew reported landing without contacting Tower.
1748726	Air carrier Captain reported being unsure if they were supposed to descend on the approach clearance received from ATC resulting in an altitude deviation.
1748714	Air carrier Captain reported being unable to obtain PPE (Personal Protective Equipment).
1748709	Air carrier First Officer reported an airborne conflict attributed to the Local Controller working more than one combined position.
1748675	Tower Controller and pilot reported a runway incursion due to expectation bias. Pilot stated the Controller was working multiple positions at the time of the event.
1748670	Controller reported that someone in the facility had tested positive for COVID-19. Controller was concerned about the decontamination process.
1748666	MRI Tower Controller reported LOA problems with the overlying A11 TRACON.
1748648	Tower Controller and small aircraft pilot reported a runway incursion resulting in an aircraft having to go-around.
1748639	Pilot reported a critical ground conflict with a non reporting departure aircraft.
1748593	Technician reported flight crews are concerned that when they receive an aircraft that has sat for a few days some switches are in the wrong position.
1748591	Maintenance Technician reported that aircraft are coming out of storage with circuit breakers and other systems in the incorrect setting/position.
1748585	Maintenance Technician reported confusion on who is responsible for cleaning bio-hazards in the interior of the aircraft cabin.
1748574	Flight Attendant reported not completing the exit row briefing until airborne because of distraction caused by moving a passenger to a different seat.
1748573	Flight Attendant reported moving passengers around due to COVID-19, but didn't brief the emergency row until after the main cabin door was closed.
1748566	Flight Attendant reported social distancing concerns during boarding and deplaning the aircraft.
1748559	Flight Attendant reported the time allotted for the required checks and briefings is not enough.
1748558	Flight Attendant reported a passenger refused to wear a mask.
1748543	Air Carrier Captain reported fatigue issues while flying as a reserve pilot for a 4 day pairing during the COVID-19 pandemic.
1748516	Air carrier flight reported due to ATC staffing issues the flight would have to be delay vectored. They opted to land at an alternate airport and receive more fuel, then continued on to destination.
1748506	Air carrier flight crew reported landing without a clearance after dialing in the incorrect frequency.
1748482	Ground employee reported concerns with being notified that someone he had contact with tested positive for COVID-19.
1748460	Ground employee reported problems associated with clearing the ramp during a lightning storm and while parking aircraft.
1748455	Ground employee reported concerns with touching bags on a daily basis and would like the bags to be sprayed to prevent infection.
1748443	Customer service employee reported the Airport Authority had turned off the lights in the over-sized baggage for cost cutting purposes during the COVID-19 pandemic.
1748435	Ground employee raised concerns with the health effects of people wearing a COVID-19 type mask for long durations of time.
1748405	Dispatcher reported problems with the SATCOM lines going unanswered due to COVID-19 staffing levels.
1748404	Dispatchers reported problems with taking an aircraft out of storage and an associated MEL that was not applied before takeoff.
1748383	Air carrier Captain reported a passenger was non-compliant with wearing a face mask during the flight.
1748376	Air carrier Captain reported experiencing mechanical problems after pushback resulting in a return to gate.
1748340	Air carrier Captain reported flying three flights in an aircraft with an expired CAT III status.
1748315	Air carrier Captain reported that many of the first officers he flies with are not current, especially in the landing environment.
1748311	Air carrier flight crew reported they unintentionally missed the revised route segment given in their PDC.
1748303	Pilot reported an increase in the number of pilots who are non current due to the current schedule reduction and reserve staffing levels.
1748283	Tower Controller reported a 'plethora of deals' due to working with small arrival holes and not using the designated departure runway.
1748282	Center Controller reported being overloaded with traffic, MAP [Monitor Alert Parameter] was in the red, having a loss of separation, and an airspace violation due to COVID-19 staffing.
1748275	ZDC Center Controller reported a loss of separation between two aircraft while working 6 sectors.

ACN	Synopsis
1748229	Maintenance technicians reported that while performing a test of the pitot/static system on an aircraft, the job card failed to ensure the Mode S transponders were disabled.
1748223	Flight Attendant reported that the smoke detector alarm was triggered by a passenger smoking an e-cigarette in a lavatory. Flight Attendant stated that wearing a personal face mask made it hard to smell the smoke/vapor plume to determine whether the smell was due to an e-cigarette or other burning material.
1748208	Flight Attendant reported problems associated with wearing the required COVID-19 type mask while performing duties.
1748186	Dispatcher reported not reading a NOTAM completely caused problems relating to limiting the hours of operations at a foreign airport.
1748156	Air carrier flight crew reported experiencing a runway incursion during taxi and cited several factors including a runway change and communication issues.
1748126	Air carrier First Officer reported taxiing out to the runway and finding items were missed during their before taxi flow checklist.
1748102	Pilot reported not being able to turn as required by the SID because of traffic.
1748019	Air carrier flight crew reported being distracted and not arming the autothrottle prior to departure resulting in a rejected takeoff.
1748014	Air carrier Captain reported after a mechanical issue, switching planes and a lengthy delay; they had a speed deviation on the departure SID.
1747998	Flight crew reported they departed without an ETOPS Pre-Departure Check and an open AML write-up for the same issue. Maintenance personnel reported the aircraft was not assigned to anyone, therefore the work was not accomplished.
1747988	Flight crew reported that during takeoff they dialed in an incorrect frequency while trying to contact Departure. The crew attributed the error in part, to the Tower Controller working both Local and Ground positions.
1747955	Local Controller reported an aircraft departed wanting to fly just under the clouds, but encountered IFR and the pilot was not certified for IFR flight.
1747951	Instructor and trainee pilots reported experiencing an airspace incursion into Class C airspace.
1747934	Pilot reported that shortly after takeoff the engine oil pressure indication dropped to zero and a successful return to the airport was done. Postflight maintenance inspection revealed that the oil pressure transducer had failed.
1747907	Pilot reported they were advised by ATC they forgot to cancel VFR flight following.
1747902	Pilot taxied without clearance because he thought Tower was still closed, but it was actually 15 minutes after the Tower had opened.
1747863	Pilot reported encountering multiple delays from ATC while on an IFR flight and was given an approach clearance into the wrong airport.
1747854	Pilot reported thinking the Tower was closed due to no response on the radio and departed airport. While airborne pilot realized the radio was not functioning correctly therefore had taken off without a clearance.
1747851	Pilot reported forgetting to set the correct code in the transponder due to not talking to Clearance Delivery, but rather the overlying TRACON since the Tower was closed due to COVID-19.
1747849	Captain reported various issues with having to wear a mask during the COVID-19 pandemic.
1747810	Flight Attendant reported a passenger seated next to her was coughing and not wearing a mask. Flight attendant posed the question as to whether or not she could move to other non-assigned seats.
1747722	Air carrier Captain reported multiple system switches are set in the wrong position on aircraft coming out of storage.
1747685	Pilot reported forgetting to arm the thrust reversers upon landing and cited distraction and lack of flying as contributing factors.
1747656	Captain reported the First Officer's seat belt broke delaying the flight until the next day due in part to operational issues caused by the COVID-19 pandemic.
1747597	ZID Center Controller reported an airborne conflict while working all sectors in Controller's area during COVID-19 scheduling.
1747418	Pilot reported radio communication confusion as to which runway they had been cleared to land.
1747416	Instructor pilot reported dialing the incorrect CTAF frequency and landed while an aircraft was lining up to takeoff on the same runway.
1747388	Air carrier flight crew reported an unstabilized approach, citing FO's lack of flying and a late change by Approach Control as contributing factors.
1747387	Air carrier Captain reported being advised by a Flight Attendant that while wearing the COVID-19 type mask Flight Attendant felt hypoxia like symptoms.
1747359	Air carrier First Officer reported a taxiway incursion due to distraction from dealing with Engine 1 indications being higher than Engine 2.
1747234	Air carrier First Officer reported experiencing an altitude overshoot during climbout while hand flying and attributed it to lack of flying.
1747217	Pilot reported finding bird droppings in the cockpit and throughout the aircraft after aircraft had come out of long-term storage.
1747165	Ground Controller reported an airliner taxied in the wrong direction toward the ramp.
1747136	Pilot reported taking off in the wrong runway direction.

ACN	Synopsis
1747125	Technician reported a work order was missed and not completed.
1747061	Air carrier Captain reported receiving a cabin pressure master warning during departure and executed a return to departure airport.
1747020	Air carrier flight crew reported a waypoint crossing altitude dropping out of the FMS and not knowing why resulting in an altitude deviation.
1746999	Air carrier flight crew reported getting confusing intersections and routings they were not familiar with and were also concerned about being routed more than 50 miles off shore by ZJX Center, which reportedly does this often.
1746974	Air carrier flight crew reported they began taxiing out without clearance. Captain stated lack of flying was a contributing factor.
1746929	Pilot departed airport without communication with Tower. Pilot mistook LOCAL time for ZULU time, and departed the airport when Tower was open.
1746913	Pilot reported listening to the ATIS which stated the Tower was closed, and started a taxi towards the runway when Ground called the pilot and advised Tower was still open.
1746906	Pilot reported landing without clearance due to a sticky radio switch and lack of incoming radio transmission, and thinking the Tower was closed due to COVID-19.
1746826	Pilot reported issues relating to a circling approach to Runway 32 at RDU and ATC communication issues for the circling approach.
1746796	Air carrier flight crew reported a track heading deviation. ATC questioned their routing and the crew realized they had an amended clearance.
1746792	Pilot reported due to light weight and high climb rate the aircraft received a Resolution Advisory.
1746781	Flight crew reported not flying the assigned heading on departure and being corrected by ATC. The crew referenced lack of flying as a contributing factor.
1746772	Air carrier First Officer reported experiencing a course deviation and stated being away from flying was a contributing factor.
1746769	Air carrier Captain reported experiencing a track heading deviation due to FO entering the wrong heading on the PFD. Captain and ATC caught the mistake and corrected the heading.
1746754	Air carrier flight crew reported experiencing an unstabilized approach, disconnected the autopilot and stabilized at 500 feet and landed uneventfully.
1746744	Pilot reported departing a runway and then observing an aircraft departing from a crossing runway causing an airborne conflict.
1746738	Air carrier flight crew reported experiencing an unstabilized approach and setting up to land on a closed runway with anticipation of changing to landing runway later.
1746726	Air carrier flight crew reported during climbout they received a route change that was not on the filed route.
1746706	Air carrier Captain reported a track heading deviation after accidentally pressing the heading select switch.
1746571	Air carrier First Officer reported forgetting to get a landing clearance from Tower.
1746549	Air carrier Captain reported executing a go-around due to a quartering tailwind and then electing to divert to filed alternate.
1746536	Center Controller reported clearing an aircraft for a NA (Not Authorized) Approach, and observing the aircraft descend below the MEA.
1746530	F11 TRACON Controller reported a conflict after an aircraft came over at the incorrect altitude.
1746513	Pilots reported entering the incorrect routing in the FMS resulting in a track heading deviation.
1746493	Pilot reported receiving a traffic alert shortly after takeoff requiring immediate evasive action. Pilot noted that the PHL TRACON Controller seemed incredibly busy, thereby potentially missing the conflict.
1746463	Flight Attendant reported feeling dizzy along with another Flight Attendant and attributed it to having to wear a protective mask.
1746444	Air carrier Captain reported a taxiway incursion due to expectation bias.
1746439	Air carrier First Officer reported being notified that the flight release had not been signed prior to departure. The FO stated that technology challenges as a result of COVID-19 procedures contributed to the event.
1746434	Air carrier Captain reported that the over-wing doors were not armed and the aircraft had been flown for several days in this condition. The aircraft had recently come from storage and the escape slides had not been enabled for deployment by Maintenance.
1746383	ZOB Center Controller reported forgetting to ask 3 different aircraft if they had weather and NOTAMs for their landing airport.
1746354	Pilot reported issues with the service provided by SLC Tower and cited Controller workload as a contributing factor.
1746329	Mechanic reported that after performing work on the nose gear door, the aircraft had nose gear problems in flight. Mechanic was concerned that fatigue due to changes in work schedule hours contributed to a possible error.
1746320	Air carrier Flight Attendant reported a sick passenger boarded a flight, but was removed from the flight prior to departure.
1746311	Air carrier flight attendants reported that a passenger was vaping in the lavatory and was not wearing a personal protective mask during the flight.

ACN	Synopsis
1746310	Flight Attendant reported experiencing fatigue from extended work hours and additional duties due to change in flight schedules in response to the COVID-19 pandemic.
1746282	Air carrier Captain reported having inadequate cleaning supplies to sanitize their cockpit equipment.
1746254	Pilot reported a track heading deviation and cited lack of flying as a contributing factor.
1746189	Pilot reported a track heading deviation when executing a 360 turn resulting from confusing a fix name which sounds like the number 360.
1746167	Air carrier First Officer reported a CFTT incident citing unfamiliarity with the airport and issues relating to the surrounding terrain.
1746158	Pilot reported experiencing a runway incursion after landing.
1746108	Flight Attendant reported wearing a COVID-19 mask hindered her ability to smell smoke in the cabin.
1746089	Air carrier flight crew reported forgetting to turn off APU and later exceeding the APU ceiling.
1746006	TRACON Controller reported a loss of separation event and made reference to COVID-19 staffing levels as a contributing factor.
1746005	ZLA Center Controller reported losing separation due to traffic volume, watching too large of an area and the COVID-19 configuration.
1746003	SLC Tower Controller reported an aircraft went around twice due to windshear and also reported that the way the Tower cab positions are split up are not flexible and not safe.
1745982	Captain reported ATC issued a climb 2,000 feet above the filed altitude, crew took the altitude and did not question ATC. Another Center Sector Controller eventually asked crew why they were going to newly assigned altitude instead of filed altitude.
1745951	Pilot reported flying into a restricted area and attributed it to weather and not receiving ATC flight following.
1745930	Pilot reported concerns with the limitations imposed by the SFAR concerning the ability to exercise instrument privileges.
1745885	C172 Instructor reported a NMAC with an opposite landing aircraft.
1745872	Pilot reported an altitude deviation due to excessive climb rate.
1745854	Technician reported work card discrepancies for two different types of aircraft and being pressured to continue working after finding these errors.
1745850	Technician reported being distracted by possible lay-offs and did not complete a work order correctly.
1745712	Pilot reported attempting to land at an airport with a closed Control Tower and other aircraft landing on an unlit runway at night.
1745709	Air carrier First Officer reported a miscommunication problem with TPA TRACON resulting in an altitude deviation and attributed it partly due to not flying because of COVID-19.
1745694	Pilots reported being advised that the aircraft was flown with open write ups on three legs.
1745666	SCT TRACON Controller reported experiencing an airborne conflict between an air carrier and a GA aircraft.
1745614	Lead Flight Attendant reported the red tag was not put in place after disarming the door.
1745547	Air carrier flight crew reported experiencing an altitude deviation during approach. Lack of flying and proficiency were contributing factors.
1745485	Pilot reported a taxiway incursion, citing distraction with aircraft condition and lack of recent flying as contributing factors.
1745467	Air carrier Captain reported forgetting to turn on three of the four window heat switches during pre-flight.
1745422	Flight crew reported overshooting altitude and then returning to assigned altitude. The Captain stated lack of flying was a contributing factor.
1745410	Air carrier Captain reported a loud hum during climbout emanating from the door and having to return to departure airport.
1745376	Pilot reported experiencing a track heading deviation and cited rustiness and lack of flying as a contributing factor.
1745365	Instructor pilot reported taking off with incorrect transponder code and cited lack of flying due to the COVID-19 as a contributing factor.
1745329	Pilot reported exceeding 250 knots below 10,000 feet.
1745290	TRACON Controller reported an airspace violation occurred due to lack of coordination. Traffic volume was cited as a contributing factor.
1745186	Air carrier flight crew reported experiencing an unstabilized approach resulting in a go-around. Unfamiliarity with the airport and rustiness from lack of flying were cited as contributing factors.
1745174	Air carrier flight crew reported an altitude deviation during arrival. Captain stated rustiness due to lack of flying was a contributing factor.
1745071	Pilot reported being rusty after lack of flying due to the COVID-19 pandemic resulting in communication issues with ATC.
1745059	Pilot reported an alleged airspace violation while being under flight following and handed off to a Tower by Approach Control. Reportedly, Tower Controller was working numerous frequencies/positions and advised pilot that he had violated the Class Delta airspace.
1745054	Pilot instructor and student reported distraction in the cockpit resulted in executing a touch and go without ATC clearance and cited lack of flying as a contributing factor.

ACN	Synopsis
1745052	Pilot reported while on a sightseeing trip they went too low, pilot eventually caught the mistake and climbed back to a normal altitude.
1745049	Pilot reported communications issues due to Tower Controller working multiple positions on same frequency due to facility staffing issues.
1744987	Pilot reported a taxiway incursion and cited being off for a month and a half as a contributing factor.
1744964	Pilot reported clearance was different than what they had filed and would like to see HPN ATC Facilities re-open.
1744945	Pilot reported a taxiway incursion partially due to expectation bias.
1744942	Air carrier flight crew reported experiencing a low speed buffet alert during cruise due to having the aircraft in the incorrect configuration with autothrottles not engaged. Lack of flying was cited as a contributing factor.
1744800	Air carrier Mechanic reported that wearing a mask and safety glasses causes the glasses to fog up, resulting in safety concerns when working on ladders, lifts, and in tight places. Mechanic also expressed concern that while working with chemicals, they could inadvertently be transferred to the mask.
1744783	Air carrier flight crew experienced a high work load during an approach which resulted in unstable approach and a missed approach. The crew cited lack of experience and recent flying as contributing.
1744763	Air carrier Captain reported an airframe overspeed in cruise that likely resulted from the autothrust not being engaged during takeoff. Captain noted that the failure to see the FMA indications resulted from a lack of proficiency and recency of flying.
1744694	Instructor pilot reported an airborne conflict with an aircraft that was not on correct frequency.
1744678	Air carrier First Officer reported forgetting to turn on the probe heat and stated lack of flying was a contributing factor.
1744573	Flight Attendant reported that another Flight Attendant refused to wear a mask during boarding and throughout the flight. Reporter expressed concern that the health of passengers and other cabin crew were put at risk.
1744482	GA pilot experienced an airspace incursion while returning from a practice flight. Pilot reported not being fully prepared for the flight and had not flown lately due to the COVID-19 pandemic.
1744433	Lead Aircraft Technician reported an aircraft in storage had both engines run with no oil in either the main oil tank or accessory gearbox.
1744430	Air carrier Maintenance employee reported adverse health symptoms after exposure to an aircraft just cleaned using electrostatic spraying.
1744335	Air carrier flight crew reported rejecting a takeoff in response to multiple warning lights. The aircraft had been in storage and anti-ice circuit breakers had been collared and not removed by Maintenance prior to flight.
1744314	Air carrier Captain reported concerns with re-qualification training courses after not flying due to the COVID-19 pandemic.
1744310	Air carrier First Officer reported inconsistent use of masks per guidelines by crewmembers.
1744306	Air carrier Captain reported concerns with wearing masks during pre-flight crew briefings.
1744199	Pilot reported a communication issue resulted in an altitude deviation.
1744193	Pilot reported being on the incorrect frequency and thinking it was odd that no other aircraft were heard while landing.
1744138	Flight crew reported missing a crossing restriction during approach.
1744131	Air carrier Captain reported an unstabilized approach resulting in a go-around.
1744087	Air carrier Captain reported having to remove a passenger showing symptoms of illness.
1744071	Dispatcher reported re-routing issues associated with the deferral of a flight's CPDLC system.
1744067	Air carrier First Officer reported he had inadvertently pushed the thrust levers into detent setting on takeoff, which was not recognized until reaching cruise flight.
1744042	TRACON Controller reported an airborne conflict and attributed it to staffing levels due to the COVID-19 pandemic.
1744041	Center Controller reported an aircraft attempting to land on the wrong runway resulting in another aircraft executing a go-around.
1743932	Air carrier flight crew reported that Tower instructed them to abort the takeoff roll which was requested by the ARTCC facility due to traffic and staffing issues and could not yet accept the flight into their airspace.
1743906	Pilot reported that after checking in on Center frequency, no response was received for some time. The pilot delayed locating an alternative frequency due to the quiet frequencies that have become prevalent during COVID-19 reduction in air traffic volume.
1743857	Air carrier Flight Attendant reported forgetting to notify other FAs that the AFT doors were disarmed. Flight Attendant stated not having been in an airplane for an extended time due to the COVID-19 pandemic contributed to the event.
1743853	Air carrier Flight Attendant reported interacting with a sick passenger in flight who was possibly exhibiting COVID-19 symptoms.
1743844	Air carrier Captain reported not recognizing until cruise that the transponder was set incorrectly. Captain recommended that crews visually confirm checklist items since many pilots are flying infrequently due to COVID-19 reductions in travel demands.

ACN	Synopsis
1743828	Air carrier Captain reported a series of miscommunications regarding a boarding passenger who was possibly contagious with COVID-19. After the Captain spent time resolving the issue, it was determined that the passenger could be allowed to board.
1743824	Air carrier Captain had an airspeed deviation and cited being rusty due lack of flying as contributing.
1743792	Air carrier Captain forgot to do a SELCAL check and cited as contributing factors multiple tasks in a short period and having not flown in a long time.
1743769	Controller reported using a configuration that did not show an airspace that was open. Controller thought airspace was closed and had an airspace violation.
1743749	Corporate pilot reported having an altitude deviation while hand-flying the aircraft and attributed it to lack of flying due to the COVID-19 slow down.
1743722	Air carrier Flight Attendant expressed multiple concerns regarding company COVID-19 protocols, including alternative jumpseat locations, social distancing in the flight deck, safety equipment demonstrations, and the wearing of protective masks.
1743562	GA pilot reported experiencing an airborne conflict during departure having to take evasive action. Reporter cited an increase in traffic due to the lifting of stay at home restrictions as a contributing factor.
1743554	GA pilot reported inadvertently leaving the transponder code set from the previous flight. The pilot was accustomed to getting a code from the Tower, however the Tower had closed early due to COVID-19 hours and the pilot did not check the transponder.
1743551	Pilot reported calling on radio for traffic and attempting to depart in a 2 minute window, when an aircraft on final requested pilot to hold position, but ultimately had to go-around.
1743473	Air carrier flight crew reported that deferred maintenance items were not properly documented due to multiple distractions in the flight deck, including international COVID-19 screening protocols.
1743466	Air carrier Captain reported aborting a takeoff roll when the tiller was accidentally bumped, causing the steering to disengage.
1743435	Pilot reported an unstable approach and requesting a 360 turn on final from Approach. Reporter cited lack of flying and distractions during the approach as contributing factors.
1743200	Air carrier flight crew reported a brake issue on landing and re-occurring at the gate. Captain stated lack of flying was a contributing factor.
1743199	Air carrier flight crew reported equipment problems and having to change destinations due to COVID-19 restrictions.
1743149	Flight Attendant reported forgetting to brief the over the wing passengers until at 10,000 feet.
1743084	Center Controller reported being distracted due to COVID-19 issues and did not hear a wrong read back from a crew, which resulted in an altitude deviation.
1743080	Pilot reported inadvertently flying into Class Bravo airspace and cited lack of flying during the COVID-19 pandemic as a contributing factor.
1742979	Air carrier pilot described the potential negative aspects of wearing a face mask in the flight deck.
1742952	GA pilot reported misinterpreting an altitude alert and descended from assigned altitude while on approach. Lack of familiarity with the instrument panel and lack of recent flying due to the COVID-19 pandemic were cited as contributing factors.
1742870	Air carrier Captain reported alcohol from cleaning products may be entering the boom mike causing the equipment to malfunction.
1742867	Dispatcher reported being advised of an aircraft that took off with incorrect weights and the need to ensure a certain row in the aircraft was empty to be within limits.
1742866	Air carrier Captain reported experiencing an unstabilized approach in which they should have executed a go-around but decided to continue and stabilized at 500 feet. Captain reported rustiness from lack of flying contributed to the event.
1742861	Air carrier flight crew reported multiple changes to the arrival and runway resulted in a track heading deviation. Flight crew stated lack of flying was a contributing factor.
1742856	First Officer reported setting the incorrect flaps resulting in an immediate rejected takeoff after receiving a configuration warning.
1742825	Air carrier Captain reported operating flights with an incorrect MEL applied. The flight deck sanitizing process was cited as a reason for not closely reviewing the logbook and MEL.
1742814	Corporate Captain reported experiencing an undershoot of a crossing restriction and cited lack of recent flying experience due to the COVID-19 pandemic as a contributing factor.
1742780	GA pilot reported not being sure if he was cleared into Class B Airspace. Reportedly, the decision to fly into Class B airspace was based on the lack of traffic due to the COVID-19 pandemic.
1742767	Pilot reported being switched from Approach to Tower, but dialed incorrect frequency resulting in a go-around.
1742760	GA pilot reported forgetting to turn on Navigation Lights so the ADS-B would activate.
1742716	Flight Attendant reported a passenger's displeasure with other passengers not wearing masks.
1742698	Flight crew reported climbing 500 feet above assigned block altitudes and cited COVID-19 conversation distractions and fatigue as contributing factors.
1742622	Center Controller reported a loss of separation event due to being distracted while cleaning equipment.
1742618	Local Tower Controller and Radar Controller reported a conflict between a go-around aircraft and a slower moving departure.

ACN	Synopsis
1742507	Air carrier First Officer requested guidance in a scenario where two air carrier pilots, neither of whom has flown within the prior 90 days due to the new 2-month FAA extension, are operating on the same flight. The First Officer expressed concern regarding the issue of pilot currency versus pilot proficiency.
1742475	Air carrier Captain reported that the aircraft departed with passenger distribution data different from the actual distribution due to one passenger changing seats. The Captain noted the aircraft was very lightly loaded and it was important to ensure an accurate record of passenger location, as this could affecting weight and balance data.
1742319	Pilot reported having to descend to avoid a collision, then realized aircraft may have been too low over a group of people.
1742312	Pilot reported wind gust caused the aircraft to porpoise twice during landing causing minor propeller damage. Pilot cited lack of flying as a contributing factor.
1742311	Instructor pilot reported thinking Tower instructions for them were for another aircraft resulting in a heading deviation. Reporter cited Tower staffing issues due the COVID-19 pandemic as a contributing factor.
1742273	Flight Attendant reported a passenger cleaned the seat with bleach. Bleach was removed from aircraft and flight departed.
1742271	Flight Attendant reported difficulty and confusion with guidelines when trying to enforce the mandatory mask requirement.
1742175	Pilot reported experiencing an altitude deviation during departure. Reporter cited routing clearance issues and lack of flying due to the COVID-19 pandemic as contributing factors.
1742161	Pilot reported being unsure if he had a release to get airborne on a flight. Fatigue from COVID-19 restrictions was cited as a contributing factor.
1742159	Pilot reported after landing a crosswind took control of the aircraft causing a runway excursion.
1742152	Pilot reported landing without clearance and cited the COVID-19 environment as a contributing factor.
1742122	Flight Attendant reported requesting a passenger be moved to accommodate for COVID-19 social distancing. Passenger was not moved and in the process Flight Attendant forgot to brief emergency row.
1742121	Flight Attendant reported not being informed of passengers on the aircraft with COVID-19 symptoms until after airborne.
1742058	Air carrier First Officer reported taking off without a required alternate. A delay due to spraying for COVID-19 was cited as a contributing factor.
1742028	Air carrier Captain reported that airline is not following the SAFO2009 guidance during the COVID-19 pandemic.
1742024	Air carrier Captain reported a passenger was removed from flight due to exhibiting COVID-19 symptoms. Reporter suggested masks should be mandatory for all passengers and there should be screening for COVID-19 symptoms at security checkpoints.
1742005	Air carrier flight crew reported not calling Ramp before taxiing.
1741998	Center Controller reported working 3 sectors combined during the COVID-19 pandemic and did not point out an aircraft resulting in an airspace violation.
1741968	Instructor pilot reported that while flying with a student they struck the ground with the tail of the aircraft during landing.
1741944	Flight Attendant reported catering personnel were not wearing masks, and a non-revenue pilot was not complying with mask usage until pilot was asked twice to comply.
1741926	Air carrier Captain reported they departed with the flight release form still in the aircraft. Reportedly, ramp personnel forgot the form in the aircraft after the crew had handed it to them.
1741905	Air carrier flight crew reported landing without a clearance. The Captain made reference to lack of flying time in recent weeks as a contributing factor.
1741873	Center Controller and Front Line Manager reported an airborne conflict event while working Center airspace along with three other Approach Control airspaces.
1741854	Pilot reported flying out of radio contact with the Center due to complacency from the reduction of air traffic caused by the COVID-19 pandemic.
1741839	Air carrier Captain reported issues with the passenger count on board and social distance seating guidelines which delayed the flight.
1741756	Flight Attendant reported being asked to continue flying after being notified of being in contact with a crew member who had tested positive for COVID-19.
1741713	Pilot reported doing pattern work, practice landings and takeoffs at an airport that had been NOTAMed closed.
1741701	GA pilot reported landing on a closed runway, that was NOTAMed closed after pilot had already checked NOTAMs and had departed.
1741693	Flight Attendant reported a passenger asked for a different seat, but Flight Attendant was unable to comply with the request due to social distancing concerns from other passengers.
1741691	Flight Attendant reported they found a 3/4 used cigarette on the aircraft while doing initial inspections and wondered how the cleaning crew missed it. Also, there were no alcohol based cleaning/sanitation supplies on the aircraft.
1741688	Flight Attendant reported initially forgetting to move the door flag to the disarmed position due distraction from putting a mask on to avoid COVID-19 exposure.

ACN	Synopsis
1741683	Flight Attendant reported an immediate burning sensation in eyes/nose/throat/lungs and an immediate headache, from the cleaning products used to combat COVID-19.
1741644	Air carrier Captain reported pushing back before brakes were release causing the tow bar shear pin to break.
1741632	Pilot reported flying aircraft with an overdue inspection.
1741625	Air carrier Captain reported smelling a burning smell during cruise. Post-flight Maintenance briefing advised the pilots alcohol from wipes may be shorting out wires.
1741536	Pilot reported being outside of flight currency requirements and cited distraction from the COVID-19 pandemic as a contributing factor.
1741533	Pilot reported experiencing an altitude deviation and cited lack of flying due to the COVID-19 pandemic as a contributing factor.
1741509	Two flight attendants reported having to work a flight a few days later after being on a flight with a passenger who had tested positive for COVID-19.
1741474	Air carrier Captain reported being notified that he had operated a flight with the vertical stabilizer probe covers on during flight.
1741452	Air carrier flight crew reported mistakes in flight release documentation relating to the number of jumpseaters on board.
1741398	Air carrier Captain reported significant safety compromises with wearing face masks during the COVID-19 pandemic and associated problems with oxygen masks.
1741389	TRACON Controller working COVID-19 schedule reported a loss of separation between two IFR aircraft while accidentally providing VFR instructions to one of the aircraft.
1741388	TRACON Controller reported a loss of separation due to an aircraft taking too long to turn inbound on the approach. Controller made reference to COVID-19 related issues contributing to the event.
1741300	Ground employee expressed concern over being the only employee who wears a face mask and works in close proximity with other team employees.
1741275	Corporate pilot reported turning the wrong direction to a heading issued by ATC. The pilot stated they were new to the airplane and had not flown much recently due to the COVID-19 pandemic.
1741266	GA flight instructor reported lining up on final approach with a runway parallel to the assigned runway. Cited as contributing were weather conditions and a lack of recent proficiency flights due to the COVID-19 pandemic.
1741227	Air carrier Captain misread the BOW (Basic Operating Weight) placard which resulted in a weight and balance miscalculation. The placard had become distorted and worn due to COVID-19 cockpit cleaning procedures.
1741215	Air carrier Captain reported being notified by the company of a possible exposure to COVID-19 through another crew member. The Captain expressed concern that deadheading crew was notified before the on-duty crew and suggested that they should have been removed from duty sooner.
1741192	Air taxi pilot reported that while deviating around thunderstorms, the track resulted in flying farther offshore than allowed by company Ops Specs. The pilot noted that due to COVID-19 the co-pilot's overwater training had been cancelled.
1741165	Air carrier Captain reported an altitude overshoot during approach and cited reduced flying as a contributing factor.
1741125	Air carrier Captain reported various issues relating to the COVID-19 pandemic including FAs not properly using masks, passenger complaints regarding seating issues and lack of flying time.
1741118	Pilot reported executing the wrong missed approach procedure after not being issued missed approach instructions. ATC cleared the pilot for the approach and issued instructions to contact airport advisory frequency, however there was no such frequency published for the airport and the Tower was closed due to the COVID-19 pandemic.
1741074	Flight Attendant reported a passenger vomited throughout aircraft causing aircraft to be taken out of service after landing at destination. Flight Attendant suggested passengers should wear masks and have their temperature checked prior to boarding during the COVID-19 pandemic.
1741073	Flight Attendant reported a passenger brought on board a smelly spray container made with an alcohol base mixture. Passenger reportedly started spraying walls, windows, seats and armrests.
1741072	Flight attendant reported passenger sneezed directly into Flight Attendant's face without attempting to cover the sneeze. Flight Attendant suggested passengers should be given hygiene tips during pre-boarding announcements.
1741053	Air carrier Captain reported being scheduled a flight at full passenger capacity and was concerned about social distancing and exposure to COVID-19.
1741023	Ground employee reported concerns about having to wear commonly shared wireless headsets during the COVID-19 pandemic.
1741022	Air carrier ground crew reported that while repositioning an aircraft in a remote parking location, the wing struck an adjacent parked aircraft. The crew reported that the move was done to fit more aircraft into the parking location.
1741018	Air carrier Captain reported inadvertently flying with an expired FMC database. The Captain noted that distractions due to numerous added cautions for cockpit cleanliness may have contributed.
1741003	Air carrier pilot expressed concern about the safety aspect of the FAA's extension of the landing currency requirement from 90 to 180 days.

ACN	Synopsis
1740938	Flight Attendant reported wearing a personal face mask while demonstrating oxygen mask use during the pre-departure safety briefing. The Flight Attendant was concerned that passengers would think it would be acceptable to place an oxygen mask over a personal mask.
1740911	Air carrier First Officer reported no sani-wipes were on the aircraft, nor available from operations.
1740830	Ground employee reported the use of shared headsets exposes ramp employees to COVID-19.
1740829	Ground employee reported two team members were less than 6 feet apart and not in accordance with social distancing government guidelines.
1740821	Flight crew reported having to move passengers from two rows for weight and balance causing a delay, and then once airborne crew was told they took off with incorrect final weights.
1740815	Flight crew reported a similar callsign issue resulting in a takeoff without clearance. The crew attributed this to a lack of alertness and complacency due to the irregular times.
1740811	Center Controller also working Approach Control airspace due to the COVID-19 pandemic, reported communication issues with another Approach facility resulting in an airborne conflict.
1740805	TRACON Controller reported that while working traffic at a combined position during COVID-19 reduced staffing period, they experienced a loss of separation.
1740738	Air carrier flight crew reported receiving a flap setting warning horn during initial power push for takeoff. The Captain cited lack of sleep as a contributing factor.
1740708	Air carrier Captain reported that during recurring ground training individuals did not always wear a mask to protect from COVID-19 exposure.
1740686	Ground employee reported a flight departed with incorrect weight and balance numbers. Reporter cited COVID-19 guidelines and social distancing issues as contributing to the event.
1740684	Air carrier Captain reported being advised after departure that a passenger's family member had been exposed to COVID-19. The crew followed proper CDC protocol at destination.
1740683	Air carrier First Officer reported no Personal Protective Equipment (PPE) or sanitizing equipment were provided for a round trip flight.
1740640	Flight Attendant reported concerns about safety and security issues relating to new COVID-19 jumpseat arrangements and social distancing guidelines.
1740585	Flight Attendant reported concerns with another Flight Attendant bringing a passenger on the shuttle bus and flight during the COVID-19 pandemic.
1740550	Air carrier Captain reported no sanitation equipment was available for use while at a foreign destination during the COVID-19 pandemic.
1740533	GA pilot had a Class B airspace incursion after assuming they were cleared through the airspace by ATC.
1740532	GA pilot reported flying formation with the wrong aircraft. Reporter cited a number of contributing factors that led to this confusion.
1740524	GA pilot reported a flight over homes may have been too low.
1740521	Technician reported an aircraft was supposed to be deep cleaned after possible COVID-19 contamination, but when cleaners were questioned they had not been advised to deep clean the aircraft.
1740471	Air carrier flight crew reported being exposed to COVID-19 from another pilot and having to self quarantine after notification.
1740411	Pilot reported experiencing a track/heading deviation. Pilot stated the deviation occurred in part due to flying with an inexperienced co-pilot.
1740402	Technician reported that employees are not being issued PPE, especially masks, which are needed to avoid contracting the COVID-19 virus.
1740401	Flight Attendant reported a passenger complained about a deadheading pilot who was coughing and requested deadheading pilot put on a mask. Passenger ended up moving to a different seat.
1740396	Flight Attendant reported concerns with being pressured to board early with only a few passengers. Flight Attendant stated it would be best to avoid boarding unnecessarily early to minimize the time of possibly being exposed to COVID-19.
1740373	Corporate First Officer reported descending prior to a crossing restriction during arrival. First Officer referenced being distracted talking about COVID-19 related logistical issues that may have contributed to the event.
1740337	Flight Attendant reported thinking she was drinking out of her own cup and realized cleaners had put a different used cup in place, and was concerned about possible COVID-19 exposure.
1740294	Ground employee reported a person came to work after a family member had allegedly tested positive for COVID-19.
1740283	Air carrier flight crew reported many delays encountered to get a flight going that eventually departed the next day.
1740275	Air carrier pilot reported concerns with the inability to maintain proper social distancing in the cockpit during the COVID-19 pandemic. Reporter suggested guidelines should allow for pilots to wear surgical masks in the cockpit during this time to minimize COVID-19 exposure.
1740252	GA pilot reported experiencing a taxiway incursion citing multiple distractions and other human factors as contributing to the event.
1740241	Flight Attendant reported concerns with passenger use of masks during the COVID-19 pandemic and the lack of instructions to remove them in order use the oxygen masks in case of a rapid decompression.

ACN	Synopsis
1740238	Flight Attendant reported a passenger was coughing in the gate area making the crew and other passengers uncomfortable due to the COVID-19 pandemic.
1740213	Air carrier Captain reported pushing without contacting ground, citing COVID-19 operations as the reason for disrupting flows and habits.
1740159	Maintenance Technician reported questions and concerns relating to cleaning techniques for aircraft during the COVID-19 pandemic.
1740092	General Aviation pilot flying VFR reported experiencing an airborne conflict with an airliner. Pilot stated that lighter traffic during the COVID-19 pandemic was a factor in the decision to not contact ATC, which may have contributed to the event.
1740086	Flight Attendant suggested changing the safety announcement during the COVID-19 pandemic to include instructions for passengers to remove their personal protective masks before donning drop-down oxygen masks.
1739963	Technician reported a Supervisor made two calls before reluctantly providing him with a mask. Technician stated they are not adequately being supplied with PPE equipment during the COVID-19 pandemic.
1739948	Air carrier Captain reported that the crew was transported to the aircraft in the same bus as the passengers to a remote hard stand, and that a separate bus would lessen the risk of exposure to COVID-19.
1739882	Center Controller reported that while working through COVID-19 Operations, they became very busy working combined sectors resulting in an airborne conflict.
1739830	Flight Attendant reported a passenger violated COVID-19 social distancing rules when approaching the galley mid-flight to ask for a beverage.
1739795	Air carrier Captain reported having to ferry a flight for storage due the COVID-19 pandemic without correct maintenance release documentation.
1739663	Flight Attendant reported they are not being provided with adequate cleaning supplies and sanitizers during the COVID-19 pandemic. Flight Attendant also expressed concern with the flight being overstaffed for no reason.
1739613	Air carrier flight crew reported conducting an unstable approach to a landing into an unfamiliar airport. The crew cited flying frequency as the main cause attributed to a reduction of flights during the COVID-19 pandemic.
1739597	Center Controller reported management was not following COVID-19 related facility policy for social distancing.
1739596	Center Controller reported holding several aircraft due to weather at intended airport, interacting with TMU, lining aircraft up 20 MIT, then after the first three aircraft the Controller was told to hold remaining aircraft. Controller reported that due to the COVID-19 pandemic he did not call for D- Side help because of social distancing concerns.
1739595	Flight Attendant expressed concern that attending a scheduled recurrent training class with a group of flight attendants could increase the risk of spreading the COVID-19 virus to other crew members and passengers.
1739577	Technician reported being told the aircraft was 'okay' to board, but received no documentation stating the aircraft was properly sanitized.
1739520	Air carrier First Officer reported the flight crew decided not to write up a minor in-flight equipment malfunction as a discrepancy, which might not be deferrable. The decision was due, in part, to the crew's uncertainty around recent changes in COVID-19 screening procedures at the destination airport.
1739456	Dispatcher reported a similar callsign issue and cancellations attributed in part to COVID-19 pandemic related work environment.
1739384	Maintenance Technician reported a collision with an object while taxiing aircraft for maintenance. The rush to ground planes due to the COVID-19 pandemic was referenced as a contributing factor.
1739379	Flight Attendant reported having difficulty clarifying the company's current policy on the use of shared jumpseats and social distancing. The Flight Attendant occupied a passenger seat during takeoff and landing, rather than the assigned jumpseat. After the flight, the Flight Attendant found that jumpseat policy changes had not been put in place.
1739319	Air carrier First Officer expressed concern about the erosion of skills and knowledge while awaiting OE and consolidation flights. A restrictive flight schedule due to the COVID-19 pandemic was cited as contributing.
1739228	GA pilot had difficulty finding a flight instructor during the COVID-19 pandemic to conduct a flight review.
1739176	Air carrier flight crew reported the aircraft had a bounced landing resulting in a go-around. The crew cited the handling and performance characteristics of the lightly loaded aircraft as a contributing factor.
1738848	Ground employee reported problems associated with sharing headsets.
1738713	Air carrier Captain reported that due to weight and balance needs, the Operations Agent directed passengers on a nearly empty flight to sit close together, violating social distancing requirements. The Captain suggested that weight and balance be reworked to allow appropriate spacing between passengers.
1738687	Flight crew reported landing without clearance due to fatigue and lack of recent flying assignments due to COVID-19-related decrease in flights.
1738676	Reporter was concerned that there weren't safety masks or respirators available for use.
1738653	Flight crew member reported the bag containing protective gear for COVID-19 was not boarded on the aircraft, and that the on duty in-flight Supervisor directed the crew to depart without the bag.
1738644	Flight crew member reported the company was sending crews out during pandemic without proper safety equipment.

ACN	Synopsis
1738582	Pilots reported departing without clearance in what they thought was an uncontrolled airport resulting in runway incursion and airspace violations.
1738571	Air carrier ramp agent reported being uncomfortable with a company procedure requiring wearing shared headsets amidst the COVID-19 pandemic.
1738544	Pilot was concerned why a site was temporarily closed for cleaning and what caused the closure.
1738454	Flight Attendant reported that a crewmember had possibly been exposed to COVID-19. For social distancing purposes, Flight Attendant sat in a cabin seat for takeoff and landing.
1738408	Air carrier flight crew reported the ATC Tower changed hours of operation and was closed due to COVID-19, resulting in a takeoff before curfew ended.
1738406	Air carrier First Officer reported issues with COVID-19 screening procedures after a flight.
1738354	Pilot reported the company provided face masks do not fit the reporter's face, causing fogging of glasses.
1738292	Air carrier flight crew reported an erroneous frequency change that resulted in a track heading deviation.
1738277	Ground personnel reported that persons exposed to COVID-19 were allowed to continue to work.
1738151	Ground employee reported concern over his employer's Coronavirus related procedures.
1738150	Load Planner expressed concern about Coronavirus related company procedures that resulted in personnel being seated too close to one another.
1738146	Ramp employee expressed concern about Coronavirus related company procedures.
1738143	Air carrier First Officer reported the company training center and simulators could benefit from more sanitation and cleaning supplies for staff and trainees in order to support a safe training environment. The crew member suggested that the company pursue FAA approval to extend training events deadlines in order to have time to deep clean the training facility.
1738069	Flight Attendant stated preoccupation with COVID-19 concerns resulted in forgetting to bring the EFB to work.
1738049	Pilot and Controllers reported an altitude overshoot that caused an airborne conflict.
1738047	Dispatcher reported prior to flight departure, a required alternate airport was NOTAMed unavailable due to COVID-19.
1738026	Air carrier Captain reported receiving a TCAS RA related to an abnormally high climb rate associated with very lightly loaded aircraft because of the COVID-19 pandemic.
1737991	Ramp agent reported working too close to others and not having sufficient antiseptic wipes.
1737827	Pilot reported concerns with carrying passengers who were COVID-19 positive.
1737824	Center Controller reported unusual traffic flows due to COVID-19 and its effect on the normal workload.
1737774	Flight Attendant reported not following procedures during the disarming of doors after the arrival and stated distraction and anxiety about COVID-19 contributed to the event.
1737763	Flight Attendant reported a passenger sprayed Lysol on and around his seat.
1737730	First Officer reported concerns with having to ride a bus full of crammed passengers from the gate to the aircraft increasing their risk of being exposed to Coronavirus.
1737717	Captain failed to verify that the release was properly electronically signed prior to departure.
1737694	Pilots reported routing and fuel problems associated with a ARTCC airspace closure.
1737668	Ground employee reported the employee bus carries more than 10 passengers and 6 feet social distancing separation is impossible.
1737641	First Officer reported issues relating to NOTAMS and towers closing for COVID-19 cleaning.
1737621	Air carrier flight crew reported having an aircraft pressurization problem thinking it was an equipment problem but the Packs were not turned on.
1737577	Center Controller reported that under-staffing due to COVID-19 has resulted in numerous aircraft reroutes.
1737462	Flight Attendant reported lack of disinfectant wipes and cleaning agents on the round trip flight.
1737454	Air carrier flight crew reported issues with a Center being ATC Zero and having to divert to obtain more fuel to reach their destination airport.
1737243	Air carrier Captain reported that during boarding they noted a child passenger had COVID-19 like symptoms, but at the time did not know what the correct protocol was to address the situation.
1737230	Air carrier Captain reported departing with a passenger count discrepancy resulting in a weight and balance issue.
1737150	Dispatcher reported a lack of personal protection equipment and improper cleaning and sanitizing of the dispatchers' office.
1737116	Air carrier flight crew received a momentary EGPWS terrain warning while turning base on a nighttime visual approach. The flight continued to a safe landing. The crew noted that distraction due to the COVID-19 pandemic, its impact on the company, and family concerns contributed to the event.
1737105	Air carrier Captain reported a Control Tower that was ATC Zero, leading to a disruption in communications.
1737091	Center Controller In Charge reported an unacceptable workload was placed on the facility which resulted in controllers being unable to practice social distancing at the facility.
1737088	TRACON Controller reported problems with overlying Center not complying with LOA and the contingency plan.
1737075	ZZZ Center Controller reported that an adjacent area went ATC Zero, resulting in a complex and difficult traffic situation.

ACN	Synopsis
1737008	Air Carrier Captain reported that concerns about COVID-19 and possible furlough resulted in an unstabilized approach.
1736933	Gate Agent reported computers at this company's terminal need a deep cleaning for employee safety. The only cleaning items currently available are wipes.
1736927	Ramp personnel reported concern regarding unnecessary delays regarding Hazmat (Biologicals/Blood) cargo from Coronavirus Testing. This cargo has a limited risk of spillage.
1736891	Air Carrier Captain reported being unable to obtain hand sanitizers at base and throughout other company locations.
1736809	Reporter stated issues with training during COVID-19 pandemic relating to use of correct mask, gloves, and PPE to protect each other in class from exposure to the virus.
1736477	Ground employee reported the lack of sanitizing agents especially in the clock in/out areas.
1736437	Air Carrier Captain reported the crew made the decision to suspend in-flight service for COVID-19 social distancing reasons contrary to company policy.
1736368	Maintenance Technician reported an aircraft arrived at the facility as a result of a 'Corona issue' and needed deep cleaning. The Maintenance Technician reported that there are no policies in place for this issue.
1736305	Flight Attendants reported concerns about a sick passenger in their flight.
1736278	Dispatcher reported a NOTAM runway closure was overlooked due to the increased workload created by the COVID-19 pandemic.
1736080	Air Carrier Captain reported lining up for the incorrect runway on a set of parallel runways.
1735831	Flight Attendant reported ill passengers on the flight and was concerned regarding lack of COVID-19 testing for the crew.
1735720	Air carrier Captain reported a passenger was suffering from the chills and a runny nose during flight.
1735514	Air carrier First Officer reported not meeting a crossing restriction and cited several distractions which contributed, including problems with call sign and concerns with COVID-19.
1735386	Captain reported two safety ideas to assist with reducing exposure to COVID-19 in the flight deck.
1734918	Dispatcher reported there was concern and confusion regarding an ill passenger due to the lack of defined policy and procedures for situations involving COVID-19.
1734850	Air Carrier Captain reported there were no protective gloves on the aircraft nor available at the station.
1734698	Flight Attendant observed two passengers wearing face masks who were seated by exits and asked them to remove the masks during takeoff and landing in the event they needed be heard while giving commands during an emergency.
1734659	Air Carrier Captain reported the only available means to clean the crew O2 mask was to use SaniWipes, which are reportedly inadequate.
1733973	Flight Attendant reported the aircraft departed with one working lavatory sink which impacted the ability of crew and passengers to wash their hands to help prevent the spread of COVID-19.
1733947	Flight Attendant reported one lavatory sink inoperative and no hand soap available on multiple flights.
1733143	Air carrier pilot gave suggestions to improve passenger safety during the COVID-19 pandemic.
1711682	First Officer reported a passenger illness causing a diversion which then led to the crew not having enough rest to continue flight.

## Narrative: 1

It has come to my attention that a great many Pilots and Flight Attendants are operating an aircraft under a climate of increased stress and decreased quality of life due to recent COVID-19 vaccine mandates. Never before, at any time in my career, have I witnessed a more divisive and disruptive workplace issue as is this particular mandate. Civilian Pilots in

the United States are presently operating thousands of aircraft, and managing the well-being of millions of passengers, with what is essentially a proverbial gun held to our heads. The timer is running out. The pressure is increasing every single day. To quote a pilot I spoke with earlier this week, "I'm having difficulty sleeping...anything that wakes me puts my mind into overdrive...the stress is destroying my life." After nearly two years of challenging COVID-19 operations as "Essential Workers," the unvaccinated members of our aviation community are faced with an additional truly unprecedented situation. We must choose between maintaining our livelihood or maintaining what is viewed by many as the most basic of all human rights; medical autonomy, personal control over what gets injected into our bodies. I can assure you that the overwhelming majority of my colleagues, the vaccinated and the unvaccinated alike, are uncomfortable with the coercive nature of this draconian ultimatum. It is my firm belief that the pressure on pilots will inevitably increase as the looming termination deadlines approach. I believe these vaccine mandates already have and will likely continue to narrow the precious safety margin we ALL work so hard to maintain. I would consider it a personal failure on my part if I did not report the critical human factors I have observed out on the line: significant increased stress, confessions of loss of sleep, frustration, anger, feelings of betrayal, mental, and physical fatigue. It all adds up. With the recent introduction of the vaccine mandates, I have watched what was already an unusually challenging COVID-19 operating environment deteriorate rapidly into something far worse. I am extremely concerned. We pilots have persevered, we have overcome the widely-reported increase in passenger disruptions since the introduction of the mask mandates. We've adjusted to the complexities involved with highly dynamic/rerouted flight schedules. We have scrambled to find food sources while previously reliable food options in hotels and airports have become inconsistent at best. We have flown safely despite all this. This past week thousands of "Essential Workers" just like me were issued a cruel ultimatum: get vaccinated or you're fired! As the termination-or-comply clock is ticking, the stress levels and fatigue I've witnessed will only escalate. We've all been told, "We have no viable choice but to comply with the U.S. Government mandate for Employees to be vaccinated." I firmly believe the current COVID-19 vaccine mandate has all the makings of another bad policy which can easily become a contributing factor to an aviation-related mishap. Let's not ignore what's happening here. Many special people in this industry are distraught over having the will of others imposed upon them. This report is filed as an awareness builder for all parties involved, as well as a plea for help from anyone interested in helping us maintain our national aviation system with its enviable safety record. [I recommend] elimination of the forced vaccination policy.

## Synopsis

Air carrier Captain reported that pilots and flight attendants are experiencing stress and reduced quality of life due to the upcoming deadline to either get the COVID-19 vaccination or be terminated from employment. Reportedly, this contributes to reduced margins of safety during flight operations.

## Narrative: 1

My general safety concern is that Company's daily operation has been pushed beyond the airline's actual logistical capacity. I believe that the recent route system expansion was not well thought out logistically, and is now creating an unsafe chain of events that increases the likelihood of a significant aviation mishap. In addition to an already strained route system, I believe that the recent decision to require vaccinations for all employees will only compound (Company)'s already significant personnel shortfall. Many employees will choose to be placed on unpaid leave just before the busy Christmas and New Year Holiday travel season rather than be forced to receive a vaccination that they do not want based on their sincerely held beliefs or cannot take because of personal medical concerns. Meanwhile, these same employees are expected to show up to work between now and (date) and perform as if their livelihoods are not being threatened. I believe that the situation that Company finds itself in today is very similar to the situation that NASA found itself in just prior to the launch of the Challenger in 1986. The chain of decision making errors could have been broken at many points leading up to that ill-fated launch, which I watched live on television. Unfortunately, the poor decision making chain was not broken, and people died as a result. My hope is that Company will learn from history, identify the very real and present threats to our operation, and balance the appropriate barriers against these threats to ensure that Safety of our Customers (both external and internal) comes first. Company must reduce its daily operation to something that is logistically

feasible and can handle the fluctuations that are to be expected in a route system of that size and scope. The Company must plan for the additional reduction in personnel at the beginning of Month as a result of its vaccine requirement and policy. The Company should also explore its options regarding the recent Federal Government mandates for vaccination requirements of companies engaged in federal contracts. Did the Federal Government breach its contracts when it unilaterally changed the terms of said contracts?

## Synopsis

Pilot reported safety concerns related to inadequate staffing that could result if employees take leave in order to not comply with the company's vaccine mandate.

## Narrative: 1

We were cleared to cross ZZZZZ at FL 300. I entered 30,000 into the altitude window and verified LNAV, VNAV and VNAV PATH. I also checked that there was a TOD on the MFD. The aircraft did not descend via the entered criteria and we missed the altitude by 1,140 feet. [I was] distracted by the mandated vaccine that I have to get now. [I need to] pay more attention.

## Synopsis

Air carrier Captain reported an altitude deviation during descent and cited distraction due to the vaccine mandate being a contributing factor.

## Narrative: 1

This is a general concern of safety regarding the (Company) vaccine mandate. After the mandate was announced on (date), I noticed many employees were distracted by the impending decision between their livelihood and a permanent medical decision. On the push back during one flight, a ramp crew member stated their concern. Other crew members stated their concern about this mandate and this could lead to distractions at work, which could in turn lead to unsafe conditions. If employees were given a choice or an option for this mandate, I believe the distractions would be eliminated.

## Synopsis

Ramp employee reported that pushback ramp crew members have expressed concern about being distracted due to the company's vaccine mandate which could lead to unsafe conditions.

## Narrative: 1

As of Date the company has again instituted their [attendance] procedures. This results in Flight Attendants having to jump through major hoops going to a special clinic if they call out sick. If they don't comply, they face termination. This further results in flight attendants who would rather go to work sick with the possibility that they are COVID positive than go through the process defined by the company. I myself along with many other passengers and crew have been exposed to COVID by these flight attendants in the past. I do not feel safe going to work knowing that there is a greater possibility of flight attendants who are going to work sick putting myself at greater risk of being exposed to COVID-19.

## Synopsis

Flight Attendant reported the company attendance procedure could result in flight attendants who are COVID-19 positive reporting for work instead of calling in sick.

## Narrative: 1

I was approaching FNL from the southeast with the intention to land. When 10 miles out and at pattern altitude, I called the temporary Tower to report my position and intentions. I was instructed to report 4 miles out. When 4 miles out, I reported and was instructed to enter the midfield left downwind for Runway 15. I was also informed to look for departing traffic headed to the northwest. Suddenly, my ADS-B traffic alerted me to traffic at same altitude, same position. I saw a low wing aircraft at the top left of my windscreen headed for me. The other pilot dived and passed approximately 300 feet under me and continued seemingly barely missing two water towers seemingly flying between them. It should be noted that the tower at FNL is temporary and has no current access to radar but relies on visual observation from the ground level. Though, radar has been installed, it has not been certified for almost a year now due to FAA imposed Covid restrictions. Seems to me that having radar access would have avoided this situation and not having radar is likely to lead to similar such close calls.

## Synopsis

GA Single Pilot reported an NMAC event with departure traffic while entering landing pattern. The temporary Tower without radar access was a contributing factor.

## Narrative: 1

I attempted take off from the wrong runway at STS, at a known hot spot (Taxiway Hotel at Runway 20). This is a stupid mistake that "I would never make", nonetheless, even after I made the mistake, I was not convinced that it happened, so much did I believe that I had lined up correctly. (This is one of the reasons for the delay in filing this report; I needed to convince myself that my impression of what happened was incorrect, and to revisit the scene of the crime.) I was in Aircraft X and started out by getting the ATIS. This included the runways in use (landing [Runway] 14, takeoff [Runway] 14 and [Runway] 20, and a caution about ensuring that one is on the correct runway before takeoff). I was aware of this and kept it in mind. With the airport diagram at hand, I got my taxi clearance ([Taxiway] A4, A, North Runup). I taxied along the edge of the ramp, ([Taxiway] Z, parallel to [Taxiway] A) but believed I was already on [Taxiway] A. As I believed I was on [Taxiway] A, I missed the [Taxiway] A4 entrance to the actual taxiway, and continued to [Taxiway] K, where I was surprised the taxiway ended. I stopped to check the diagram and get oriented, and ground control then cleared me via [Taxiway] K, A, North Ramp. I proceeded thus to the North Ramp, and read the signage about calling the Tower to get a runway assignment before taxiing further. I completed my runup, called the Tower, and was cleared "hold short of Runway 20". Taxiway H, right in front of me, led to the edge of Runway 20, and I proceeded to that point and held. I was in the right place. I did all the things. This was the correct runway. I was set. I was then given a clearance for immediate takeoff and advised of traffic on short final. An airplane was taking off at the time, and as I pulled onto the runway to follow, my thoughts were "Man, they're packing them in tightly!" However, at Company they pack them in even closer, and this was not the time to have a discussion over the radio. My choice was accept or reject the clearance, and I had already accepted it and was in position. I did wait briefly until the aircraft in front left the ground, and then applied power to take off behind it, so that I had what I believed to be safe spacing, without dallying and using up the distance behind me that the following traffic would be dealing with. At that point the Tower canceled my takeoff clearance and told me to exit (I don't remember the actual verbiage, but my impression was to exit to the right). I pulled power back and started to the right, but there was no exit to the right. So I went to the left and exited at [Taxiway] A3, and was cleared to the North runup area. I was at this point still unaware that I had been on Runway 14 instead of [Runway] 20, as I was clearly at the correct runway prior to takeoff. I was subsequently given another clearance to hold short of Runway 20, and then a takeoff clearance, and I took off on Runway 20 without further incident. After landing and being told to phone the Tower, I still

did not know what it is that I had done wrong. The illusion that I had turned onto the correct runway was so strong that it was only far later, when I realized that I could only have exited and taxied to the runup area if I was on [Runway] 14 at the time, that I realized that I must have somehow been on [Runway] 14. My post-flight review of the incident included reviewing the airport diagram, and also close-ups of aerial photographs of the [Runway] 14-20 intersection, including the airport markings. Two days later I went on a "taxi tour" of the airport and did a takeoff from [Runway] 20 at Taxiway H with an instructor, to help prevent such an incident in the future. The pilot in command has the sole responsibility for the operation of the aircraft, and this incident was a failure of the pilot in command to operate with the degree of precision needed. Nonetheless, there are contributing factors that could be mitigated to break the error chain in other places, leading to a safer situation for all pilots. I had not flown at a complex airport in a long time (thank you Covid!), so my awareness of the need for extra awareness was not as sharp as it might have been. I should have planned my taxi route before moving, rather than as I proceeded. (This extends to post-landing taxi also.) Although I have operated out of this particular airport in the past, again, it was not recent, and I should have spoken to local pilots about the specifics of the hot spots in question. That said, while I was aware of the issue with wrong-runway departures, the thing I was not aware of was how easy it was to make that error. (More about that later.) At a hot spot where it is necessary to pause and verify the runway heading with the DG while on the runway, issuing an immediate takeoff clearance is asking for trouble. Pause to verify and one runs the risk of collision (or a deal). Fail to pause and verify runs the risk of wrong runway takeoff. And in the case that the relevant traffic that leads to an immediate takeoff clearance is on Runway 14 and not Runway 20, it is technically possible to issue a "position and hold 20" clearance, but this invites not only the error of holding on [Runway] 14 by mistake (as above), but the error of holding in position at the intersection. Of course, that's also a mistake "I would never make", but here we are. People make mistakes; this section is about reducing their probability and impact. That said, a clearance to take off on [Runway] 20 while [Runway] 14 is in use increases the efficiency of runway usage, and if all goes well, doubles the capacity of the airport. So there's a tradeoff there and I am not in a position to second-guess the air traffic controllers' decisions. When turning onto "the runway" from Taxiway H, one makes a left turn. The pilot sits on the left, and the left edge of the taxiway and the left edge of the runway are very powerful alignment indicators. This is especially true for aircraft that sit low to the ground, where the runway ahead is not as evident as it might be for larger aircraft. I am pretty certain that I was using this "left edge" to help me line up on "the runway", since I already knew I was at the correct runway. The stub of [Runway] 20 extends just enough from [Runway] 14 that as an aircraft turns into position, the other runway (and runway edge) comes into view, inducing the pilot to continue turning to line up on "the runway". Three possible mitigations come to mind; airport markings show that one of them is already partly in place. The yellow taxiway line already points straight onto [Runway] 20 without curving, though it once did curve. However, the left edge still curves. If the left edge lines of Taxiway H were also straight, the pilot would be led more strongly straight (and perpendicularly) onto Runway 20, and would be much less tempted to begin the turn onto the Runway (20) while close to the intersection of [Runway] 14. I believe it is the early turning onto the runway that leads pilots to continue too far, both using the left-edge effect I mentioned above, and due to the proximity of the next runway surface. Making the intersection of [Taxiway] H and [Runway] 20 strictly perpendicular may mitigate this risk to a meaningful extent, and is an easy fix. Additionally, the signage on [Taxiway] H at [Runway] 20 indicates only Runway 20. Signage indicating the proximity and angle of [Runway] 14 would go a long way towards reminding the pilot that they are not at "the runway" (decision behind them) but at two runways, and must still be very mindful of picking the correct one (decision ahead of them). This is a slightly more involved solution as it requires constructing a runway sign. But I believe it will also greatly

mitigate the issue. The two suggestions above, in conjunction, may significantly reduce the danger of wrong-runway takeoffs at this point on the airport; perhaps enough that it no longer would be a dangerous hot spot. A third option is to extend Runway 20 to Taxiway A, and eliminate Taxiway H. This will move the entry point to Runway 20 far enough from the intersection with [Runway] 14 that it becomes difficult to accidentally end up on [Runway] 14. This is admittedly quite involved and may be impractical for other reasons. I am not an airport designer; I'm just tossing out my ideas for what value they may have. None of this relieves the pilot in command of the responsibility to operate their aircraft safely. However, there are many links in an accident or incident chain, and these are the links that I can identify which contributed to the issue at hand. Note: "time in type" is approximate and only counts Aircraft X and Aircraft X Variant Ceiling was unlimited.

## Synopsis

Pilot reported confusion during taxi for takeoff and lined up on the wrong runway for departure from STS airport. ATC notified pilot and the pilot taxied to the correct runway.

## Narrative: 1

While parking at [the] gate, we repeatedly received a stop obstruction command from the automatic parking system. This instruction precluded the display of our aircraft and flight information, so to verify we had the correct gate, I had to look at the flight info. There I confirmed our flight number, [then received] an administrative message reminding employees to upload their vaccination info by Date. Since the company has told me I will be placed on involuntary unpaid leave with no benefits starting Date 1, this surprising announcement immediately captured my attention. I worked to compartmentalize my thoughts and maintain my focus on aircraft movement and my duties, but it was challenging. We parked, the Captain set the brake, I shutdown the motor and turned off the fasten seatbelt sign, sterile light, and beacon, but then I accidentally deviated from my flow and began cleaning up the flight deck. I neglected to finish my flow until about a minute later. This is a mistake I don't think I have ever made before. I am certain my lack of focus was caused by a reminder that I am about to lose my job that I worked so hard to gain.

## Synopsis

Air carrier First Officer reporter getting a distracting message during taxi into the gate regarding a company requirement to report vaccination status. Reporter stated the distraction caused them to deviate from their flow.

## Narrative: 1

I was Captain on a flight. Once the flight reached cruise altitude I received a call from the [A Flight Attendant] that discussed with me he had a passenger with mask compliance issue and that he had spoken to the passenger several times. He also had the other crew members check on the passenger who was with a teenage child. I asked him to try again, and issue information for noncompliance if needed. Later he called me and said he had attempted to give the information to the passenger who refused it, and also refused to wear the mask. He had asked the teenager to also wear the mask, but the parent had snapped at him and said it was a child and leave them alone. The teenager was acting as if asleep, but not wearing a mask either. I took note of the names, and contacted dispatch. The dispatcher let the Customer Service (CS) know the details and we were told they would meet the flight. As the flight continued, this became more of a distraction as many other passengers were visibly upset about the passenger not wearing a mask, and several stated that it compromised their safety. Several people wanted to be moved as it wasn't a full flight, however the passenger causing the problem was in a premium seat. When we took a bathroom break, passengers approached my First Officer about the issue even though it isn't allowed for passengers to come up front when the cart is out protecting the cockpit. I noted the passenger's name, and personally made a few announcements regarding mask usage in airports and on aircraft along with my normal announcements. When we arrived at ZZZ a CS agent met the passengers. I debriefed this CS agent as I departed who said the passenger also wouldn't take any info from him, and was not cooperative. He stated he would send the names and info to security and that the couple would likely be banned from travel on our airline. I do hope this is followed through on because it was a distraction and I would say to the point of a safety problem as it distracted all of the crew in critical flight duties.

## Synopsis

Captain reported passengers refused to obey the face mask policy in flight, which was a safety concern because of the distraction created during critical phases of flight.

Narrative: 1

We were descending on the [arrival] from the northeast for an approach to [Runway] XXR in VMC. We had briefed the extensive military training and the towers in the airport area. We were on a vector of approx 260 and were cleared for the visual. I selected 2800 ft. in the FCU (Flight Control Unit) altimeter (the FAF/ALAMO altitude), and we began to descend and start the big left hand turn (120+ degrees) to final. The runway was actually behind the Captain's head and while I was looking outside and dialing in intercept headings, I noticed we were below 2800 ft. I remarked that 2200 ft. was in the altimeter, but I didn't know why. (In hindsight, I must have bumped or spun the dial as I reached up to make heading adjustments). About this time we received a GPWS obstacle alert for the tower we had briefed and was in sight. By the time we climbed back up to 2800 ft. we were high (ILS NOTAM'ed OTS) and I couldn't see [the] runway in the climb and then was slow to get speed back. We finished configuring, ran the checklist and briefed a go around if not stable by 500 ft. [Cause includes] Lack of recency of experience -- I sat for a year before Airbus training after the [other make/model] was grounded. I was on that aircraft [for about a year], but flew 2/3 to 3/4 as the [relief pilot]. Prior to that, I was out on a 4 yr leave (not flying). Lack of time in Airbus - [this month] was my third full month of being qualified on the aircraft. Not yet comfortable with [the] concept of "flying the FCU" on visual approaches. There is no way to 'chair fly' the approaches in an Airbus. I don't enjoy this feeling. I've looked for a simple computer simulation program for the FCU, FMA, PFD and ND that I could purchase so I could chair fly some of these situations and see what happens as different modes of speed, alt, and nav are selected, but have not found one yet.

## Synopsis

A321 First Officer reported descending below minimum altitude on approach and receiving a GPWS obstacle alert. Reporter stated lack of recent experience and practice using the various navigation equipment contributed to the event.

ACN: 1837600

## Narrative: 1

Due to numerous emails from management regarding vaccination requirements and issues regarding reasonable accommodation I became distracted. During before takeoff checklist, I failed to notice our final weights had not been sent and used the weight on our T/O performance data. We finally received our weights after takeoff. This caused another distraction that resulted in a missed ATC traffic call and vectors from ATC.

## Synopsis

Air carrier First Officer reported failing to notice the final weights had not been sent and inadvertently used old data. The reporter stated they were distracted by company communications regarding vaccination requirements.

## Narrative: 1

I was asked to train a CPC-IT with over a decade of radar experience and with over half of the allocated hours allowed for the position at hand. Traffic was light and I kept getting distracted by the Data position near the radar scope. I had to stand further away than I usually would because of the constant traffic in and out of the data position, noise from the load speaker, and trying to have some social distancing for COVID. I have made many complaints about the data position being a complete distraction and today it most certainly was a contributing factor to a NMAC. Aircraft X departed ZZZ and the tower put the aircraft on a 250 heading. The aircraft never checked in and I scrambled to call the tower so they could climb and switch the aircraft before it crossed directly over the obstruction depicted on the video map and below the MVA (Minimum Vectoring Altitude). While this was going on, there were 2 other aircraft on frequency that were becoming a conflict. Once I realized that the trainee was not doing any of the instructions me or the supervisor was giving, I took over the frequency to prevent a loss of separation. Unfortunately, in my scramble to coordinate with all the appropriate sectors and facilities that Aircraft X was seconds from violating, I missed a readback from Aircraft X and they took another aircraft's instruction. I did not notice Aircraft X turning northeast bound immediately because of the coordination at hand and Aircraft X turned right at Aircraft Y that was VFR on frequency. I instructed Aircraft X to turn left and climb, but Aircraft X was already too far in the turn and I continued the right turn back to the east. I however did expect Aircraft X to climb in a timely manner in which they did not. This in turn created a dangerous situation that forced Aircraft Y to turn to the north to avoid the traffic. Although traffic was issued to Aircraft X, I did not see how close the aircraft actually got from the distance I was forced to be from the scope and my coordination efforts that needed to be done. I believe this event happened from combination of multiple events and some expectation bias. The Data position being a major distraction, COVID social distancing, ZZZ tower procedures allowing an aircraft to depart on a heading at an obstruction and maintaining an altitude below the MVA, Aircraft X not checking in, training on the position, expecting the CPC-IT to not freeze up, Aircraft X not climbing in the timely manner that I assumed they would have, and most importantly, I take responsibility and will definitely lose sleep over the fact that in my scramble, I missed the read back that ended up putting 2 planes in a dangerous situation. My recommendations to hopefully minimize any such event from occurring again would be to: MOVE THE DATA POSITION! Change the departure pie for ZZZ departures off Runway XX.

## Synopsis

TRACON Controller reported an airborne conflict and possible descent below minimum altitude occurred when the controller became distracted with the data position, social distancing requirements and supervising a trainee.

## Narrative: 1

While climbing out of ZZZ1 enroute to ZZZ I noticed that in RVSM we were close to having a 200 ft. discrepancy between mine and the FO's (First Officer) altimeter. We didn't go beyond 200 ft. difference and never got an ALT miscompare message. At cruise (FL350) the difference was roughly 130 ft. During descent in to ZZZ, I don't know when exactly it showed up, but I noticed at roughly FL330 during the descent we had a ALT message flashing on my altimeter. I thought maybe the BARO knob on my side or the FO side got bumped. I checked and saw that all three altimeters were showing STD. Then the message went away only to show up 100-200 ft. later. I looked at the altitudes and saw that we were either 200 or greater but not more than 220 ft. off. But then the next 100-200 ft. we were 200 ft. or less on the miscompare and the ALT message went away only for in the next 100-200 ft. for the ALT message to return and the discrepancy being 200 ft. or greater. It back and forth intermittently until roughly FL290, possibly lower, I do not recall when exactly the issue stopped. I sent an ACARS message to Dispatch to inform them and so that they could inform maintenance so that the issue could start getting worked on when we got to the gate. I also informed ZZZ Operations on the in range call what was going on and that we would need maintenance. I was looking through the QRH to see if there was a checklist for it just in case even though I was pretty sure there wasn't one.

This being the first time that this has occurred to me, I unfortunately did not think to reference the standby altimeter to try to help isolate where the fault may lie, as the issue went away while I was diligently looking for a checklist and the issue was intermittent. Also because it was intermittent and went away on its own I also did not think to inform ATC since we were already in the process of exiting RVSM. No other messages on any display unit, including the EICAS, showed while this was happening nor throughout the remainder of the flight. We landed in ZZZ without incident. I should have known that there wasn't a checklist for this issue and I need to read back up on alt miscompare procedures and how it affects RVSM and what to do. I should have informed ATC and I should have referenced the standby altimeter to help isolate the problem. Otherwise I think we did everything else correctly. After working with Maintenance in ZZZ it turns out the number 4 probe had failed even though we didn't get any messages other than the ALT message on the altimeters. Maintenance said that there when they initially went through their task that there wasn't any active or logged faults with the system and that they had to do another task to isolate where the problem was, in this case the faulty probe.

## Narrative: 2

In ZZZ, during descent we had an ALT disagree message during descent. Upon arrival into ZZZ we had everyone deplane, had maintenance come on and do some checks. They were able to isolate the issue and ascertained it was going to be a lengthy delay. We got word that our new departure time was going to be XE:00 so we got a day room. We got back to the airport at XD:15 for the re-report time. Upon arriving at the aircraft I was informed that there was still work to do but that they just needed to tape a cover back onto the plane for one of the pitot tubes. After that they still needed to do some testing and that it would be about 30 more minutes. So, we went to the crew room to wait for the work to be done. I went back out several times to get updates and each time the return to service kept getting pushed back. Finally, once it became a return to service time of XG:00 I realized that we were going to be within an hour of our FDP (Flight Duty Period) time out in ZZZ1. So, I called scheduling and got a wheels up time of XG:55 before the pilots timed out and due to contractual issues that the main cabin door needed to be closed at XG:34. I was told that Maintenance would call ZZZ Operations who would then call me in the crew room when Maintenance was done in the flight deck and that we could go to the plane, preflight, board, and wait for the maintenance log to come back so we could hopefully get out in time. The call did not come in until roughly XG:10. We went out to the aircraft, I told the flight to not rush the preflight. I told them to take their time, not to slow down so that we didn't hit our times, but so that something wouldn't be missed, prevent mistakes, keep us legal and not on the wrong side of SOPs and Regs. We were able to accomplish our preflight in a timely matter, board in a timely matter, and we were able to get the MCD closed at XG:32. The AML (Aircraft Maintenance Logbook) hadn't returned yet so I figured let's get the door closed so that we hit the Flight Attendant contract time and that hopefully the AML would arrive soon and could be handed to us through the flight deck window. I called Dispatch to make sure we were on the correct revision since we had a hard time getting our IFR clearance. I verified all the fuel and time values along with the correct revision. A few minutes after that a Ramp crew member came to the flight deck informing us that the fuel truck had arrived. There was apparently some confusion about fuel. I initially dismissed the fuel truck only to decide that I should make sure that wasn't any last second changes. So, I called Dispatch to re-verify our fuel numbers. There wasn't any changes and I moved on to the next step. Some time after this the AML arrived around XE:40-XE:45. After the cabin secured and we started our air start checklists due to the APU being INOP. At this point I knew that our timeline most likely wouldn't work but that it would close and that we needed to give our best effort. Right as we got to the part in the checklist to apply air to the aircraft for the air start, the FAs (Flight Attendants) called and informed us that a passenger had gotten up to use the lavatory. I told them to

let me know when they had returned and were seated. I told the ground crew to apply air but that we were going to wait for the passenger to come out of the lavatory since the cabin was no longer secured. I do not know if this was the right call but I thought that it was the best call in regards to safety. After a minute or two we got a call from the FAs that there was a possible passenger removal situation going on. I asked what was going on and they informed me that the passenger was being non-compliant with the face mask and was being non-cooperative and nasty in the process. Knowing that we as a whole crew were feeling stressed, tired, and unhappy about all the delays I made sure to ask had we been on time, no maintenance, still XA:30, would this situation rise to the passenger being removed. They talked about for a few seconds and agreed that it wasn't. I then instructed them that since he was still being non-compliant, go back one more time and see if we can get him compliant and in line or that we would then look into removal and top report back. After a minute or two I was called back and the FAs informed that the passenger was apologetic and now being compliant and we were good to go. At this point, with the cabin re-secured, I turned back to do the air start. I glanced at the clock to check our time and it was XG:51. At this point I knew that there was no possible way to get the air start, taxi, second engine start, and wheels up at XG:55. I conferred with the FO (First Officer) if he was in agreement and if he was willing to do an extension. He gave valid reason for not doing an extension and agreed with me that there was no possible way that we could get wheels up by XG:55. The reason I asked him was just to get a second opinion and he reaffirmed everything that was already thinking. I had already decided once I saw it was XG:51 that we were done, that there was no point in starting the engines, wasting fuel, taxiing out and turning back. The most efficient and economical path was to admit defeat on there being no possible way to make it off by XG:55 for FDP limit reasons and throw in the towel. We had been fighting a losing battle, we did everything we could to safely get the plane going in time and we just had too many issues pop to delay us going out. I then informed the ramp that we had timed out and to pull the ramp back to the plane and that I would inform the Flight Attendants to do arrival procedures and that we were going to deplane. The FO and did after landing and parking flows and checklists. I then exited the flight deck to tell Flight Attendant A that we were done and to do arrival procedures and that I would inform the passengers. I wanted to be out in the cabin for the announcement to not only own the decision but to not leave our Flight Attendants hanging to deal with potentially irate passengers. I made the PA informing them what was going on, the regulations on duty limits, that we tried our best but unfortunately had timed out and that we need to deplane, that they would be taken care of inside the terminal and apologized profusely for the situation. The passengers got off, mostly understanding, some were understandably irritated, but left without incident. I called crew scheduling to let them know and it sounded like word had gotten around already. We waited with the plane until a hotel was assigned. We then shut down the aircraft, secured it, turned it over to the ramp crew, and left the airport. It was a comedy of setbacks. It was just one thing after another. If it wasn't for the passenger, or the maintenance, or the air start due to the APU being broken, take any one or two items out of the equation and we most likely would have made it. It was a losing battle from the get go, we just didn't know it until the time came where there was no possible way to get out in time. I believe we did everything safely, timely, accurately, with safety and service in mind. At no time did myself, the FO, or FAs intentionally slow down the operation for the goal of timing out. The times we slowdown was to make sure things were done safely and correctly, to catch our breaths, and move on the next step to be completed, all with safety in mind. I do not know what else we could have done. We were ready and on time until the passenger, air start, AML delay, fuel confusion came about. It just wasn't our day. That being said, in order to help speed up AML paperwork we should seriously look into getting electronic AMLs and maintenance. This has a huge potential to cut down the time it takes to get paperwork done. Plus, since we would have access to the AML on our iPads and that the AML lives in

the cloud that anyone in the operation can access, we wouldn't have to wait for the AML to come back to the aircraft. Just like in [program] we would get an alert that the AML is finished, review the changes, sign off on the review, and be on our way in a significantly shorter time. In addition to that, ZZZ is not only a base but also a place where maintenance takes place. There shouldn't be an excuse to not have parts and/or the tools necessary to get jobs done. We shouldn't be having to rely on parts and tools being flown in and we definitely shouldn't be relying on borrowing tools from [other airline] like our maintenance had to do today. I understand that it would be expensive to do all of that but is it more expensive than what we just paid for crew to stay in ZZZ in a more expensive hotel, giving 500-dollar voucher to the passenger in addition to getting them hotel rooms and food vouchers? More expensive than the domino effect that just occurred down the line. Vouchers and hotels were given to those passengers in ZZZ1 no doubt. It's more expensive to not give our Mechanics the resources to do their jobs in a timely fashion than it is to try to save money on parts and tools. Also, across all [aircraft type], things are failing at, to me, an alarming rate. Be it in the cabin or on the flight deck, these planes are not that old and should not be having things break this much, this fast. We need to stop kicking the can down the road and actually fix things rather than defer and hope for the best. Also, we need to figure out why things are breaking so much so often so soon. This is getting embarrassing and the 3rd major delay, break, cancellation in the past week for me and in talking with other crews and ramp crews, I'm not the only one experiencing these issues. We clearly have systemic issue that we are either unable or unwilling to address and sooner than later it is going to bite us real hard and cause a serious incident or accident.

## Synopsis

Air Carrier Captain reported a delay followed by a cancelled flight due to a discrepancy between the Captain's and First Officer's altimeters on a previous flight which lead to maintenance action.

## Narrative: 1

It was a very early show time XA: 30. Once we landed in ZZZ, we had over 2.5 hr wait time for next flight. We had experienced a maintenance issue on the first aircraft after we had already boarded passengers. We had to deplane. Do plane swap, board and taxi out for departure. Just before takeoff another issue with the second aircraft. Return to gate, wait for maintenance decision and deplane. Waiting for another aircraft, that's a third one.

Waited in open hot air at the gate area for next crew. Felt nauseous and lightheaded. Impossible to continue. We had been dealing with extreme heat, upset passengers and stress due to maintenance issues. I have long haul COVID symptoms. Get tired faster than before. Coming back to full health is taking time. All together had put me in the mental and physical condition of being unable to continue my work duties at 100%.

## Synopsis

Flight Attendant reported fatigue and being unable to perform duties due to multiple return to gate incidents and plane swaps.

## Narrative: 1

I have not taken the COVID vaccine. Because of this, I expect to lose my job in XX days or less. I flew a scheduled trip, ZZZ to ZZZZ, on Date 1 and returned Date 2. I am new to the [aircraft type] fleet and have XX total hours on type with XY hours towards my hours required for consolidation. In training, I was taught the importance of discussing threats before a trip with the other pilots. My dilemma was deciding whether to tell the other pilots that I am distracted because of my upcoming termination or not to tell them. I decided not to tell them because, having never met them before, I was concerned that this information might be perceived by them as anything from a minor annoyance with me to a possible outrage. Prior to both flights, I addressed all my concerns and considered myself fit for duty. Although I just recently completed training on the [aircraft type], I am proficient in my skills. I was convinced that should any non-normal situation occur I would be competent and able to properly perform my duties. What I did not expect to encounter was the anxiety and inner conflict I experienced once airborne. After the flight, I was unable to go to dinner with the other pilots on the overnight because I do not have a vaccine card which is required in Country. I felt uneasy about giving a vague reason for declining the invitation because I was uncertain about revealing the truth about my vaccination status. While in ZZZZ, I thought about the inner-conflict that I am experiencing, anxiety about losing my job, and concern over possible discrimination by other pilots and/or cabin crew members should they become aware of my vaccination status. I was pilot flying on the return leg to ZZZ and I found it more difficult to concentrate on simple tasks especially since I am new to the aircraft. I was also unable to sleep during my rest break and unable to eat very much due to the heightened anxiety I was experiencing. My landing at ZZZ airport was not as good as I had hoped. The inner tension was compounded by my uncertainty as to whether I should have confessed my vaccination status to the other pilots and what would happen to me if I made a mistake and they found out later that I did not tell them. The unexpected level of anxiety never reached a point that I would consider dangerous, but the possibility of increased errors was apparent to me. The conflict that I experienced because I did not reveal my vaccination status at the onset of the trip was an unnecessary distraction imposed on me by the company. In addition, I did not want to introduce an issue to the other pilots that could cause a hostile work environment. At the end of the flight, at the gate in ZZZ, I told the other pilots that I was unvaccinated and would be losing my job soon. I could sense their concern and as they are both true professionals, they seemed empathetic with my plight. I have not yet determined the best way to deal with my predicament and since there is no guidance from my union or the company, I will probably conceal my vaccination status on my next trip. I would hope that there would not be any hostility directed towards me if I revealed my status at the beginning of my next trip, but considering the contentiousness of the situation I am unsure. I believe that my training and prior experience make it easier for me to deal with these types of distractions than others. I am very concerned for those who may be unable to effectively manage their personal problems caused by the vaccine mandate. I believe that the company's vaccine mandate has created a potentially dangerous work environment that could impact safe operations. The divisiveness caused by the vaccine issue, the unknown side effects for those already vaccinated and the prospect of impending job terminations have culminated and become, in my opinion, an inherent risk to aviation safety.

## Synopsis

Air carrier First Officer reported experiencing stress and anxiety resulting from working while being unvaccinated and the company requiring employees to be vaccinated.

### Narrative: 1

I was relieving another controller. He was getting off position to take the CIC position. I listen to him brief. I turned up the overhead lights. Before I sat down, two aircraft were flashing. I sat down. Turned one 40 degrees right and the other 30 degrees left. My recommendations are, even though COVID is a factor of why I was distant from the sector to give both controllers room and space, I will have to get closer to see the scope to see what is going on.

### Synopsis

ATC Controller reported during a position change with another controller, two aircraft entered into an airborne conflict situation. The conflict was not immediately noticed because the ATC personnel were social distancing.

## Narrative: 1

This report is submitted due to concerns regarding return-to-service preparation of our long-term stored aircraft. This aircraft had a number of issues which precluded an on-time departure and caused us to question the true airworthiness of the aircraft. Specifically, the aircraft had massively incorrect fuel loading, such that it required ~4+ hours to move fuel to the appropriate, legal-for-flight, locations. Second, upon the first engine start, we were surprised to see to ECAM Caution messages for "ENG 1 (and ENG 2) REV INHIBITED." Thrust reverser operation was, indeed, inhibited, so we encountered another half hour+ delay while computer settings were changed to allow thrust reverser operation. (Maintenance Control advised that these messages were likely the result of a release-from-storage checklist item being left undone/missed.) Our total delay ended up being five hours as our Dispatcher and us concurred that additional fuel was required for our flight to ZZZ due to incoming weather, which added another 20 or 30 minutes to the delays. Our concern is that the number of time consuming and potentially unsafe items we encountered in successfully launching our aircraft suggest that either the team at ZZZ1 was rushed to accomplish these tasks, and/or given insufficient time or staff to complete them. Another possibility is that the appropriate training and task cards were not been provided? Regardless of the causes, with so many aircraft coming back into service, it behooves us to look into the events of this return-to-service flight so as to preclude them from occurring again, thus enhancing flight safety. Simply suggesting an investigation or evaluation of what transpired in this return-to-service flight so as prevent compromised flight operations going forward.

## Synopsis

Captain reported long delay due to fuel imbalance and thrust reversers inhibited caused by human factors during return to service from long term storage.

## Narrative: 1

ATC direct failure to advise hold short of Runway 9C in the initial clearance. After the switch from Ground to another Tower frequency no instruction was given to hold short 9C. We were given clearance to taxi M1, M, right onto Runway 22R hold short of E. Aircraft Y was ahead of us given the same clearance hold short E monitor Tower 132.70. The Aircraft Y encroached Runway 9C as Aircraft Z was on its takeoff roll on 9C. ATC Controller yelled Aircraft Y stop! Immediately after Aircraft Z cancel takeoff clearance STOP! The Aircraft Z appeared from behind the hangars with the nose wheel off the ground in a slight right bank as the Controller said 'Do you see that plane'? Aircraft Y was given a number to contact the Tower. There are no "wig wags" installed at any intersections along this runway. There are no stop bars installed. There are multiple obstructions to visibility. Taxiing into the sun is a factor. Runway markings and signage is unacceptable for the size and scope of the runway, and it's intended use. New construction all around the airport with pilots returning to work from furlough, and layoffs or leave of absence. Trust bias that ATC is correct in the instructions given. Attempting to move aircraft with expedience rather than a structured taxi route. No designation of any "hot spots " on aeronautical

charts. Cease and desist using Runway 22R as a taxiway! The use of this Runway as a taxiway is the inevitable set up for a mass casualty accident!

## Synopsis

Air Carrier Captain reported observing a critical ground conflict at ORD airport when Runway 22R was being used as a taxiway.

## Narrative: 1

I was working two sectors combined during a west flow. We were ILS XXR and visuals to Runway XY. I was trying to lay off of Runway XY because I just didn't have time to vector and hit the ghosts. I am already busy vectoring for space to [Runway] XXR and I had a couple that I was taking to Runway XY. Aircraft X popped up from ZZZ and I just didn't have a good way to take them to Runway XXR. I decided to assign them Runway XY. All my arrivals to XXR are already descended to 6,000 feet. Aircraft X came to me at 6,000 feet and I needed to get them under my ZZZ1 arrivals. I then descended Aircraft X to 5,000 feet and didn't see the traffic in front of them who ZZZ1 was working. By the time I noticed it Aircraft X was already responding to an RA. After coming off of a COVID-19 reduced staffing schedule a lot of ATIS are a little rusty in the radar room. I think that sectors should have been split.

## Synopsis

TRACON Controller working busy combined arrival sectors descended an aircraft from 6,000 feet to 5,000 feet which caused a conflict with another aircraft.

## Narrative: 1

We took off out of ZZZ to ZZZ1 for a night ETOPS flight. Everything was normal. Although the crew was current, all hadn't flown much in the past XX months due to COVID. We briefed this fact and were aware that we would all have to be on our toes due to the fact that our flying skills were rusty. The flight was normal. We operated the flight very close to the flight plan. After a normal approach and smooth landing, we taxied to the gate. After shutting down the engines and performing the Parking Checklist, we were surprised to see an overweight landing message being printed. We had landed approximately 700 pounds overweight. We sent the appropriate overweight landing code and I called local maintenance to report the issue.

## Synopsis

Air carrier Captain reported an overweight landing at destination airport caused by failure to monitor fuel burn during flight. Captain cited rusty pilot skills caused by COVID inactivity as a contributing factor.

## Narrative: 1

We had coordinated on a ZZZ to ZZZ1 out and back for extra gas so we wouldn't have to shut down the engine at ZZZ1. We had a quick turn and the APU was INOP. After taxiing into the gate without incident, we shut down the left engine and left the right engine running. I got our new release and it said we needed 7.8k gate/6.1k min fuel. We had 6.8k on board and Dispatch gave us a ton extra for holding. I called Dispatch and asked just to take the fuel we had on board and they agreed and sent us a new fuel plan via ACARs. Simultaneously, I had the First Officer go out and tell the ramp we didn't want fuel or external power. He came back and said in informed the Ramp Supervisor. AC power was not applied to the aircraft. We deboarded and boarded without incident. Then about 20 minutes after getting into the gate, while briefing the takeoff, I noticed the AUTO XFLOW INHIBIT message and saw we were taking on fuel. It was less than 300lbs at that time. I immediately jumped up and opened the galley door and shouted to the fueller to stop because the Right engine was running. It took him approximately a minute to understand what I was saying and he stopped fueling. We took on about 1000 lbs total. I contacted the ramp and he said that they were Other Company and not under his direct control. I informed him I would write up the incident. Rest of the flight was without incident. Have a notice to the pilots and to stations directed specifically at the rammers and fuelers that aircraft cannot Hot refuel. This seems to be more of we're finally busy and COVID is over so we're rusty and rushed. I had a second incident at ZZZ on the return flight. We arrived at the gate at ZZZ without incident. I shut down the left engine while leaving the right one running since we had no APU. The ground crew had trouble hooking up power and before I shut down the second engine, I saw the AUTO XFLOW INHIBIT status message. I had the First Officer immediately head to the galley door to have ramp stop fueling which was just starting. I was mostly deplaned and power was coming up so I killed the engine. The First Officer got the fueller to stop and we took on less than 100 lbs. I discussed with ramp personal reminding them not to start fueling until the engines are shut down. Nothing further of noted happened after that. Unrelated, but distracting, update the APU start checklist and remove all items that are duplicates and will be handled under another checklist (told data, doors, trim, fuel check value test, etc.).

## Synopsis

CRJ-900 Captain reported that during arrival with an inoperative APU, the fueler hooked up and began his upload prior to the engine being shut down or gate power applied, causing the Captain to secure the engine and order the fueler to discontinue fueling. He further stated that COVID had impacted the currency of training and compliance with procedures.

## Narrative: 1

Passengers in XX3/4 repeatedly removed their mask during flight. Male passenger in XX3 removed his mask twice during the flight and had to be told to put it back on. He also removed it during deplaning. I had to make an announcement and he also put it back on. Passenger in XX4 removed his mask 3 times during the flight. When I first noticed his mask off I asked him to pull it backup and he did. (Gaiter style mask). During takeoff while I was in my jumpseat he removed his mask again. I decided to wait until the chime to ask him to pull it up again. However, it appeared the passenger behind him had asked him to pull his mask back up and he was starting to argue. (I was unable to hear the actual conversation.) In order to prevent conflict/escalation I got up and told him he needed to put his mask back on. He did. After service, (he did not eat or drink) during trash pick up - I noticed he had his mask under his nose. When he saw me looking at him he pretended to be asleep. I called the pilots and told them I need to issue a notice to the passenger and told them what seat. I went back and handed him the notice and he pulled

his mask back up when I "woke" him. I came back a few minutes later to make sure he was still complying and retrieve the card. He looked shock and made gestures asking me why I had given it to him. I told him that he needed to keep his mask on. He sarcastically pulled it up to his eyes and asked if that was OK. I said yes, took the card and left. There was no additional interaction for the rest of the flight. The Captain called and asked if the issue was resolved and we told him yes.

## Synopsis

Air carrier Flight Attendant reported passenger misconduct related to COVID-19 mask requirements.

## Narrative: 1

I was on Ground Control and Clearance Delivery, I read clearances as normal and coordinated flow times. The facility both Tower and Radar were evacuated and went to ATC Zero for COVID-19 Cleaning. I instructed all IFR aircraft on frequency to contact ARTCC for IFR services and broadcast it on the ATIS frequency. I did not specifically tell the IFR aircraft that had already been read clearances while the airport was controlled to hold for release. After the facility had been evacuated and the airport deemed uncontrolled, an IFR aircraft departed without coordinating with ARTCC. I would recommend a procedural amendment to the local contingency plan to broadcast that all IFR aircraft that had been issued IFR clearances to hold for release and contact ARTCC or FSS to coordinate their departures prior to taking off.

## Narrative: 2

Received pre departure clearance from ZZZ clearance. Clearance informed us the Tower would be closing due to the Tower getting cleaned. Departures/Arrivals and Ground and Tower would be closed. They asked if we would be gone before then and we said probably not. They did not give us a hold for release instructions. They gave us Center frequency before the tower closed. We finished, pushed back and broadcast over CTAF we would be

taxiing out. We attempted to contact Center several times before departing. We called in the blind on CTAF as we took the runway and departed. We contacted Center at around 1,500 feet and continued on our way. 10 minutes later Center informed me to contact Center via the telephone for a possible pilot deviation. It is unknown what the actual deviation may have been if there was a pilot deviation.

### Narrative: 3

I was the First Officer operating Aircraft X from ZZZ back to ZZZ1. We had a very busy turn. APU fault and shutdown mid-turn which led to the logbook entry, Maintenance Control call, and MEL addition, all while the aircraft was boarded, very full, and heating up quickly. We were waiting on paperwork to finalize the release and push, and we started up the right engine at the gate as soon as we could to reduce the heat for the passengers. There were thunderstorms along our route. Cells were closing in and ZZZ1 was near their peak of inbounds for the day. It was a very busy flight and we were doing our best to keep the process moving quickly to keep the passengers comfortable and make it into ZZZ1 before the storms complicate our already-complicated turn. We received our clearance around XA:50 local time and we were due out around the top of the hour. We caught word that the Tower was closing at the top of the hour due to cleaning. We discussed the frequency that we will need to call, and if we couldn't get a hold of them, we would depart VFR and pick up our clearance in the air. We tried Center twice to no avail. We made our position reports and departed. We got a hold of Center at 2,900 feet and carried onto ZZZ1 as filed; we received a phone number from ZZZ1 telling us to call Center over halfway through the flight. Departing VFR in controlled airspace was our mistake and in the heat of the pressure to cool the airplane quickly by getting airborne and dodging the weather, this is where we made this mistake. Picking up VFR in the air doesn't work when the airspace is controlled and we weren't "officially released yet", as we had mistaken. I remember thinking "I did this in the [region] just a month ago, and we had no issue picking up [Center] in the air". The heat and external pressures added to my lapse in judgment to think a Class D airfield turns into uncontrolled airspace when the tower closes. I recall hearing tower say "ATC zero" and that was an incorrect call to depart without the release. The [regions] are clearly not the same as ZZZ and this was a mistake I made to connect operations in the USA and the [regions], despite the similarities in the circumstances. I am confident I completed our flight brief and clearance verification operating procedures; my mistake was in letting the time constraint and environmental pressures affect my judgment and depth of thinking about our changed departure rules. I should've spent more time thinking about that vs. the thunderstorms, aircraft threats, and hot passengers. External pressures and time constraints caused me to overlook a critical error in controlled airspace clearance despite having a closed control tower. I did not prioritize quality over timeliness like I should have. More controlled and uncontrolled airspace scenarios to familiarize pilots with the differences in clearances among different airspace, especially under pressure and time constraints. Yesterday, I learned a valuable lesson about the importance of prioritizing the core pilot competencies above all other environmental and organizational pressures. Should I have taken another 5 minutes to collect ourselves and review my flight brief one more time, with more depth, I would've caught this error and we would have had no issues with our clearance.

### Synopsis

A Tower controller and flight crew reported the flight crew departed an airport with a closed tower without approval for release from the ARTCC. The Tower Controller reported they failed to advise the flight crew to hold for release after issuing their clearance prior to Tower closing.

## Narrative: 1

Due to being sick from this flight, this is my first chance to write this report. I was on standby from XA:00am-XG:00 on Date in ZZZ. Crew Scheduling called me at XF:06 to work a 1-2-1 three day trip. They assigned me position 1 and the first leg of the trip was to ZZZ1. I switched positions with Name and became the #3 because I don't like being #1. While walking to the gate flight service called to check on us (they thought they were calling the #1 from the original crew but instead called me by accident) and informed me that the original crew was being taken off this trip due to a fume event. When we arrived at the gate, our flight had begun deplaning. We were told that they had sat out on the tarmac for 2 hours before they were able to get to the gate and deplane so the aircraft could be checked out. During deplaning, Name 1 (the #4) and Name 2 (the #2) called the union and Name 3 to talk to them because we were very nervous about flying on this aircraft after it just came back to the gate and had to have us re-crew it due to a fume event. We did not know the original crew personally but as they deplaned they warned Name 2 and Name 1 that we should not get on that aircraft because something was wrong with it and that they were on the way to the hospital. They were shaken up, pale, and were visibly ill. One of the girls even had to get a wheelchair to wheel her out of the terminal. I immediately felt very unsafe about proceeding forward on this trip. Seeing the crew so visibly ill from a fume event and then being expected to take that aircraft right back out and move on like nothing happened is extremely terrifying and irresponsible of the flight deck. Our health and safety clearly was not a first priority in this instance. After original crew and passengers deplaned we were immediately sent down to the aircraft and the agent wanted us to check our equipment so we could board again and get this flight out as quickly as possible since it was so delayed. I was the first FA on the jet bridge, and I ran into the maintenance man on his way out. He told me he did an inspection of the aircraft and it was cleared to fly. He said he could smell stuff in the aft lavs but that everything was clear. He told Name 2 when he saw her that it was all good and to not get on and break anything. This was all happening so fast that it was hard to process it all and I was very uneasy and felt pressure to work this flight. After I got on the flight, the Captain was dismissive of the event. He informed me that he thought the previous crew was being overly cautious because two of the four flight attendants had just recently been through an incident on one of their trips that they had not been able to fully recover from, so that is why they turned around, but he did not think there was a serious issue to be concerned with. I interpreted this as the Captain thinking the previous crew was overreacting and that he did not take their concerns seriously. He and the First Officer said

they attributed the fumes to there being a lot of aircraft congestion on the way out and that they thought it would be fine this time around. They said to let them know if we experienced anything this time, but it seemed as though the flight was going no matter what based on the flight deck's attitude. They continued to dismiss our fears before boarding started again saying it was fine to fly on this aircraft and that maintenance didn't see a problem. I was hesitant with this news because maintenance was on their way out not even 5-10 minutes after deplaning took place, and I did not think that was a substantial amount of time to do a thorough check of the aircraft. After the Captain informed me of this, my other crew members got on board and they asked me what he said. Name 2 was especially nervous because she has a health concern that if mixed with a fume event could be life threatening, so she went into the cockpit and had a long talk with the Captain. I'm not exactly sure of what he said to her because I was out of earshot but she told me he was dismissive and also mentioned what he said to me about the other 2 flight attendants from the other crew being overly cautious due to their past experiences on a trip. Name 2 told me that the Captain also made a joke when she expressed her concerns about how his mother thought he was the smartest guy in the world but there is always a chance that I'm wrong. We re-boarded passengers on the flight without there being a substantial amount of time to pass after it was deplaned the first time (like 15-20 minutes). During boarding, passengers kept asking me if it was safe to fly, and I told them that the Captain had told me he thought it was due to congestion from other aircraft that caused the smell the first time and that maintenance had cleared us to fly. The Captain never once made an announcement to the passengers to update them on the situation and reassure passengers once they re-boarded. Name 1 called Name 3 during boarding and asked Name 1 to ask the Captain if he had filled out the cabin odor fume report. Name 1 called me since he was in the back to ask. Name 2 had come to the front during boarding and she ended up being the one to ask the Captain. The Captain's response was that he had never heard of the cabin odor fume report before. There was another report that the union wanted us to ask about (the report is named with numerics) and when Name 2 asked the Captain about this he said he was going to pull it up but we never actually saw him do it. He then changed the subject with Name 2 to talk about his vacation that he was going on at the end of the trip. I had COVID back in month and ever since I recovered, my taste and smell have not returned, so I am not a good judge on if there was an odor in this aircraft. However, Name 1 and Name 2 mentioned they smelled something gross in the back of the aircraft. Once in the air, Name 1 and I started feeling very light headed. Name 1 and the #1 Name 2 also started having a bad headache. During the middle of the service, there was moderate turbulence that continued the duration of the flight. We ended up having to suspend service because it was too dangerous to be in the aisle. I even felt like I caught some air at one point. We hurried to secure the carts and ourselves in the back. This is not what this report is about, but I think you should know that the Captain did not communicate with us the entire time about the turbulence or when it would end. We had to call him to ask if the turbulence would continue the rest of the flight and if there was a different altitude we could try because we were all feeling whiplashed in the back and queasy. He said we should suspend service and that he would make the announcement to the passengers about it. Name 1 then had to call him about 15 minutes later after the initial call to see if he was still going to make the announcement because he had yet to do it. He finally made the announcement to the passengers that we would not be completing the rest of the service due to the turbulence. However, he called the #1 Name 2 to make sure she had completed first class service because he wanted to make sure the customers were getting what they paid for. The Captain's unprofessionalism and lack of care for the flight attendants and our safety was astounding. Once we landed he and the First Officer were one of the first ones off the aircraft and they left to go straight to the van for their layover. These pilots ran off right when we landed. It was evident that the Captain was in a hurry to start his layover and had no concern for health and safety of

his flight crew. He never once checked on us or asked us how we were feeling from the fume event or the turbulence. Now you have at least two flight attendant crews sick and a Captain and First Officer that could care less. Was this airplane truly airworthy? Name 1's headache continued for the next 3 days. On the second day of our trip, after we worked from ZZZ1-ZZZ2 Name 1 had to call out because he threw up mid flight, had a horrible headache, and had an upset stomach. He said his symptoms started that first flight from ZZZ-ZZZ1 and only continued. We had to get a standby from ZZZ2 to finish the trip with us. I have felt extremely lethargic ever since that flight. It feels like I took 10 Benadryl. I have had a very foggy brain and have slept non-stop. Writing this report is the longest I have stayed awake since I got home from that trip. I have also had shortness of breath. Name 1 and I went to the ER on Date 3 and got our hemoglobin levels tested and our chest x-rayed. Our hemoglobin levels were normal but that is to be expected since we went 48 hours after exposure. We called out on flight because we felt so sick and unable to fly. I talked to nurse when I called the number and after describing my symptoms she told me she was going to have me stop right there and recommend that I go get checked out at the ER and call her back within the next few days after I was checked out. I am still experiencing extreme brain fog, exhaustion, and shortness of breath. At the end of the day, we felt forced to get on an aircraft that had an issue and work Aircraft X to ZZZ1 because the union told one of the other flight attendants if we didn't we would get in trouble with the company and a refusal to fly. We have been given points against us when we were injured on the workplace in a fume event of some sort and now we are having our jobs jeopardized by points. The points are penalizing us for being sick and being taken to the hospital on a work injury/fume event. Why would a company that I give my time to penalize us for a work related injury? I want to recap that you have 2 crews that are sick with a Captain who was absolutely unprofessional, unsafe, and dismissive. This is a serious safety issue, and with this aircraft still flying you are risking the safety and health of passengers and crew members. Train your pilots and ground staff (the Tower and Ops) on how to handle fume events. We should have never taken this aircraft after knowing that 4 flight attendants were taken to the hospital sick and now we are all sick. At the end of the day, this flight deck crew and the company is responsible for our illnesses. I have not received any calls from our department. It is like no one cares how sick we are. This is my first fume event and I have had no guidance on how to handle this and proceed from here. Communication is key.

## Narrative: 2

I was on standby on Date at XA:00 sign in & was called at XE:15 to work the flight from ZZZ to ZZZ1. I was assigned position 4 on the trip with 3 other crew members. I made my way to the gate & as I arrived there were still passengers getting off the aircraft. I went over to the side & started talking to the crew that I was going to be working with. We saw the other crew come off & they did not look okay, the crew came over to us & said that the airplane had just had a fume event & that it wasn't safe for us to fly. We continued down the jet bridge after scanning in with the agent, upon arrival to the aircraft I saw that Maintenance was on board & talking to the Captain. As we got on we asked the Captain what had happened & if the airplane was safe to fly. He began to say that the other crew was just smelling fumes from the congestion on the taxi way & that it was nothing to be worried about. As I got to the back of the aircraft I smelt a terrible pee smell which seemed to be coming from the aft lavatory's. I informed the Captain but he said he was aware of the situation in the back. Our number 2 made sure to go up front & ask a bunch of different questions to the Captain about the aircraft & what had just happened. The Captain didn't give us much information with the plane & so I called the union. As I called the union, I was told to ask for a cabin air quality check, upon asking the Captain for this he said it was not necessary & that he wasn't needing one done. We tried our best with not feeling safe going on this aircraft, we boarded up & began pushing back. Upon push

back, I was informed that 3 of the 4 flight attendants on that flight before us were headed to the hospital & one had to be wheeled out in a wheelchair. We were already taxing & there was nothing we could do at this point. We got up in the air & I started to have a terrible headache, later in the flight the number one came to the back & said that she was having a headache as well. We thought nothing of it for the most part, we then began to all feel light headed. We continued onto ZZZ1. The headaches continued onto the next day when we were working our flight from ZZZ1 to ZZZ2. About 30-45 away from landing I began to feel super nauseous from the flight & ended up getting sick on the flight. I proceeded to call the Captain to call tracking & have a standby waiting at the gate for me because I wanted to get off of the trip because I started feeling so sick. I got off the trip went to my hotel & slept for 12 hours before waking up. I was foggy & very out of it, very unlike me in any way. I still had my headache even after I had taken my medicine that I had been given by a doctor a while back for pain. The headache continued through the night & I was deadheading on a flight the next day, I was very very exhausted & short on my breath. I got on the plane not thinking much about it. As we were in the air I started to feel light headed, like I was going to pass out once again. Upon landing I got a message from the other crew informing me that 2 of the 4 had been in the ER still. One of the flight attendants did test positive for carbon monoxide poison. I proceeded to call the injury number and report everything to them. I was informed that I needed to go to the hospital & get checked out. Me & the number 3 flight attendant ended up going to the hospital together to get checked out, all of our tests came back normal but the doctor said that was to be expected since it was so long after exposure. He said there was a very good chance that is what it was but the test didn't show it. He gave us a note & recommended us stay rested & healthy. I don't believe that I should be punished with points for the company's inability to properly check the aircraft & deem it not safe. I should not be receiving any points for the situation as it was an injury on duty & was reported to the company in a timely manner. The points should not count against us in this event since it was a fume event. The points are given to us for being proactive about our safety & well being, Why would a company that I work for & give most of my time, want to give us points for a situation we believe is linked to an unsafe aircraft. We now have 2 crews who have been sick & however many after the fact. You have a Captain who was not in charge enough to say he wanted an air quality check of the aircraft for the safety of his crew & passengers. You still have this aircraft in service & are potentially putting other people's life & health at risk. Pilot & airplane need to be taken out of service for endangering passengers & crew members.

## Synopsis

Air Carrier Flight Attendant crew reported a fume event during flight which resulted in physiological symptoms.

## Narrative: 1

First, the biggest threat to the flight was that I hadn't flown in a little over a year, zero hours. This was due to COVID related reduction in flying at my airline. This flight was my first flight on Operator Experience (OE). We were cleared to line up and wait on Runway XXY at ZZZ. A regional jet was also cleared to line up and wait on Runway XXZ. The tower frequency was busy due to landing traffic on the crossing runway and communication between tower and a previously departed aircraft reporting bird activity. I haven't flown at ZZZ for a long time and had forgotten that they normally clear the smaller aircraft to takeoff before the heavy due to wake turbulence. Tower cleared the regional jet for takeoff and in the busyness my brain processed the clearance as ours. The last factor for me was we were right in the middle of transferring the aircraft from the captain to me and so the radio call, acknowledging the takeoff clearance I thought I heard, got dropped. I don't recollect making it. In addition, I failed to verbalize, verify and monitor the clearance with the captain. When tower saw us begin our takeoff roll prematurely, they cancelled our takeoff clearance and we rejected the takeoff at very low speed...I estimate 50 knots. We acknowledged, cleared the runway and taxied back to XXY. The following takeoff was uneventful. Lastly, we noticed on our second takeoff that red lights on the runway were illuminated in front of us prior to getting takeoff clearance. They extinguished when we received takeoff clearance. The lights were not used for our first takeoff.

## Synopsis

First Officer reported a rejected take off after mishearing a take off clearance as theirs, that was meant for another aircraft.

## Narrative: 1

Aircraft X was inbound to ZZZ from the ZZZ1 airspace. I verbally coordinated a 360 heading with the north controller because I was vectoring off the arrival for sequencing. I took a handoff on Aircraft Z at 10,000 feet direct ZZZ2, at the same time I had two ZZZZ departures that I was worried about being a factor. I was vectoring Aircraft A off of the arrival as well as Aircraft B. I was trying to make sure there was enough room for Aircraft A because he was a heavy and [I had to] get Aircraft B behind them. I wanted to group the 3 small transports together and get them to final before the next set of arrivals. I turned Aircraft X. I then turned my attention back to the final and didn't notice Aircraft Y, who was controlled by the north controller at 4,000 feet inbound to ZZZ3. As soon as I noticed there was going to be a loss of separation i turned Aircraft X northeast and

climbed them. It is very hard to get used to the traffic after Covid. This was the first day I had to take every aircraft off the arrival in years. I was so concentrated on my feed to final that it caused me to lose track of other aircraft away from the airport. I think there should have been stricter Traffic Management Unit (TMU) numbers in because both of my sessions I was vectoring over 20 miles off the arrival. If the sector was not combined that would have helped too.

## Synopsis

TRACON Controller reported they issued a 360 degree vector for sequencing to an aircraft and failed to notice that it put the aircraft into conflict with traffic at the adjacent sector. The Controller noted a lack of proficiency at working busy periods due to the recent reduced air traffic due to COVID-19.

## Narrative: 1

Flight started at the helicopter pads - second flight out of ZZZ for the day. This was a training flight with students. I was the Flight Instructor. I started up and prepared for takeoff as normal. The weather was IFR which required a SVFR clearance for our departure. I received weather and contacted Ground and requested the SVFR to the northeast with a present position departure from the helicopter pads. This was the expected as we had done so earlier. Initially, I was told to standby while the Controller was getting other aircraft taxiing. After the wait, the Controller came back and cleared us to the northeast at or below 1700 ft. via SVFR, which I read back. Despite still being on Ground frequency, I erroneously mistook the SVFR clearance as a clearance to takeoff as requested from present position. As such, I instructed the student to initiate the takeoff and depart, which we did. Our flight path was to the northeast which took us across Runway X, the active. As we reached 500 ft. and [was] approaching clear of the ZZZ Class "C," I expected a switch to Approach as usual but when I looked down at the radio I saw we were still on the Ground frequency. I quickly switched to Tower and was informed of my lack of takeoff clearance and additionally the overflight of an aircraft on takeoff from Runway X which we didn't see. Our departure flight path was at a 40-degree offset roughly 040, which put the start of Runway 8 behind us. Sitting on the right side, I didn't see Aircraft Y who was actually cleared for takeoff start their roll at roughly the same time as we did. Due to the angle, they were aft of my scan during the takeoff. Based on the info from the Controller, we passed over them by about 200 ft. as they were departing. Because we were still on the Ground frequency, we also didn't hear towers call to us when we started to depart without takeoff clearance. Unfortunately, all of this was caused by my assumption of having received a takeoff clearance and acting accordingly. Obviously, I should have been more aware and realized that it wasn't a takeoff clearance that was issued. I should have also noticed that we had not switched to Tower from Ground earlier. Not to pass blame, but an observation - it is common for a Ground Controller after issuing a clearance to push us to the next Controller, i.e., "Read back correct, contact Tower/Ground for takeoff/taxi." This would seem more critical, particularly for a helicopter present position departure such as this one that does not require a taxi to a specific runway. In this case, that was not stated as far as I can remember. Additionally, there has been a lot of Ground and Tower combined frequencies lately and that also could have

played into the confirmation bias that led to assuming my SVFR clearance was also a takeoff clearance and not switching to the Tower frequency. In this case, Tower and Ground were on different frequencies. Regardless, I have executed present position departures many times and not had an issue like this and I definitely made a mistake which almost resulted in a collision. In the future, I will exercise extreme caution and slow down to ensure this mistake does not happen again.

## Synopsis

Flight Instructor reported mistakenly taking off without clearance which led to an NMAC event with another aircraft taking off.

## Narrative: 1

This aircraft just came out of long term storage. It needed a full thrust takeoff, ETOPS verification for hi-altitude APU start and an Autoland update. Two separate Maintenance write-ups occurred after door close but prior to push back. This resulted in delays and multiple MRD updates. Both pilots reviewed and verified FMC load was normal after each anomaly corrected. On takeoff the FO (Flying Pilot) called for "Autothrottles." EPR mode engaged normally but throttles were slow to advance and left throttle lagged approximately 1 knob width. At "check thrust" call FO commented to check left engine throttle. I had noticed the slow movement and manually moved both throttles to the commanded full thrust EPR setting. When passing 3,000 ft. the aircraft speed bug would not accelerate above CMS (approximately). We set 250 manually and each time we tried to engage VNAV or FLCH the command bug retreated to approximately CMS. We also noticed the command EPR was indicating CON thrust. I tried to engage CLB on TMSP panel but had no effect. At this point I said we'll wait until above 10,000 ft. to troubleshoot further. Above 10,000 ft I noticed that the VNAV CLB page appeared normal, but there was an "ALL ENG" prompt at 5L which I'd never seen. After selecting the ALL ENG prompt the airplane returned to normal CLB mode. At no point during ground operations did either pilot ever select the CLB EO prompt or the subsequent Execute key. After landing and debriefing with Maintenance and the next leg's Captain, this Pilot stated she had also previously seen a 'split throttles on takeoff result in the aircraft believing it was in a single-engine situation and engaging the EO CLB mode. A Maintenance write up for Autothrottles was written up and Maintenance debriefed. (Autothrottles worked normal for remainder of our flight).

## Synopsis

B-757 Captain reported aircraft being returned to service from long term storage suffered an auto throttle malfunction on climb out and subsequently learned that later flights had the same problem.

## Narrative: 1

Working arrival wall combined. Aircraft X inbound to ZZZ was vectored around weather to get the Visual Approach for ZZZ. I failed to make a point out to Departure Controller for the inbound aircraft as required and he was cleared for a Visual Approach and shipped to ZZZ Tower. I issued traffic for a VFR aircraft off the field before shipping to Tower. Departure Controller approved automated release for Aircraft Y off ZZZ. Aircraft departed ZZZ but was not on an IFR Beacon but instead on a 1200 code. Aircraft remained on 1200 code and was shipped to Departure Controller. This was in fact the VFR aircraft that I issued traffic for to Aircraft X prior to switching to Tower. Departure Controller assigned new beacon code and then saw the IFR inbound I had already switched to the Tower. Departure Controller immediately issued an Eastbound turn away from the other aircraft. I completely forgot to make the point out or hand off to the Departure Controller. For the last 15 months [the] schedule we worked combined so often I just didn't remember at that moment that ZZZ was not in my sector at the time. I needed to make the point out or hand off and be more aware of the room configuration and this event could have been avoided. This was just an accidental mental lapse in realizing the configuration of the radar room at the time.

## Synopsis

A TRACON Controller reported they forgot to handoff an aircraft to Departure Controller.

## Narrative: 1

The crew waited on the jet-bridge during the plane cleaning and electrostatic spraying process. The crews aren't being allowed even 30 seconds after spraying completion to wait boarding the airplane. As we board the plane there is still the overwhelming smell of

chemicals in the cabin. It would be helpful if policies were put into place that allows time for the smell of the chemical to dissipate before we have to board the plane.

## Synopsis

Air Carrier Flight Attendant reported electrostatic cleaning fumes linger on to preflight and boarding of subsequent flight.

## Narrative: 1

We were flying ZZZ1 to ZZZ, a XA00 report in ZZZ1. It was the First Officer's (FO) initial trip back from a 10-month furlough. We were on the ZZZZZ RNAV arrival from the northeast. I was the PF. ZZZ was landing north. ZZZ airport had an overcast layer obscuring the airport. At the appropriate time, I briefed the ILS XXR approach. We set up the FMS and tuned/identified the NAV radios for XXR, the normal approach for this arrival. When we checked in with ZZZ Approach, we were advised to expect the ILS XXL. I briefed the approach and we tuned/identified the NAV radios. We were being vectored to intercept the localizer. It looked like we overshot the localizer on the NAV display, so I turned to intercept. ATC advised us, "It looks like you are lining up for the wrong runway," and turned us off of the approach. There were no conflicts with any other aircraft. They then told us to expect the ILS XXR. We flew that approach successfully to a landing. While we were setting up for the XXR approach, we discovered we never set up the FMS for the ILS to XXL. [I believe the cause was] early sign-in. Overcast skies obscuring airport. [It was also the] FO's first trip after furlough. [I suggest] verification that both the NAV radios are tuned and identified and the FMS is set for the proper runway/approach.

## Narrative: 2

Planned and briefed approach for ILS Runway XXR and was given ILS Runway XXL. The CA (Captain) set up and briefed new approach. I verified the frequencies and inbound course but neither of us set the new approach into the FMS. Was getting vectors to the ILS XXL [and] we had the correct ID for the ILS. When the CA looked at the ND and saw himself flying through the course for what was ILS XXR, the wrong approach, he corrected the heading to go back to intercept the course on the ND. The Controller said you are turning to line up for wrong approach and told us to go around. I have not flown since [last year]. I also do not have much experience in the aircraft. Was first flight since furlough. [I plan on] getting more flying in and becoming more comfortable in the aircraft, getting back into the rhythm of the flights.

## Narrative: 1

While flying out to the practice area outside of the Bravo, I was attempting to maintain an altitude 100 feet below the shelf of the ORD Bravo airspace. There were some up and downdrafts during the first portion of our flight. Based on the altimeter reading in the aircraft I had thought I had caught it in time, but while reviewing radar/ADS-B data on an aviation website, I concluded I did enter the airspace. It was only for a few seconds, but I do take this quite seriously. I believe an additional factor is a lack of flying currency related to the pandemic. In the future, when I feel unstable air, I will select an altitude even lower to provide more of a buffer.

## Narrative: 2

Flying with a private pilot to help him get recurrent. Departed ZZZ and climbed to intermediate altitudes to avoid the Bravo airspace. Pilot selected 3,500 [feet] and acknowledged he would stay clear of the Bravo. He leveled at 3,500 [feet] but then caught an updraft and allowed his altitude to surpass the 3,600 foot floor of the ORD Class B momentarily. He called out that he had allowed the aircraft to climb 100 feet high and I immediately commanded a descent back to the selected altitude. No other aircraft were in the vicinity. Lack of currency, having been out of the cockpit for months, turbulent conditions, and the distraction of instruction as we were reviewing G1000 operation led to the momentary altitude excursion.

## Synopsis

Small aircraft instructor and student reported momentary incursion of ORD Class B airspace, citing lack of recent flying experience as contributing factor.

## Narrative: 1

With just 0.9 hrs of PIC time YTD, I arrived at my flying club's towered home field, ZZZ, rested and eager to shake off some rust. My first sign of how much rust I had came when I accepted a Ground instruction to RWY XX but taxied to the nearer RWY XY. After completing my runup, Ground advised me to taxi to RWY XX. I thanked Ground for "that catch" and received a double-click "you're welcome." I paused, ensured I was focused and not letting myself feel rushed, and proceeded to RWY XX. I completed four takeoffs and landings, and after reviewing LiveATC recordings I believe that my radio communications were professional and crisp. Ground did request that I confirm one hold-short instruction, and Tower asked that I confirm a "give way to helicopter" instruction as part of a "hold short" read back. However, I acknowledged and complied with all instructions promptly, including hold-shorts, midfield reports, extended down winds, go-arounds, no delay etc., using proper phraseology. A midair near-miss occurred when two Cessna's with "XXXX" in their call signs began to turn base at the same time -- Aircraft Y from Right Downwind, and I, Aircraft Z, from Left Downwind. I mistook a "cleared for the option" instruction for Aircraft Y as being intended for me, and radioed my acceptance for a full stop. I believed Tower had cleared me to land. The conflicting traffic had been advised of "that Cessna on Left Downwind," from which I further inferred my own landing priority over this newcomer to the pattern. Upon review of the recordings, it is clear to me that Tower attempted to clarify that the landing clearance was for Aircraft Y, and that the call out to my position was purely advisory for Aircraft Y -- and not a reaffirmation of a clearance for Aircraft Z to

land. However, someone stepped on the frequency, and I missed the clarification. It was only after Tower instructed me, "You need to turn right now" that I saw the conflicting traffic approximately 1/2 mile turning right base. Tower then instructed me for the first time that I was #2 for the field. I attribute this near-miss primarily to my own lack of recency, but secondarily to additional factors. I lost situational awareness of other similarly-[call] signed Cessna's entering the pattern from the opposite direction. ATC could have clarified our landing sequence earlier, or verbally emphasized the differences in our call signs. (A minute later, Tower itself briefly confused two call signs, instructing me to turn Right Base when I was already on Short Final from Left Base; Tower quickly corrected itself when I advised of my position.) It was also a very busy pattern in which to shake off rust -- for pilots and ATC alike. Simultaneous radio transmissions obscured instructions that might otherwise have been sufficiently clear. Stress was apparent: After landing, I complied immediately with Tower's instruction to exit without delay -- only to be told urgently to "stop right now" to avoid a jet on its takeoff roll. (I appreciate Tower's urgency: I had acknowledged the hold-short instruction and was already preparing to stop, but to their eyes I was still in "no delay" mode as I transitioned from RWY to Taxiway.) Tower similarly expressed frustration with another pilot for requesting "a turn around a point," a term that Tower did not recognize; they doubtless would have preferred "a 360" or "a circle." When I was finished with my pattern work, I briefly expressed my appreciation to Tower and received a friendly "no problem" in response. I think we all did what we could to be as clear as possible (urgently if the situation demanded it), and to correct our mistakes. Although it will be frustrating at times, on balance I think this is a good set of attitudes to have, especially as the entire National Airspace System shakes off varying degrees of rust coming out of the pandemic. The dangers here were addressed, but a slightly more intransigent attitude, or a slightly more congested frequency, might have tipped the balance to a midair collision.

## Synopsis

A Single Light Aircraft Pilot, with low flight time because of the pandemic, reported a NMAC turning final after getting confused because of similar call signs. The Tower controller separated the aircraft and a normal landing was accomplished.

## Narrative: 1

Pilot report that his right inboard brake was not actuating. Supervisor in Charge, Name, decided to change the right inboard brake. Assignment was given to Name 1. I, Name 2 was behind the desk that day printing all necessary paper work, Name 1 calls for assistance due to having brake jack issues. Name 3 and myself arrived at Aircraft X to help Name 1. Name 3 was in the cockpit monitoring hydraulic system and brake temp. I assisted Name 1 with lifting and changing the right inboard brake only due to the brake jack having issues and the weight of brake. Name 1 told me he was good from there and he will take care of the rest such as brake fittings, brake lines and brake temp sensor. I received a call from my Supervisor, also I sent pictures of what happened. After spending nearly an entire year without touching an aircraft due to the pandemic it is a possibility that Name 1 might of had a relapse reading the job card. After hearing about the incident from the Supervisor I was upset, frustrated that having done the job in the past, this could have happened. But I was more relief to know that problem was caught and rectified before something serious happened that could have put our customers, crew and aircraft in jeopardy. To read and ask as much question as needed in order to perform our duties in compliance with company and FAA policies.

## Synopsis

Technician reported a coworker struggled with a main wheel brake change and made errors during installation, even with help, possible due to lingering COVID issues.

## Narrative: 1

During the preflight, I had a jumpseater come to the cockpit and ask to ride in the jumpseat to our destination. This was my first time having someone occupy the jumpseat in over a year due to Covid, and this was my first experience with an Additional Crew Member (ACM) in the auto-closeout passenger counts. The First Officer performed the W&B and Takeoff calculations. Neither of us noticed that the jumpseater was missing from the ACM data that was pushed to us from the gate agent. As a result, we took off with an improper W&B and Takeoff performance calculation. During the climbout I realized I didn't double check the W&B for the ACM before departure and found the ACM was missing. I was chatting with the jumpseater and did not double check the First Officer's work to make sure the jumpseater had been added into the W&B. I should have remained focused and double checked the W&B for the ACM.

## Narrative: 2

Full flight with jumpseat access granted from gate agent, jumpseat would be occupied. Received auto closeout thinking everything was taken care of including ACM in jumpseat. After departure, the Captain asked if the takeoff data included the ACM, after review, it did not. Cause of this event was being in the mindset that passenger auto closeout took care of all people loading considerations without double checking that the ACM was included. Recurrence of the event can be prevented by verifying ACM is included when they are occupying jumpseat instead of relying on auto closeout.

## Synopsis

CRJ-200 flight crew reported failing to include the jumpseater in the weight and balance calculations.

## Narrative: 1

After a 2 hour maintenance delay I was taxiing from gate XX to spot XX. My First Officer (FO) was just back from furlough and [was] a bit behind. He was having trouble with the ground frequencies so I diverted some of my attention to helping him with the frequency. In doing so I taxied across the line and my nose was out on taxiway Kilo. There were no other airplanes in the area but Ground did point it out to us (when we finally got the right frequency) that we were on taxiway Kilo. I've been doing this a long time and I violated one of my own rules- stop the aircraft and sort out the problem. I also did another thing that I strive not to do- micro-manage my FO. Causally speaking it was a wake up to me. Stop the plane.

## Synopsis

Captain reported passing the hold short lines on a taxiway due to distractions from helping his First Officer with tasks.

## Narrative: 1

During taxi on an IFR flight plan, I was cleared to taxi Foxtrot to Sierra to [Runway] 12L at STL. I had the taxi diagram displayed on the MFD of the G1000 and was using it for reference while taxiing. I became fixated on Runway 12R on the taxi diagram and was mistakenly thinking I was taxiing to [Runway] 12L but in fact was heading towards [Runway]12R. After the turn to taxiway Sierra, I informed Ground that I would need a 1 minute run-up prior to departure. During this exchange, ATC asked what I was doing and when I looked back to the taxi diagram, I realized that I had just crossed the departure end of [Runway] 12L. Ground asked me to taxi past [Runway] 12L and then stop, which I did. I apologized for my mistake and asked ATC for further instructions and was instructed to do a 180 back towards [Runway] 12L and hold. I've flown into many Class B airports without an issue but feel that at least one contributing factor was my infrequent flying since COVID. In a normal year, I fly 300+ hrs but in the past year have logged only ~60 hours. I spoke with my flight instructor and FAA examiner about the incident including factors that led to the incursion and thoughts about how to avoid repeating the incident in the future.

## Synopsis

Light aircraft pilot reported a runway incursion during taxi and cited lack of current flying experience due to COVID restrictions as a contributing factor.

## Narrative: 1

Taxiing out from spot. Ground controller stated "After the heavy join Lima Zulu bridge to 18L". As trained, the FO (First Officer) read back the clearance and stated the clearance to the Captain. As the Captain, I stated the clearance back to the FO. As we proceeded to Lima taxiway the Ground Controller stated " Aircraft X where are you going?" The FO stated you " said join Lima.." upon to which I said to the FO that's what the Controller said. After being felt like we made a mistake. The FO and myself noticed this Controller made a few more clearance errors that needed to be corrected. The FO and I (Captain) discussed the event later on. Suggestions from our side that might have caused the event is that: 1) The Controller might have been tired at the end of their shift. 2) Controller had grown complacent and had expectation bias of what Company operated aircraft doing what they "normally" do. From the crew side of the event, we should have questioned the clearance since it was an abnormal clearance. Bring back pre- COVID staffing to ATC so proper rest can be had for ATC personnel.

## Synopsis

Air Carrier flight crew reported incorrect taxi clearance was issued by ATC and cited possible staffing issues at the controlling facility as a contributing factor.

Narrative: 1

Crew was waiting to board. On jet bridge when chemical smell very strong came upon us. We felt like we were ingesting it. Eyes teared throat burned. Looked at the plane and first class Galley was being boarded door was opened. That's why the smell came into the jet bridge. I immediately got my eucalyptus spray and tried to breathe it in. I have asked for over a year for the actual ingredients and again no reply. After being masked during boarding on the way to ZZZ. No APU. Sweltering in back of plane. Captain said was trying to get outside air. It is absolutely horrible that we have to deal with this and feel like their is a diaper on our faces. Absolutely disgusting! Can't breathe properly, can't hear my own flying partner yesterday at all. It creates a frustration and headache asking pax and flying partners to repeat themselves over and over. This is the continuous of over a year and I wrote at that time that I do not consent to this experimental tyranny. I can't see faces, can't describe anyone and it brings on anxiety when I can't even breathe. Being masked as a healthy person is the worst thing to do. It destroys our immune system.

## Synopsis

Air Carrier Flight Attendant reported a fume event while waiting to board passengers resulting in physiological symptoms.

## Narrative: 1

On the departure, the First Officer (FO) had requested Heading Mode (HDG), Flight Level Change (FLCH) during the climb out as we were given a heading. It was bumpy and he was trying to comply with the SID instructions to speed up to 250 KIAS while hand flying in bumpy air. As we approached the 5,000 foot altitude restriction, he started to slow his climb for the level off, but didn't pull back on the thrust levers. The autothrottles were on, but we were not quite close enough to the altitude for the flight director to switch to "ASEL" on the FMA and begin capturing. In a climb, the auto throttles remain at full thrust in green FLCH until ASEL is annunciated, and since the FO was hand flying and beginning the level off before the Altitude Select (ASEL) annunciation, the speed began to pick up. As pilot monitoring, I noticed the airspeed at 255 KIAS with an increasing trend and I called out "airspeed" to alert him to the airspeed. He seemed confused and did not make any corrections. I then called for him to "pitch up" which he did slightly, but he mentioned the level off altitude that was approaching. I said to "pull the thrust back" and he seemed confused again and replied that the auto throttles should do that. I then pulled the thrust levers back myself to slow the aircraft down as the speed was starting to go past 260 KIAS. ATC gave us a "climb and maintain 7000" and a direct to one of the fixes. The FO pitched up for the climb and I was able to let go of the thrust levers as the speed was again under control. As we were climbing, ATC instructed us to climb to 16,000 and the FO called for "Autopilot On" prior to the next level off so there were no further issues. I reminded him that there is no speed protection in the level off for the FLCH mode if he is hand flying it and levels off early. ATC didn't seem to notice the increased airspeed, and the flight continued without further incident. The FO said that he finished IOE and for the next month was unable to get any flying from crew scheduling. He had less than 30 hours on the aircraft. The following month, he had to be in Country to check on family due to the COVID pandemic. He said that he had flown earlier that day and seemed to be comfortable in the plane. It became clear that he was rusty on the details concerning the FLCH mode. After I spoke with him about what happened, he said he understood and he did not make the same mistake on his flight the following day. Any time a pilot has less than 100 hours (consolidation) on an aircraft, and doesn't fly for more than 30 days, they should be given

a trip with an IOE instructor both to give them recency of experience and to refresh any forgotten material.

## Narrative: 2

During take off climbing to the assigned altitude of 5,000 in flight level change plane accelerated to 250K, during last 1,000 ft I shallowed the pitch as climb was getting a bit bumpy due to builds up around [the] area and I was trying to avoid flying through a cloud straight ahead. Captain advised me of speed increasing and passing 250 and I assumed the auto-throttle would have compensated for that as it was engaged. Leveling off to 5,000 speed past 260 and the Captain reached out the thrust lever decreasing power avoiding further deviation. Soon after cleared to 7,000 climb and flight continued with no further deviation. After IOE I was put on reserve and didn't fly for about a month, I then was able to pick up a line and fly just one sequence as a tragic event forced me to drop the rest of the month and travel overseas, as a result in 2 months I only flew 19 hours and that was my first day flying after a long stop. As newly typed on a new airplane I didn't immediately recalled the different ways the autothrottle responds, however soon after the event my Captain explained [to] me what happened and refreshed my memory on it. After IOE it would be good to assign some extra flight to help consolidate, maybe assigning more frequent flights and not letting more than 2 weeks without flying would avoid skills deterioration until the first 100 hours are reached.

## Synopsis

Air carrier flight crew reported turbulence and weak aircraft familiarity, resulted in airspeed mismanagement and confusion.

## Narrative: 1

On approach to land in LAS from vectors, and cleared for the visual my Captain had just turned final at approximately 3,800 feet and was on a stable descent to land. At about 1,150 feet our RA dinged "traffic" which indicated about 200 feet below us. We couldn't see the traffic. At 940 feet to land (3,000 AGL), we had an RA warning go off due to a helicopter. The warning was to our right. We still couldn't see the traffic, but the warning soon turned into an announcement from our aircraft systems to "pull up" at 940 feet on the RA. My Captain immediately decided to call for a go-around and we executed the maneuver appropriately, were radar vectored back to land, chose the left runway to allow for some additional distance, and landed safely without incident. Cause - A busy weekend post COVID time when the helicopter industry was seeing a lot more activity. This particular situation was out of our control to avoid. We don't generally have issues with helicopter traffic, and in this situation at such a busy airspace, we could not disregard the RA instructions so low to the ground and at such a critical phase of flight. Considering the busy nature of the weekend and the idea we are experiencing such high post-COVID activity in Las Vegas, perhaps we as a crew could have suggested the left runway for some extra separation, but it's never been an issue in my time flying before.

## Narrative: 2

On visual approach fully configured turning final at approximately 3,700 feet, when rolled out on final an RA was enunciated and a subsequent go-around was performed. We returned to fly visual to the left runway with no further issues. Helicopter traffic operating too close to the active runway approach path. Either keep helicopter traffic further west or make the left the primary runway for south landing traffic.

## Synopsis

Air carrier flight crew on short final to LAS reported a go-around due to a TCAS/RA Alert for a VFR helicopter.

## Narrative: 1

We departed on a Class II international trip. The previous day (with a different Second in Command), we had tested the HF radios by receiving a time hack on the WWV atomic clock HF frequency. We had a good operations check and assumed the HF radios were working properly. The day of the trip, we again tested the HF by receiving a time hack on the ground; however, we could not transmit on the primary and secondary frequencies at the time due to our close proximity to the FBO hangars. After departing and prior to coast-out, the Second in Command (SIC) (also an experienced Captain who happens to have a lot of experience with HF in the military) attempted to test the HF radios using the Primary Frequency and a Secondary frequency while I flew the plane and managed the VHF radios. Prior to coast-out, the SIC determined that the HF radios were not transmitting. We reviewed the Operations Manual to make sure we were operating the HF radio properly and to make sure we weren't missing anything. We determined that we were operating it accordingly and that we had tried everything we could in order to troubleshoot the problem. We briefly discussed our contingency options again prior to coast-out (including returning to our departure airport) and informed Center of the issue. Center informed us that there was a flight right behind that we could relay our position with until we got back in radar contact. After that, there would be a southbound flight that was paralleling our course that would relay for us until we reached our destination. After discussing this with ZZZ Center, the controller also assured us that this was a legal option. We made radio contact with the relaying flight on the VHF air-to-air frequency. After we were confident we could continue to communicate and relay, the SIC and I again discussed our options and contingencies and we both elected to continue. We relayed our positions successfully until we reached ZZZ Center on VHF again. Our next contingency plan was that if we couldn't relay with another flight we would divert as ATC did not have any northbound traffic for us to relay with in order to return state-side. During this time, we briefed the passengers on the possibility of [diverting]. I transferred the controls to the SIC so that he could fly while I coordinated with ATC, relayed our position, plotted our course, and kept up with the NavLog in an effort to reduce each other's workload. He had worked hard attempting to troubleshoot the HF radios, meanwhile having me manage the radios and navigation allowed me to handle the lost HF event. Once talking to ZZZ Center, we made VHF contact with the southbound flight and we were confident that we could continue relaying position reports, we elected to continue to our destination via relay. We recorded each waypoint along the route on the NavLog and plotting chart, and successfully relayed each one. The other flight in turn would verify that each reporting point was received by ATC. Once we were within range of ATC, we contacted via VHF, they confirmed radar contact, we again exchanged the flight controls (I resumed pilot-flying duties and the SIC resumed pilot-monitoring duties) and we continued the rest of the way to our destination on VHF radios in the radar environment. The rest of the flight was uneventful. After deplaning our

passengers at the destination, I called Maintenance Control to create a write-up and MEL the HF radios. The MEL restricted us to VHF communication. The log was completed and the MEL was complied with. My next call was to Operations to inform them of the issue and restrict the aircraft to "Class 1 navigation only" until maintenance could fix the HF radios. The remainder of our scheduled trips were within radar service areas, so there were no additional operational issues concerning the HF radios and the MEL. As a side note, despite being a stressful situation, I believe the SIC (another Captain) and I handled the situation quite well all things considered. We communicated, risk assessed, and split duties effectively. If ATC hadn't assured us this was a legal option (it sounded like we weren't the first one to have this problem) or other flights had not been willing or able to help us relay our position, then we would have definitely had to have returned to our departure airport or diverted after burning off a bunch of fuel to get the plane below landing weight. These HF radios probably have not been exercised in over a year due to COVID-19 international travel restrictions and lack of Class II flying. While we did test the HF the previous day by receiving a time hack, we did not check the transmit function of the HF radios. We checked the HF radios reception the previous day by receiving the time hack; however, we did not test the transmit function of the radio. Checking the transmitter the day before would have allowed us to MEL the HF earlier and prevent this trip from occurring on this tail number. Also I would recommend that as we continue to develop training scenarios as part of our recurrent training programs, that we include Class II navigation scenarios to supplement that training. In a normal year (without pandemic-level travel restrictions), we don't individually get to perform very many Class II trips. I believe including Class II training scenarios, including what to do during lost-comm events as well as other emergencies such as single-engine failure, depressurization, and medical emergencies), would be extremely beneficial in building decision-making processes in a Class II environment.

## Narrative: 2

During the departure, I told the PIC that I would conduct the FMS navigation check and the HF check. The FMS navigation check was conducted almost immediately using a VOR. The HF check was another story. On deck at departure airport, I was having issues getting a radio check on the ground with ZZZ Radio, but after discussing with maintenance, we collectively thought it was interference from the hangars right at the ramp. An air check was required. We could hear the HF clock on 10000 MHz but just could not raise ZZZ Radio. As the departure airport is very close to the ocean, we coasted out as I was attempting to get the HF to work. Both HF radios seemed to be having a common issue with transmitting; this despite being able to hear intermittently HF traffic. I was able to tune the radios but continued to fail in any contact with ZZZ Radio. (HF1 seemed to not electronically tune as I pressed to transmit; HF2 seemed to tune pressing transmit, but no one could receive). While the PIC flew the plane (and spoke with ATC), I continued to trouble shoot the radios exhausting all system knowledge. We even pulled the manual out to make sure I was not missing anything. During my troubleshooting of the radios, the PIC was provided an option from ATC of relay with other aircraft. Specifically, there was another aircraft very close by our position. The other aircraft pilots agreed to take our HF relay if we needed that option. At this point, I reported to the PIC that our HF radios were failed. We were pretty much at the final fix prior to HF operations (20 minutes after takeoff). We both discussed the options prior to committing to the HF relay. We could turn around and head back. We could relay with other aircraft. We could also pick up another relay that could take us all the way down (or perhaps back to ZZZ if we wanted that option). We decided to continue with company to keep the flight going safely. The clients were kept informed. ATC was kept completely in the loop. As we entered radar control, ATC called to tell us that there were no northern flights that could help us get back but there was an Air Carrier flight which was willing to relay HF the remaining way. Since the

remaining oceanic airspace had 3 more fixes, we decided that this was a safe option allowing us to keep the mission on track. With ATC facilitation, we contacted the flight while in radar control and established the link for our HF relay. The HF relay with the Air Carrier took us into ATC airspace. The rest of the flight was uneventful. Primarily, we both felt comfortable that we could continue to our destination safely. Secondly, This HF teaming, thanks to ATC, [and other flights] allowed our passengers to get to their destination with all the COVID restrictions compliances intact for their entry (a significant travel issue). Cause, aging equipment. I am not sure that this HF failure can be avoided. Perhaps we need to do more checks of our equipment and keep them at a higher standard of repair and readiness.

## Synopsis

Fractional jet crew reported their HF Radio did not work during a flight through non radar airspace so they relayed required position reports through other aircraft.

## Narrative: 1

While preparing for departure we were interrupted in the middle of our pre-departure brief several times as a result of not having enough time to complete all required checks to be ready for all other work groups checking in before departure. Scheduled hotel pick up time put us at the airport right at 45 minutes. However, because of the requirement to accomplish COVID temperature check, and health screening, we arrived at aircraft with not enough time to complete all the International/Oceanic checks before the different team members that need to check with us to be ready to depart (i.e.: gate agent, ramp, flight attendants etc.) began to check in. Especially, when all other work groups were ready to depart 10 minutes before departure time and we were trying to catch up with our checks. This time constraint created a significant threat as every time we got interrupted there was the possibility of missing something in addition to the extra mind workload of having to shift attention and re-focus.

## Synopsis

Air carrier Captain reported numerous interruptions caused distractions during pre-departure checks and caused concern over following published procedures.

## Narrative: 1

Aircraft Y landing VPS was descending over V198 to FL200. Aircraft X, a departure from CQF in P31, was vectored NE bound to climbing to FL190 to allow Aircraft Y to descend south of the aircraft. Traffic was called to both aircraft. Aircraft X read back "200 Aircraft X" which was not caught or verified by the controller. The controller was busy separating aircraft arriving and descending to the northeast CEW landing VPS. When the controller noticed Aircraft X starting to climb, Aircraft Y was turned 25R to the southeast to try to get some lateral separation. At first since the targets were close, I thought it was MODE C interlace. Since I was unsure what altitude Aircraft X was climbing to I decided to try to get lateral separation instead of vertical. Upon further query Aircraft X misunderstood the traffic call and thought it was a climb to FL200. Traffic at the CEW sector has increased by multitudes over the past year due to numerous airlines starting and expanding service to the FL panhandle. Before COVID, the departure list from the 3 panhandle complexes (P31, Eglin RAPCON, and Tyndall RAPCON) rarely went over 30 proposed departures. Now we are regularly seeing 40-50 proposed departures. When the military airspace gets activated, the sector becomes an inverse T with about 10 MI on either side of the "T" to separate commercial jets, slow props, military trainers, and fighters. The departures and arrivals are all filed over the same fix CEW creating a dangerous situation with minimal time to solve conflicts. There should be a redesign of this sector.

## Synopsis

ZJX Center Controller reported an aircraft started a climb due to incorrect readback/hearback which resulted in a loss of standard separation.

## Narrative: 1

We had been cruising at FL370 for almost an hour. We were with Jacksonville Center on frequency 135.62. At about 86 NM south of CAMJO - proceeding direct, we received a TCAS traffic advisory. While decreasing the range scale on the Navigation Display and trying to acquire the traffic, the advisory transitioned to a TCAS Climb RA. At the same time, Jacksonville Center told 'Aircraft Y [we were Aircraft X] to turn 50 degrees right. We were already performing the TCAS RA maneuver as this call came in. Clear of conflict came about 37,700 and we smoothly transitioned back to FL370. Jacksonville pointed out additional traffic above us to our left as we transitioned back to our assigned altitude and cleared us back to direct CAMJO. Jacksonville was told on the radio of us responding to a TCAS RA. Dispatch was contacted by ACARS to report the event. ATC doing more with less during the pandemic. Controllers should only work a single frequency.

## Narrative: 2

We had been cruising at FL370 for almost an hour. We were with Jacksonville Center on frequency 135.62. About 86 NM south of CAMJO - proceeding direct, we received a TCAS traffic advisory. While decreasing the range scale on the ND and trying to acquire the traffic, the advisory transitioned to a TCAS Climb RA. At the same time, Jacksonville Center told Aircraft Y to turn 50 degrees right. We were already performing the TCAS RA maneuver as this call came in. Clear of conflict came about 37,700 and we smoothly transitioned back to FL370. Jacksonville pointed out additional traffic above us to our left as we transitioned back to our assigned altitude and cleared us back to direct CAMJO. Jacksonville was told on the radio of us responding to a TCAS RA. Dispatch was contacted by ACARS to report the event. A report was filed.

## Synopsis

Air carrier flight crew reported an airborne conflict resulting in a TCAS RA.

## Narrative: 1

We were delayed and were trying our best to make up time and get out as close to on time as possible. Cause - Delayed, passenger mask issue, bad headset. Suggestions - Finish a checklist or task before moving onto the subsequent item on a to do list. Before Start Checklist below the line was called for but right at that moment, we were simultaneously distracted by both Ramp Agent and the Flight Attendant with a passenger issue. We diverted our attention to the two external factors and did not finish the checklist. Had we appropriately created a boundary between what was most important at the moment, we would've not missed the checklist prior to push back. It wasn't until after push back commenced that we realized we had not completed the checklist.

## Narrative: 2

We were delayed significantly due to weather in ZZZ, there were distractions due to ramp headset squeals and a passenger issue regarding a mask. We forgot to complete the before start checklist below the line checklist before pushing back. Cause - Passenger issues, ramp headset issues. Suggestions - Due to being late, I identified mistakes due to rushing was a threat. The mitigation strategy was to continue our efficiencies until push back time. The distractions caused us to miss the completion of the before start checklist below the line until after push back started. We will be more careful next time.

## Synopsis

Air carrier flight crew reported deviations from standard practices due to distractions in the cabin, causing check list omissions.

## Narrative: 1

Flight crew sent an ACARS message asking Maintenance Control to apply 2 placards for Aircraft X. I was not familiar with the placards so I called Maintenance for some information. Maintenance told me the placards the crew was referencing for use of the Thermal Containment Bag (TCB) on the aircraft. Maintenance further stated that the crew would need to write the use of the TCB up in the logbook and describe why used. I sent an ACARS message to the crew relaying the information from Maintenance Control. The crew stated that the TCB had been used for a passenger's charging device in the cabin that had overheated. I had also been in exchanging ACARS messages with this flight regarding 2 passengers not complying with mask policy. I also had a medical issue on [another] flight. It took several attempts to establish the ARINC patch and several call before MEDLINK was able to provide guidance for a passenger that had passed out. I did inform the supervisor of my difficulty reaching MEDLINK, but I did not advise him of use of the TCB on Aircraft X.

## Synopsis

Air Carrier Dispatcher reported a communication breakdown with Maintenance regarding Thermal Containment Bag replacement.

## Narrative: 1

During the last 15 months of the pandemic, with greatly reduced traffic volumes, Newark Tower has used the primary tower frequency for the VFR traffic traversing the Class B airspace (helicopters and VFR sight-seers) which used to be on a discreet frequency with their own controller. Now that airliner traffic is returning to normal volumes at Newark, the Tower needs to go back to a dedicated control station and frequency for the helicopter and VFR traffic in their airspace. There is just too much workload and frequency congestion, especially in the early am and afternoon rush hours.

## Synopsis

Air Carrier pilot reported excessive frequency congestion at EWR airport due to VFR transitioning aircraft using the same Tower frequency as arrival and departure traffic. The reporter stated these operations used to have separate frequencies to alleviate the congestion.

## Narrative: 1

Supervising a requalification of a Captain who has not flown in over 14 months. He was Pilot Flying. Given clearance to "cross ZZZZZ at 8,000 [feet], cleared ILS [Runway] XXC". We had briefed ZZZ note about not flying glide slope until Final Approach Fix. Captain set 2,200 feet Final Approach Fix altitude and instead of pushing managed descent, pulled open descent. We were outside of ZZZZZ1 and I noticed the Flight Mode Annunciator and that aircraft was not going to level at 8,000 feet. I announced LEVEL OFF three times then intervened with Push to Level about 7,500 feet. I instructed Captain to climb to 8,000 feet as ATC said, "...I see you are going to 7,000, re-cleared to cross ZZZZZ2 at 7,000', re-cleared ILS XXC." Not having flown in 14 months, the muscle memory may or may not be there. We must always VERIFY what input we make and MONITOR aircraft for compliance, being ready to intervene if necessary.

## Synopsis

A319 Captain Check Airman re-qualifying another Captain reported the Captain failed to comply with a crossing restriction issued by ATC during approach.

## Narrative: 1

Aircraft X was climbing out of about 20,000 feet when I switched him to the High Altitude sector. He was handed off to ZZZ1 Center High altitude sectors. A little while later the low altitude sector pointed out an aircraft at 23,000 feet going eastbound. I was thinking that they were showing it to me because the same guy was working both planes but that was not the case. I got so use to ZZZ1 Center sectors being combined down there that I didn't put together that I hadn't pointed out the Aircraft X in the climbout to the low side and he didn't know anything about him pointed right at the other aircraft. ZZZ1 Center had to turn both planes last minute to avoid and situation. I ended up violating a sector in ZZZ1 Center and cause a unsafe situation with two aircraft they were forced to turn. I am trying to adjust back to a normal schedule and this is the first day shift I have worked since last month so my sleep schedule is a little chaotic as I am trying to adjust. Not sure anything is needed to be recommended it should have been obvious on my first day shift back in normal operations that things would not be the same as they have been because of the pandemic.

## Synopsis

A Center Controller reported they assumed adjacent sectors were combined but they were not, which resulted in an airspace violation and two aircraft on conflicting routes entering the next facility sector.

## Narrative: 1

On Date Mechanic Name requested me to witness the removal and storage of the over wing slide bottle pins of the left and right wing slide bottles. The corrected action block of the non routine stated as such and that is what I witnessed and signed off as RII (Required Inspection Item). I saw nothing at the time directing the arming of the left and right over wing doors. I'm not sure why the disarming of the left and right over wing doors was written up on a non routine. There should be a Task Card for storing an aircraft and specific items called out to prepare the aircraft for storage, and to put the aircraft back into service.

## Synopsis

Technician reported confusion in signing off items when returning an aircraft to service after storage.

## Narrative: 1

This was the second leg of an OE for the First Officer who was returning to the line after more than one year on leave. We had planned and briefed a Single Engine Taxi (SET). I asked the Pushback Crew to push the aircraft "towards ZZZ" to better align us for SET Ops. As we were pushing, I noticed a Company aircraft on the adjacent gate was also getting ready to push and commented to the First Officer that we might have to start both engines to safely taxi away. I then realized we could make a left 270 to make our turn towards the east, to taxi to the planned runway. The Pushback Crew asked for me to set the brakes and I complied, then asked me to set the brakes as they were pulling away. This caused a chuckle from both he and I as he got jumbled with his scripted words. The First Officer had completed the #2 engine start and started his flow. He got to the Air Conditioning panel and asked if it was set correctly. I reached up and turned the #2 engine bleed on and commented that the pack was now being powered. Between the chuckle with the Pushback Crew and the First Officer query, I lost my focus and didn't notice the FO did not complete his flow and callout. I was also concerned with getting the aircraft moving in the left 270 before Company pushed. The FO called for taxi and we proceeded down CS and Mike. After being cleared onto Mike and seeing there was no line for Runway XX, I called for #1 engine to be started. The FO started it and did his After Start Flow, noticing and announcing that we hadn't set the flaps. I verified this, stopped the aircraft and commanded flaps 1, Before Taxi Checklist. These items were accomplished, we continued with normal operations and took off and flew to ZZZ1 without further incident. Don't get distracted during critical phases of flight, specifically when very specific cues are used to command flaps and run checklists.

## Narrative: 2

During the Crew brief, and prior to pushing back in ZZZ, the Captain briefed a single-engine taxi (SET). The Captain requested from the Tug Operator that the pushback be angled toward the turnout direction, to facilitate an easier SET break away to begin taxi. When the pushback was complete, we discussed whether or not to start the remaining #1 engine, and abandon the SET plan, because the Pushback Crew had not pushed the aircraft in the position instructed. Ultimately, we decided to request, from the Ramp

Controller, a turn in the opposite direction and continue with the SET plan. Being on the second leg of OE, and getting familiar with the switch positions of the pressurization panel, I had stopped my after start flow at that panel, to ask the Captain a question. Inadvertently and after that interruption, I neglected to continue the flow to its completion. Subsequently, we began our taxi without setting the flaps, which helps to trigger the Before Taxi Checklist. When we eventually started the #1 engine during taxi out, I noticed that the flaps had not been set, as I usually re-check the items on an after start flow. We stopped the aircraft, set the flaps, and completed the Before Taxi Checklist. The flight continued as normal. I think that getting further comfortable with the pressurization panel, and that particular flow, will increase situational awareness and become less of a distraction.

## Synopsis

B737-700 flight crew reported confusion and communications problems during push back and taxi.

### Narrative: 1

I taxied just past the runway hold at C3 from D3 in an effort to perform run up clear of the main taxiway. The hold lines had been moved back and I was now over the hold line. I realized I was over and did a 180 back to taxiway C and called ground for instructions to taxi back to the hangar. I just completed the Runway safety course yesterday and am beginning recurrent training this afternoon. My plane was just out of annual and after an extensive preflight I wanted to do a few trips around the pattern to help verify the soundness of the aircraft before I took my flight instructor up with me. I am fairly new to DVT. It is way more complicated on the ground and in the air here than I was accustomed to so I wanted to get with an instructor before I flew around the area too much. Then Covid hit and I couldn't go up. None of this is an excuse. It is just background that I hope will be helpful.

### Synopsis

Private Pilot reported runway incursion occurred during taxi and cited being new to the airport as a contributing factor.

## Narrative: 1

I am a little rusty because I haven't flown much over the past 12 months. We had a tailwind on final, but as ZZZ frequently does, they asked us to keep our speed up and maintain 180 knots until ZZZZZ (the final approach fix on XL ILS). I had configured to flaps 10 and gear down before ZZZZZ. After we crossed ZZZZZ I finished configuring but the plane did not want to slow down after flaps 25, possibly because we hit a gust or went through a shear zone. I was so distracted by the amount of difficulty I was having getting the plane to slow down so I could call for flaps 30 that I didn't realize we were lowering the flaps to 30 just as we passed through 1,000 feet. The tailwind on final, ZZZ's request for us to keep our speed up, my relative lack of proficiency and my not paying close enough attention to our altitude were the causes for my error. I will start configuring even earlier when contending with a tailwind on final.

## Narrative: 2

After fully configuring the aircraft for landing, I realized that we were below 1,000 feet. A tail wind, ATC assigning 210 knots on final, and a lack of recent experience all combined played a role in my late recognition of configuring below 1,000 feet. Configuring the aircraft earlier, and paying closer attention to procedures.

## Synopsis

Air carrier flight crew reported an unstabilized approach due to lack of recent flying experience, weather, and ATC instructions.

## Narrative: 1

After departing ZZZ for ZZZ1 on an IFR flight plan, at about 500 feet AGL and 2 miles from the airport I switched frequency from ZZZ Tower to ZZZ2 Center before being asked to switch frequency by the tower. I have not flown IFR for more than one year due to COVID. I recently completed a Flight Review and Instrument Proficiency Check, but this was only the second IFR cross-country flight since then (the first was from ZZZ1 to ZZZ a few days earlier), and the first departing from a towered field. This led to my improper ATC communication procedure.

## Synopsis

Single Private Pilot reported, after a year away from flying due to COVID-19, not following proper IFR communication procedures after departure.

## Narrative: 1

On date, I was informed that I flew an aircraft with un-reported tail strike damage. The flight in question was Aircraft X. I don't remember very many specifics from my walk around. I showed up to the airport in ZZZ a little early that day because my spouse had traveled to ZZZ with me on the overnight and she was leaving on a slightly earlier flight. The Captain and I ended up meeting up at KCM [Known Crew Member] to begin our day. I was slightly delayed getting through security due to no one attending the KCM station and then being selected for random screening. I don't recall feeling rushed though as a result. If I recall correctly, it was a sunny or partly cloudy day, and I almost always wear sunglasses during daylight hours. One threat that occurs is due to Airlines mask wearing policy. While wearing a mask and sun glasses on a walk around, the lenses become fogged often-creating a visibility issue. I am constantly battling this issue on clear, sunny days. Performing multiple walk around a day and per trip, I am having a tough time recalling what the ramp conditions were like with regards to belt loaders and ground equipment around the airplane. I do recognize the threat that dodging ground equipment and vehicles and other equipment around the airplane opens the door for distractions and the potential to miss important items on the walk around.

## Narrative: 2

I was notified by flight operations that the aircraft I flew on this flight had experienced a tail strike 2 flights prior to this flight that subsequently went unnoticed for a total of X additional flights including this flight. I did not perform a walk around inspection on this flight but the First Officer did. I do not recall a rushed departure as evidenced by the fact that we pushed 8 minutes prior to schedule but the First Officer did get selected for random additional screening that morning upon going through KCM [Known Crew Member]. I stopped on my way to the aircraft to get something to eat. The delay from the random screening as well as the fact that I did not arrive at the flight deck until approximately 25 minutes prior to scheduled departure may have caused the F/O to feel rushed when he did the walk around inspection, I am not sure.

## Synopsis

Air carrier flight crew reported being advised the aircraft had a reported tail strike that they had not noticed, and distractions from wearing masks to do required checks.

## Narrative: 1

I was working Position X. Position Y was feeding me the arrivals. I was not talking to Aircraft X. He was getting close to ZZZZZ the fix prior to approach. I think Position Y was having a hard time because ZZZ1 sector was busy and not shipping all the aircraft. I pointed to the Aircraft X and told Position Y to give Aircraft X FL190 because I was not talking to that aircraft and he had needed to start down. Consequently, I was not talking to the aircraft in time to get him down. And working without a D-side to make the call, I handed the aircraft off high to ZZZ2 Approach. He should have crossed the boundary at 120 but he was more like 170 crossing. They took the hand off and I switched the aircraft. My recommendation is more D-sides. I know there is COVID and we seem to work with fewer controllers and not have the numbers in the control room as usual. And everyone needs a break. We try to have a good work break balance. Talking to the aircraft in a timely manner would help also. As controllers to do our best in switching aircraft in a timely manner. Maybe a better, faster way to get in touch with the pilot. I think I went through company, the last controller, guard frequency, the supervisor. I think it was another company airline that got a hold of him, or that could have been another instance. Yesterday was busy with weather and the situations are all blurring together. And a D-side could have helped to make the call. I kept my eyes on the other air traffic situations to keep them flowing smoothly as well. Thank God approach took that hand off. The sector would have been 10 times more difficult if I had to spin that aircraft to get him to 120 by ZZZZZ and concentrate on the other issues by myself.

## Synopsis

Center Controller reported not being able to talk to an aircraft and the prior sector was having difficulties which left the aircraft high at a crossing restriction.

## Narrative: 1

On STAR into ZZZ I was high and was not going to make a mandatory crossing altitude. Prior to it I asked the controller if I could be relieved of that restriction and he said yes. I had not been into ZZZ since COVID and as such didn't realize that ZZZ, being a large International hub, was still operating way under capacity compared to domestic airports, meaning vectors to final were fast. I was hand flying without autopilot or auto throttles which I do typically once a trip to stay in practice. After I was given the arrival clearance the First Officer, not being familiar with ZZZ couldn't find frequency to talk to once on the ground and was asking me to help him find it. As I was flying and looking over my iPad to find the frequency I then realized I was high and requested relief from one of our crossing altitudes which was given prior to that crossing restriction. I should have just waited until on the ground to look up frequency or turned automation back on.

## Synopsis

Air carrier Captain reported being high on a STAR and asking ATC for relief.

## Narrative: 1

The lead Flight Attendant was so uptight with a passenger not complying with the Mask policies, [Flight Attendant] thought it was prudent to chime the cockpit during landing rollout and advise the flight crew to notify a Supervisor to meet the aircraft. This was a direct violation of sterile cockpit procedures. Because flight crews repeatedly experience chimes from the cabin while in simulator training, they are most associated with fire or critical aircraft issues. This is never a good time to chime the cockpit unless it is an emergency. Especially for a mask compliance issue. Relaxed emphasis from Leadership on the tattling on passengers for improper use of masks (never saw this type of behavior from FA when it came to early seat-belt releases. Reissued sterile cockpit etiquette with a bulletin on scenario that are and are not acceptable for chiming the cockpit during landing rollout.

## Synopsis

Captain reported a Flight Attendant distracted the flight deck crew during the landing rollout to inform them a passenger was not conforming to face mask policy.

#### Narrative: 1

I taxied from the southeast ramp intending to use Runway XXR for takeoff. When exiting the ramp Taxiway Alpha has an unmarked entrance at the very southeast end of the airport. While holding at the entrance line to Alpha ground cleared me to the Bravo run-up area just ahead of me. I did so crossing two separate dash lines on the pavement and

then turned 180 deg facing back at the ramp. I saw no sign for the Bravo Taxiway nor for Runway XXR. The Tower cleared me for takeoff, but did not say to use Bravo to get to the runway which was behind me. Once cleared for takeoff I crossed both sets of dashed lines thinking I was on Runway XXR but later realized I was aligned with a taxiway. The contributing factors were entering Taxiway A at an unmarked intersection and then crossing two sets of dashed lines to the run-up area that had no marking signs. Once at the run-up area I did not see any signs for Taxiway Bravo or [Runway] XXR. Perhaps another contributing factor was not flying for seven months prior to this flight because of COVID. In retrospect during flight planning, I should have gotten an enlarged airport diagram and studied it thoroughly, anticipating my route to the assigned runway and noting any potential issues in advance. I would then zoom in on satellite maps to clarify what it actually looked like on the ground. If that didn't clear it up I would call Ground Control and discuss it with them before arrival. If I'm ever uncertain when actually taxiing I can always ask for progressive taxi instructions from Ground Control.

#### Narrative: 2

Aircraft X was issued a takeoff clearance for Runway XXR and departed on Taxiway "A" which runs parallel to the runway. The Local Controller was issuing traffic to other aircraft and did not see the Aircraft X rolling on Taxiway "A". By the time we caught it I told the local controller not to cancel the takeoff clearance as it was heading directly for Aircraft Y that was taxiing opposite direction on Alpha and the departing aircraft would not have had the space to stop before a collision would've ensued. The departing aircraft passed what I estimate to be 70-90 feet above Aircraft Y on the taxiway. Recommendation - Continuation by the FAA to inform and educate pilots on the hazards associated with wrong surface departures.

#### Narrative: 3

Aircraft X was in the Taxiway Bravo run up area when he called me ready for departure. An aircraft landed on Runway XXL and was instructed to hold short of Runway XXR at Delta for the departing traffic. I cleared Aircraft X for takeoff off of Runway XXR, but he only read back his call-sign, which I did not realize until I the read back was listened to. I see Aircraft X start to pull forward away from Aircraft Z that was in the run up area with him and I continue with my scan and other tasks. A few seconds go by and my scan brings me back to the departing Aircraft X and I notice he is [on] takeoff roll on Taxiway A. Not on frequency, I yell "whoa whoa whoa" while looking down for his call-sign to cancel his takeoff clearance. I start my transmission to cancel his takeoff clearance but decide to let him continue with his takeoff because he started to rotate. There was Aircraft Y on Taxiway A taxiing toward Aircraft X. Aircraft X passed over the Aircraft Y by approximately 100 feet. Aircraft X asked if I cleared him for takeoff off of Runway XXR, in an attempt to figure out what he did wrong. I informed him that his clearance [was] for Runway XXR, however, he departed off of Taxiway A. This event was caused by the pilot not recognizing that he was departing from a taxiway. The only way I can prevent this from happening again is if I keep my eyes on aircraft that are cleared for takeoff from the moment, I issue the clearance until they start their takeoff roll. I am not sure if that is the expectation while working other aircraft.

#### Synopsis

GA pilot and ATC Tower personnel reported the pilot departed from a taxiway resulting in a conflict. Pilot cited lack of flying as a contributing factor.

## Narrative: 1

Ramp Service personnel are required to work outside in the elements while wearing a face mask as per the Government mandate. It is heating up very quickly in ZZZ. While we understand the importance of the mask mandate it is time that someone revisit the mandate and make some adjustments as far as wearing face masks outside. It is literally becoming more difficult to breathe while wearing a face mask in the extreme heat. Our Company's flight schedule and work load in ZZZ are just about pre-pandemic levels.

Today, I was on a crew that had to go across the field to the Company hangar and tow an aircraft back to the terminal gates. Upon returning from the hangar, I observed employees from two other major airlines working the ramp without face masks along with an entire construction crew working on the field for the XXXX County Aviation Authority and not one was wearing a face mask. If the mandate is not being enforced out on the Ramp, then why is the mandate still in place?

## Synopsis

Air Carrier Ramp Agent reported concerns with having to wear a face mask outside when the weather is getting hot making it difficult to breathe.

## Narrative: 1

Aircraft Y departed ZZZ1 airport IFR to the southeast out of the airspace, and Aircraft X was inbound landing ZZZ. Aircraft X was cleared to the IAF for Runway X at ZZZ and descended to 060. Aircraft Y was cleared to destination and climbed to 070. 2 additional aircraft departed ZZZ1 after Aircraft Y, and required more direct handling than Aircraft Y. Aircraft X mentioned that they were picking up traffic to their Northwest, and by the time I looked, Aircraft Y was leaving 061, and Aircraft X was at 072. They were separated by 2.62 miles and 900 feet vertically. During with dealing with the other departure's climbing out behind Aircraft Y, I lost the Aircraft Y's rate of climb reference the descending jet traffic. I immediately stopped Aircraft X 's descent, and stopped Aircraft Y's climb and descended Aircraft Y. Due to COVID protocol, this occurred while staffed with 4 CPCs and 1 Supervisor to work the facility until XA:00 local time. Better staffing to alleviate Controller fatigue. Our staffing has been tight, and time on position has been increased at the facility for a while, resulting in long work sessions and short breaks sometimes to produce coverage to work the traffic, which has resumed close to 90% of Pre-COVID numbers.

## Synopsis

TRACON Controller reported a loss of separation between an air carrier and a small aircraft and cited staffing issues as a contributing factor.

## Narrative: 1

We were descending on the ZZZZZ1 STAR. Just prior to level off at a higher altitude, the controller cleared us to descend via the STAR to 12,000 feet. The PF pointed to the altitude as I set it. However, he went out of VNAV to FLCH because he thought he heard descend to 12,000 feet now. I was busy with a frequency change and getting the new ATIS, and I missed the change in pitch mode. When I looked up, I noticed we were approaching 15,000 feet even though the fix just ahead of us had a at or above 16,000 foot restriction. I called it out and the PF immediately leveled off at 15,000 feet. I immediately informed the Controller and asked if he wanted us to climb back to 16,000 feet. He said we could just "descend to 12,000 feet." There was no conflict with other traffic. I believe this occurred for a number of reasons. It was a very difficult 3-day pairing made longer because of COVID. We were all exhausted, it was a high-workload environment, and the PF had not flown in over a year. He had trouble hearing ATC the entire trip which we attributed to his being off a year. Obviously, there was a breakdown in Verbalize, Verify and Monitor. Lesson learned: especially when tired and in a high-workload environment, strict adherence to SOP is essential.

## Synopsis

Air carrier Captain reported the PF overshoot the assigned altitude during arrival and attributed it to fatigue, workload and the PF had not flown in a year.

## Narrative: 1

Conducted a part 91 flight ZZZ1 to ZZZ2. I initiated a crew brief of the SID while still on the ramp...I had the chart display mainly zoomed in on the text description box to make the text bigger. I focused on the final altitude of 17,000 to the right of the text box that pertained to all runways. I had showed the PF the altitude and said "I will set 17,000 in the altitude select if you agree". He responded "affirm". I began to read the text version of the SID to myself and it read "Climb on a heading of 216 to intercept course 185 to ZZZZ, then on track 108 to cross ZZZZ1..." I announced we will arm LNAV for departure as the FMS matched this. At that point I did not finish reading and zoomed in and looked at the SID graphically but focused on the runway departure and how it fed into the initial FIX ZZZZ. I noticed all runways fed into ZZZZ. I knew that fix would be important on readback, (as it is at ZZZ3 for example), to ensure safety on parallel runway operations. Very short taxi out from FBO. Took off runway XXR, normal operations. Positive rate, gear up, "400 feet, flaps up select VS." Thus, we were in VS speed as is often the case for climbout. Tower sends us to departure. I call twice, no joy. Switch back to Tower and ask to confirm frequency. Call back through 6,000 and departure responds climb and maintain 7,000. We received this clearance at approximately 6,800 feet. We executed this clearance immediately however given out pitch attitude and climb rate we overshoot 7,000 feet and reached an altitude of 7,400-7,500 based on my best recollection. No TCAS alerts were issued. We maintained 7,000, were given another climb clearance and then before the ATC Controller switched us over, we were told of the possible deviation. What I have learned from this incident is to read the entire textual description in the SID and to take in the whole SID graphically as opposed to taking into account just the post departure/runway routing. I also learned poor habits can be formed from other airports, particularly our home base airport. We receive a SID on our clearance every time. We then get a heading on takeoff clearance from home base ZZZ2 ATC voiding the initial part of the clearance 99 percent of the time. Another factor is the scarcity of climb via SIDs that do not mainly incorporate "at or above." This incident taught me not to assume or have a bias to SID instructions. Another factor in this error was rust due to the COVID shutdown. Our awareness and CRM need improvement which will come with more recent operations I believe.

## Synopsis

Corporate aircraft Captain reported overshooting assigned altitude during departure due to a late ATC Clearance. Captain also cited lack of flying as a contributing factor.

## Narrative: 1

On flight from ZZZ1 to ZZZ2, which was at the limit of our aircraft range unless there are decent tailwinds, had a hard time getting a climb, barely any tailwinds and was expecting a cumbersome arrival. So, when we were over West [State] and assigned the ZZZZ arrival I was wondering if we would land with minimum IFR reserves. Asked Center to keep us high as long as possible and they did a pretty good job except this involved lots of vectors and altitudes when getting closer to ZZZ. So, during descent I was delaying a steep descent until closer and lower to save fuel. All of this ended up working and we landed with more than minimum reserves but it caused me to be really busy in IFR conditions. While direct to ZZZZ1 to cross at 9,000, I was given an eastbound vector through the arrival track between ZZZZ2 and ZZZZ1 while descending at close to 3,000 FPM. Then told to head direct to ZZZZ1 and cross it at or below 9,000. This involved a 135 degree right turn within 10 miles of ZZZZ1 but all was good on making the crossing altitude. Then was given 5,000 at ZZZZ and told to cross ZZZZ1 at or below 9,000. I entered the 5,000 in for ZZZZ but made the error of entering a vertical "Direct to" for ZZZZ and engaging VNAV. Looked up and the descent rate had switched from almost 3,000 FPM to just above 1,000 FPM. Very quickly disengaged VNAV and dialed in the 3,000 FPM on the VS mode. Finally figured out there was no way I was going to make the crossing at ZZZZ1. Told the Controller I wasn't going to make the crossing altitude at ZZZZ when within 2 miles of ZZZZ1 - a little late. We ended up crossing ZZZZ at a little below 10,000 and the rest of flight went very well. Causes: 1st would be doing that VNAV to ZZZZ - if I left everything alone, we would have been fine. 2nd was coming in high and having to do a steep descent while being vectored around and given the direct-to really close to the ZZZZ1 fix which involved lots of turning. 3rd was flying a little slow and descending a little slow to save fuel which caused problems for ZZZ Approach. 4th was getting barely any sleep the night before - had taken a natural energy booster later in the day and it didn't wear off until XAam or so then had to get up early. 5th was keeping the flight smooth for the passenger despite the steep descent and all the turns - without a passenger I would have been more positive about getting down. 6th was the low fuel situation I was concerned about - during COVID with lower air traffic I became used to getting unobstructed clearances but it is busy again - really busy this day and I didn't figure that I would have any problem getting a climb to 450, but I did and that burned more fuel than I had planned. How to avoid in the future: 1) Plan fuel for busier air traffic. 2) Don't do a VTO to the last of 2 fixes when given crossing restrictions for 2 fixes. Either VS it or if using VNAV just do the VTO to the first fix and let the VNAV figure out how to get down to the second fix. 3) Don't take that energy booster after lunch time! 4) I forgot that during descent the fuel gauges read a little low - just remember this next time.

## Synopsis

Small Transport aircraft pilot reported not making a crossing restriction during approach due to numerous distractions.

## Narrative: 1

Event took place right after takeoff. I was PF and had manually leveled off at 3,000 MSL using the "Low Alt Cap" procedure which went as briefed. At this time the PM had called Departure Control and we were issued a climb to 4,000. The PM set 4,000, I confirmed verbally and then commanded VNAV. I continued to manually fly since we were assigned a heading. I had briefed a speed of 200 knots due to being below Class B Airspace and now came to the realization that I had just commanded the aircraft to speed up while we probably weren't high enough yet to legally accelerate. As I held the pitch to hold the airspeed, the altitude alert went off at 4,300 feet. I then clicked off the autothrottle, pulled the thrust to idle and pitched to return to 4,000 feet as the Controller called to remind us to maintain 4,000 feet. We reached 4,500 feet before descending. Flight proceeded without further incident. I had not flown much recently. Reserve lines in my home town had recently materialized and I was enjoying the absence of commuting. I hadn't flown since February with the exception of a PT and upset training in March. I felt that hand flying would be good to help regain proficiency. Our clearance was to fly runway heading for vectors, so I thought this would be a great opportunity. In hindsight I should have waited for a little less busy environment to ease back into it. The FO had flown out of ZZZ1 before and was aware that things could get busy. I should have taken this as a bit of a warning. I could have also thought about how to handle this departure a little more thoroughly. FLCH would have been the better choice in this situation. It would have held 200 knots and commanded a 500 FPM climb. Far more manageable.

## Narrative: 2

I was PM. The Captain was PF. Our initial clearance was 3,000 feet and runway heading. The Captain briefed a low altitude capture using 200 knots as we were under the Class B shelf and relatively light. He briefed the intention to hand fly until we were given the intercept to the initial fix on the departure. The initial level off went well and according to the brief with the Captain hand flying. Were quickly given a new heading and a climb to 4,000, which I read back to ATC and set. The Captain confirmed the altitude and called for VNAV. I watched to confirm the start of the climb, then turned to switch my iPad view to the chart page. I heard the altitude alert, looked back to see the airplane pitched higher than the flight director and realized we were climbing past 4,000. At the same time the Captain disengaged the autothrottles, reduced thrust and pitched to return to 4,000 feet. At this time the Controller called us to tell us she needed us back at 4,000 feet. The altitude was about 4,500 feet. The PF corrected back to 4,000, then were soon given another climb. Upon debrief we both realized that FLC would have been the better mode to engage as the VNAV reverted to the programmed speed that was too fast for what we were trying to do. The Captain mentioned he increased the pitch to control the speed and

that caused us to climb thru the assigned altitude. As we were still in a critical phase of flight, I should have been more vigilant in monitoring the rate of climb, the speed and the vertical mode. If I had, I could of called it out to help the Captain arrest the acceleration and rate of climb in time to avoid the overshoot. I suggest that more emphasis be placed on the use of FLC and also VS mode. We seem to minimize their use as we rely on VNAV so heavily. The call to engage VNAV becomes a reflex. In this scenario, FLC or VS would of been a better mode that would of prevented the increase of speed that in turn contributed to the overshoot.

## Synopsis

Air carrier flight crew reported a speed deviation under Class Bravo and then overshooting assigned altitude. The Captain cited lack of flying as a contributing factor.

## Narrative: 1

We were holding short of XXL on Sierra and another aircraft, was holding (arriving earlier). Somewhat unexpectedly, we were cleared for takeoff. I pushed the Attend button, and slowly crept toward the runway to keep the operational flow going. After a long delay, and now approaching the runway, I pushed the Attend button again, with no immediate response. I continued onto the runway. A FA then called us to state they were enforcing a passenger failure to wear a mask issue (this was also an issue during boarding). I directed the FO to ask Tower for a 30 second delay on runway; which was granted. The FA then communicated to me (the exact words I do not recall), that the situation was corrected. I was fully under the impression that they were ready for departure. We then executed the takeoff, but as it turns out, a forward FA was still standing in the aisle of the cabin and had to take a seat in the aft galley. Once at level-off, we discussed the situation. This was certainly a miscommunication. In addition, they had yet to provide (me) the "Cleared for Departure" PA.

## Narrative: 2

As the A FA; I was conducting my final walkthrough. I was at the last row of seats. A child that was seated in the last row with her sister and mother was not wearing her mask. The mask was in the mothers bag. This issue had been addressed earlier upon boarding. The CA dinged us for departure. I called the CA from the AFT galley to let him know the same family was not in mask compliance. I asked if I could call him back and he replied with we are on the runway. Finally got the child in compliance so I asked the D FA to call the CA to let him know the mask was on. 2 rows in front of the mask compliance issue was an elderly lady whom refused to stow her large bag on the floor nor in an overhead bin. I had a bin open to try and coax her into letting me stow the bag for her when we took off so I took the nearest jumpseat for takeoff.

## Synopsis

Air carrier Captain and a Flight Attendant reported a Flight Attendant was still standing during takeoff roll due having to deal with a passenger not complying with face mask policy.

## Narrative: 1

Prior to departure Dispatch asked us to do an APU Inflight Reliability Check which I understood to be Section XXXX. I explained we were unable to do so because of the limited flight time and low cruise altitude. I think there was confusion about the check they wanted us to perform. I think they wanted a maintenance validation Section YYXX because they mentioned this Section, but it has nothing to do with the APU. The previous day Dispatch asked us to do the same thing. I was told by Dispatch on the previous day that the aircraft was going to be put back into revenue service for ETOPS and it needed an Inflight APU verification check. Very confusing set of circumstances. As line pilots we do not do these types of Maintenance trips very often and with COVID-19 and the length of time that these aircraft have been sitting different checks need to be performed. I had never heard of or done a maintenance validation before. Also, under Section YYXX (O) Procedures B what are the required checks to be accomplished? Is it an APU Inflight verification check? I entered information to Maintenance that the APU Inflight Verification Check could not be completed due to limited flight time and low cruise altitude. Also, with the maintenance validation the cruise altitude needs to be above FL200. Our cruise altitude was planned for FL220 but the rides were so bad that ATC kept us down at FL190 so we could not have done a maintenance validation anyway. It makes sense now... there was a note on the flight plan that we were operating under FAR Part 91. I think that note was there because this aircraft needed a maintenance validation to be put back into Revenue Service. Like I mentioned very confusing for the FO and I. Not fully understanding what dispatch wanted from us. Also not doing these types of flights often and being familiar with all of the different checks that need to be accomplished with aircraft that have been in short term and long-term storage. I think the dispatchers are in the same positions as the flight crews as far as not being familiar with what needs to be done. Have maintenance clearly explain what needs to be done by the flight crew for these types of situations with aircraft coming out of short and long term storage. Also, under Section YYXX what are the required checks under (O) Procedures B.?

## Synopsis

Air Carrier Captain reported the crew was to conduct an in-flight check of an aircraft that had been parked during the pandemic for an extended period of time. The type of maintenance check was written unclearly.

## Narrative: 1

As the CA, I was the PF landing via RNAV Y Runway XXL at ZZZ. The approach was uneventful, and the landing was well within the touchdown zone. During landing rollout, after stowing the thrust reversers and slowing to exit the runway, I started to make the left turn to exit onto Taxiway 1. At that time, Tower came on the radio and said, "Aircraft X, exit the highspeed [Taxiway] 2X or the reverse." We understood the reverse to be Taxiway 1. My First Officer then switched to Ground, who told us to "Taxi to the gate via Taxiway 2 and 3, cross [Runway] YYL, C and [Taxiway] 4," to which my First Officer acknowledged. Ground Control then came on shortly thereafter with us on Taxiway 2 and told us that he really needed us on Taxiway 2X to exit, "not" the reverse. We then realized that with everything going on in the cockpit during a typical ZZZ landing, stopping the aircraft, etc., Tower probably told us to "Exit the high speed [Taxiway] 2X, not the reverse." Instead, we heard that to be "Exit the high speed [Taxiway] 2X or the reverse." The speed of the speech to which the clearance was given by the Tower also made the clearance difficult to understand, plus the radio sounded a bit muffled (Tower controllers wear masks while working). To note, there were no conflicts and no aircraft on Taxiway 2 upon exiting. After taxiing into the gate, I called the Tower directly and spoke with one of the controllers (but not the one who gave us that clearance). After explaining what I felt we heard the clearance to be, he responded that since they wear masks in the Tower, sometimes it's difficult to discern exact language with short bursts of words and hence the confusion between words like "or" and "not" when used in a quick clearance as was done in this situation. He said that most likely Tower was trying to get us off more quickly by using the high speed [Taxiway] 2X (instead of the reverse at Taxiway 1) in order to get a departing aircraft off before the next arrival. He told us "no problem" and "I'm sure the Tower Controller was not upset at all because I haven't heard about it." So, most likely, it

was simply a sequencing issue with Tower in order to expedite their flow. If the Controller had anticipated what he wanted and told us that clearance on final rather on during the last part of the landing roll after I positioned the aircraft into a left turn off onto Taxiway 1, that might have helped him. I also believe the mask that the Controller was wearing and the speed of his speech in which he delivered his clearance muffled the word "not" that we heard as "or."

## Narrative: 2

We landed [Runway] XXL at ZZZ and upon exiting XXL pointed towards Taxiway 1 (the reverse of the high speed), we were told "Exit XXL on [Taxiway] 2X the high speed and NOT [Taxiway] 1." We both heard it as "Exit XXL on [Taxiway] 2X the high speed OR [Taxiway] 1." Since we were already positioned to take [Taxiway 1], we had an expectation bias and continued. I also didn't make it clear on the read back that I understood. I saw Taxiway 2 and read back "Exit at [Taxiway 2]" or something to that effect. On Ground frequency, we were alerted to our error. The Captain followed up via phone call and it was suggested by Tower that perhaps their instructions were garbled by their use of a mask while working.

## Synopsis

Air carrier flight crew reported a taxiway incursion and cited communication problems with ATC as a contributing factor. Reportedly, the Controller's instructions sounded muffled due to wearing a face mask.

## Narrative: 1

I am a Lead Ramp Serviceman and I get bounced around the airport gate to gate and most of the time different ramp employees on my flights. The expectation is that when I get my gate box it is clean. Wireless headsets have been disinfected. Problem is, that's great when I work my first trip. Now I get sent to another work area, with new crew, there is a sense of time pressure now since I need to get to the other side of the airport to do a departure. By the time I get there it is already past the time to start loading the aircraft so I need to plan the flight, verify any cargo or freight at the gate along with bags, and make sure whoever is assigned to that flight is there. I'm now even further behind the 8 ball. Now it comes to load and the entire time I am running around ensuring a safe operation on the gate. Now comes departure time and the pressure is so immense that the Supervisor comes out to the gate and stands there watching you for no apparent reason. I feel like I have no time to sanitize my headsets, so the new crew I have puts on these headsets without having them cleaned. I feel as if I will be spoken to if I take any more time out to sanitize each headset that I am given. This creates an exposure not only for myself, but for anyone wearing these headsets. I have had guys refuse to wear headsets

because they are not sanitized properly and, in their mind, and the wipes that are provided, they think, are not enough. Few people the wipes are OK but for most, they don't trust that it will effectively sanitize the headsets. We've lost a lot of good people here in ZZZ and everyone is on edge with this pandemic. After being moved around a lot I tend to use up all of my wipes. So, what do I do then? I barely have time to each lunch at times.

## Synopsis

Lead Ramp Serviceman reported lack of equipment sanitation due to on-time departure pressure and working with different personnel throughout the airport.

## Narrative: 1

Flight originated from ZZZ1 as a personal practice flight to do some air work, since I had not been flying as much as usual due to COVID-19 concerns and reduced flying time. Upon return to ZZZ1 about 10 miles out I began to reduce speed and attempted to go to flaps 10, the first notch of flaps on my aircraft. I could not get the flap handle to move, although it was fully operational on takeoff. I tried the flaps again several times and no movement. At that time, I was concerned with a possible split flap situation and did not want to force the manual flaps. I set the GPS for direct flight to ZZZ1 and contacted Tower to advise them of my issue and requested a straight into Runway XXL, the longest runway. Upon contacting ZZZ1 Tower I was advised that I was just inside the surface to 6,400 feet portion of the Class C airspace around ZZZ. My usual route of flight at 3,000 feet MSL would have taken me under the 4,200 feet to 6,400 feet portion of the Class C. Upon landing I called Approach Control as instructed and advised them of my error. In my focus on my flight control issue and in selecting a direct route to ZZZ1, I completely overlooked my position and wandered into the west edge of the Class C and wasn't paying attention to the position of my aircraft. This is the first time this has happened to me and certainly won't happen again. I have already had an A&P correct the flap problem.

## Synopsis

GA pilot reported violating a Class C airspace while dealing with a flap malfunction.

## Narrative: 1

Departing on the ZZZZX departure coming through 10,000 feet we accelerated. When we were handed off to Center from previous Controller we were advised "Normal speed" and realized we had not maintained 250 knots, but had accelerated to 280 knots. ATC made no other comment. The Captain had been on an LOA for 6 months plus 3 months re-qualification training delay, I had been off for 3 weeks because of COVID-19 vaccination sequence removal, with other family issues at home. The flight was an early morning departure with early commute (drive). Suggestion - More personal detail to SOP on SIDS and programming of FMS.

## Narrative: 2

On climb from 10,000 feet to Flight Level, accelerated over 250 knots climb restriction. Was given " normal speed" by Center Control after handoff. Looked at the airspeed and it was 280 knots. My first (after Re-qualification and OE) flight sequence back from 9 month leave. The First Officer was back from a 3 week absence himself. I even thought about it prior to takeoff, and noticed a 250 knot restriction was not programmed in the FMS, but assumed he would control the speed manually. I did not voice my thoughts, but should have. I became fixed on other issues, getting off the gate smoothly, taxing safely, ensuring the performances numbers were correct. Remembering and doing the after takeoff flows, check lists. All things that were once second nature, but distracted me due to the long absence from flying. Simply stating to my co-pilot that I haven't flown in 9 months isn't enough. I needed to be on my game, and not let a simple speed restriction escape me. My own technique is to program the airspeed in VNAV so such a mistake is less likely. Every pilot has their own techniques, but I should have voiced mine, so at least the issue would have been addressed and in our minds.

## Synopsis

Air Carrier flight crew reported a speed deviation occurred during the SID procedure and stated that a prolonged period of time off for both pilots was the main cause.

## Narrative: 1

Flight [XXX, date] during cruise. Flight attendant reported mild odor from the forward galley oven #2 while in use. FA quickly turned off oven and the odor dissipated. I advised the FA to pull both oven circuit breakers and not to use either ovens. Odor is described as dirty socks. Odor event report also sent to maintenance. Reporter stated cause is possible

that since the galley ovens have not been used for the year, this could be a causal factor. Start checking the operation of the ovens.

## Synopsis

A321 Captain reported a flight attendant notified them the ovens were turned off due to odor in forward galley.

## Narrative: 1

Filed flight plan was Runway XL and the ZZZZZ departure. When we received our PDC, it was changed to Runway XL and the ZZZZZ1. Climb via SID. After pushback, on initial contact with Ground, they assigned a new route Runway XXL and the ZZZZZ2 departure. Climb via SID. We stopped the aircraft and set the parking brake. We entered the new route and take off performance and while verifying the route ATC called to "advise when ready to TAXI." Caused a slight distraction and missed to verify the top altitude for the SID. For both ZZZZZ and ZZZZZ1, the top altitude was FL190, whereas ZZZZZ2 had 3,000 feet. After takeoff, at 3,700 feet, pilot flying noticed that the aircraft was not leveling off and both pilots realized altitude was set at FL190. We initiated to altitude correction but at the same time ATC cleared us to FL190. Flight resumed and completed without any further events or interruptions. 1) Distractions 2) Lack of Recent flying experience. This was my first trip after six months of furlough. 3) Fatigue factor. The sequence was built in such a way that all Red Eyes, are flights with 12 hours rest in between. 1) A Runway/SID Change Checklist needs to be added to the current Normal checklist. This will help the pilots to ensure that all the related tasks associated with a runway change are completed. 2) Assign at least two OE flights with a check airmen for the pilots who are returning from furlough. 3) Allow more resting time between the Red Eye flights than bare minimum for legality.

## Narrative: 2

Climbed thru SID published altitude by several hundred feet. Filed clearance was ZZZZZ departure, revised clearance ZZZZZ1. Upon contacting ATC ground received a runway and SID change to Runway XXL and climb via the ZZZZZ2 SID. Delayed taxing until all changes were made on the MCDU, and revised procedures were reviewed and briefed. Missed the initial climb to 3,000 feet. Previous 2 departures had initial climb to FL190. Suggestion - Take longer reviewing revised ATC clearances.

## Synopsis

Air carrier flight crew reported an altitude deviation caused by lack of recent flight experience, fatigue and three clearance changes before departure.

## Narrative: 1

I was pilot monitoring for the flight. It was my first leg after completing training and not flying for 1 year. We were cleared for takeoff from Runway X in ZZZ. I noticed that the Captain hesitated to add thrust. He was clicking the TOGA buttons and also clearing the flight director several times. I wasn't sure what was going on, and then happened to catch a red line through the bottom TO indication of the FMA just as the CA was clearing the FD again. He then added thrust and we took off. At first, I didn't realize that this was an issue, as we are allowed to take off raw data. However, as we lifted off, I realized that this was wrong and we should have figured out why the bottom TO annunciation was red. The issue was caused by some sort of FD problem that the Captain had noticed and tried to correct by clearing the FD and reactivating TOGA several times. He elected to takeoff anyway, and my slowness to realize what was happening contributed to us taking off. My lack of recent experience caused a delay in my realization that we should have figured out the problem before taking off. I was nervous to be back on the line after 1 year, and was focused on the upcoming takeoff and making correct call outs. The Captain repeatedly clicking the TOGA and FD buttons caught me off guard and I did not realize until it was too late that there was an issue. Both of us should have made the decision to simply pull off the runway and figure out why the TO annunciation had a red line through it. It wouldn't have taken very long. Yes, we can take off raw data but not if we know that there is a FD problem.

## Synopsis

Air carrier First Officer reported the lack of recent experience caused the improper use of SOP's during a takeoff configuration irregularity.

## Narrative: 1

Departing ZZZ [Airport] on the ZZZZZX Departure, the PNF Briefed all the altitudes on the departure were at or above. I briefed the departure and ended up saying the same thing about the altitudes. ZZZZZ1 [Intersection] requires a crossing altitude of 2,000 at about 4 miles of the end of the runway. With all the times I have been into ZZZ in my past, I knew this departure. I remember thinking after COVID they finally changed the departure restrictions. Should have re-checked the 2,000 altitude as I knew better.

## Synopsis

Captain reported an altitude deviation during departure.

## Narrative: 1

Established on the F track and just prior to exiting radar service we instituted a 2 mile right offset as a SLOP. This seemed routine to us until ATC asked if we were still on track to our next waypoint. It then occurred to us that we should have not instituted SLOP until we were out of radar contact. Both of us have flown very little this past year and although we are both veterans at flying [in State X], the SOP here just did not properly come to mind.

## Synopsis

Air carrier Captain reported a track heading deviation during cruise after instituting a 2 mile right offset as a SLOP while still under radar contact. Captain cited lack of flying as a contributing factor.

## Narrative: 1

Pushed back from Gate X, 10 minutes late, after a Supervisor was called to the aircraft, after boarding was complete, to assist with passengers traveling with a four-year-old child. The child would not keep his/her seat belt fastened and kept removing his/her face covering. The parents had become belligerent with the flight attendants. We received a runway change just prior to pushback that would have us departing on Runway XXR verses YYL. The takeoff data for XXR included the requirement to burn off additional fuel prior to takeoff. We loaded the new takeoff data and reran the Before Push Checklist. Then we began our pushback from the gate. Knowing it would be a very short taxi to the runway, we started both engines. During the First Officer's After Start flow, I believe I interrupted his thought process by starting to voice my idea that we could taxi a short distance via [intersection] to Taxiway 1 and wait the little bit of time to burn off the additional taxi fuel. After completing the After Start flow, the First Officer did not make the "Standing by Flaps" call. Instead, we talked for a few more seconds about moving the aircraft to a spot away from the ramp so that we could burn off the additional taxi fuel. The First Officer requested taxi clearance to Taxiway [Alphabet] and notified Ground Control that we would need to hold there, to burn off fuel prior to departing. We taxied forward onto [intersection] and made the left turn onto Taxiway 1 and brought the aircraft to a stop. Once the parking brake was set, we both realized that we had not performed the Before Taxi Checklist and subsequently had not set the flaps to the Takeoff setting prior to moving the aircraft. We then set the flaps to the Takeoff setting and ran the Before Taxi Checklist. After a couple of minutes, we had burned the proper amount of fuel for the taxi and we made an uneventful departure. It was immediately clear to me that I gave too much thought to the things that had happened prior to pushback and in doing that, caused me not to focus on the required duties after pushback. I also should have allowed the First Officer to focus entirely on the after-start process before diverting his thoughts to something else.

## Synopsis

Air carrier Captain reported not performing the Before Taxi Checklist and subsequently had not set the flaps to the takeoff setting prior to moving the aircraft. Reporter cited distraction from dealing with face mask issues in the cabin area may have contributed to the event.

## Narrative: 1

Intercepting the unstable Localizer on a 225 vector, approximately 16 nm final, the aircraft started to join the Localizer. The Localizer shifted to the right and the aircraft began a hard right turn to intercept passing of approximately 240 degrees. I instructed the FO to stop the turn and come back to the left toward final approach heading. He did not reply to my direction and did not act. As the aircraft passed approximately 255 degrees, I took command of the aircraft, disconnected the auto-pilot and started a turn back to the Localizer. I was concerned about the numerous aircraft on final for Runway XX. In my turn back to the Localizer I overshot the Localizer and deviated from the assigned 900 meter altitude by approximately 100 meters. I intercepted the Localizer, got back on altitude, and flew an uneventful ILS and normal landing. This all happened unexpectedly. The hard right-hand turn to intercept is unprecedented in my XX years of flying [this type aircraft]. Unstable Localizer and Autopilot aggressive turn to intercept. Fatigue affected my flying after taking the aircraft The current schedules to service this country during Covid leave no extra margin of safety when things like this go wrong. Multi-leg days, with long turns

between flights, after crossing X time zones leave little margin of safety. Also, the very long trip extensions for crew members leads to fatigue.

## Narrative: 2

I was the PF for the 2nd leg of the night which was a night recovery. At altitude I had briefed the STAR and approach, and once the descent started, we received numerous altitude, heading, and airspeed clearances as the controller was trying to work what appeared to be a fairly large recovery into ZZZZ [Airport]. ATIS reported that simultaneous ILS approaches were being flown to [Runway] XXL as well as [Runway] YY. Approaching ZZZZ, we were being vectored for the ILS Y, Runway XXL and at about 20 miles were cleared "heading 215, maintain 180 knots to 8 miles, maintain 900 meters until intercepting the Localizer, report established." We were already configured at flaps 15 with the ILS tuned and the approach checklist complete. The assigned heading provided a comfortable 15 degree cut, but with winds of about 120 at 25 knots at our altitude (overshooting crosswind), and parallel approaches being conducted, with the autopilot still engaged, I was diligently watching the automation. I pressed the APP/LAND tile and initially the aircraft maintained heading, but after a few seconds, it started making some gentle (level) turns left and right. Initially these turns were mild and we even chuckled at what a poor job the AP was doing to maintain heading to intercept. Suddenly, the magnitude of one of the turns to the right increased markedly and the aircraft was in a level turn to the right of approximately 25 degrees angle of bank with the heading coming through approximately 230 degrees. As I spent just a few seconds (no more than 4 or 5 I would say) trying to determine what the autopilot was doing, the CA called out, "turn left, turn LEFT, I have the airplane" and executed a maneuver that I would describe as similar to a PRM breakout maneuver. He disconnected the AP, added power, and reversed our turn, climbing and accelerating in the process. The maneuver was aggressive enough that I thought it possible the CA had SA to something that I was missing since I had already started to reach for the heading selector in order to get the plane to level its wings and come back to the left (note: things were happening very quickly now and I did not verbalize this FMC input since I would have just been trying to talk over the CA telling me to turn left even though the airplane did start to shallow its turn to the right once I pulled the selector). I verbalized "you have the controls" and monitored his inputs. As former fighter pilots, the CA and I both have fairly wide comfort zones and although the maneuver was fairly aggressive, I was still comfortable with the aircraft's attitude and remained quiet as I monitored the aircraft's flight path. I did not want to add to the confusion of the moment by asking questions or saying anything unnecessary since the CA was very purposeful in his maneuver. Now things became quite busy because in addition to receiving a "bank angle" audible warning due to our steep turn to the left, the approach Controller began talking to us rapidly. He made several transmissions and told us repeatedly that he had us on a heading that was not going to intercept the Localizer and that we were above our assigned altitude and asked what we were doing. I replied that we were still below the glidepath at approximately 930 meters, and maneuvering to intercept the Localizer. After a few more moments the CA stabilized the aircraft's attitude, I selected FMS speeds (since we had accelerated to approximately 210 knots and needed to slow back to 180 knots), and he began a turn back to the right to intercept the Localizer. The CA re-armed the approach (but never re-engaged the AP), slowed to the assigned speed, returned to the assigned altitude, and leveled the wings on an appropriate intercept heading. The FD provided what appeared to be valid guidance to shoot the rest of the approach. The aircraft was configured and stable before glide-slope intercept and the remainder of the approach proceeded normally with me remaining in my role as PM. We went from conducting a routine controlled approach, to one where I think we had widely differing perceptions of what was actually occurring in the space of literally about 4 or 5 seconds. This rapid breakdown of CRM resulted in actions that were perhaps more

aggressive than they needed to be, and a deviation from the ATC clearance. I would actually say there were two separate events. The first being the aircraft's unexpected and overly aggressive turn to the right to capture the Localizer for ILS Runway XXL, and the second being our response to it. The first I would potentially attribute to a software issue, a problem with the ILS tune, or some sort of RF interference. As far as the second I would suggest the following; 1) Even though I did not feel fatigued during the approach, it was at the end of a long day and it's possible I underestimated my level of fatigue. That said, I did have some coffee prior to Beginning of Daylight (BOD) for this reason and, I felt like the CA and I were both alert and engaged and don't feel like my response to the aircraft was unacceptably slow or inappropriate. 2) The CA believed that the intercept angle was excessive (he referenced 45 degrees during our debrief) and that based on his prior experiences, there was no way the airplane was going to be able to capture the Localizer. Since I had not experienced the automation act in the manner it did during our approach, I was perhaps more comfortable than I should have been with the AP's ability to capture the Localizer, even with the admittedly substantial intercept angle that we had before the CA took the controls. 3) The CA stated during the debrief that he thought we had already flown through the Localizer, and that he was therefore worried about a lack of separation from the traffic that was flying the ILS to Runway XX, to our right. I did not perceive that we had flown through the Localizer for the following reasons: a) We were in a phase of flight where we both (certainly I was) monitoring the raw Localizer data in anticipation of Localizer capture, and neither of us ever called "Localizer alive". I felt like I was hawking this for the reasons listed above (overshooting crosswind and proximity to other landing traffic). b) The AP commanded a turn to the right, which in my mind it would have only done if it were trying to intercept the Localizer from the left. c) When ATC contacted us, it was to say that we were not on an intercept heading. He did not indicate that we had flown through the Localizer or were encroaching on the protected airspace between the approach corridors for the active runways. He never issued a vector to East which is likely what he would have done had he perceived there to be a risk of loss of separation. d) When we finally got the situation under control, the aircraft intercepted the Localizer from the left. Again, this entire narrative took place in what I suspect was less than a minute. Between the uncommanded turn to the right and the CA taking the controls, maybe 5 seconds passed. That said, I could have acted sooner and certainly should have verbalized when I reached for the heading selector to stabilize the heading, since that may have precluded the CA from taking the controls and executing the "escape" maneuver. I think in the CA's mind, we were probably already past the point where that was going to mitigate our situation since he perceived that we had already crossed the Localizer, but it might have helped. I wish the CA would have verbalized why he was maneuvering as aggressively as he was. I thought that perhaps he saw an impending collision that I did not have SA of, and so I stayed quiet for longer than I should have before I started to rebuild the picture and work to develop a CRM. Ultimately, he was well within his authority to act in the manner he did and fully adhered to the company's three step intervention process. This was a tough one for me to analyze and I welcome any feedback you might have.

## Synopsis

Air carrier flight crew reported an altitude and track heading deviation during approach to an international airport. The crew stated this sequence of flights, since the COVID-19 pandemic started, are very long and fatiguing which may have been a factor in the event.

## Narrative: 1

After block out and starting our pushback from the gate, a Flight Attendant called up to address a concern about the passenger count. It was a busy time in the flight deck where I was trying to manage the safety of the push. The FO answered the call to the flight deck from the cabin while I was talking to the ground crew and ramp was talking to our flight and the flight next to us pushing off the gate. The ramp personnel had left several pieces of ground equipment in the way of our push from X1 and we were trying to find out about getting it moved. As all of that is going on the narrative that myself and the FO got from the FA seemed to be one of more a compliance with the mask policy than one of weight and balance. She told us there was a large child sitting in a seat for which they were ticketed next to their mother and the child was having a hard time wearing the mask. The FA told us that the mother was now saying the child was less than 2. The FA believed that the mother was saying the child was less than 2 to skirt our mask policy and we needed to change the count for weight and balance because the child was an infant. I tried to clarify with the FA about the child because it was not clear to me because she was telling me the child was not listed as an infant, had their own seat, and by the FAs thought it was more about the mask. My thinking was that for the child to have that seat a birth date would have to be listed when that seat was purchased. Previously the FAs and the gate agent had reconciled the count, and the FA thought the child was older than 2, so I elected to leave the weight and balance as it stood. We continued to our destination without further incident. It was a busy time in the flight deck when this issue was brought to my attention. After things had calmed down with push I should have checked back with the FA to make sure I was hearing everything she was trying to tell me. Factors for me with my decision making were the high workload at the time, alertness because of the late time of day of the departure and having been scheduled with early AM shows for the three days prior to this event.

## Narrative: 2

I walked through to do my cabin count and confirmed that I had a child in row XX just as it showed on the sheet. I had already asked the mom to get a mask on the child before we closed the weight/balance. She said the child did not have a mask so I brought her one. After the safety demo I walked through the cabin again for final compliance and saw the child was not wearing a mask. Mom said he had ripped it so I offered to get a new one. She then said that the other FA told her he didn't need one if he was under the age of 2. I was surprised to hear the child was an infant as he was quite large and had walked on board the aircraft by himself. I asked if he was still only 1 and she said he was not yet 2. I alerted the CA that I had possibly made a mistake in the count. I mistakenly counted an

infant as a child. I didn't ask how old the child was, it only came up because of non-compliance with mask policy. I honestly think she claimed the child was an infant in order to avoid dealing with the face mask. In the future I will make sure to ask passengers with small children if they are in fact under the age of 2.

## Synopsis

Air carrier Captain and a Flight Attendant reported a passenger's child was resisting wearing a face mask. After this problem started the parent then stated the child was under 2 and did not need to wear the face mask.

## Narrative: 1

First legs on MAX aircraft in over two years, and when I went to accomplish a Heads-up Guidance System (HGS) takeoff and landing, I became confused on where the CAT III placard was located/displayed on MAX aircraft. Nothing in logbook about downgrade, and HGS presentation was correct, but I could not locate the placard. We continued with flight, and researched the placard location enroute with MAX manual resources in flight to understand correct CAT III placard display. At conclusion of flight, I intended to contact a Check Airman and/or the flight training department to understand, but then my FO sent me a picture of a MAX he was operating the next day with the CAT III placard displayed on Captain Auxiliary Display HGS Annunciator Panel. I next contacted the Chief Pilot to inform him and Maintenance (MX) that this aircraft's displays were not set up properly. The Chief Pilot said he would contact Maintenance Control to query. He called back a few minutes later to explain that Maintenance had inadvertently de-selected the CAT III placard "Off" on this aircraft, and would send someone to correct ASAP as the aircraft was on the ground in ZZZ. Chief Pilot suggested a safety report to highlight location of MAX aircraft placard location as it is digital versus "the bone," as well as highlight there appears to be no information in MAX manuals concerning the placard display. The only reference found was for the MAX AUX Display HGS Annunciator Pane, which only displays an example of FO's display; nothing about the Captain-side display.

## Synopsis

B737 MAX Captain reported that the CAT III Placard was not visible to the flight crew due to the cockpit displays not configured properly by Maintenance.

## Narrative: 1

I was informed by my Chief Steward that I signed for bolt and bushing that was not installed. This happened if I recall in [Date] last year when everybody is worried of being

furloughed and shifting around because of pandemic. This is also the stage where we are fixing a lot of paperwork to better organize the system. Job cards are not intact and constantly being put to revision to better understand by the mechanic. I know for a fact that sometimes a lot of mechanics are hesitant to sign because they don't understand the card or what component they wanted to put in. And there are some scenarios that the Engine was already built but paperwork are not being signed. I did install the component because I signed for it. At the time a lot of mechanics in this area were new like me. I was working alone and I did not have a qualified technician with me to double check my work.

## Synopsis

Technician reported being advised of signing off for work that was not completed.  
Technician cited COVID-19 pandemic related worry and distraction as contributing factors.

## Narrative: 1

The APU went out on this plane before landing initially in ZZZ. Of course, it was deferred and we were cleared to return to ZZZ1. It was a warm day - not exceptionally so, but hot. These airplanes retain heat all the time, but with a broken APU, the plane becomes a miserably hot metal tube. I had a plane at maximum capacity with a lot of large, hot passengers. I also had a plane with elderly passengers, small, crying children, and people who did not understand English. All were compliant with the masks, but I also know those masks are dangerous in heat. The CDC has listed these warnings on their website and in their tweets. I was very concerned about their health and the heat inside the cabin. While returning the cart to the galley after service, I began to get light headed. I stood behind the bulkhead (away from passenger view) and removed my mask to breathe oxygen. I also had to fill a glove with ice to put on the back of my neck to cool myself. I was very concerned, if I felt that way on a spring day what are the rest of my plane of passengers experiencing? Masks are a very serious and concerning safety issue on hot planes - especially this type and especially when temperatures are climbing. The summer is going to be a hazard to everyone's masked health - including customers and crew. The mask policy on airplanes needs to be reviewed by the FAA - especially on this make and model. There are serious safety issues caused by the mask mandates. Anyone with asthma, heart conditions, lung issues and those who are extremely obese are already at risk when their bodies are exposed to heat. Constricting their ability to breathe oxygen and fresh air is a danger in HOT spring and summer conditions. I was taught in training that crew members are more susceptible to hypoxia in the air, but now that threat is greater with FAs flying in masks in hot metal tubes at high altitudes.

## Synopsis

Flight Attendant reported health concerns for the crew and passengers having to wear face masks after the APU was inoperative and the cabin temperature was hot.

## Narrative: 1

Just below 1,000 feet AGL, ATC directed us to go-around, due to previous aircraft still on the runway. I performed the soft go-around procedure. I called for go-around flaps and the FO selected flaps 2, but the correct flap setting for go-around was flaps 3, as this was a flaps Full approach. I noticed the incorrect flap setting when I saw the airspeed was down in the aircraft's amber "hook" indication. Normally we would be five knots above the top of this hook, the top of which is Vref. I manually selected a higher airspeed and accelerated before commencing the turn away from the runway. The rest of the go-around and subsequent approach and landing were normal. Lack of recency of experience due to short term leaves of absence may play a role. My FO hadn't flown a lot since returning from a six month hiatus. I also had close to a month off, due to COVID. I feel that I could have reduced my approach speed earlier and thereby increased our spacing. However, we had been assigned 160 knots to a 5 mile final. We complied with that ATC instruction. When I am pilot flying, I brief that a go-around is a successful outcome and encourage my FO to call it out if I don't meet stable approach criteria. I think in the future I will include in my approach briefs which flap setting corresponds to the "go around flaps" call. This aircraft family uses flaps 3 and flaps full for landing, but "go-around flaps" is a command to go either from flaps full to flaps three or from flaps three to flaps two. We don't do that

many go-arounds, so a quick review might help. Additionally, watching the preceding traffic more closely on TCAS could have prompted an earlier speed reduction and notice to ATC that we were unable to comply with the previous speed assignment.

## Narrative: 2

During go-around I inadvertently selected flaps 2 instead of flaps 3 during the flap retraction sequence. The PF noticed and compensated, and we continued with the cleanup and subsequent climb and re-vector back runway for a landing with no other issues. I inadvertently selected single engine go-around flap setting of flaps 2 instead of full flaps to flaps 3 go-around. Continue training go-around procedures in training and being more mentally prepared for a potential go-arounds in the landing phase.

## Synopsis

Air Carrier flight crew reported selecting the incorrect flap setting during a go-around maneuver. The Captain stated lack of flying was a contributing factor.

## Narrative: 1

On ZZZZZ SID out of ZZZ, I overshoot at or below altitude of XX,000 at ZZZZZ1. At XX,000, I noticed the overshoot and proceeded with correction. Aircraft settled at XX,500 before altimeter showed trend correcting back to XX,000. ATC called us at about XX,300 to verify we were going to stay at XX,000 until ZZZZZ1. Contributing factors include light aircraft with high climb rate, hand flying and pilot proficiency deficit.

## Narrative: 2

We were cleared to climb via the ZZZZZ RNAV departure from ZZZ. As we approached ZZZZZ1 intersection, I went heads down to get a sunshade. ZZZZZ1 has a restriction of at or below XX,000. We exceeded the altitude by 500 feet. ATC called us as we returned to XX,000. After ZZZZZ1 continued our climb.

## Synopsis

Air carrier flight crew reported an altitude overshoot during departure and cited the aircraft being light and lack of flying as contributing factors.

## Narrative: 1

I worked a very busy arrival push into the ZZZ Metroplex. Because of the lack of staffing, I was forced to work [Position 1] and [Position 2] combined with weather and substantial in-trail requirements which I was physically unable to meet. The entire workload was pushed onto one controller. During this time, Operations Manager [name] was a direct distraction to the operation of the sector and a detriment to safety. His loud conversation caused me

to have a difficult time hearing the aircraft. Eventually, I was forced to ask him to have his conversation further than 3 feet away from me. Of course, this led me to take my focus away from the task at hand, which was the safety of air traffic. There needs to be some reasonable in-trail requirement restrictions from ZZZ-TMU. If I have to give 15 miles in trail, and I am only receiving 10 in a sector filled with weather the task is near impossible. Especially, if the majority of my clearances are "When able" clearances. There is just not much you can do to conduct a safe operation in such a situation. This is a direct and detrimental distraction to air traffic safety. I would avoid having managers enter the control room and have loud conversations about things other than air traffic right behind or beside controllers.

## Synopsis

Center Controller working combined position reported communication issues with an aircraft after being distracted by a nearby manager having a loud conversation.

Narrative: 1

After arriving to the morning shift, and after completing the pre-duty checks, I was assigned to work Ground Control West, Ground Control East, Clearance Delivery, and Flight Data. This task was very daunting and unsafe to work all combined as it is the time of a departure push mixed with arrivals and maintenance repositions about the airport while also giving clearances, marking flight progress strips, updating the ATIS, etc. The weather was also IFR, protecting airport critical areas, and heavy in trail spacing from ZZZ Center and ZZZ TRACON because of thunderstorms in the vicinity. I felt overwhelmed with the amount of tasks to complete and think that safety was compromised and efficiency was depleted. Staffing needs to immediately be visited, and the ability to call in overtime without the many approvals that are needed. Safety is number one, and I feel that we are not taking care to ensure safe operations exist. Almost all employees are working mandatory 6-day work weeks with no end in sight and working today from XAam until XHpm with 4 controllers is not safe.

## Synopsis

Ground Controller reported safety concerns with working combined positions, being overworked and under staffed especially in weather conditions.

## Narrative: 1

While on descent in to ZZZ, I the CA was PF. We received a different runway assignment than anticipated. We were cleared to "cross ZZZZZ at 3,000 feet, cleared the ILS [Runway] XXR approach ZZZ." The runway change was made in the FMS from YYR to XXR. While in VNAV path and cleared for the approach we set FAF Glideslope intercept altitude of 2,000 feet in the altitude window. The last-minute change left us a bit high so we lowered the landing gear and selected LVL CHG in order to re-intercept the path. ZZZZZ the IF was in the FMS twice and while trying to correct that and heads down and distracted (because we were no longer in VNAV) the aircraft descended through 3,000 feet towards the 2,000 feet set in the ALT window. I caught the mistake at approximately 2,600 feet MSL and leveled off until intercepting the glide path. There was no correction from ATC, no known traffic conflict etc. Normal uneventful landing. Upon further consideration I determined it was best to file a report. Cause - Short night, last minute runway change, lack of recency of experience...infrequent flying over the last year with the pandemic. PF [should] have better situational awareness and avoid both pilots being heads down even if the PNF is having difficulty correcting the FMS issue.

## Synopsis

Air Carrier First Officer reported an altitude deviation during approach caused by possible fatigue, a late runway change and lack of recent flying experience during the pandemic.

## Narrative: 1

While flying I failed to fully configure by 1,000 feet AGL. Approach was a Visual Approach. Conditions were clear, 10-mile visibility, and light winds. When landing on Runway XX, TRACON had a restriction to cross a point at 2,600 feet. Configuration at that point was Gear and Flaps 15. Began the descent but had trouble initiating the descent due to automation configuration. During this phase of the approach for some reason I thought I had until 500 feet AGL for final configuration during a Visual Approach. Final configuration was accomplished by 700 feet. Later I referred to the Operating Manual and realized my mistake. Causal factors [included] a lack of recent flying. Aircraft was a B737 Max and this was the first time I flew one in over X years. This aircraft does not slow down and go down like the B737 NG thus adding to configuration delay. Failure to remember that ALL approaches require final configuration by 1,000 feet. Pairing had a XC: 10 Sign-In requiring me to get up at XA: 30. Although this occurred at approximately XI:00 I had already been awake for 9 hours, some of it on the back side of the clock. Perhaps have the same criteria for both IMC and VMC as far as being "in the slot" this would eliminate any confusion at all. Bottom line, I confused the issue and will not allow that to happen again.

## Synopsis

Air carrier Captain reported final configuration was not accomplished until 700 feet which is not in accordance with the manual.

## Narrative: 1

I arrived at the aircraft about an hour prior to departure. The gate agent checked me in and let me down the jetway. I began my standard pre-flight flow, loading the flight plan, and setting up my EFB. Due to COVID, I had not been flying very much (my second turn/trip since 202011) and I was making sure I double checked all data entries and flows/procedures in the cockpit. After completing the pre-flight, I was again focused on double checking the route and weather. Unbeknown to me, a deadheading crew stayed on the aircraft after arriving from their inbound/working leg. The flight departed uneventfully and safely arrived at ZZZ. Because of COVID and manpower adjustments, I had not been flying recently. During pre-flight, and while setting up the cockpit, my focus was 100% on completing procedures and properly setting up the FMS. I had very low situational awareness on what was going on in the back of the aircraft, and any ramifications during the crew swap. During the next recurrent training or quarterly distance learning, the importance of minimum crew should be emphasized. In addition, it should be emphasized that an off going crew, though trained on the aircraft, are considered "passengers" if they are not specifically working the flight.

## Narrative: 2

When I scanned my badge at gate, I was advised by Agent that there were deadheading FAs already on-board, because they brought the aircraft in. I was the last working FA to board aircraft. When I boarded, I noticed several FAs and a couple pilots already seated. This constituted a minimum crew violation since all working FAs were NOT on-board prior to customer boarding. It could be helpful to make it a bit more clear that, even when FAs bring an aircraft in and are deadheading back on the same aircraft, they must exit the aircraft (take their belongings??), and scan their boarding pass at the gate with the Agent, since they would then be considered a passenger. It could also be helpful to send a reminder to our Agents kindly asking any inbound crew (pilots or FAs) to deplane (with their belongings?) until minimum working FAs are on-board, to comply with FARs.

## Narrative: 3

When I arrived at ZZZ in the morning I discovered my First Officer had been replaced. At that point I discovered that I would have a new First Officer on each leg probably a short call reserve guy there had been a weather event the day before on the east coast. The first leg was uneventful and the First Officer and I said our goodbye's. I was assigned to fly the same aircraft again on the leg to ZZZ1 and assuming the second First Officer was also called out short call. I stayed on the aircraft to pre-flight and do the walk around in case he was also delayed getting to the airport. Apparently, at some point the gate agents allowed some DH crews to board the aircraft while I was doing my pre-flight checks. I never learned of this for XX days and can only assume that if I heard them boarding that I thought it was my working flight attendants or catering. When my First Officer arrived at the aircraft, we completed the pre-flight checks and then I walked back to give the flight attendants a briefing. Since this was so long ago, I can't say for sure what I did or didn't say to them but I probably didn't say anything about the minimum crew because they were all there and boarding had begun. I was never informed by any flight attendants or gate agents that DH crew had been boarded before they arrived. I could have been more aware of who was getting on and off the aircraft. But the DH crew themselves should have realized there was no FAs on board and did the right thing and deplaned. Suggestion - Gate agents [should do] their job and not allowing DH crew on aircraft like their supposed to.

## Synopsis

Air carrier flight crew and a Flight Attendant reported a minimum crew issue prior to boarding of deadheading flight attendants and pilots.

## Narrative: 1

While flying Southbound at 1,800 feet. I established radio communications via CTAF. Self-announcing to low level helicopter traffic in the vicinity of the [POU] airport in order to ensure proper separation. I was queried by a voice as to my call sign, in which I replied my call sign. I believed at the time that I was speaking with the operator of the helicopter which I was attempting to communicate with. The voice then advised me that POU Tower was currently open. I requested clearance, which was approved. The Controller did advise me that a violation may have occurred. The flight continued without incident where we landed safely at the destination. All NOTAMs for the enroute phase of flight were checked prior to with no mention of normal hours resuming at POU. It has been my experience since the COVID Pandemic that Dutchess Tower was operating on an amended schedule, 4:00 PM Tower closure. I was not aware nor did I see any notice that normal hours had resumed. I did call the POU Tower after landing. I did identify myself as the pilot. ATC collected my information and advised me [further]. I was advised that no notice or NOTAM was put out as to the change, but LACK of a NOTAM was the indication that normal hours had resumed. A NOTAM or notice needs to be circulated advising local pilots who have become programmed to the early Tower closure since the beginning of the pandemic, that normal hours have resumed. More so than just the "lack of a NOTAM."

## Synopsis

Pilot reported the ATC Tower at POU airport closed mid-afternoon during the COVID-19 pandemic, but unbeknownst to the reporter; the Tower had returned to normal hours of operation during this flight. Reportedly, there was no notice or NOTAM advising of the change.

## Narrative: 1

From frequency XYZ.A to XZB.A we not only received a ridiculously late handoff, but we in turn found our self at 22,000 feet 30 miles out from the airport. We were only able to maneuver to descend because of visual conditions. This is the first of many reports due to ATC inappropriate staffing. The Controller that was unable to hand us off was clearly saturated with work and busy enough to make us pilots concerned that the Controller did not have ours or others best interests at hand.

## Synopsis

Pilot reported communication issues with ATC left them too high near their destination and stated the Controller was overworked and understaffed.

## Narrative: 1

I had just arrived for my shift for the day. It was mostly slow to start with, however bad weather had already moved through the airspace and another, much larger weather system was moving into the sector below me. I was told the ZZZ [Airport] and ZZZ1 [Airport] arrivals were shut down over ZZZ2 [Airport] and would be coming my way. Next thing I know, I have about 20 planes flashing at me from sector X West of me and every airplane was routed ZZZZZ [Intersection], ZZZ [VOR] next fix. A lot of those next fixes were bad routes and would have not been per the letter with how we would give planes to ZZZ Approach or ZZZ1 [Approach]. Besides that, though, a lot of those airplanes were not properly separated and would have been in conflict shortly after entering my airspace with not only the airplanes they were handing me but with the airplanes I already had. They needed ZZZ1 [Airport] arrivals down to at least FL280 or lower at Sector Y (the sector I was feeding) and we were receiving them. Stacked from [Sector] A and [Sector] X some as high as FL400. That gave us approximately 20 miles to get them down all the while receiving north bound traffic over the same 10 miles stretch that we were putting south bound planes through because ZZZ1 [Airport] departures and overflights from ZZZ3 [Airport] had not been shut off. After it become so congested at the south end of my sector that I could no longer separate planes or data blocks, I requested a D Side. One was not available because the only staffing we had was currently plugged-in working. I then told informed my Supervisor that I could no longer accept hand offs from Sector X. He said he would tell them. Sector X, however, continues to drive airplanes into my sector without a handoff or point out. I had to take evasive action on one airplane and turn one of mine 35 degrees to avoid hitting an airplane that was 10 miles in my sector with no hand off or point out. Once we finally got that sorted out, those airplanes continued south to [Sector] Y who became so saturated that he could no longer take handoffs from me so I had to put airplanes into holding with nowhere to hold them because military airspace was active and I was still very congested. I may have violated military airspace because of trying to descend airplanes to avoid another aircraft at the same altitude. I also had to pull my mask off at one point when I started to get bad read backs because I didn't have time for bad read backs. Every second counted when you are solid red with no D side. I did eventually receive a D side sometime later. There NEEDS to be better pre-planning. Especially from TMU. Also, when it is requested that TMU shuts down departures from ZZZ1 [Airport] they need to do it! Telling ZZZ1 [Airport departures] we can still take them but 15 in trail doesn't work. Also, the masks are a safety hazard when we are busy! Pilots cannot hear us properly and if we are having to repeat ourselves, wait for another read back it is taking away precious seconds we could be giving the next plane a control instruction and breaking our thought process to the next airplane. Also having only enough staffing for one D side in the entire area is ridiculous! Every sector needed a S side and there was only one available. We are back to normal schedules and working 6-day work weeks with overtime and the staffing is still not enough for safety! Not to mention we are

tired working 6-day weeks. It doesn't allow us to properly recoup after long days working. There also needs to be more organization when something is shut down. Planes should come to us sequenced so we can then Sequence with the airplanes we already have and not aimed at the same fix.

## Synopsis

Center Controller reported an unsafe shift due to weather and lack of staffing resulting in handoff and separations issues.

Primary Problem : Human Factors

## Narrative: 1

Taxi for departure, instructed to taxi from the FBO ramp to runway via [Taxiway] 1 cross Runway XX, I missed the right turn onto [Taxiway] 1 and ended up on the X/XX intersection via [Taxiway 2]. I made a right turn onto XX around the same time that ground asked if I needed assistance. I verified with ground that a left turn would get me onto [Taxiway] 1. This area is noted as HotSpot on the airport diagram. I had noted the hot spot earlier when reviewing the diagram and was familiar with the airport. Possible contributing factors are a lack of recent operations at airports other than my home base (approximately four months of no cross-country operations involving landings) due to COVID and possible distraction due to having just dealt with an apparently flooded engine. I was probably also expecting Runway XX instead of X; winds were light and variable, and tower was apparently switching runways with some frequency.

## Synopsis

Private pilot reported a taxiway incursion and cited lack of flying and being distracted dealing with a flooded engine as contributing factors.

## Narrative: 1

Airline was notified by the FAA twice that Aircraft X was not broadcasting ADS-B Out Parameters. The First time the item was deferred and wasn't worked for a year due to the aircraft being in storage because of the pandemic. The item was worked in ZZZ1 and signed off. Airline was notified again the ADS-B Out was not broadcasting. Airline found a wire that wasn't capped as called out in COA (Certificate of Approval/Authority) X.

## Synopsis

Maintenance Technician reported one of their aircraft was found to have wiring issues causing the ADS-B to malfunction. The aircraft had been in storage for an extended time period.

## Narrative: 1

Sequence XXXX is paper legal but challenges common sense. Bottom line up front, the overall experience level and proficiency of the [aircraft type] pilot group, the training for ZZZZ, ZZZZ itself and the lack of an opportunity to get real rest while flying creates the perfect storm of factors with the potential to cause a true safety event. We had no safety issues on training flight X into ZZZZ and on training flight Y out of ZZZZ. However, this trip inherently causes the whole crew to be "in the red" at the gate day one. The [aircraft type] Pilot Group in normal times run on the low end of the proficiency spectrum with 4 takeoffs and landings a month being a good month as compared to a narrow body pilot who will get close to that in one trip alone. With COVID, the reduced flying schedule, and

pilots taking leave of absences this proficiency has diminished even further. There is also a steady stream of new [aircraft type] pilots entering the fleet despite the flying downturn as retiring pilots are often [aircraft type] Captains. For example, on this crew, the Captain had XXXX hours, the Check Airman and myself had in the XXX-hour range, and the experienced pilot was the Relief Pilot with around YXXX hours. I would say this is typical with two of us have less than a XXXX in the equipment and one pilot being experienced. Point being the [aircraft type] pilot group in a COVID world with diminished proficiency is not at their peak performance capability. Now we add in ZZZZ and the training into ZZZZ. My training into ZZZZ took place at night on the jump seat. Again, this may be paper legal but to me negates the intent of in person training. After this trip my spouse asked me how did the mountains look. My reply, "What mountains?" On our VFR night, I could see none other than the EGPWS red and yellow dots. Luckily, I have a strong memory of going into ZZZZ in a [type aircraft] model and my flight engineer sweating as he ran spaghetti charts trying to figure if we could climbout. With training at night into ZZZZ, it is like someone asking you to find the bathroom in a dark hotel room never seeing the room in the day. You know there are some walls and furniture for obstacles but until you turn on the lights you don't get a sense of how close you are to smacking into something. Also, the elevation and ground speed while sensed was reduced due to being night. We as a [aircraft type] group fly through mountainous terrain to mountain airports that are not high altitude. Thus, we are "new" as a group on this equipment despite previous experience on other equipment. Finally, we have the problematic rest issue which is paper legal and perplexing of how it meets the intent of rest. Typically, the Relief Pilot gets the first break. On our Continent Y flights that depart at similar times, most don't sleep but the key difference they land 1-3 am body clock time. So, staying awake the whole flight and not being fatigued is more attainable. This sequence, however, lands at XA am body clock time and flies through the whole WOCL. If a flight is going to this location area, they also land close to XA am body clock time but most Relief Pilots will sleep as the flights takeoff closer to a normal bedtime hour. On this sequence, I would suspect most Relief Pilots will not sleep as they are past the normal circadian dip in the afternoon but not ready for nighttime sleep. End result landing in ZZZ or ZZZ1 with a fatigued third pilot. Now for the PF/PM. Usually, the PF takes the second break. But this is inherently problematic on this trip. If you alternate legs, the PM from the first leg now will be the PF on the second leg. The concern is that typically on a long-haul flight requiring three pilots the workload at this point has decreased and that pilot is winding down for their break. This sequence is the exact opposite. Everyone after sitting on the ground for an hour plus is at a heightened awareness due to the ever-present terrain and typical weather. So, the usual 15 minutes after takeoff to start a break might not work in that it may be less than ideal while still climbing out navigating storms to swap seats. Since we had four pilots this played out differently. Once the PF is able to commence a break that heightened awareness may work negatively against sleep. Also, on long haul flights this is the quietest break as the first service is done and the second hasn't started. Not the case with this sequence as their will be a service because it is a new flight. There is a strong potential that none of the pilots get sleep. All this will be repeated the second day with the added potential for hotel sleep issues etc., and maybe not being able to get the restorative sleep needed to make up for the first night deficit. The second night the takeoff out of ZZZZ will be the most critical in my opinion especially if there is strong weather and or any maintenance issues. But will a pilot really call-in fatigue on the go home leg to attempt rest at 8,000 feet? Finally, there is the human element that no one wants to talk about. What are the options for a crew who knows their limitations when it comes to this trip such as proficiency, experience, fatigue, age etc. All four of us didn't think this sequence was smart and were cautious about being there. Most [aircraft type] sequences are 1 leg and 1 leg or it is a day turn. COVID has changed this but not the expectation level of the [aircraft type] pilot group for this type of flying. When I was junior in the company on reserve, I flew a lot of ZZZ2,

ZZZ3 and ZZZ4. Why because the senior pilots could avoid these high workload cities. Now we are on a senior fleet that by definition is older. There is no true junior pilot on the fleet. Pilots are doing their best to see and avoid this sequence understanding their limitations. I think this adage sums up the situation there are bold pilots and there are old pilots but there are no old, bold pilots. The sequence is ripe with pitfalls and I think the group would rather be old than bold. Somethings we can't overcome no matter how good or professional we are as pilots. One is fatigue. Two is experience and proficiency. This sequence challenges both of these. [Airline] pilots will fly to ZZZZ. This is not in question. How we do this and how smart we are about this is the reason for this report. First examine if the loads and cargo warrant the use of the [aircraft type]. If yes, can it be flown into daylight hours letting the pilots be at their peak waking performance? This would allow two of the challenging factors of this trip to be negated which are night operations into ZZZZ and rest issues. If no, can the trip be divided into a ZZZ1 turn and a ZZZ turn at night that leaves earlier? Still not ideal but better. Finally, can training be accomplished in daylight hours. We can't change the challenging nature of ZZZZ's terrain and weather, but we can change how we operate in and out of the airport to recognize rest concerns, crew limitations and thus optimizing safety every flight.

## Synopsis

Air carrier First Officer reported safety related concerns with flying into and out of a challenging foreign airport. Reporter cited lack of flying, training and fatigue inducing scheduling all increase the risk of flying into this location.

Narrative: 1

I am not sure the exact detail but it is my understanding that due the COVID crisis ZZZZ airport (ZZZZ) shuts down operation at XA:00 Local. Aircraft X is 'scheduled' to depart at XZ:50 L. Clearly this is unrealistic planning. CLEARLY. I had done this flight the previous week, for the first time, and didn't appreciate how unrealistic the planning was. This is because we got to the airport early, had a light load and we were authorized an early departure. That flight was 'uneventful'. This flight was very different. We showed up on time but were unable to get on the airplane because they were still deplaning wheelchair passengers. The flight was full, XXX passengers that all expected and deserve an uneventful flight. The agents did the best job possible, as well as the flight attendants (who did, as usual, a wonderful job as they were quite aware of the restriction at hand). ZZZZ airport operations is also quite aware of the unrealistic nature of this plan and, although trying to be helpful, were constantly reminding us of the impending airport shutdown. We blocked out 1 minute early. The push and startup were uneventful although very rushed, despite the knowledge we needed to be safe and not 'rush to comply'! We had planned, per the ATIS, for a south departure but ZZZZ, I am sure to 'help' the flow, changed the departure to the north. We safely accomplished all checklists and briefings and managed to make it down and 'ready for takeoff' at approximately XX:00 z. The whole time from pre gate to this point we had been 'reminded' multiple times by everyone including dispatch (who did a fine job) of the impending 'return' to the gate if we didn't get airborne on the hour. Upon check in with tower we were told to stand by. I was fully expecting them to tell us that we were unable to depart and to return to the gate. We waited and were ultimately cleared for takeoff. Our off time is XX:03 z. It is my belief that, despite the accounting of this event, the entire crew did an outstanding job and I believe we did not compromise safety despite multiple opportunities to do so. I am filing this report the unsafe nature of this 'setup' and also to account for a 'late' departure from ZZZZ at XX:03 z (XA:03 L). The rest of the flight was, thankfully, uneventful. I believe my previous description outlines the factors. How anyone can plan for a 10-minute window on a full international flight, departing at XA:00 am body clock time in a foreign location is beyond me. This is an accident or a incident waiting to happen that is totally unnecessary. This is a peacetime operation, not wartime. Change the schedule. Put some realistic thought into how pilots can be pushed into rushing to comply. As the Captain I had to balance the needs of our passengers, the demands of the local airport personnel, the well-being of the crew and the safety of entire operation leading into a stressful 10 minutes of 'getting it done'. I will be inclined to decline in the future.

## Synopsis

Air carrier Captain reported that a foreign airport under COVID-19 closure scheduling does not allow for proper pre-flight procedures.

## Narrative: 1

As a pilot, I am not required to wear a mask in the flight deck, because of the potential safety consideration of not being able to don my oxygen mask quickly enough and degradation of communication. But yet I have to watch the flight attendants wear a mask continuously throughout our duty day. I have had many flight attendants complain of fatigue and headaches due to wearing the mask. I fear this could cause a safety issue- degradation of communication with passengers, unable to communicate effectively in the case of an emergency, slower reaction time in an emergency. I would also argue that ground personnel should not be wearing masks. As I conduct my walk around the aircraft,

the noise of the APU and airport in general prevent normal conversation. Yelling and hand signals have to be used. Many, many times I have been unable to understand what is being yelled at me, and have to move within 6 feet of the other person to understand what is being said. Ground personnel are also throwing heavy bags constantly, in all weather. The WHO does not recommend wearing masks during heavy exertion, and a wet mask is a worthless mask. The front-line workers of the airlines were forced to wear a mask based on the potential that the mask would prevent transmission of a virus. I argue that not enough research and consideration was made into the potential harms of wearing masks in and around aircraft. OSHA recommends mask fit tests, education, breaks from masking, and studies into the effects of mask wearing in workplaces. I do not believe cost benefit analysis were conducted. We should not be masking children younger than 5 years old. This is a recommendation by the World Health Organization. I would like to see a survey or study done on the effects of mask wearing on employees in the aviation industry. I understand a study was conducted on mannequins in regards to viral transmission on aircraft, but this is inadequate.

## Synopsis

Air carrier First Officer reported safety and health concerns with personnel having to wear face masks.

## Narrative: 1

Upon arrival in ZZZZ, we were instructed to taxi on Taxiway E and hold short of the ramp since our gate was occupied. I was watching the activity on the ramp that was indicating a possible gate change to hard stand X. During that time with the parking brake set and while I was looking at the airport diagram the First Officer informed me that we had reached the 3-minute required cool down of the engines. I asked him to shut down engine 2. I instinctively followed his movements and noticed that he was holding eng1. Without thinking I said "no no no" and as a result he moved the engine master from off back to on and the EGT momentarily entered the red zone. All other indications were normal and no ECAM or STATUS messages were displayed. I then asked the First Officer to shutdown engine 2 which he did. We taxied to hardstand X with no incident, shut down engine 1, and performed the parking and terminating checklists. We debriefed the incident and it was obvious that the First Officer was really affected by the mistake. After the last passengers deplaned, I called Maintenance Control to discuss the incident. Local Contract Maintenance also arrived because they were going to move the aircraft. I asked the crew to head to the hotel and I stayed with the airplane to make sure everything was taken care of. The EGT exceedance was considered transient and the required inspection was minimal so the airplane was available to return to service quickly and caused no delays. Later I met with the First Officer and we had a long conversation regarding what went on, the threats this pandemic had brought to us as a pilot group especially the fact that we don't fly much, what we both learned from the incident and what we could have done better next time.

## Narrative: 2

Taxing to the gate, ramp told us to hold short of the ramp on [Taxiway] E. While holding short of the ramp on E, I told the Captain that we had our 3 minutes for engine cool down.

The Captain told me to go ahead and shut down engine 2. I ran my flow and instead of selecting engine master 2 I select engine master one. The Captain saw that I had select the wrong one, and said, " no no no". With the Captain saying that, I took that as put engine select one back to on. I put the selector back to on and the engine stayed running but the EGT came up and momentarily touched the red arc. Once we got to the gate, and accomplished all of the checklist and got the passengers off the plane the Captain called Maintenance and was talking with the local Maintenance guys on the situation. He stayed behind to make sure everything was being taken care of properly and making sure Company Maintenance and local understood what had happened instead of just writing it up and walking away. Kudos to the Captain! I was disappointed in myself for making the mistake and during the debrief the Captain could see that. I apologized to him for making the error that I did. We talked about it and he mentored me through it. I believe not flying that much in the past year do the pandemic played a factor into my error. I am not blaming the pandemic, but do to not flying as much it's a link to the error. Another link to the error, is I reverted to the last plane I flew. We would shut down engine one while taxing in. What I learned from this situation is that when you are not flying as much as you normally do, you really need to slow down and be more deliberate in your flying and flows. Think what you are doing and what you will be doing next. Do more chair flying to help close the gap from not flying as much. Do to flying not as much before each trip I will review flows, procedures, and do more chair flying to keep this from happening again.

## Synopsis

Air carrier flight crew reported the First Officer inadvertently turned off the number one engine rather than engine number 2 during taxi-in resulting in a momentary EGT spike. Both crew members cited lack of flying as a contributing factor.

## Narrative: 1

Ordered to wear a mask that covers my nose and mouth while working on position. Noticed multiple read back errors as pilots were having a difficult time hearing and understanding my control instructions. Covering my mouth directly impacted my ability to communicate effectively with pilots. Wearing a mask while on position is also a major distraction as it interferes with my headset. I feel as though I could not efficiently control traffic, check routes and perform any other duties on position with this distraction. I believe this has also led to a work environment wherein certain members of management are seeking disciplinary action against controllers. This is raising the stress level of an already stressful atmosphere. It has become abundantly clear that safety of the NAS is no longer the priority at ZZZ Center. Air Traffic Control Specialists should not be required to cover our mouths while on position. The safety of the NAS and the flying public is being **compromised to comply with a "mask mandate" order. Covering one's mouth with anything while on position directly effects an Air Traffic Control Specialist's ability to safely and efficiently separate aircraft, issue control instructions and disseminate weather information.** I do not accept responsibility for potential incidents or fatalities due to being forced to cover my mouth while on position. It is unsafe.

## Synopsis

Center Controller reported safety concerns with having to wear face masks while on position. Controller referenced the face mask is distracting and make instructions difficult for pilots to understand.

## Narrative: 1

At ZZZ [Center] I have experienced multiple issues with equipment failures related to the Level 3 cleaning being performed. Today we had 4 separate data input keyboards which were not functioning properly. On one sector, as we tried to open the sector, the code button on the \*DIK was stuck. As a result, we could not see that any handoffs were in progress to the new sector being opened. This caused unsafe delays in opening sectors as we tried to find the root of the problem. I have noticed the multiple equipment issues since we started level 3 cleanings. I reported the issues to the SOC, they said they understood and agreed that it has a negative effect on the equipment, but there is nothing they can do about it. They said that they have also expressed their frustration on the damage it is doing to equipment, but fallen on deaf ears. Stop Level 3 cleanings. The CDC has reported that there is a 1/10,000 chance of COVID transmission through surface contact. One of the latest CDC releases said that these cleanings are "theater" and not necessary. The FAA should be following CDC guidelines and stop these cleanings.

## Synopsis

Center Controller reported that due to COVID-19 cleaning, four separate data input keyboards were not functioning properly.

## Narrative: 1

Picked up newly acquired aircraft at ZZZ1 [Airport]. Filed an IFR flight plan to ZZZ2 [Airport]. Prior to departure I tried the ZZZ Approach frequency on the ground to activate my flight plan. There was no response (probably no GCO). On departure I called ZZZ Approach to activate flight plan. ZZZ [Approach] advised they had no flight plan on file; I requested in-air filing. ZZZ [Approach] notified [me] they were understaffed due to COVID and couldn't help. Advised contact with ZZZ1 Approach. ZZZ1 Approach said they couldn't provide services and instructed me to remain clear of Class Bravo. I misread the new-to-me GPS and entered Class B airspace. I was monitoring XYX.Z; ZZZ1 [Approach] called, vectored me out of Class B and advised ATC phone number to call. There were several contributors to the incursion but ultimately it was avoidable by taking different action when my flight plan was not available - landing and re-filing. Contributing factors included (1) unavailable flight plan, (2) familiarity with the equipment on board this aircraft, and (3) pilot's expectation of receiving a clearance in unfamiliar airspace (95%+ flights are conducted under an IFR plan ).

## Synopsis

GA pilot reported not being able to activate an IFR Flight plan due to ATC not having it on file. An adjacent ATC facility could not provide help either. Pilot also reported entering Class Bravo airspace unintentionally after misreading the aircraft's new GPS system.

## Narrative: 1

This covers two flights in the same airplane. I was doing a Captain OE flight with a Check Airman for both legs. The airplane had come from the hangar to try to address an MEL. The FO's audio control panel inoperative. The procedure in the MEL was used to recover the audio channel on the affected side. However, doing this rendered the following systems inoperative. The FO's side stick Push To Talk (PTT) would not work. The ACARS would not work. We failed to write up the above items since we knew the cause was the audio switching panel issue. If we had written up the ACARS as not working, we would have seen MEL #### which has some Dispatch procedures and operational procedures on our part. One of which is to monitor company communications thru SELCAL or voice on appropriate VHF/HF frequencies. However, the FOM enroute/communications section states that flights will continuously monitor ACARS, SELCAL, and/or appropriate VHF/HF frequencies (121.5 does not transmit SELCAL). Although ACARS is the primary means of maintaining this watch domestically, foreign coverage is limited. If ACARS is inoperative or in an area without ACARS coverage, establish a SELCAL or monitor the appropriate voice frequency. The Company must be able to immediately communicate with the aircraft at all times. We both failed to do this on both legs of the day. Although I finished training on Date, my first OE trip started approximately 3 weeks later. This was my second OE trip. There have been huge time gaps in my training and I was still feeling very much in the yellow on this airplane. My inexperience with the airplane and domestic flying kept me very firmly in the yellow while flying those legs. It wasn't until I was able to decompress from those flights the next morning that it occurred to me that we didn't adhere to the above referenced FOM. Even though I am flying with a Check Airman and said Check Airman has signed for the airplane, I still need to be in command and take my time to check all of my available references. Even if this means the flight goes out late or we refuse the airplane.

## Synopsis

Air Carrier First Officer reported not following company communication procedures and cited lack of flight time between training and actual OE flight as a contributing factor.

## Narrative: 1

The flight was worked by myself/CA as the PM and the FO as the PF. Both of us are reserve pilots and haven't flown very much this year. Extensive ground delays combined with multiple weather reroutes caused us running 3.5 hours behind schedule. We ended the day with 11.8 hours duty and approximately 8 hours flight time after factoring in a maintenance test run prior to our turn. On the arrival we were assigned delay vectors for Runway XXC due to ZZZ airport's wind shear concerns. We continued to plan accordingly. Visual conditions in the ZZZ terminal area, current speed was 220 knots, approach cleared us down to 3,000 feet and 030 heading. Shortly after they asked if we had the field in sight. We confirmed, then they cleared us for the visual approach Runway XXC and gave additional instruction to slow down to 160 knots. The PF called for Flaps 8 and then Flaps 20 at appropriate speeds. As we continued to slow down, he contemplated a need for flaps 30. Due to it being almost XA PM, the flight deck was dark, so I grabbed the speed cards and turned on my chart holder light to verify if we needed flaps 30 to stay above maneuvering speed. I noted flaps 20 provided a 4 knot buffer above slowest maneuvering speed, however, the flight conditions caused some light turbulence stemming from gusty wind conditions. The PF called for flaps 30 to provide a bigger margin of safety above Va. Unfortunately, as I got distracted with our Va and speed cards previously mentioned, I failed to notice that the APPR mode was not armed. As result, staying in HDG mode and distracted we flew through the Localizer. Approach called and queried us on our flight path. The PF disengaged the autopilot and corrected back without delay while I responded to ATC that we're correcting. The PF landed the aircraft shortly after without any further irregularities. Despite a warranted concern to make sure we're at a safe speed for the given aircraft configuration, I let myself become distracted with said task and should have done better dividing my attention. As soon as the words "cleared for the approach" are broadcasted, focus should shift to the FMA by both pilots for confirmation that APPR Mode is armed.

## Synopsis

Air Carrier Captain reported a track deviation and cited lack of flying by both pilots contributed to the event.

## Narrative: 1

Was re-routed on different arrival due runway change from XC to XXC; we were subsequently given a crossing altitude of 12,000 feet by ZZZZZ [Intersection]. We were close and had a tailwind of 45 knots. I mentioned several times to the FO, who was PF, that we needed to get down. First, we were told to speed up to 300 knots and subsequently slowed down to 250 knots. I loaded points and altitude in the FMC and initially the FO was high on the path and going higher, but then started to correct to the path. It looked like we would still make restriction initially. Again, I told him to get down and then the FA called from the back. I made a PA which distracted me from monitoring the FO. He changed the modes from VNAV to VS when we were slowed and leveled off to slow down. A radio change came and he had to talk to ATC since I was off the radio; then we missed the altitude constraint by 800 feet. The FO was freshly back from a year leave due COVID. Also, I was being distracted and off frequency due to FA call, the tailwind and my underestimating the FO's ability. All these contributed to my poor pilot monitoring. It initially looked like he was joining the path but when he changed modes to VS all bets were off. The FO was behind and I did not realize it fast enough to prevent the mistake. Focus on flying plane and monitoring same too complying restraints or clearances before other tasks.

## Synopsis

Air Carrier Captain reported an altitude deviation during arrival. Captain cited the First Officer's lack of flying and being distracted by a PA as contributing factors.

## Narrative: 1

Flight was from ZZZ to ZZZ1 a route that both pilots were very familiar with and regularly fly approximately once a month. Our filed route and our cleared route was "ZZZ2 ZZZZ1.ZZZZZ1.ZZZZZ2.ZZZZZ3.ZZZZZ4.ZZZ3." Cruising at FL300 ZZZ Center on [frequency] called: "Aircraft X cleared direct ZZZZZ3" as PNF I looked down to select direct ZZZZZ3 in the FMS. I was surprised to see that neither ZZZZZ2 or ZZZZZ3 was in the flight plan entered in the FMS. I entered ZZZZZ3 and selected DIRECT. At this point we were approximately abeam ZZZZZ2 and paralleling our correct route but several NM to the east of it. I was certain that I had entered both ZZZZZ2 and ZZZZZ3 into the FMS prior to departure from ZZZ, but apparently, I then had inadvertently linked the end of the ZZZZZ SID which was ZZZZZ1, to the beginning of the ZZZZZ5 STAR which was ZZZZZ4, which effectively eliminated the two waypoints ZZZZZ2 and ZZZZZ3 which were in between the SID and the STAR. Our SOP is for both pilots to review the filed flight plan, the clearance and the FMS flight plan together before leaving the ramp. I was hurried that morning and made a mistake which was not discovered on the ground because we neglected to review the Flight Plan/Clearance/FMS per the SOPs. Our flying has been greatly reduced in the last 12 months and we seemed to be rushed to prepare for the flight despite showing 1 hour and 10 minutes prior to the scheduled departure. Strict adherence to the SOPs is planned for all future flights.

## Synopsis

Corporate pilot reported a track heading deviation after misprogramming the FMS resulting in two fixes being dropped from the route. Pilot cited time pressure and lack of recent flying as contributing factors.

## Narrative: 1

I was the Captain on Aircraft X from ZZZ to ZZZ1. We were boarding the flight and all activities by my First Officer and I were finished. We accomplished the release briefing, departure review, and the appropriate checklists. Our flight was originally planned with a Ramp Fuel of 6300 [pounds]. We had 6600 pounds on board as Gate did not have any ground power or ground air available. I found out that through personal sources that ZZZ1 was going ATC - Zero due to COVID cleaning. This information was not on our release and had me concerned. I called our Dispatcher and he stated he was unaware of this situation. My Dispatcher did some checking and found the closure announcement. We determined an alternate of ZZZ2 and enough holding fuel for 48 minutes would be enough. This put the Ramp Fuel at 10,000 pounds. I accepted Release X and ended the call. The flight took off and we proceeded to ZZZ1 via the STAR arrival. We were initially given a hold assignment at the ZZZZZ Intersection. Just as I had put that hold into the FMS, that clearance was cancelled and we were sent directly to ZZZZZ1 to hold as published. This hold was on the final approach course of Runway XXR. We held for about 15 to 20 minutes before being cleared for the approach. Had I not checked my personal sources, there is a good chance the flight would have had to declare a fuel emergency. However, the flight was done safely and arrived only a few minutes late.

## Synopsis

Air carrier Captain reported finding out a FAA facility was going to close via personal sources rather than through the flight release information.

Narrative: 1

I am a flight instructor at a 141 school. I am currently one of the instructors teaching the Private Pilot curriculum. The error I committed was sending one of my students on a solo flight without a current solo endorsement. Normally in our curriculum, a student pilot solo endorsement would not expire before the student earns their PPL. Due to COVID, our curriculum got pushed back and winter break put a pause on the private curriculum just a few flights before the check ride. The time added was enough for all student solo endorsements to expire. Knowing this, we added a reminder in our CFI guide that follows along with our Private Pilot Training Syllabus. The reminder was placed on the flight just before the solo flight. Due to the lost proficiency over winter break, I was not ready to give this student a new solo endorsement at the beginning of this spring semester. The issue began on the flight before the solo flight. This particular flight was the fourth time I had instructed this curricular period in the last 30 days so, I felt confident on the expectations of the flight. Because of this, I did not review the CFI guide before or after the flight and therefore missed the solo endorsement reminder. With my full permission, my student then flew solo the next day. I discovered the issue when I went to send that student on their next solo flight and I asked them to prove to me they had their required documents and endorsements. I then quickly gave a new solo endorsement.

## Synopsis

Flight Instructor reported a student flew a cross country flight without having the correct solo endorsement.

## Narrative: 1

Approximately midway through the pushback, the ground crew indicated that the tow bar had broken and requested that I set the brakes. It caught me off guard as I hadn't felt anything unusual, so I asked them to clarify that they indeed wanted me to set the brakes. They confirmed that they wanted [me to] set the brakes, so I complied. The push crew lead left the radio to retrieve an aircraft mechanic before I was able to obtain more information. The FO and I had a brief discussion as I had a vague recollection that broken tow bars might require a logbook entry, but the only reference we found was that it required a safety report. When the lead returned to the frequency, he indicated that the aircraft mechanic had inspected the nose gear and there was no damage (I witnessed a gentleman with an aircraft maintenance safety vest walk out from under the nose, but I did not speak to him). I asked him to please clarify the nature of the issue, and he indicated something to the effect that the bar had "cracked where it hooked to the tug, not the airplane." I asked the FO if he was satisfied with the response, which he indicated he was. They swapped the bar and we continued without further incident. I filed a report after the trip, and was contacted today by my union advising me that I failed to recognize that this event required a maintenance write-up and sign off. The biggest causal factor is my limited time in the seat, exacerbated by little flying during the pandemic. I had logged only XX hours since completing my upgrade in Month X of 2020, and that trip was the first live leg I'd flown in over five weeks. I remembered that a broken tow bar required additional acknowledgment, but I let myself be satisfied that I was compliant when we found the safety report reference. I think I also reasoned that since a mechanic knew what happened, he would have advised me if further action was required, and I see now that's not dependable logic. I will be spending more time reviewing my manuals in hopes of eliminating future oversights. The best suggestion in this case is the one I must make to myself- to know my company policies/procedures better, as well as striving to clearly understand how to access required information when I need it. I did search the FOM while we were stopped, but now know the reference I needed was actually in the OM. In the future, I will call the maintenance center as well, but this only provides another layer, not absolute protection, as they may not be certain of the policy either. Bottom line is that it's my job to know my manuals. I believe that the return of regular flying that looks to be unfolding over the coming months will help tremendously as we all get reacquainted to the tools of our profession.

## Narrative: 2

During push back the ground crew advised the Captain to set the parking brake. After setting the brake he was advised that the tow bar had malfunctioned. They then decided to get a new tow bar and push us out the remainder of the way. After the push back was

complete the Captain discussed what happened to the tow bar. the ramp personnel said it was no big deal because it was broken on the tug side and not the aircraft side. I told my Captain that I think we have to do something for a malfunction of the tow bar so I looked in the FOM and told him he needed to file a safety report. It was later brought to my attention by a union safety representative that we should have returned to the gate and made an AML entry and had a maintenance inspection. I did a search in the FOM for tow bar and didn't see anything that would have led me to believe we needed a AML entry for our situation. Better training on this type of event.

## Synopsis

Air carrier flight crew reported not filing correct paperwork for a tow bar that broke during pushback. The Captain stated lack of flying contributed to the oversight.

## Narrative: 1

After landing at night in ZZZ we taxied as instructed by Ground to a surface designated point. When we arrived, there was an outbound jet taxiing on the south line and another air carrier under tow on the north line. We advised ZZZ Ground of the conflict and they then instructed us to just take the south line after the outbound jet. The First Officer advised me that there was not a ramp frequency when there actually was. We thought we had been cleared in by Ground but by the time I taxied in I felt like something wasn't right due to the congestion on the ramp. I asked again " Are you sure there isn't a ramp?". He then found the frequency on the 10-7 after we had entered the ramp area. After parking at gate, I made contact with ramp and relayed our confusion. Contributing factors include, unfamiliar operations at ZZZ. First time operating there in over a year plus first time at the new terminal. New First officer fresh off OE and only my Xth flight segment in a year due to pandemic reductions.

## Synopsis

Air carrier Captain reported a ramp incursion resulting in a conflict and cited lack of flying as a contributing factor.

## Narrative: 1

On Date, ZZZ [TRACON] experienced a positive COVID-19 test that required facility cleaning. This cleaning required the facility to shut down radar operations, known as an ATC Zero event. ZZZ ARTCC contingency plan would then be put into place. Earlier discussions before I arrived at work discussed the options of how to work the ZZZ [TRACON] airspace. ZZZ [ARTCC] was advised that ZZZ [TRACON] would be working radar in the Tower, and the option of ZZZ [ARTCC] assuming the airspace did not become an option. The contingency plan states that ZZZ [ARTCC] clear the airspace and hold aircraft, not assume the airspace. [A telecom was] convened to discuss the plans for the closing

and cleaning of ZZZ [TRACON]. It was clear to me and those listening at ZZZ [ARTCC] that the decision had been made for ZZZ [ARTCC] to take control of the airspace and continue operations at ZZZ [TRACON]. After the call, ZZZ [ARTCC] was given an hour to work through any issues and develop a plan to accomplish the mission. In conversations with the ATM, I advised him of what the Contingency plan stated, and even had a copy of the plan [sent] to him so he could read it. I also advised him we were creating a plan to work the airspace and we would be ready to go for the XC:00 deadline. I immediately brought together TMU, Tech OPs, FDCS, ZZZ [TRACON] ATM and area X staff to put a plan together to carry out the continuation of ATC services into and out of ZZZ [TRACON]. NOTAM was published closing the ZZZ [TRACON] airspace, TMU had instituted an X hour ground stop to slow the initial volume, I conferred the command center the request and they agreed and put in the ground stop. The plan was delayed for about XX minutes due to traffic volume at ZZZ [TRACON], and we assumed the airspace about XC:XX pm. I sat in the area during the entire event, just to ensure what procedures we had developed were followed. I also ensured correct phraseology was used concerning arrival traffic being cleared on the ILS [Runway] XXR. Overall, the professionalism of all involved provided for an orderly outcome of the event. We controlled the airspace for a little over an hour until the cleaning was complete. My only concern was that we did not follow published procedures during an ATC Zero event. I am filling this out today because I just received a call from another person at ZZZ [Center] concerned that I did not follow proper procedures concerning the ATC Zero event. I did not fill one out that night because I believed I was acting with approval from my ATM and District to assume the airspace and continue operations at ZZZ [TRACON]. We proved that we could operate the airspace in a controlled manner for short periods. ZZZ [ARTCC] needs to develop basic procedures for all of our underlying 24 hour facilities in the case of an ATC Zero event. The controllers on the floor working the airspace need to have the basic information in front of them as they work through the basic issues during such events. While I know that all contingencies can't be covered, that list would be exhaustive, we could have a strong baseline to follow during a similar events in the future.

## Synopsis

Center Operations person reported procedural confusion when they took over the operations of a TRACON facility that went ATC Zero due to COVID-19 cleaning.

## Narrative: 1

I was working a fairly busy session at the beginning of my mid shift. Aircraft X checked on to the NE of ZZZ and was given a heading of 280 and descended to 80, which they read back correctly. Aircraft Y was being vectored from the SW of ZZZ and was descended to 60, which they read back correctly. A little while after descending Aircraft Y I noticed that Aircraft X was at 60 just about to exit the NW corner of the 65 MVA entering the 60 MVA. When I realized that Aircraft X was at the unexpected altitude, there was not enough time to issue a safety alert before they entered the 60 MVA (which was fine for their current altitude). I talked to the pilot of Aircraft X and they indicated that they were sure that they had read back to descend to 60. I reviewed the incident multiple times and only heard Aircraft Y confirm that they were descending to 60. However, both aircraft were on separate frequencies and there could have been a "stepped on issue" that caused Aircraft X's incorrect read back to not get through to me. There are a couple of things I will work on in the future: - The call signs of Aircraft X and Aircraft Y were similar enough that I should have informed them, that they were both on separate frequencies. I will work on making that a priority in the future. - Aircraft X descended 2,000 feet before I realized the deviation. I was fairly tired after a long work week and think under normal circumstances my scan would have caught the deviation. I should have recognized I was not operating at 100% and asked for an extra set of eyes from the ZZZ [TRACON] Controller. In the future I will work on recognizing this and ask for help. - I don't normally put in assigned altitudes on IFR aircraft data blocks but after this incident I will probably start. Keeping up with strip marking can be difficult when busy and take your eyes away from the scope. Maybe having the altitude in the data block may have helped me recognize Aircraft X was descending past their assigned altitude. - I don't normally come in for XA: 15 mid shifts (Usually start at XC: 15 or XB: 15) and should have asked to work a slower position knowing I was fatigued and on my 6th day. From a technology standpoint there are a couple of issues: - I didn't ever see the Low Altitude (LA) alert go off when I reviewed the falcon replay. The LA indication would have definitely got my attention to issue a safety alert. In my experience working and training it seems like it rarely goes off when it is actually needed. That alert system needs to be revamped, it could be a very useful and a life saving tool! - I wish we could somehow keep everyone on one frequency when we are combined. I think there may have been some kind of "stepped on" issue with this situation, that one frequency may have helped with. Our staffing has been really bad lately and controllers including myself have been working lots of overtime since last fall. I know management doesn't have many options to alleviate the problem and I don't mind helping

out with working overtime. However, here are some recommendations that might help: - We have X supervisors that are certified and can work positions. With COVID vaccines going on they should absolutely be used as staffing until we get people through vaccines and some stability in our staffing. I feel like having well rested controllers that are working less overtime is way more beneficial to safety, then having a stand-alone supervisor in the operation as often possible. Once we get out of our current staffing slump, having stand-alone supervision is a great idea! However, it is currently NOT A GOOD use of our resources. - Plan ahead and be proactive. The entire facility was aware over a month ago that controllers were going to be eligible for COVID vaccines in March. However, there was nothing done to try and stay ahead of all the sick hits that we're going to be happening. There could have been COVID vaccine signup sheets back in January or February to find out who wanted it right away, who would wait, and who didn't want it at all; then plan the schedule based off of that. In addition, the union put a schedule together well ahead of the vaccine eligibility to help mitigate the problem, but it was not implemented for some reason. As a result of no planning or forward thinking, for the past few weeks staffing has been very unstable. There have been many last minute changes to controllers schedules with extra OT to make things work. This is not a safe way to run things and could have been avoided.

## Synopsis

Controller reported similar calls signs may have contributed to an aircraft taking another aircraft's assigned altitude. Controller also cited staffing issues as a contributing factor.

## Narrative: 1

Chain of events. ZZZ Ground cleared me to taxi from FBO. 'Taxi to Runway XX via Taxiway 1, Taxiway 2, Taxiway 3, cross Runway XY.' On Taxiway 3, approaching Runway YX/XY, I was looking down at my checklist, when I looked up, I was startled to see a regional jet on relatively short (1 mile?) final for Runway YX. After I crossed XY/XY, the regional jet landed without incident. Human Performance Considerations. First, when taxiing, one needs to be focused outside the airplane. When approaching a runway, slow to look for landing/departing traffic. If I had seen the regional jet earlier, I may have either increased taxi speed, determined no speed change was required or called Ground and advised that I would wait for landing traffic. With the pandemic, until recently, commercial air travel has been significantly reduced. Tower personnel may have been reduced as well. I believe one Controller was handling Ground and Tower. With activity picking up, ATC needs to be staffed appropriately as well.

## Synopsis

GA pilot reported a conflict after being told to cross a runway, and while crossing observed an aircraft on short final. Pilot cited distraction and ATC staffing as contributing factors.

## Narrative: 1

We did night currency at our home airport. There was one Controller for Clearance [Delivery], Ground, and Tower. It was pretty busy with military aircraft doing night landings and airliners coming in. I had to ask the Controller to clear us to land each time. Usually they say report downwind or base and then will clear us to land or have us extend after we report. He was probably overwhelmed because he was constantly talking while working three frequencies. I wanted to report just in case it was unclear at any point if we were actually clear to land. The second landing he sounded annoyed when I asked if we were cleared to land - I had to ask because he had not cleared us. It didn't help that we were going 150 knots over the ground because of the 40 knot tail wind. It would help if there were separate people working Ground and Tower.

## Synopsis

Pilot reported having to ask Controller several times if they were cleared to land during approach. Reporter stated the Controller was probably overwhelmed working three positions/frequencies at the same time.

## Narrative: 1

Due to the pandemic and the reduction in flight and passenger activity, many piers were closed. This led to packing more flights into fewer piers, while the passenger volume was low this did not have an effect on safety. The pier worker was able to work more flights simultaneously with a very low baggage volume. Many employees have expressed concerns to management and to their labor leaders. Today, the same piers are closed while the open piers are still working multiple flights and the baggage and passenger counts increasing. This is where the safety concern develops; there is limited space in the piers and the worker are forced to place bags on the ground waiting for future equipment to be placed in the pier. The main issue is that international destinations (bags) come down in advance of the ETD and other heavy volume flights cause the same hazard. The walking and working floor space is negligible. We have identified it as a serious tripping hazard. The majority of work place injuries come from "Slips, Trips and Falls." This has been identified and brought to operations leadership, no actions have taken place. Reopen closed piers and space out the work, as work volume has increased.

## Synopsis

Ramp employee reported that passenger counts and baggage are increasing, but there are not enough piers open to safely accommodate baggage handling.

Narrative: 1

Preparing for departure, the Agent informed the A-Flight Attendant (FA) there would probably be an issue with a male passenger traveling with two children over the age of two with onboard mask compliance. I contacted Dispatch who patched in the Supervisor for clarification on how to handle the situation. The passenger knew the rules well enough to know his compliance was required to get the aircraft in the air, but once we were airborne, he and his children removed their masks. The A-FA called the cockpit shortly after reaching our cruise altitude to inform me that this individual and children were not complying with the onboard mask mandate issued by the Federal Government, and that this individual had become rude and hostile when reminded that he was required to comply with the federal mandate. The A-FA also reported that children were not well behaved and were disrupting the nearby passengers. The A-FA reported that while asking this individual to wear a mask and control his children, one of the children was banging his head into the tray table of the seat back in front of the child. The FA said he touched the child's arm and said, 'You can't do that'. I notified Dispatch through ACARS of the events and set up the appropriate response team to meet the aircraft. I was kept informed of the actions of the individual for the remainder of the flight. As far as I know, the individual and children were not compliant with the mask requirement for the majority of the flight. I did talk to one of the passengers who witnessed the events. The passenger said the FA acted professionally and that the individual with his children was out of control. This situation put **a significant amount of the crew's attention on this passenger** and his children. I believe the event could have been prevented with better policies evolved to handle our current social environment. Prior to departure the person was identified as a problem, but the Agent was obviously reluctant to remove him from the flight. We clearly have a mandate from the Federal Government to wear masks at the airports and on flights. This person was NOT compliant at the airport waiting for the inbound aircraft. He was then boarded onto the aircraft to be handled by the flight crew.

## Synopsis

Air Carrier Captain reported a father with two children were non-compliant with face mask policy during the flight.

## Narrative: 1

I was working east flow North Tower Ground/CIC. The main Tower was intermittently departing Runway XC, so I was giving aircraft shortcuts to get to their gate more quickly. I noticed that a departure Aircraft X was taxiing to XC, so I decided to give the next aircraft (Aircraft Y) a hold short at the taxiway (north) parallel taxiway prior to the runway (Taxiway 4), just as an extra precaution. However, I inadvertently said the taxiway name that was the south parallel to XC (Taxiway 5), and did not catch my error. I switched the aircraft to the XC Local Controller's frequency. They had rolled their departure (Aircraft X), and Aircraft Y continued to taxi past the hold bars of XC before they stopped. I did not clear the aircraft to cross Runway XC, nor did the other Controller. Despite my mistake in issuing the incorrect taxiway name, I do not believe anything but the phrase "Cross Runway ##" gives them the clearance to cross a runway. I, and most other controllers are questioned frequently about runway crossings or unclear taxi instructions. The taxi instruction I gave this aircraft made no sense, because to execute it, they would have needed clearance to cross Runway XC. I made an error by using the wrong taxiway name, but there was no accompanying runway crossing given. I don't know, as I was trying to be extra safe by holding an aircraft at a point further from the runway since there was a departure, as opposed to at the runway. I suppose next time I will just have them hold short of the runway, instead of a taxiway, just so there is no confusion or possibility of mis-stating a taxiway name whatsoever. Additionally, I think that the drop in traffic due to COVID may have played a role. Pilots may have not been to ZZZ since Runway XC was under construction, and they were able to cross it at will before there were proper pavement markings. There are proper markings now, but possibly expectation bias that they were previously able to taxi in this manner played a part.

## Synopsis

ATC Ground Controller reported giving incorrect taxi instructions to a crew resulting in a ground conflict. Controller reported the crews had not flown into their airport in a while due the COVID-19 pandemic, which may have contributed to the event.

## Narrative: 1

Aircraft X was on heading direct to ZZZ [VOR] at 3,000 feet and cleared for a visual approach, Aircraft Y was on the [Runway] XXR Localizer for ZZZ [Airport] and descending to 3,000 feet. Conflict alert activated and I noticed Aircraft X turned east directly towards Aircraft Y. I turned Aircraft Y to a 090 heading to avoid. This incident occurred because Sector 1 and Sector 2 and Finals were combined with too much volume to safely run the amount of traffic at the time. At the time we had no one on break due to having the Special Flight Rules Area (SFRA) opened and reduced staffing levels for COVID. We should have flexibility to close SFRA and open a radar position that would alleviate sectors being overloaded.

## Synopsis

ATC TRACON Controller reported an airborne conflict and cited short staffing levels due to COVID-19 scheduling as a contributing factor.

## Narrative: 1

During the course of planning for my next medical certificate, I noticed the Company showed my certificate expiring two months earlier than I was aware of. Due to the COVID extension from the previous year, it appeared I did not need a new exam until the following [Month X]. I apparently did not fully understand the details of the COVID extension. Nor did [the app] alert me of the expiration of my medical. The FAA letter I received after the extension showed a [Month X] expiration in bold typeset. Further down in the letter however in normal typeset it shows an exam due six months before. The actual certificate I received in the mail from the FAA shows the following [Month X] as the expiration date. The COVID medical extension caused confusion for multiple parties, including myself, my AME, the company, and possibly even the FAA itself. The bold typeset states a [Month X] expiration which apparently does not apply to the COVID extension. The verbiage in the FAA letter is difficult to understand and lends itself to multiple interpretations. Clearer verbiage and guidance regarding the COVID medical extension would certainly have helped. Closer attention to detail by all parties involved would hopefully mitigate these types of threats during an unprecedented pandemic.

## Synopsis

Air Carrier Captain reported confusion regarding medical certification expiration date in reference to the COVID-19 extension.

## Narrative: 1

I was enroute on an IFR flight plan. Sometime after passing ZZZZZ intersection on my assigned route and altitude I realized I had not spoken to ATC in a longer period of time than expected. About 18 miles south of ZZZ [VOR], I received a traffic alert on my ADS-B display of traffic 1,000 feet below, 2 miles. This prompted me to then call to ATC on my assigned frequency. Since I reached no one, and it had been longer than expected I figured they forgot about me and I searched for a frequency to reestablish contact. (I have had ATC miss handoffs occasionally before). I believe it was ZZZ Center I contacted, who then told me to contact ZZZ Approach. I was initially told they were "too busy for flight following". I advised them I was on an IFR flight plan. After another attempt or two to have them accept this, my communication with them was established. Several minutes later I was given a telephone number to call after landing, and upon querying why, they just said it was ZZZ Center. I do not know for sure what problem was supposed to be. But I suspect since I received the ADS-B traffic alert, it was a possible loss of separation. When I was somewhere in the vicinity of ZZZZZ intersection, a Controller told all aircraft "don't call in, I'll call you". I never received a call from this Controller, and it was only after I did not feel comfortable waiting longer for a call that I then called back to establish contact. I do not believe I missed a call or checking in on a frequency change. ATC was somewhat overwhelmed in spots in this area. I had noticed in my home area flying that some of the frequencies were not staffed during the COVID pandemic, and I think some of the facilities may have needed to re staff more quickly as traffic began to grow again.

## Synopsis

GA pilot reported a loss of communication with the ATC Center resulting in an ADS-B traffic alert. Reporter cited possible COVID-19 related ATC staffing issues may have contributed to the event.

## Narrative: 1

We had returned to the gate 2 times for passenger related issues. We then taxied out to the hold short line. We sat there awaiting the final closeout for ten minutes or so. When the close out came, there was no performance uplink, so I went to change ZFW and CG to match the latest closeout. I then verified that the V-speeds matched the takeoff performance page and we departed. The flight plan had us filed for FL380, but the VNAV page capped us at FL370. We then leveled off at FL360. After some discussion given our light weight and nearly standard day temperatures, we began looking for the reason for the low Maximum Altitude. We found that I had entered the ZFW incorrectly from the final closeout. Causal factors could include feeling a little rushed to get going after the half hour delay. Another factor could have been the lack of an uplink that led me to manually enter data. Additionally, while I have been to training recently and am fully current, there is no smoothness or rhythm to my flying due to a lack of consistent time in the aircraft. Hopefully having a regular line in Month will improve my proficiency.

## Narrative: 2

After returning to the gate for a passenger issue, we were running slightly behind schedule. Original closeout deleted and after starting the second pushback, we had a new closeout (Rev 01) with good numbers which were accepted by the FMS. During the second pushback, we were directed to tow back to the gate for a baggage issue. Finally pushed back a third time and during taxi for departure, we received an ACARS message that closeout had been deleted and to wait for new numbers. Received revision 02 (one pax less) of the closeout. Did not get the prompt to accept new numbers. Got another message of a deleted closeout and to wait for new numbers. As we were getting more behind schedule, we ran through the numbers with the latest closeout (Rev 02) and confirmed the numbers as OK for a Flaps 10 degree, 10 knot tailwind TPS, with a plan to then cover the changes (if any) in the next closeout revision. Waited approximately 20 more minutes at the end of the runway, number one for departure and finally got Revision 03 of the closeout, which was unchanged from Revision 02. No prompt to accept the new numbers, so we manually updated them. After I had checked the PERF page TOW numbers with the latest closeout numbers, the First Officer noticed that the ZFW was slightly off and updated it, but entered XYZ.X instead of correct number XAZ.X. (Unnoticed at the time) Original number had been XAB.C. V-speeds did not delete from the FMS, and with a slightly lighter TOW than the plan, I figured we were good to go. V-speeds did not need to be changed, so we didn't. We then completed all items of the Before Takeoff checklist and took off normally. During the climbout, VNAV showed a max altitude of only FL360 instead of the planned FL380. I found this odd, as we were lighter than the original planned weight and the temp at altitude was normal. When we leveled off at FL360, I looked again at the closeout and compared it to the FMS perf page and then discovered the ZFW entry error. Corrected it then and the VNAV max altitude fixed itself. Remainder of flight uneventful. Because we were late and at the end of the runway, I may have rushed the FO to enter

the ZFW data too quickly, which resulted in wrong data in the FMS. I did not specifically verify the entered ZFW number because I had previously seen that the revised TOW was below the planned TOW and we didn't need to calculate new TPS numbers. Even though the entered ZFW was incorrect, it was not used in calculating new QRH V-speeds, so the error went undetected as we went with the planned TPS. In the future, if a closeout does not uplink, I will call up the perf page on my FMS (as opposed to looking at the FO's perf page) and confirm each entry with the closeout.

## Synopsis

Air Carrier flight crew reported entering incorrect performance data and cited being rushed for takeoff and FO's lack of flying as contributing factors.

## Narrative: 1

This flight was the first leg of a four day for the Captain and I. The Captain said he would be the pilot flying, that I would be pilot monitoring and he briefed everything up, including threats. We made each other aware of our lack of recent flying experience and lack of proficiency. I informed him that I only have a little over 700 hours on type, that most of that time was trans-cons prior to the pandemic and that I haven't flown much in the past twelve months. I also informed him to the best of my knowledge this would be my first time flying into ZZZZ [Airport]. We agreed that we would take things slow and that we were doing everything correctly. Our taxi out, take off, departure and cruise were routine and uneventful. Approximately twenty minutes prior to the Top of Descent the Captain briefed our descent and approach into ZZZZ and we ran the descent checklist. Center gave us a descent, followed by descend via the X Arrival. We were handed off to approach and told to expect the VOR [Runway] X, after ZZZZ [Intersection] to fly present heading for a vector to the VOR approach. Prior to ZZZZ the Captain called for flaps 1, After ZZZZ he called flaps 5, slowed to 190 knots and approach gave us the vector and cleared us for the VOR X approach. We were at or near the final approach fix when the Captain called gear down, flaps fifteen followed by flaps 30 landing checklist. I set final approach altitude, we were VOR/LOC and VNAV descending per the approach and slowing to our vref of 156 knots. At 1000 feet we were fully configured, and I believe we were at 165 knots. I called

1000 feet, the Captain was task saturated so I said 1,000 feet, set missed approach altitude and said cleared to land. I noticed VNAV had kicked off, I verbalized it and re-selected VNAV, I thought it went to VNAV PTH, but in our debrief I learned it went to VNAV SPD. Between 1,000 and 500 feet the fastest speed I saw was 170 knots. At 500 feet I called 500 feet and saw 171 knots and almost called a go-around. I called 15 knots fast, the Captain said correcting and I saw the speed slowly begin to decrease. I was focused on airspeed as we were at the limit for a stabilized approach and I was looking at the runway as I was concerned, we were going to be high. We continued our approach and I was beginning to become uncomfortable, at approximately 200 feet I noticed we were at 170 knots (it may have been a couple knots faster) but 170 is what I recall. At approximately 200 feet I called that we were high and fast, the Captain said correcting and I saw the speed slowly begin to decrease and he pitched down to correct. At approximately 100 feet I wanted to call for a go-around as we were fast, 170 knots or faster, however I was unable to verbalize it. We touched down hard and flat, we may have had a small bounce, but I don't believe that we did. The Captain deployed the reverser's and we made a normal exit onto taxiway and proceeded to parking. Upon parking, we debriefed this event, we both conducted thorough post flight inspections of the exterior. To the best of our knowledge the aircraft was not damaged. The Captain contacted Maintenance and they wrote up the hard landing. The Captain also called the Duty Manager. Factors that led to this event were both of our lack of recent flying experience, unfamiliar airport, night operation, Runway X PAPI out of service, the change from VNAV PTH to VNAV SPD and I did not call for a go-around. I have learned from this event and will call for a go-around if I become uncomfortable or we become unstable in the future.

## Narrative: 2

We were flying into ZZZZ [Airport] on the VOR [Runway] X approach at night. I had not flown for a year. Currency was a factor. While on approach I configured on time and landing checklist was called for and completed. At 500 feet we were 15 knots fast (171 knots) and the FO said we are fast. I said correcting. At 200 feet I was 17 knots (173 knots) fast the FO said we are fast, I tried to correct. Also, at 200 feet the FO called out high. I over corrected and landed abruptly from 50 feet to touch down. I do not believe this was a bounced landing but may have been. Our pitch was flat, and we landed main gear first. Our descent rate from 50 feet to 0 feet was extreme. The failure of myself or as a crew to not call a Go Around was the primary mitigating factor. Also executing an off center VOR approach with a PAPI OTS at night was a factor. I felt I was not high but in reality, it was due to lack of visible surroundings. Furthermore, the VOR approach only gave guidance to 1,054 feet MSL. To further complicate issues the VNAV disconnected. So, in essence we were left minimal visual guidance. Winds were 20 knots reported and was another factor. My FO stated he was about to call for go-around at 500 feet and 200 feet, but neither of us did. After landing we taxied in normally. We both did several post flight inspections. I also notified Maintenance and the Duty Pilot of the events. This was the first leg of a 4 day with an FO I've never flown with. All briefings were completed. The FO and I discussed before departure how infrequently we have flown due to the pandemic. He had never been to ZZZ [Airport]. I had not been in 2 years. All approach briefings were concluded in a timely manner. The STAR in use was the X arrival. After ZZZZZ [Intersection] we were instructed to fly present heading for radar vectors to join the VOR X LOC. The VOR approach X is a very tricky approach. It is offset with limited visual guidance. Flaps 1 was initiated prior to ZZZZZ. Flaps 5 was initiated after ZZZZZ. Best to our knowledge we were configured by the FAF. The FMA was showing VOR/LOC and VNAV path commencement to approach, at some point we lost VNAV path and went to VNAV speed. I accomplished a LAVS check but did not add 2 and 4 mile rings. I may have gotten very close to exceeding flaps 30 speed. I also believe my flare was minimal at best. Having a PAPI would have been beneficial.

## Synopsis

Air carrier flight crew reported an unstable approach and a hard landing. Both pilots reported lack of flying as a contributing factor.

## Narrative: 1

Around XA:00 pm local I was working Area D mids at sector X when the nightly COVID cleaning crew came through and cleaned half of our area. After they left I asked the other Controller in the area to go set up to bring the sector over to Sector Y, so when the cleaning crew comes back they could clean where I was sitting. Controller went over, opened the position, and took control of the airspace. I then went over to take the position back from at Sector Y so I could sit down and continue working, and at this time we realized that the VCSC [Voice Communication Switch] was not properly configured for the mids position. There were only 5 or 6 frequencies on the panel out of the 16 or so for Area D, and very few random landlines were available for ZZZ, ZZZ1, and ZZZ2 [Airport] towers. We had to scramble to tell other sectors to use only the frequencies that we had up, as the standard frequencies were not available. To make things worse, there was a

massive push of ZZZ3 [Airport] departure traffic at this time coming out over ZZZ4 [Airport] and we didn't have the frequency they use OR the landline to ZZZ3 to tell them to use a frequency we had up. The other Controller then went over to sector A which wasn't being used but had all the correct landlines and used it to call the sectors around me including ZZZ3 and tell them to put aircraft on a different frequency. It was a pretty bad situation considering if any of those departures had an issue and had to return to ZZZ3 I would have had no way to communicate or coordinate with the ZZZ3 approach controllers. I had to work like that for 15 minutes or so until the crew came back to clean the rest of the area and we moved the position back to Sector X. This is the third or fourth time I've reported this by now, we need a massive overhaul at this point of the Area D VCSC system to get everything where it needs to be, and have management properly trained on how to format it and be able to quickly fix it when there is something missing.

## Synopsis

Center Controller reported trying to move sector positions to help accommodate COVID-19 cleaners but ran into problems with the voice switches and frequencies not being configured correctly.

## Narrative: 1

I had just been relieved on Local [positions] combined and this occurred during my two minute overlap and the relieving Controller had the position. Departure traffic was slow and GCN [Ground Control North] "Convenience taxiing" Runway XL arrivals at their discretion mostly south on Runway YL to hold short of Runway XC. The relieving Controller cleared Aircraft Y for takeoff from Runway XC full length. Aircraft X was taxiing south on Runway YL to hold short of Runway XC (presumably; at the time of this report as I have not heard the audio replay from that position). The relieving Controller saw Aircraft X continuing towards Runway XC at a rate of speed not consistent with holding short and keyed up and said "Aircraft X stop stop stop", which they did. He then keyed up and said "Aircraft Y, cancel takeoff clearance stop stop". Aircraft Y, said something to the effect of "Say again" and shortly thereafter rotated. The ASDE did alert sometime after the relieving Controller told Aircraft X to stop. Aircraft X appeared from my point of view to be over the hold line and extremely close to Runway XC. Aircraft Y, rotated near the point of conflict and I believe had Aircraft X continued a collision would have been difficult to avoid. Aircraft X was then given a crossing clearance. I then completed my overlap. Discontinue this operation immediately (convenience taxi down Runway YL). In my opinion this represents the culmination of drift that this facility has acquired during the lower "COVID traffic" we have experienced in the last year (I am guilty of this too as I did this operation until I saw it not work today). There are periods of pronounced lulls in traffic (at least departure wise) where it would be poor service not to shortcut arrivals. However, to taxi on a runway to hold short of a runway I think is now demonstrably unsafe. I believe it requires the flight crews (and possibly ATC) to digest too much information quickly and perform too flawlessly for little appreciable gain. We will always have to perform up field crossings due to the layout of the airport, but I believe we should keep them on a taxiway with a good hold short read back as this is a routine occurrence in the NAS and should elicit better performance from flight crews.

## Narrative: 2

After landing on Runway XXL tower cleared us to join Taxiway 1 and contact ground on XYZ.YA [Frequency]. The Ground Controller issued a taxi clearance limit of taxi right hand turn onto Runway 22R -Then hold short of Taxiway 2 - Monitor Tower on XYX.XA [Frequency]. The taxi clearance was written down and verbalized after it was given. The clearance limit issued only included a hold short of [Taxiway 2]. As we approached Runway XC the flight crew acknowledged an aircraft was in position on Runway XC. As we were passing Taxiway 3 told us to stop immediately as the aircraft had been issued a takeoff clearance. We stopped immediately. The aircraft on Runway XC was issued a cancel takeoff clearance which they did not do and continued the takeoff. During our

monitoring phase of the taxi we were never issued a hold short clearance just the hold short of Taxiway 2 Nor did we hear a takeoff clearance for the aircraft on Runway XC. Once clear of the conflict - Tower issued a number to contact them. As we responded the with the read back we heard the aircraft following us tell Tower that they had received the same clearance as we had received. Poor ATC communication and poor clearance limits expectations were the biggest causes of this event. Flight deck protocol was followed by utilizing sterile flight deck and writing and readying back clearances and following airport charts. An expectation from tower that wasn't issued via the taxi clearance was what the greatest factor contributing To the event We debriefed the event and acknowledged even though the taxi limit was followed the importance of vigilance in an high demand taxi environment like ZZZ [Airport] we must be adhered to and even questioned to clarify and avoid the type of scenario to happen as a crew again.

## Synopsis

Local Controller who was in the 2 minute relief window observed a runway incursion that resulted in a ground conflict and cited COVID-19 related taxi procedure as a contributing factor. A Captain of one the the aircraft also reported the event and stated communication issues with ATC a factor.

## Narrative: 1

I was thanking passengers as they disembarked onto the jet-bridge in ZZZ, and I was trying to call rows to deplane on the PA. The cleaning crew were at the front door (1Left) trying to get on the plane while the passengers were leaving, and the pilots were also trying to gather their bags and leave. This made the situation very chaotic. I was not aware of it being a "quick-turn", as I am always happy to try and help out with the quick-turn cleaning. The cleaners slipped on a few at a time, in between passengers leaving. I saw the two aft crewmembers with their luggage, and moving forward through the cabin, towards me. The cleaners were already onboard, cleaning throughout the plane. I said, "last but not least!" to the final passenger, thanked her and gathered my belongings. I looked back and only saw the cleaners, and my crew who were almost to me. I didn't see any more passengers and thought we were done. I double-checked my doors and the forward lavatory and stepped off the plane. When the aft crew stepped off, there was a male passenger with them who had been mixed in with the cleaners. He did not have his boarding pass with him. He said he wouldn't leave without it, and that his seat was XX6. He wanted to go look for it himself, but crew went to look. His boarding card was found under his seat. A contributing factor is having so many people onboard/in jetbridge and the cleaning crew coming onboard (sometimes in just sweatshirts, hoodies, jackets, hats, masks, etc.) and mixing in with disembarking passengers, and vice versa. Flights are more full now, and anyone can be mistaken for a cleaner. Other factors: double-checking the passengers haven't lowered or removed their masks, as they often do now, as they are coming down the aisle towards me and the boarding door. The passengers are trying to look down the aisle and gauge how far we've gotten with the row announcements to deplane. Also, 2-3 pilots using the lavatory, gathering bags and leaving, while passengers are disembarking causes more confusion. All of this, and the extra amount of ground-staff/cleaners onboard and in the jet-bridge in civilian clothing, causes more confusion, multitasking/load at the boarding/deplaning door. I assumed the last passenger I saw, and said goodbye to, was our final passenger onboard. I would not have stepped off the plane had I known there was still one passenger onboard. I will also alert corporate security to this incident, and the added potential for this confusion during disembarkation.

## Synopsis

Flight Attendant reported the aircraft cleaners were slipping onboard to clean the aircraft before the passengers were completely off. One last passenger, resembling a cleaner, remained intermixed with crew and cleaners during the crew's exit.

## Narrative: 1

I was seated on the jumpseat on flight deck and the First Officer demanded I wear a face mask after pushback per policy, while they both (Pilot Crew Members) did not, which is inconsistent with Safety and general communication requirements requested of a Jumpseat Crew Member. Here is why: To ride on the jumpseat we must be a current licensed pilot, with current medical license and fit to perform duties. 1. We are consistently asked to be a second set of eyes. Because I wear glasses where I wear my face mask my glasses fog up. I'm unable to see instruments and other traffic. 2. The face masks impedes verbal communication with the other Crew Members if needing to intervene because the Crew is wearing headsets, jet noise and unable to effectively hear or read lips. This is well documented in studies. 3. The time to useful consciousness is limited. Having glasses and face mask impedes putting on O2 mask on in the event of a Rapid Decompression. The flight deck door is locked, we have NO rubber jungle that falls and I'm solely responsible for my own Safety to get my mask on. This is an impediment to Safety as a Jumpseater. I am not treated the same as the operating Crew Members, even though I'm asked to be a Safety Observer.

## Synopsis

Air Carrier jumpseat pilot reported the First Officer on this flight insisted the jumpseater wear a face mask throughout the flight. Reporter described safety related concerns with having to wear the face mask including fogging of glasses, communication problems, and issues associated with putting on the O2 mask in case of a rapid decompression.

## Narrative: 1

Since COVID, these particular international schedules have been in a lot of flux. Most sequences, up until now, have been "rockets" where we only get to rest a relatively short amount of time during the day after an all-night flight, and then fly back all night. I have

written about this before, and this is to reiterate: these sequences are sub-optimal in terms of safety due to the limited rest. The threat on these sequences is NOT a virus, it's the cumulative fatigue after being up for two straight nights. There is no reason not to make ALL these flights have a longer sleep opportunity with a 30 plus hour layover. Three times in the last 2 months we lined up for the wrong runway in ZZZ after the double all-nighter. Fortunately, someone caught the error before it was critical, but it is reflective of the fact that the three of us are sleep-deprived. In this aircraft category, you have an older pilot group to begin with. Give us the opportunity to get enough rest. Upon arrival in ZZZ, I was extremely tired, and felt my ability to monitor was degraded. Schedule all these international trips as longer layovers. It's a safety issue, pure and simple.

## Synopsis

Air Carrier First Officer reported fatigue related concerns with the scheduling of particular international flights since the COVID-19 pandemic began.

## Narrative: 1

While on visual approach to Runway XX and configuring, we had configured normally through gear down. The Captain called "flaps 30" and I reached for the handle while looking at the speed. The trend indicator was well below 185 and I was too focused on the trend rather than the actual speed. I was too quick to move the flap handle. We were actually about 187 knots. We got the flap overspeed warning for about one to two seconds as our speed continued to dissipate. It was my first flight from furlough and recurrent training. I was allowing myself to rush, even though there was no need to rush at the time. I made an error of referencing the trend before the actual speed. I also need to refresh my habit of not touching the flap handle until I have stated "speed checks."

## Synopsis

Air Carrier First Officer reported a flap overspeed during visual approach. It was the First Officer's first flight after being out due to furloughs.

## Narrative: 1

Aircraft X was a departure from ZZZ [Airport] enroute to ZZZ1 [Airport]. The aircraft checked on frequency climbing to 14,000. I acknowledged the aircraft, issued them normal airspeed and the local altimeter setting. There was weather south of my sector, but I did not depict any weather along Aircraft X's route of flight. Prior to ZZZZZ waypoint, the aircraft was level at 14,000. I was working a normal amount of departure volume. However, due to COVID staffing, I was working a combined sector. 2 Low Altitude sectors, and 1 High Altitude sector, which has been common during COVID. The difficult part is

that we typically work the low altitude sectors on around a 50 mile range, but since we have the high altitude sector, we need to have the combined sector using a 150 mile range. As Aircraft X was right over ZZZZZ, I noticed moderate precipitation was beginning to appear, but I did not have time to issue the weather before the pilot reported turbulence. The pilot stated they were in moderate and basically severe turbulence and asked for a vector or different altitude. I immediately descended the aircraft to 13,000 and coordinated with the next sector, since they had track control. I again asked the pilot if they need anything and they asked for a lower altitude. I coordinated with ZZZ Approach, to point out the aircraft descending to 10,000 due to the turbulence. I then descended the aircraft and asked the pilots if there was any damage or injuries. The pilot stated that he and the other pilot were the only ones onboard and they were not injured and did not suspect any damage to the aircraft. When the aircraft was level any 10,000 and clear of the now depicted weather, I asked the pilot again how they were doing. They said that the ride had improved. A short time later, the weather in that area grew rapidly to moderate and heavy precipitation. I transferred communications of Aircraft X to the next sector. After the incident, I needed to vector numerous other aircraft away from that hazardous weather. COVID schedules, low staffing and long time on position were all contributing factors. My area has been extremely short staffed during our COVID schedule and tonight was no exception. We only had 5 CPCs scheduled for the shift, and also needed to staff the CIC position all night. There were numerous instances when all 5 controllers were working over 2 hours on position and we had 4 sectors open, plus the CIC and no controllers on break. The fact that I was working a non-typical configuration (outside of COVID) was also a contributing factor. I was not able to have a normal range for my sector and if I was using a low altitude scope and map, I may have noticed the weather earlier and issued it quicker to the aircraft. COVID schedules, minimal staffing, working long sessions on position and controllers continuously having to staff the CIC position have created additional strain and fatigue on the controllers.

## Synopsis

Center Controller reported an aircraft was in severe turbulence and was descended out of the altitude for safety. Reported stated it was a difficult situation to deal with due to COVID scheduling/staffing and working a combined position.

## Narrative: 1

I just took over the position X. I was briefed that we would be switching from east operations, to west operations because of a wind shift. About 3 weeks ago, we moved scopes and positions around to accommodate increased social distancing. Due to this, there are new macros and procedures that supervisors must adhere to. As our last aircraft landed on the east runways, the Supervisor started to put in new macros. My tags did not acquire, and I had to manually coordinate with the Feeder to let him know when I had radar on traffic. When I was starting to get busy and it was clear the macros being entered

were not working, my scope changed from a west operations final pref set to an east operations final monitor preference set. I had to slide over to the adjacent position and work my final off of that scope because mine was completely unusable. This is an absolute safety concern that I have heard has happened before. I recommend they move the scopes back to the normal working configuration because this is clearly not working and is a huge safety hazard and it should concern everyone.

## Synopsis

TRACON Controller reported having to make a configuration change but the data tags did not change to the correct airport configuration, making the reporter move quickly to a close by position and sharing the scope.

## Narrative: 1

I was working Sector X (AOA [At Or Above] FL360) and another sector was being saturated (Y/Z/A combined. Training was being done at this sector), so they split off A to me. There was a lot of traffic and weather in the area. Apparently, restrictions were put in place that aircraft entering ZZZ1 [Center] from us and landing at ZZZ [Airport] needed to be AOB FL260. I was working an Ultra High Sector. When I was given the briefing by the trainee, the trainer ran over to my scope and said that Aircraft X needed to be AOB [At Or Below] FL260. The aircraft was at FL430 and maybe 40 miles from the boundary, on top of same direction and opposite direction traffic. Aside from that there were numerous conflicting aircraft issues already fixing to happen. My EDST [En-route Decision Support Tool] had a bunch of red alerts of which should have been fixed prior to the aircraft entering our area. Again, this was on the sector I was gaining, NOT the one I was already working. I was bit overwhelmed taking the sector just due to the amount of work that needed to be corrected due to the neglect of the training team. I descended Aircraft X to FL390, knowing I would have to move or quickly descend the aircraft through two others converging at FL390 and another directly below at FL380. I assigned the altitude and realized the speed gain was great enough that I could get Aircraft X down to FL360 (base of my stratum) and miss Aircraft Y, heading the same direction at FL380. To ensure I had room and miss opposite direction traffic at FL390, I turned Aircraft X. My turn was a bit too aggressive and in doing so, the wind caused the aircraft to lose a bunch of speed, resulting in the CA going off. I turned Aircraft Y to the left to keep separation, but it was already lost. From my observation, I showed a loss of separation to where they were separated by 4.9 miles and 900 feet vs the 1000/5 I need. I didn't stare too long as I had to go on to other separation tasks that were not completed prior to receiving the additional airspace/traffic. First, splitting sectors at the last minute has become all too common an occurrence with this COVID schedule and working "more with less." The whole environment is unsafe and the things we do are dangerous, resulting in issues like the one I had. Secondly, I won't be taking sectors from a person who doesn't have it all figured out, no matter what the Supervisor says. I take pride in what I do and having separation errors is unacceptable. I had the pilot helping me out the best he could and I second guessed myself that the aircraft would descend through the altitudes fast enough in a straight line Aircraft X started to outrun Aircraft Y as he descended. My turn was too aggressive, and I never played it into my head how much the wind would impact the turn. I think just trying to take action to descend the aircraft to meet a restriction overruled my common sense to think how my actions would play out. Solely my fault, but it could have and should have been avoided had other things been done in a timely manner prior to my taking the airspace. It seems to be a trend to do everything last minute, which is what

creates such mistakes. Had I worked that aircraft and known of the restriction, Aircraft X would have descended below all my traffic 100 miles prior. Maybe not to FL260 so as to penalize the aircraft, but at least below those who were deviating and being rerouted around the weather.

## Synopsis

Center Controller reported having a loss of separation after assuming a busy sector from a training team.

## Narrative: 1

We were advised that someone had tested positive for COVID. It had been a long period of time since they were in the building. It was during the mid shift, so they didn't have contact with anyone. The TRACON was shutdown and relocated to ZZZ1 Tower at XA:0L on a weekday. This is a busy day of the week and time for us. The functionality of working from the Tower is limited. It also requires all radar sectors to be combined. The volume and complexity was far too great at this time of day. Even with trying to limit operations the radar scope was too cluttered. There were many uncontrolled VFR's. The data blocks overlapped and the Mode-C was unreadable. Traffic workload was high. We asked ZZZ2 Traffic Management Unit (TMU) for 20 Miles In Trail (MIT), but that was not adhered to. Communications were also difficult. We asked all surrounding facilities to use a single

frequency but that was not always followed. VFR's calling for service were using published frequencies. There was no reason to rush this cleaning. Everyone in the facility had already been exposed for hours, if not days. Waiting until XF:00L would have ensured traffic volume and complexity was light enough to work from a reduced area such as ZZZ1 Tower. The rush for cleaning was not worth the safety risk to the flying public.

## Synopsis

TRACON Controller reported the facility went to ATC Zero after someone tested positive for COVID-19. Controller stated they were moved to the Local Tower and worked from there. Reporter advised the move could have been delayed to a non-busy time due to everyone already being exposed.

## Narrative: 1

We were approaching ZZZZZ intersection from the west which is a transition onto the ZZZZZ 3 arrival and had received multiple descent clearances out of our cruising altitude of FL350. Eventually we were cleared to cross ZZZZZ at FL230. Flying the ZZZZZ 3 "as published" we would normally cross ZZZZZ1 at FL230 per the STAR and the FMS altitude crossings were set for this. ZZZZZ is 14 miles prior to ZZZZZ1 so crossing ZZZZZ at FL230 requires a change in the FMS and a steeper descent. We acknowledged the clearance and a few minutes later while performing a challenge and response descent checklist and when flying overhead ZZZZZ I realized that we were still on the original profile descent to cross ZZZZZ1 at FL230 and we were crossing ZZZZZ above our assigned altitude of FL230. I attribute this error to our reduced amount of flying in the past 12 months due to the COVID lock down and to distraction by the descent checklist.

## Synopsis

Corporate Captain reported an altitude deviation during approach and cited lack of flying as a contributing factor.

## Narrative: 1

I fly X type missions, for which I'm wearing a mask, which I knew harms the sealing of my active noise reduction headset (and as a result reduces the sound quality, bringing in some ambient noise). It was not until yesterday that I realized how disruptive this is. I was flying on the last leg of my IFR flight plan, from ZZZ to ZZZZZ (from there to my destination - ZZZ1). ATC called me and said something about heading 290 with ZZZZZ in it, I assumed they're telling me I need to fly 290 to ZZZZZ (and from there proceed as usual). That's what I did, ATC got (rightfully) upset and told me that I was asked to fly 290, which I then did and later cleared for a visual approach to Runway XX at ZZZ1. Listening to the recording on liveatc.net, I could clearly hear the ATC telling me to depart ZZZZZ at heading 290. That "depart" is the one piece of the puzzle I didn't hear during the flight. On my way back - no passengers, no mask - all of a sudden ATC sounded much clearer. It made obvious to me this has to change, and I need to find a mask that does not interfere with my headset.

## Synopsis

Single pilot reported unable to understand the Controller's instruction clearly due to the pilot's face mask interfering with the over ear headset.

## Narrative: 1

We were cruising at FL320 around late afternoon when transmission with ZZZ Center became difficult as we were handed off to the next frequency. ZZZ Center's transmissions were muffled and unreadable at times. Multiple aircraft, including my own, had to ask Center to repeat instruction due to the muffled voice and weak transmission. My belief is that the Center Controller was wearing a mask and that mask was causing the majority of communication difficulty. If true, the use of masks by Center controllers is creating a serious communication and safety issue between pilots and Air Traffic Control. Everything about the national air space system is designed so pilot to ATC communication is to be understood without interference or confusion. The use of masks by ZZZ ATC has the potential to create confusion and ultimately a sacrifice of safety.

## Synopsis

Air Carrier Captain reported difficulty understanding Center controllers and believes the problem maybe the controllers are wearing face masks.

## Narrative: 1

We were returning to ZZZ from ZZZ1 late on the afternoon. The enroute environment was apparently busier than the recent "new normal" for that time of year as we had been limited in our climb clearances to between one- and three-thousand feet per climb clearance since our departure 25 minutes earlier. Our most recent climb clearance was to FL400 (on our way to our filed FL410). Subsequently, ATC called traffic (I don't recall the model or the horizontal distance away) at "1,000 feet ABOVE YOUR ASSIGNED ALTITUDE" (emphasis mine). I would have replied "Looking" or some similar acknowledgment. I did look and then subsequently noticed my FO (who was PF and in the left seat) had shallowed our climb to 100 FPM or so out of FL390 -- significantly less than the 5 or 600 FPM I would have expected. We were also very light, so a climb rate that shallow would have soon required a power reduction. At about the same time we got a TA and the Controller asked us to confirm we were level (or leveling?) at FL390. I don't recall the exact exchange, but I would have replied something to the effect that we were climbing to FL400, he would have said something to the effect of maintain FL390. At that point I fully processed what was happening, gave silent kudos to my FO for correctly interpreting the bad direction this was going, and directed him to "push." As what we had was a TA, not an RA, the autopilot was left engaged, but he did direct the nose down and I dialed 390 into the ASEL. The Controller asked us to confirm we were at FL390. I interpreted that as him wanting that confirmation on tape and I gave it to him, although we were, in fact, changing our vertical direction from up to down at FL393 at that point. We are a very structured flight department. In order for an airplane to be directed to an altitude during enroute climb or

descent, the Controller has to assign that altitude, the PNF has to read it back and dial it into the ASEL, the PF has to verbally and independently repeat that altitude for both of us to hear, and has to acknowledge that he sees that same altitude displayed in front of him. Owing to that routine sequence and cadence of events, we are both 100% certain that we were assigned FL400. That said, I can allow as how I have possibly been wrong at least once in my flying career. My FO was hired on just as COVID came on the scene last year. With the reduced amount of flying we've been doing since, he is still considered "new" to the operation and as such not fully comfortable with our procedures. By that, I mean that I sometimes sense a hesitation for him to be as assertive as he should be and as assertive as he would be by now had this been a normal year. That notwithstanding, I would expect any pilot in our organization to question, in no uncertain terms, anything they were uncertain about, especially an ATC clearance. Likewise, no one in our organization, from Director of Flight Ops down, would hesitate to ascertain verification of any such uncertainty, no matter who questioned it. That's the way we move airplanes without bending them. I'm still 100% certain we were cleared to FL400. In retrospect, and we observed this at the time, the primary thing that would have alerted us to this unfolding conflict would have been for the Controller to have called the traffic as "...opposite direction at FL400." That would have raised the hackles on the back of my neck and elicited from me a request to confirm our assigned altitude. There is no error-trapping possible when traffic is called as "1,000 feet above your assigned altitude." Additionally, and this is not a negative, just observation and fact: we're flying the oldest, and by far the most reliable, airplane in our fleet of four; however, owing to her age, we're looking at a pair of >XX-year-old TCAS displays on dedicated three-inch round screens. There are no course overlays, no distance rings and, especially on the longer ranges (20 and 40 mile), no way to precisely assess the relative position, direction or closure rate of traffic approaching, especially when doing so nearly head on. Technology is good. Newer technology can sometimes be better. On a positive note, we did visually acquire the traffic while far enough apart that had evasive action been necessary (it wasn't), we would have had plenty of time to take it. We did debrief this incident immediately after its occurrence, replayed the events out loud and decided the error was ultimately ATC's, that we had done everything we could to mitigate the repercussions to the controller and that we were not at fault.

## Synopsis

Corporate Captain reported an altitude deviation that caused an airborne conflict (TA) and cites Controller/Pilot communication and the First Officer's (PF) lack of flying as contributing factors.

## Narrative: 1

It was determined that pilot's FAA Medical was updated on 202011 with special Issuance / Expiration date and it was defaulted to the 6-month expiration date in Pilot Records. Due to the high volumes of FAA Medical coming in for the past few months and FAA Medical extensions, this one fell through the cracks. Because of the pandemic last year, pilots were granted FAA medical extensions on their "Expiration Time", and that may have caused the confusion and to slip by. We are very careful when processing FAA Medicals including other work that we process, and fully intend to process our work as accurately as possible.

## Synopsis

Air Carrier Administration Office employee reported a pilot's FAA Medical Certificate was erroneously marked as expired during the COVID-19 extension period.

## Narrative: 1

During single-engine taxi out, the A FA called the cockpit, informing us of passengers' non-compliance with the facemask policy. The decision was made to return to the gate. As we taxied back toward the Ramp, I coordinated with the Captain, advising that I felt it was appropriate to perform an After Landing flow prior to returning to the gate. Captain agreed, and I accomplished the flow. While holding for a gate, and on the apron with the parking brake set, the A FA called back to the cockpit, advising that the passengers were now willing to comply and that the three FAs were comfortable with continuing the flight. At this point we re-accomplished a Before Taxi flow (as appropriate for our single engine taxi configuration), then ran a Before Taxi Checklist. We then coordinated with ATC to proceed with a taxi clearance for departure. The Number 1 engine was started and the rest of the taxi and takeoff proceeded uneventfully. Once airborne, I noticed that we had departed with the autobrake selector in the OFF position. As I thought about the sequence of events leading to that I thought of two things: placing that switch to RTO takes place in the Captain's Before Start flow. I also recalled that when I performed the After Start flow (following the Passenger incident), I placed the Window Heat switches to ON, another item that is normally accomplished in the Captain's Before Start flow. Clearly, in our unique situation, a Before Taxi flow, followed by a Before Taxi Checklist was insufficient to reposition all switches to their appropriate positions prior to taxi and takeoff. Of note, neither of us felt rushed, and we both felt that we used good CRM to methodically think through our situation before continuing, yet in the end, something was missing. I've referenced the manuals, looking for a procedure that would have trapped our errors, but am still left wondering. Since we started the original taxi single engine and never shutdown that engine, the procedure in Flight Ops Manual never entered our minds, yet

that guidance probably would've caught the error. Non-standard Ops lead to inadvertent takeoff with auto brakes selected off.

## Narrative: 2

On taxi out, the A FA called to tell me that there was a family being non-compliant regarding the face mask policy. I made the decision to taxi back to the gate. I asked the FO to complete the After Landing Checklist. While we were waiting for a gate, the FA called to tell us, "Never mind, the issue is resolved." At that point, we completed the Before Taxi Checklist and taxied to the runway. After takeoff, the FO pointed out that RTO switch was not re-selected to "armed." Our unique situation made it impossible for autobrake re-selection to occur. In this situation, our normal checklist does not catch the error. I should have triple checked everything because our routine taxi out was interrupted. RTO reengage missed during a taxi back to the gate and subsequent cancellation of that.

## Synopsis

Air carrier flight crew reported missing re-setting the auto-brake system before takeoff and cited dealing with a passenger not complying with face mask policy as a contributing factor.

## Narrative: 1

Aircraft X was IFR inbound to ZZZ requesting the LOC RWY XX; however, the tower still on their COVID hours closes early. When the tower closed they put the localizer on RWY YY so the LOC RWY XX was unavailable. Due to winds Aircraft X was unable RWY YY. They requested the RNAV Y RWY XX. I had traffic for Aircraft X as they were approaching ZZZZZ with the crossing altitude of 051 and the traffic at 047 I gave a restriction for traffic. This confused the pilot so I went back and cancelled the approach clearance and told the pilot to expect clearance at ZZZZZ1, but this was a mistake, what I meant to say was ZZZZZ. The pilot did not question me but did seem confused. Rightfully so. When Aircraft X was clear of the traffic they reported that they were direct ZZZZZ. I then cleared Aircraft X to cross ZZZZZ at 5,100 cleared straight in RNAV Y Rwy XX approach. Aircraft X appeared to overshoot ZZZZZ before turning to ZZZZZ2. I questioned the pilot that the next fix past ZZZZZ was ZZZZZ2, is that where they show their self going. The pilot stated they just passed ZZZZZ2 and I can't quite understand what they said after that. But at the time I thought they said going to ZZZZZ3 the next fix on the approach. While this was going on I had a couple other aircraft waiting and another facility call me for point outs. When my attention took me back to Aircraft X their path appeared off and had began a go around and the moment they called me I issued the low altitude alert and an immediate climb. They attempted the approach and landed safely on the second attempt. My initial reaction to this approach was that something was off, which is when I questioned the pilot. I gave them the benefit of the doubt and hoped that they had corrected the overshoot at ZZZZZ and was properly on the RNAV Y RWY XX at ZZZ. However; I should have just gone with my gut and broke the aircraft off the approach when I noticed the error and vectored back around for a second attempt. Hindsight when you look back is always better. We try to not delay aircraft and hope that they are truthful when we question them about approaches. However; safety is our number one priority and concern and I did feel like there was something not right and looking back I wish I would have just broken the aircraft off the approach and re-sequenced. It is always easier to watch a replay to see how we can improve, but that is important so we do not repeat our mistakes.

## Synopsis

TRACON Controller reported having an aircraft that wanted one approach, but the tower was closed and the approaches were set up for the opposite direction. Controller reported possibly confusing pilot with clearances.

## Narrative: 1

I was the Pilot Monitoring (PM) on the flight to ZZZ. Descending on the ZZZZZ FIVE arrival heading to the ZZZZZ1 fix. Approximately 20 miles from the ZZZZZ1 fix ATC called and revised the fixes after ZZZZZ1 but told us to comply with all the restrictions. The ZZZZZ1 fix includes a crossing restriction of 27000 feet. I read back the new clearance and confirm it with the Captain/PF. Done, then I went heads down to re-program the FMS including changing the landing runway. As I transfer my eyes back to the PFD to continue with the PM duties, I noticed the altitude at approximately 25,000 feet. I pointed the deviation to the Captain who stopped the descent. No traffic conflict was issued by ATC and we continued with the arrival using the depicted profile. While I have the primary duty of PM there are additional duties such as the checklist, FMS Programing, radio calls etc., that can distract us at important times. Compounding the situation was long days with five legs and 10 plus hours of duty. On top of that, due to the COVID crisis, we are operating with reduced staff and salary freeze creating additional stress and fatigue. I think prioritizing the duties is important and an art. Yet sometimes we reach limits and we don't recognize it.

## Synopsis

Air taxi First Officer reported an altitude deviation during arrival and cited short staffing, fatigue and stress due to the COVID-19 pandemic as contributing factors.

## Narrative: 1

We conducted the ZZZZZ4 arrival and joined the ILS XX approach from ZZZZZ [Intersection] as briefed. When the Captain contacted the Tower, the Controller cleared us to land XX Right. The Captain read back the clearance. I said, "Can you confirm Controller wants us to land on the right? We're on the ILS XX Left." The Captain confirmed with the Controller cleared to land on the right. The Controller responded "Affirmative. XX Right, Cleared to land." At the time, we were well above 1,000 feet in visual conditions with the runway in sight and, so I had no objection. I clicked off the autopilot and side-stepped to XX Right and we landed. No issues arose with ATC or any other traffic. The next day, the Captain reached out to me and we spoke over the phone. Captain learned that we had actually been cleared for the ILS XX Right approach and Captain intended to file a report. A couple of days later I was finally able to confirm that this was correct. We aren't able to determine if it was being read back correctly or incorrectly, but there was never a clarification type of response from ZZZ Approach. It's also important to bring up that the Captain was wearing a face mask throughout the flight operations which did contribute to difficulties in communication with myself and with ATC at various times during the trip. This likely was a contributing factor to our deviation. Another contributing factor was the violation of sterile cockpit below 18,000 feet by the Captain and myself. Personally, I was distracted by our conversation as well as the fact that Captain was wearing a mask during the flight. Complacency is also a factor as the ZZZZZ4 Arrival usually results in the ILS or visual to XX Left. I think our company needs to take a harder stance on mask-wearing during flight operations in the flight deck. I recommend that the company forbids the use

of masks by pilots during flight operations to ensure that communications are clear and effective. In this case, it can be assumed that the Captain was repeating the clearance saying "XX Left" but the Controller did not hear it clearly and assumed Captain was saying XX Right. Therefore, Captain was never corrected and we continued with what we had expected in our heads. There were multiple points throughout our trip that ATC did not understand the Captain and asked who was calling or needed clarification on what Captain was saying because it was difficult to understand with the mask. I thought on several occasions throughout our trip that it was the Captain's choice to wear it but if we have an emergency situation that I really hope Captain would take it off so that effective communication could be established and maintained. An emergency situation did not occur, but clearly an issue did arise with our approach to our destination.

## Narrative: 2

ZZZ had a broken layer at 1,700 feet and we were expecting to do an approach. Descending into ZZZ on the ZZZZZ4 arrival we had set up for the ILS [Runway] XXL. We were assigned to join the ILS [Runway] XXR at ZZZZZ [Intersection] and then later cleared for the ILS XXR approach. We did not fly the ILS XXR. We flew the XXL approach and when we were on with Tower, we told them we were inbound on the ILS XXL. Tower cleared us to land XXR. By the time we contacted Tower we were out of the clouds and could see the runway. We verified two times that we were cleared to land XXR and not XXL. And Tower confirmed that we were to land XXR. Since we had visual on the runway, we side stepped and landed on XXR. We were probably at 1,500-1,600 feet AFE when we side stepped. We were confused as to why they had changed runways on us, but we knew that XXR was longer than XXL and that the landing speeds were the same and we were familiar with the airport. As we side stepped, I programmed in the ILS XXR so that we had a backup source even though we visually had the airport in sight. Later in the evening it still didn't sit right with me that we had a runway change that late, especially since we had been on an IFR approach. I realized we had in fact been assigned ILS XXR all the way back on with Approach. They never corrected me. So, I either read it back correctly but we were really hearing what we wanted to hear (ILS XXL) or they never corrected me and we all missed it. The approach was stable all the way through for XXL and the sidestep was done in a safe manner. I attribute not being sterile in the descent as a factor even though we were assigned to join ILS XXR at ZZZZZ prior to FL180. I would say complacency and expectancy were the primary factors. XXL wasn't closed and we were set that we would be doing the ILS XXL. It was also the last leg on the last day of our trip and we had had a long day. I had been up since 8 or 9am and we had flown 4 legs. This flight landed around XApm. I can say that I once again am reminded how serious our jobs are and that miss hearing a simple "L" vs "R" can be life changing. I can only say that I am thankful that this took place during a low traffic period and that we were able to maintain a safe condition. I'm honestly not too sure how to avoid this situation. I believe that writing down my clearances would assist in allowing me to verify and that maybe I need to make sure to turn my headset up so that I won't miss ATC.

## Synopsis

Air Carrier flight crew reported a track heading deviation during approach due to communication issues with ATC. The First Officer cited the Captain wearing a face mask on the flight deck may have contributed to the communication problems with ATC and between them.

## Narrative: 1

Sat in ZZZ for hours for a delayed flight coming from ZZZ1. During the swap, the outgoing Captain informed me that the Crew that brought the aircraft into ZZZ1 said that upon landing the right thrust reverser malfunctioned. The delay was due to Contract Maintenance MEL'ing the right thrust reverser. During pre-flight I checked the logbook, Release, and stickers as well as looked up the MEL on my EFB. During this time the "A" Flight Attendant informed me that a passenger was refusing to wear their mask and creating a scene and that the CSR had been called. Eventually the passenger was removed and an updated report was sent to the aircraft. During the distraction I neglected to click on the hyperlink in the MEL in the Maintenance portion labeled MEL SP#XX Thrust Reverser System. If I had I would have noticed on that a Circuit Breaker for the #2 Engine

should have been pulled and collared. Upon landing in ZZZ2 I informed the outgoing Captain of the MEL. During my commute home I received a text from said Captain that he found the wrong CB had been collared and that he had written it up and ZZZ2 Maintenance was fixing the issue. Upon reviewing the SP#XX I can only assume that the CB for the #1 Engine had been pulled instead.

## Narrative: 2

Inbound Captain advised that they had received the aircraft late in ZZZ due to Thrust Reverser MEL applied in ZZZ1 on previous flight and then further delayed on their flight due to a Passenger refusing to comply with mask requirements. In reviewing the logbook I found that the MEL sticker in the front of the logbook was not completed. The MEL number was not entered, the Special procedures performed were not entered and the circuit breakers pulled and collared were not entered. When I reviewed the logbook entry, the special procedures were references SP-XX. I also observed C/B's #2 Engine TR Sync Lock and #2 Engine TR INTLK pulled and collared. I then reviewed the MEL and SP-XX and discovered the following errors. 1. SP XX calls for the #2 Engine TR Sync Lock c/b and the #2 Engine TR Control c/b to be pulled and collared. the Control C/B was NOT collared as prescribed in SP XXnd the INTLK c/b WAS collared contrary to SP XX 2. There was no MEL sticker placed on the Inoperative TR lever. 3. There was no MEL sticker placed above the respected N1 gauge. I contacted Maintenance Control to confirm my understanding of the MEL regarding the incorrect Circuit Breakers and they confirmed the wrong circuit breaker had been pulled. Notified ZZZ2 Maintenance and entered the discrepancy in the logbook. ZZZ2 Maintenance arrived and corrected the circuit breaker configuration and signed off the discrepancy I had entered. Missing information on the logbook sticker was also corrected. I have long felt that our MEL is VERY inadequate when it comes to circuit breaker identification. In this particular instance the nomenclature is correct and was just applied incorrectly by the Mechanic, but if the C/B locations were included it would have been much more apparent to the Mechanic as well as flight crew that the two C/B would not be immediately adjacent to each other. I have brought this to the attention of Flight Ops previously with regards to other MEL's and have been advised that changes are slated for a future revision that has been delayed due to aircraft out of service returns, COVID and other issues. I also feel it should be reinforced to flight crews that MEL compliance is not solely the responsibility of the Maintenance department and that we should always verify (to the limits of our abilities) those aspects of MEL compliance which we have ready access to on each airplane we accept regardless of previous crews acceptance of the aircraft.

## Synopsis

Two air carrier captains reported delays due to incorrect MEL procedures performed by maintenance and a passenger not complying with face mask policy.

## Narrative: 1

I filed IFR flight plan. The flight was uneventful. I was cleared by ZZZ Center to descend to 10,000 feet MSL. I confirmed that clearance. I descended and was level for a minute or so when the Controller said to climb back up to 11,000 feet which was the altitude to which Controller cleared me. That was incorrect and would have been the wrong altitude for that direction of flight. The Controller admitted on the radio [to] working six frequencies at once. There was no traffic conflict. I think it is unfortunate that the Controller was so busy and the transmissions revealed Controller was very new on the job but the Supervisor should have helped out. Controller cleared me to 10,000 feet about a minute after Controller told me to climb up to 11,000 feet. Controller was clearly confused.

## Synopsis

Corporate Captain reported the Controller was working 6 frequencies at once and issued an incorrect altitude clearance.

## Narrative: 1

I was pilot monitoring. We were given a clearance to maintain 250 knots until advised. Upon reaching 10,000 feet we accelerated to 290 knots (our normal profile). I advised the Captain that we were given a 250 knot clearance...we discussed and I probed the Controller and confirmed we were given a 250 knot speed restriction until 14,000 feet. We began to slow down. I believe the cause of this is the fact that we have not been flying a lot because of COVID. I had been furloughed and brought back to the line and retrained. I believe if I had been flying more often than I would have been able to catch this lapse earlier or could have reminded the Captain once we reached 10,000 feet.

## Synopsis

Air carrier First Officer reported a failure to notify the Captain that the aircraft's speed was exceeding the clearance limit during climbout. First Officer cited lack of flying as a contributing factor.

## Narrative: 1

On the ZZZZZ X arrival into ZZZ, we were given a descent to FL230. As PF, I re-cruised for FL230. Prior to ZZZZZ1 we were told to descend via the arrival. I dialed in 6,000 feet for the Runway XXL approach. Initially the descent point was visible and looked normal. After flying several more minutes it became clear that we were past the descent point. It was about this time that the descent point disappeared from the ND. We started an immediate Open Descent with full speed brakes. We were unable to get relief from the altitude/airspeed requirement at ZZZZZ2 (250/110) due to radio congestion. We were given a frequency change and got relief from ZZZ Approach who gave us a descent to 6,000 feet which we accomplished. The rest of the approach and landing was uneventful. When the PF re-cruised he inadvertently typed in '320' instead of '230'. There was not an immediate erroneous depiction on the ND. Everything looked normal, however we continued past the descent point. Just as we realized there was something wrong, the ND descent point disappeared. The PF has been on reserve and has flown very little in the last two months. The next two flights went well with no problems. The two pilots were on the first leg of the trip. It was the first time they'd flow together. They were working well together and both were attempting to follow policies/procedures. This was a dumb mistake by one pilot that was not caught by the other. By re-cruising, the goal was to have the ND provide usable descent point information. I listed this as a 'Moderate' risk rating because we easily received relief from ATC. If they had not assisted us, the risk would have been higher.

## Synopsis

Air Carrier Captain reported an altitude deviation and explained the PF had been on reserve and flown little in the last two months which may have contributed to the event.

## Narrative: 1

We were level 5,000 feet 250 knots approaching ZZZ VOR on the ZZZZZ2 Star. Approach gave a heading 280 and slow to 180 and asked if we had the field in sight. We were heading 330 and I was thinking a turn to 350 was coming so 280 heading caught me a little off guard. I (FO) was pilot flying. The sun was just above the horizon as I looked west and across the cockpit for the field. Simultaneously I was looking cross-cockpit and programming the speed and heading change into the FMC. I could make out the field so I said to the Captain (PM), "I can see the field, you can call it in sight." I noticed another aircraft on TCAS at our altitude on TCAS and then saw them visually less than ten miles away, also headed west toward ZZZ [Airport]; I noted the paint scheme and relayed to the PM all that information and that they were probably headed to the north side of the airport. In my head I was thinking that our airplane was not slowing down as fast as I would like when the PM said 'where is that airplane, I think we need to turn.' I pushed the localizer button on the FMC but the airplane did not turn so I turned the autopilot off and manually turned to intercept final for [Runway] XXR. As I did, we received a TCAS TA then a few seconds later a TCAS RA to climb. The ADI showed a red boxed area from level flight down (I was descending) so I just leveled off until we heard "clear of conflict." Then Approach gave us a 180 heading, paused, and then said "you guys can't do that," and switched us to Tower. I was able to correct the high energy level of the airplane using gear, flaps, and speed brakes and continued the approach and landed uneventfully. Fast close to the airfield, sun in eyes, failure on my part to use automation. Something from ATC that I was going to turn towards the runway instead of downwind in the [Runway] XXR pattern or an advisory where we were in the sequence. My recency of experience led to not arming the localizer; while I did brief that at the start of the first leg I could have reemphasized it during the approach brief.

## Synopsis

Air Carrier First Officer reported a track heading deviation and an altitude deviation during approach resulting in an RA event and cited lack of flying contributed to the event.

## Narrative: 1

Assigned to descend via. Inside ZZZZZ assigned 300 knots. Captain used the speed window to adjust speed. Approaching ZZZZZ1, realized he was crossing low. He attempted to correct but still crossed low by what I estimate to be 500-800 feet low. I looked and realized he did not use Speed Intervention but instead had used LVL Change. ATC did not query us about the error nor was there traffic in the area. Captain new to aircraft and seat with limited recency of experience confused speed/descent modes. FO (PM) limited recency of experience involved with approach programming and communications did not notice the error. For our part better announcement and verification of MCP changes. Better monitoring during busy descent.

## Synopsis

Air Carrier First Officer reported an altitude deviation and cited the Captain being new to the aircraft and both pilots' lack of flying contributed to the event.

## Narrative: 1

Aircraft X was southbound at 030 for a visual approach to Runway XX at ZZZ. I accepted a VFR point out from ZZZ1 facility on a XXXX code just a few miles east of ZZZZZ intersection going a few miles west of ZZZZZ to turn back to ZZZ1 airspace along the coastline at 015. I did not tag up the point out because there was no traffic in that vicinity, and I was busy messing with my COVID mask. I was trying to put my mask on which I had in my pocket. I cleared Aircraft X into Runway XX for the visual approach. I switched Aircraft X to the Tower when the point out aircraft was 7NM East of Aircraft X at 015. The tower controller issued traffic to Aircraft X three times. The first traffic call Aircraft X reported seeing the aircraft on TCAS. The third traffic call Aircraft X reported the traffic insight. No traffic alert was given to Aircraft X and no TCAS RA was performed. Aircraft X continued inbound and landed without further incident. I lost track of the point out because when I took it I was working planes while trying to fix my COVID-19 mask. When I decided to just work without one, I had moved on to other traffic and forgot to tag up the point out. The fact that I was more concerned with getting in trouble for not having my mask on rather than doing a completely efficient job is the FAA's fault. The FAA is making us fear the repercussions of the mask mandate, so much its eroding the safety of the NAS...DO NOT REQUIRE MASK TO BE WORN ON POSITION IF WE ARE ALREADY SIX FEET APART, which we are based on the distance of scope to scope. Whether its distracting, [probably] muffles transmissions, the mask mandate on position is depleting the safety of the NAS.

## Narrative: 2

I was working LC. Runway XX was the active Runway, advertising RNAVs. Aircraft X, checked on Tower frequency on an 11 mile final at an altitude of 1,700 feet. I noticed a target moving east to west at a high rate of speed (240 knots) and was not tagged up. I called traffic to Aircraft X at his 2 o'clock 3 to 4 miles moving westbound at 1,500 feet. Aircraft X said he had it on his TCAS and he was looking for traffic. I continued to watch the westbound traffic realizing it was going to potentially become a conflict for Aircraft X and continued to call traffic to them. I advised Aircraft X to try and maintain 1,700 feet based on the fact the westbound traffic appeared to be holding 1,500 and Aircraft X was on an instrument approach. I also told Aircraft X it appeared the traffic was going to pass underneath. Aircraft X reported the traffic in sight right as my Ground Control and I realized the target was making a hard 180 degree turn back to the east while climbing up into Aircraft X's flight path and altitude. I responded back to Aircraft X to maneuver at his discretion to avoid the aircraft. The target continued eastbound. Aircraft X landed without incident. I asked Aircraft X if he would give me a call so that I may ask questions. I told

him he was not in trouble, he obliged and I gave him the tower number. I then attempted to call the Supervisor from our communications counsel to ask what was going on with the target to no avail, the Supervisor did not pick up. Once on break I was able to speak with the pilot: The Pilot said it was a [description]. He caught a glimpse of it while it passed underneath then Aircraft Y did the 180 degree turn back east and passed right off the nose of his aircraft at his altitude. The pilot also mentioned that his passengers had asked about the aircraft, leading me to believe in fact Aircraft Y was extremely close and causing this to be a significant event. The pilot said he was also going to file a report. I took the information down to my Supervisor. My Supervisor called the ZZZ [TRACON] Supervisor who said he didn't know anything of the event and that he was too busy to look into at the moment. Seeing as how Aircraft Y came from ZZZ's TRACON airspace, my Supervisor gave them a call to see if they knew anything about Aircraft Y and what it was doing. ZZZ4 said they were talking to Aircraft Y and had coordinated with ZZZ with a point out, ZZZ accepted the point out on Aircraft Y. There was never any coordination from ZZZ to myself on LC in reference to Aircraft Y. Note: I did not issue a Traffic Alert because I had no clue what Aircraft Y was doing, I was focused on calling the traffic from the beginning, and with the 180 degree high speed turn I felt like giving the pilot discretion to maneuver as needed (since he had him in sight then) was the best course of action for the pilot to be able to keep his passengers alive. Note: Aircraft Y was never tagged up on the scope. They appeared to be VFR but I'm really unsure if they were. Events like this in the ZZZ [TRACON] airspace and ZZZ [Tower] environment in my opinion are a consistent problem.

1. ATC 101: coordination and positive control. ZZZ1 [TRACON] coordinated with ZZZ [TRACON] as a point out. ZZZ [TRACON] accepting the point out. In all reality both facilities should be monitoring what Aircraft Y was doing. The original point out coordination was that Aircraft Y was going 6 miles west of the fix ZZZZZ. Once Aircraft Y passed 6 miles there were 2 possible controllers to notice and do something about it. ZZZ [TRACON] should have questioned ZZZ1 [TRACON] and myself reference Aircraft X, ZZZ1 [TRACON] should have reached out to Aircraft Y and ZZZ [TRACON]. Because no one did Aircraft Y was 15 miles west of ZZZZZ and crossing through the final of Runway XX at ZZZ.
2. Take responsibility when you have accepted a point out by keeping an eye on the target as well as looking at your current traffic and what may be a conflict between the point out and current traffic. Do NOT lose track of your traffic and or point outs (which was the excuse of the ZZZ [TRACON] Controller). If you're busy do not accept the point out potentially causing yourself to "lose track" of traffic.
3. CARE! This job is not a game. There is not time to not care when human lives are at stake. For my side: 1. I have re-played this 1000 times over in my head. I think maybe I could have called a traffic alert but what I can't see is what I would have suggested to Aircraft X. I called the traffic early and continued too, once he got it I felt like the pilot knew how to fly that plane better than me, and could see what Aircraft Y was doing better than me as well. If I had given him a suggestion based on how erratic Aircraft Y was I truly think it would have ended badly.

**The pilot's RA** never went off, and speaking to the pilot he wasn't sure why but he said it probably had no idea what to do based on what that Aircraft Y was doing.

2. Suggestion, call the pilot if able or the airport and question said pilot. Potentially file a deviation or ask what was going on.
3. Stop the "holes in the swiss cheese". This was always my favorite CBI [Computer Based Instruction]. In order to not have the holes line up you have to be vigilant always. I try and will continue to try. Maybe I could have even been more vigilant today? Saw it coming earlier?
4. Encourage pilots to file reports so this information can be turned into learning experiences. Thank you for reading some recommendations, and there are probably 100 more things that could be done. This event took a toll on myself the rest of my shift. Some things you just can't un-see, but for myself it makes me better and care even more for our pilots in the sky and their passengers.

## Synopsis

TRACON Controller reported being distracted by attempting to put on a mask and did not issue important traffic to an air carrier on final. Tower Controller reported issuing traffic to an arrival about an unknown aircraft that was pointed out to the TRACON, but the TRACON Controller never advised the Tower Controller.

## Narrative: 1

I was assigned to work position Flight Attendant (FA) D on the aircraft and completely forgot my exit rows briefing duty the flight. I didn't realize my failure to brief exit row passengers the entire flight. It was during the boarding process of the second flight when I

briefed those exit row passengers, that I became aware of what I overlooked on the first flight. I believe upon freshly returning to active duty, after almost an entire year being on extended leave of absence during COVID-19 schedule reductions, led to my lack of attention to flight steps in which years of routines were disrupted. To prevent this event from reoccurring, I need to refresh my memory and utilize my work manual in reviewing duties of each phases of flight. Realized mistake of skipped exit briefing for ZZZ-ZZZ1 flight while initiating exit briefing for the return flight ZZZ1-ZZZ.

## Synopsis

Flight Attendant reported after almost an entire year of being on extended leave of absence during COVID-19 schedule reductions, the disruption of routine led the FA to forget the safety briefing for the exit row passengers.

## Narrative: 1

I was PM. On initial climb passing 1,500 feet there was no power reduction as programmed on T/O page X. I reached up and manually reduced power then checked T/O page X to find it was in fact still programmed properly. Passing 3,000 feet the speed bug did not bug up for flap retraction. That is when I realized VNAV was not selected. I selected VNAV. We retracted the flaps on schedule and continued the flight to destination. I have low experience with only 40 hours on the aircraft. My Relief Pilot also was not yet consolidated and my FO just recently consolidated. I must have incorrectly responded "checked" to the "MCP" challenge on the before Start checklist and missed that VNAV was not selected. Fly more often. But hard to do under COVID. Be more deliberate in accomplishing checklist especially at the gate before airborne when stress and task demand is low.

## Narrative: 2

Departing ZZZZ at 1,500 feet power did not reduce to climb power. The Captain checked the takeoff pg X for altitudes, they were correct. At 3,000 feet the speed bug did not bug up for cleanup, that's when the Captain realized VNAV was not engaged. He engaged VNAV and I called for flap retraction on schedule. Cause - Recency in right seat. Monitoring. Refrain from staying heads down in the checklist. Confirm selected items.

## Synopsis

Air Carrier flight crew reported not following SOPs during the takeoff and departure phase and forgetting to select VNAV mode resulting in a delayed flap retraction. Captain stated lack of flying contributed to the event.

## Narrative: 1

I had a civilian jet at 6,000 feet on a vector to miss ZZZ west airspace that was hot 6,000 feet and above. He was in ZZZ central that I was showing active 8,000 and above. Turns out ZZZ central was active 060 and above. Make sure airspace is coordinated correctly and is reflected in airspace status.

## Narrative: 2

I walked into the aisle to split 3 sectors out to a different position but the current radar working it all/receiving the briefing from the shift leaving for the day said he needed a D-side now. I sat on the D-side and was given a verbal briefing when he had time. I did not know the previous shift changed to bottom limits of a MOA to an altitude that is usually reserved for summer dates, 8,000 feet, and is frequently displayed wrong because the default in the EDST is 080 not 060. The Radar Controller cleared aircraft into the MOA/ATCAA with normal winter base limits of 6,000 feet. I received a call from XX

[Sector] asking if he can have control of a departure to climb to 7,000 feet and I questioned his request. I asked the radar is the ZZZZZ airspace normal altitudes, he said yes and I explained to the controller that the base limits should be 6,000 feet not 8,000 feet. I asked the XX [Sector] Controller if something else was coordinated from the day shift on a higher altitude limit and he said no. I only assumed it was displayed incorrectly as 080 because it happens more often than not in winter time. Come to find out, the day shift controllers did coordinate the base altitudes of 8,000 feet, that information was given to the Radar Controller I was working with as part of the briefing. I was unaware of this information at the time this event happened. During the Summer months the MOA has a section of airspace with a base of 8,000 feet to allow for arrivals and departures out of a regional airport that sees most of its traffic during the summer. In the winter time this base altitude is 6,000 feet. In the EDST (Enroute Decision Support Tool) to activate the airspace, the default is 8,000 feet. Because the default is 8,000 feet, it is a REGULAR occurrence that 080 is incorrectly displayed. Controllers open the airspace activation menu, change the Top altitude and hit enter. There should be a procedure, an additional memory aid or something else that happens if we change the base altitudes outside of the normal because it cannot be relied upon during the winter months that it is accurate. I questioned it because it happens all the time and in this situation, I was incorrect in saying the base was 6,000 feet. In the X years I have worked here, this is the first time that during the winter months I have been incorrect when saying the base should show 6,000 feet, not 8,000 feet.

### Narrative: 3

I received a position relief briefing. Traffic was complex with a lot of military activity in ZZZZZ and ZZZZZ1 airspace. As was later determined, I was briefed that ZZZ Central was capped at 8,000 feet. After receiving the briefing, I immediately began working the traffic I had. It was busy and fairly complex with many VFR aircraft calling for IFR clearances, military flights inbound to ZZZZZ, and outgoing military returning to ZZZ1. I had a D-side to help with coordination, which was significant. I misunderstood the relief briefing and cleared Aircraft X and Aircraft Y into ZZZZZ all, base altitudes to FL300. This removed the 8,000 foot altitude cap on ZZZ Central, and put the military aircraft into potential conflict with a FLC aircraft operating and civilian jet. I did not have any details at the time of the FLC operations. COVID-19 has been a unique event for all of us. It has led to significantly less time on position. I personally have primarily been working the CIC position for the past few months. There are two trainees who need training time every night. The end result is me getting only the bare minimum amount of currency every month. I feel that this has been detrimental to my ability to work aircraft as proficiently as pre-covid times. I generally only work slow traffic, so this particular scenario was difficult for me because I simply do not work traffic enough with the current schedules. We should return to our Basic Watch Schedule (BWS) as soon as possible so that we don't further erode our skills.

### Synopsis

ATC Controllers reported an airborne traffic conflict due to changes to the base altitude of the restricted airspace. A Controller stated it is difficult to keep informed of changes and stay proficient because controllers are working several different positions for short periods.

## Narrative: 1

While working [sector] X there were significant areas of weather that were impeding aircraft transitioning the sector. One area in particular was south of ZZZ and it was causing large deviations for aircraft inbound to ZZZ. Due to a recent Memorandum of Understanding (MOU) that drastically alters Controller's working conditions on sector, which mandates the wear of facial coverings due to COVID-19 communication began to break down with aircraft on frequency. While trying to describe the precipitation to pilots the mask created interference and the pilots could not decipher what I was trying to relay, which was weather that would affect their route. This was especially the case with a

handful of aircraft inbound to ZZZ that needed information on the weather and on the other aircraft they would have to follow into their destination airport. My only option was to remove the face covering so that I could communicate directly and effectively to the aircrews trying to navigate these storms. I am simply trying to comply with the duty priority. Management at this Center is more concerned with complying with the MOU regarding face coverings than they are about safely moving aircraft about the National Aerospace System. If I were to be seen without my face covering on sector I would undoubtedly be reprimanded for the "face mask violation." Ironically enough, if I were to not be able to communicate with the aircrews effectively and they enter an area of severe turbulence associated with thunderstorms I would also be reprimanded by management. We have now entered a situation where controllers are going to be forced to decide what is more important, the aircraft on frequency or the arbitrary rules being enforced by management due to a "pandemic" that is now over a year old that has proven to represent little-to-no risk to the controlling workforce. By the end of the session I had several instances where separation errors almost occurred because of deviating aircraft and having to repeat transmissions to climbing/descending aircraft...this was even after I removed the face covering. I would recommend that someone in the Air Traffic Organization stand up for the safety of the system and issue some direction for controllers that need to communicate with aircrews. It is unreasonable to expect controllers to day after day wear a face mask while on position that causes distractions and limits the ability to safely conduct air traffic control procedures. There is currently no direction as to when a Controller can remove a face mask in order to promote safety.

## Synopsis

Center Controller reported having difficulty communicating with pilots while wearing a face mask and stated that the requirement to wear face masks causes distractions and limits the ability to safely conduct air traffic control procedures.

## Narrative: 1

Started APU shortly after arrival to cockpit and noticed a dusting of what we thought was debris coming from the ducts. I asked the support crew to get in touch with maintenance to take a look. Me and the crew continued with our duties and at some point we noticed an odor. We felt it must be the COVID spray so we were not alarmed. Spoke with maintenance about the dusting but language was a barrier. Later alerted by the crew that smoke in the supernumerary was getting worse. In the cockpit we had not noticed. Maintenance came into the cockpit and told us to leave and shut down. We vacated immediately.

## Synopsis

Air Carrier Captain reported during pre-flight duties the crew noticed dusting in the air and believed it to be spray for COVID. Captain was told by Maintenance to shut down and vacate the aircraft.

Narrative: 1

I wouldn't mind to serve the passengers with our normal service any other time however with the national crisis still going on and only about 20% vaccination rates. With the new menu option, I feel that it is still too early to provide these options. At first, I noticed even with the menu placard, several people lower down their masks to order their drinks despite the numerous PA about the mask compliance. It is quite distracting and uncomfortable environment to other passengers who are sitting next to them and myself. Few people were chewing their food and talking to me without the mask. The second thing is that more people are traveling which I am happy for however the social distance is impossible already. After serving snacks they immediately remove their masks. By the time I bring my drinks to serve, I am exposed to all these passengers and passengers themselves while they are chewing and talking themselves. The third problem is that more drinks, more contacts. Almost everyone touched my hands when I served the drinks. And immediate contacts with them handing over the drinks, it makes some passengers quite uncomfortable and distracted events for the crews. The fourth problem is that WiFi is inadequate and lots of people ask how or where to find the menu, it may sound simple to do it but it's not something that generally people are familiar with our website and not many frequent fly members on board. It takes lots of crew time and distraction in fact. Lots of crew members are still not having the access of the vaccine yet. I feel that our company put our crews in great danger in our work environment. If we follow the federal guideline, I strongly believe that we are not ready for this, yet. Thank you for your consideration and help in advance. We must vaccinate the crews 100%. I believe it is the upmost important event the company needs to focus on and resume the service we normally do after. This extra menu service, is simple I understand, however it still too early to say we are safe.

## Synopsis

Flight Attendant reported it is too early to expand the inflight service. There are too many passengers with face masks down, talking with masks down, and social distancing issues during the inflight service.

## Narrative: 1

I was made aware that our flight was flagged for a passenger location/count audit. Apparently, we sent two requests via ACARS for a manifest/performance numbers with the location/count of the second one being off from the first. I cannot recall the exact details of this flight but I believe what happened is that I was notified of passengers moving zones due to social distancing. When this happens, I request a manual location/count be completed by the flight attendants to ensure we have accurate zones for the takeoff data. I believe there was a count error that was missed by us or the cabin crew. Although every effort was made to ensure we had accurate zones for departure, we ended up with three extra passengers than what the final location/count included. We were doing our best to ensure we had accurate numbers before block-out and perhaps the final count was overlooked as we were pressured for time. I am often notified of these changes with only minutes to spare before departure, so I feel that letting the passengers move rushes us and exposes errors like this one. While I understand some peoples need to distance on an airplane, I think there should be a cutoff in time before departure for this to be allowed. This creates an unnecessary distraction for the crew, and could create potential discrepancies like this one for the location/count. I think it could easily be explained to a passenger that they are free to move at some point after departure.

## Synopsis

Air Carrier Captain reported an error regarding passenger seating location and took off with an incorrect passenger count.

## Narrative: 1

We were cleared approach RNAV Z XXR. I looked at the navigation display and saw a solid unbroken magenta line from our position to the runway. LNAV and VNAV displayed in FMA's. Prior to this we were given delete speeds and at some point, I think we were assigned 210 knots. Weather was clear VMC. We were looking for traffic. At some point traffic was called to us. I did not see the discontinuity at ZZZZZ in the MCDU. Approaching ZZZZZ I felt the plane was not turning to follow the path as it should. I disengaged the autopilot and hand flew the rest of the procedure. ATC asked us if we were turning and then asked if we could land. In the 10 months preceding this incident, I have 18 hours of block time. I have 2 hours of block time in the last 90 days. I was an X type aircraft Captain but was retrained as a First Officer (FO). I have 0 hours as an FO in this aircraft prior to training. My training consisted of one 4-hour sim period and two OE legs. I believe the Captain was just back from a medical issue, had done a short training course and this was his second trip on the line.

## Narrative: 2

Arrival into ZZZ during daytime VFR conditions with excellent visibility. Our FMC was programmed for the arrival as well as the RNAV RNP Z to XXR with the transition at ZZZZZ intersection. Our primary error was that we did not close the FMC discontinuity between the arrival and the approach. The result was that we overflew ZZZZZ1 intersection and corrected immediately after recognizing that we were not turning at the appropriate time. In hindsight it appears that multiple distractions contributed to our failure to remove the discontinuity. The change in speed assignments as well as a request by the Controller to watch for Aircraft Y traffic on a parallel runway and the timing associated with the issuance of our approach clearance. We were able to visually identify the Aircraft Y parallel traffic and kept visual separation. Once established on the extended runway centerline we received TA/RA warnings associated with the proximity of the Aircraft Y on XXL. Also, there was never any indication that our aircraft deviated laterally of the extended runway centerline that would have compromised separation. Immediately after arrival at the gate I called approach control to discuss the late turn on the approach. (I was not asked to call.) I requested to speak with a Supervisor and we had a 5-10 minute discussion. I was told there was "nothing on their end" in the way of a complaint. We also had an additional

discussion about the traffic advisories associated with our approach given the close proximity of parallel traffic. One of the challenges of flying into ZZZ is that we typically are issued our runway assignment, approach, and transition in the latter stage of our arrival. Also, once issued, it seems to be relatively common to be reassigned to yet another runway, approach and transition. It is also common to receive speed modifications on the arrival. We were prepared for the RNAV Z to XXR and per company procedure we had the default arrival transition programmed. In hindsight I believe that if our clearance to fly the approach had come earlier in the arrival phase (when we had less distractions) that we would have been more likely to close the link between the arrival and approach and avoid our error.

## Synopsis

Air carrier flight crew reported a track heading deviation during approach and cited lack of flying as a contributing factor.

## Narrative: 1

Descending into ZZZ, I was keeping my speed below 250 knots while descending through 10,000 feet using speedbrakes (power at idle). As I was reaching my level off altitude in the descent, I retracted the speedbrakes and the aircraft speed increased to around 258 knots. Upon seeing this excess speed, I re-extended the speedbrakes and slowed the aircraft to below 250 knots. Cause - Not noticing the increasing airspeed was a rusty move on my part, I believe, due to lack of flying over the past few months. To prevent this from occurring again, I'll be more focused on the task at hand when changing configurations.

## Synopsis

Corporate Jet Captain reported exceeding the 250 knot speed restriction below 10,000 feet and cited lack of flying as a contributing factor.

## Narrative: 1

Turning for a 7 to 8 NM final from left base to Runway XX with aircraft configured flaps 20, PF established aircraft on ILS Runway XX GS and LOC for visual approach. PM made a VFR traffic call for an 8 NM final landing Runway XX. Another jet on the ground at ZZZ made multiple calls for a radio check and the PM responded he could hear the jet loud and clear. PF called autopilot off, and request the visual approach for Runway XX in the FMS. The PM entered the Runway XX visual approach into the FMS. PM made a 5 NM final call on CTAF. The jet on the ground informed the PM they were taxiing on Runway XX and would clear the runway prior to aircraft landing and then engaged the PM in a conversation about their inability to contact ATC Clearance. PF called flaps 30 and flaps 45 and slowed the aircraft on speed and Glide Slope. PM read the before landing check and at the LANDING GEAR DOWN call both the PF and PM noted the lack of DOWN 3 GREEN on the display panel and then visually checked the gear handle and noted it was in the up position. This occurred at about 1,100 feet HAT and was follow by the gear horn going off. PF immediately began a go-around and made call outs PM preformed G/A TO actions and traffic calls. The aircraft descended to 900 to 1000 HAT before entering the upwind for Runway XX and performed an uneventful left traffic pattern landing on Runway XX. This was my first day back from a month of leave and my Captain had also recently returned from leave. Rust may have been a factor. Additionally, we were flying at a high altitude airport with terrain at night with no Tower. There was definitely a communication break down and I was tasked saturated and should have let the Captain know I was in the red, and I could have missed the gear call. The final distraction was the jet on the ground taxiing on Runway XX where they should not have been, and fixation on them clearing the runway and engaging in a conversation about contacting ATC to get their IFR clearance was also a factor taking my awareness outside the aircraft. In the future I need to be more aware of my saturation level and communicate this correctly to my captains and avoid engaging in extraneous ground communications with other aircraft. Also, I need to visually and verbally verify my actions and confirm call outs by myself and other pilots regardless if I am PM or PF and verbally verify ambiguous calls or situations.

## Synopsis

Air Carrier First Officer reported an unstabilized approach and cited not using SOPs and missing call outs from the Captain as contributing factors.

## Narrative: 1

We were with ZZZ Center and I was having trouble understanding the Controller. I told him that he was coming in 3x5. The Controller proceeded to tell me that he had numerous complaints about being hard to understand and the reason was, that he was required to wear a mask while at work. I started thinking about this and realized that I was having trouble with other controllers throughout the country and never made the connection. We never had an issue but the Controller had to repeat himself several times which seemed to clog the radio. Suggestion - Have the controllers not wear face masks that might make their transmission difficult to understand.

## Synopsis

Air carrier Captain reported the ATC Center Controller was difficult to understand because the individual was wearing a required face mask.

## Narrative: 1

While descending to FL240 we were cleared to descend via the ZZZZZ X RNAV Arrival. I selected 11,000 feet. Approaching ZZZZZ Intersection I noticed that we were in open descent. I disconnected the autopilot and leveled off at FL238 and then started a climb back to FL240. Cause- While level at FL350 ATC cleared us to FL240 with a restriction to descend below FL310. I selected open descent to meet the restriction. After being cleared to descend via the arrival I did not select the managed mode. I need to increase vigilance when flying with people coming back from leaves for both PF and PM roles.

## Narrative: 1

Approximately 20 minutes after departure I received a call from the Flight Attendant that we had a couple passengers that weren't complying with the mask mandate and asked me to make our announcement reminding passengers of the Federal mask mandate. I made our announcement. Just prior to going through sterile flight deck period the Flight Attendant called again with passenger seat numbers X3 and YX4 and asked me to relay non mask compliance to the station. We made several attempts to contact Operations. After being unable to do so I sent an ACARS to Dispatch notifying them of mask non-compliance and asked them to have a CSR meet the aircraft. Being so close to the destination we elected to continue to the destination. After landing we tried several more times to contact Operations on taxi in and were unable to do so. Upon arriving at the gate the CSR came on board and informed me they had LEOs waiting at the counter and the TSA had been notified but she wasn't sure if they were sending a representative to speak with the passengers. She requested keeping the passengers on board for several minutes, so they could make sure everyone was prepared to receive the passengers. Given the all clear, the passengers disembarked without incident. The Flight Attendant mentioned she made multiple announcements and handed the passengers the information describing the penalties for non-compliance that are included in the packs of masks/alcohol wipes. It sounds like she made every available effort per SOP to have the passengers comply with the mask mandate. As states continue to withdraw mask mandates I foresee this becoming an increasingly widespread issue. I thought the idea of handing the passengers the information card was a very smart idea as seeing this in writing may carry more weight. Perhaps aircraft can be stocked with additional copies of these cards to hand out. Also our current guidance on the mask mandates in the flight crew memo make this policy sound like it is just per company policy. Updated guidance stating that this is a Federal mandate may make it more clear to the passengers that this is a serious federal violation. Every day we see passengers wearing masks that are not allowed on our flights and have to be given masks that meet standards, gate agents policing masks that required standard would also be helpful.

## Synopsis

Air Carrier Captain reported passengers not conforming with face mask policy during flight and had personnel meet the aircraft on arrival.

## Narrative: 1

Briefed low level level off at gate. On taxi out, ship phone rang in cubby hole and I couldn't reach it. Dispatch informed us that we needed to hold on the ground for a maintenance carry over item that would expire before the completion of the mission. We waited ready for takeoff for almost an hour with several updates from Dispatch that sounded like we were going back to the gate. Then suddenly told to go. Briefed again the low level level off while waiting. Took off and did not execute the maneuver as we briefed. Got ATC call to switch to departure control right before ALT CAP. Noticed the FMA was not matching the calls. I switched my eyesight to the FO's hand on MCP. Once correct, I returned to ADI and discovered altitude was approaching 2,500 feet. Corrected pitch to return to 2,000 feet. ATC then assigned us 5,000 feet. No comment was made about the altitude deviation. Cleaned up aircraft, engaged autopilot, no further incidents. Cause - Pilot flying distracted to monitoring. Pilot monitor error in MCP. Pilot proficiency played a role. This was my first flight in 2 months and second in 5 months as pilot flying. Pitched down to correct altitude. FO contacted departure and we got an immediate climb to 5,000 feet. The main thing that sticks out is pilot proficiency.

## Narrative: 2

Briefed low altitude level off thoroughly. While taxiing, received phone call to hold for Maintenance waiver issue that affected later flights. Held for nearly 45 minutes at end of runway. Got the go ahead and proceeded to takeoff. Normal Takeoff until "Alt Cap" called. VNAV was pushed initially then immediately corrected to Speed Mode and set 200 knots. Scanned back to instruments and noticed and called out altitude deviation. Pilot flying corrected immediately. Called departure with no further comments from ATC and rest of flight was uneventful. After MCP operation, noticed altitude deviation. Made deviation call out and pilot flying corrected immediately. Pilot flying became distracted with MCP operation. Pilot monitoring procedural error in MCP operation. Pilot proficiency. Time compression. Aggressively corrected and contacted departure. No comment from them and received immediate climb to 5,000 feet. Pilot proficiency should be maintained/bettered through flight/simulator scheduling efficiency.

## Synopsis

Air carrier flight crew reported an altitude deviation during departure and cited lack of flying as a contributing factor.

## Narrative: 1

While boarding the ramp manager arrived to the flight deck with a NOTOC regarding 20 KG of dry ice being loaded onto the aircraft. The Ramp Manager informed the Captain that

it was freight containing pharmaceuticals, not a UN3373. She also told the Captain that [this] was not an expedite item. Moments later the Dispatcher sent an ACARS to tell the Captain to verify that the package was an expedite item. The Ramp Manager again confirmed that it was NOT an expedite item. The Captain called the Dispatcher and they discussed that the package was not a expedite medical supply item or an expedite UN3373 and was therefore limited to 2.5KG per package. Because the package was 20 KG the Captain asked that it not be loaded. After swapping aircraft due to an unrelated Maintenance issue, the Captain went to look at the package and noted that it had a handwritten label saying it was the X Company Vaccine. The Captain noted that because it was not an expedite item it was not labeled normally, i.e., it did not state "Contains dangerous goods..." and did not have the dry ice placard. It also had a marking indicating that it contained no dangerous goods. When speaking with the Dispatcher again the Dispatcher told the Captain that we were indeed authorized to carry it citing the national state of emergency due to the pandemic. Captain read the FOM chapter pointing out that it was not an expedite medical supply item and not an expedite UN3373 and should therefore be limited to 2.5 kg of dry ice, but the Dispatcher assured the Captain that we could take it. The Captain confirmed that the package would not be able to fly on any other flight that day. After conferring with Dispatch, and the manager who brought up the NOTOC who confirmed the contents the package was loaded on to the aircraft. There were no further issues. Flight crew and Dispatch worked together to determine if the item was safe for transport. Speaking with Dispatch and the Ramp Manager, it became clear that each party agreed that the 20 kg of dry ice would normally exceed the limit for an individual package that is not an expedite medical supply item or expedite UN3373; it was, however, also agreed that this vaccine shipment was somehow excepted from that normal requirement. The cause would seem to be some confusion as to whether or not freight which is not an expedite item that contained medical supplies, specifically the Vaccine, were allowed. Perhaps a lack of guidelines specific to the transport of the vaccine was a possible cause (if such an exemption from policy exists). The Captain determined after speaking with the individual parties that it would be safe to transport. Better guidance, including up to date flow charts, to help navigate this issue. It is not entirely clear whether a medical supply needs to be an expedite item in order to be exempt from the individual limitations of 2.5 kg. Although both the Captain and the Dispatcher initially thought that it does need to be an expedite item to contain more than 2.5 KG, the chapter in the FOM does not expressly say either way. The exception to the limit of 2.5KG appears to be listed under the expedite item section on the maximum limits page of the FOM, but it then states, "Dry Ice weight may exceed the 2.5 kg (5.5 lbs) limitation, if contained within the UN3373 expedite item or medical shipment." The use of the word "or" may indicate that a medical supply need not be an expedite item even though it is located under the expedite item section. This could use clarification. If a medical shipment can exceed 2.5 KG without being an expedite item, then it should be listed as a separate exception. Similarly, if the medical shipment MUST be an expedite item that should also be clearly stated. If there is some exception due to the pandemic for the COVID vaccine that should be conveyed. The current flow chart contained on our system could stand to be updated. Specially, it lists all limits in pounds, but the NOTOC is in KG, which in itself renders the tool useless. Also, the flow chart ask the question "is dry ice in an expedite item?" This is a yes or no question, but the flow chart only has an option for "YES."

## Synopsis

Air carrier Captain reported a hazardous material documentation issue while attempting to transport a vaccine.

## Narrative: 1

Departed ZZZ after an unexpected runway change from Runway X to Runway YL due to high winds. After takeoff I was the PM and the FO was the PF. We were assigned Runway YL ZZZZZ. ZZZZZ1 departure. There was a fair amount of turbulence due to the strong westerly winds flowing over the mountains. On the departure you are supposed to cross the fix ZZZZZ2 below 10,000 feet MSL. We were climbing in VNAV Path and the FO was hand flying. We ended up going thru 10,000 to approximately 10,400 feet MSL due to VNAV not commanding the FD to level off. As the FO who was the PF was returning to 10,000 feet MSL the Controller told us to level off at 10,000 feet MSL, which we were already doing. It was clear and VMC at this time. There were no targets on TCAS and nothing was said about any loss of separation. I immediately rechecked the box to ensure the departure was there and the rest of the altitude constraints were correct, which they were. The flight continued to ZZZZ2 uneventful and nothing else was said by the Controller. Last minute runway change was a contributing factor as we more thoroughly briefed the Runway X departure at the gate. The moderate turbulence on departure affected aircraft controllability and instrument scan. The fact that we departed from a field elevation of XXXX feet MSL and 10,000 feet MSL came a lot quicker than normal (flying from home base). The fact had I recently transitioned to the aircraft and have only flown less than 50 hrs since October 2020 and often go 2-4 weeks without flying. Another contributing factor is my lack of HUD experience and the division of duties when looking thru the HUD but not having any navigational information presented on the HUD. Long sit time in ZZZ Departure airport. Take more time to rebrief a departure after runway change. Emphasize the high field elevation and how much quicker we will be at 10,000 feet MSL than what we are typically used to flying out of ZZZ1. Use the HUD for the takeoff but develop a better scan with the navigational display to enhance situational awareness on a departure procedure. Consider the use of a higher level of automation to reduce workload in turbulent conditions.

## Synopsis

Pilot reported overshooting an altitude on departure and attributed the event to lack of recent flying and poor use of HUD.

## Narrative: 1

We pushed off the gate and taxied out to spot XX to switch to ground. Upon reaching the spot, we contacted ground a minimum of 6 times and sat for more than 5 minutes before finally getting a response. We had planned for runway XXL but were given XY which was unusual for a northbound departure out of ZZZ. We were told to taxi 1, 2 and to give way to company traffic which was passing right to left on [Taxiway] 1. Once the traffic had passed, we made the left turn onto 1 and I announced to the Captain that I was going heads down to change the runways. I changed the runway on the route page and it did not uplink so I glanced at the iPad for a quick check of the numbers. During that quick look, movement caught my eye out of the rear right window and I turned to see another aircraft quickly approaching the Captain's blind spot on either [Taxiway] 3 or 4. I alerted the Captain of the traffic and he aggressively applied the brakes and stopped the aircraft prior to the intersection. The other aircraft taxied past without noticeably altering its speed and we continued taxing once clear. I am confident that both aircraft would have experienced a fuselage to fuselage collision had we not noticed the traffic at the precise moment that we did. Ground controllers were busy and weather was in the area. I don't know where the other aircraft came from but we were never given any reference to the traffic or hold short instructions. Additional staff working the ground frequency for that particularly busy bank in ZZZ. Also, make crews aware that when two taxiways intersect at less than a 90 degree angle on the right side, there is a significant blind spot for the captain which makes checking for traffic very difficult.

## Narrative: 2

We were cleared to taxi to runway XX from spot XX via [Taxiways] 1 and 2. The airport had just reopened after being closed for weather. Controllers were swamped trying to give

clearances and deal with multiple aircraft. We were not advised of approaching aircraft nor were we issued hold short instructions. Another aircraft was approaching the [taxiways] 1 and 2 intersection on [Taxiway] 2 while we were approaching on [Taxiway] 1. They were coming from our right rear at a 45 very fast. My FO (First Officer) saw him first as he broke into his field of vision he alerted me. I applied mildly aggressive braking to stop while the other aircraft showed no signs of slowing down. If I had not been alerted or even alerted 2 seconds later there would have been a collision in the intersection. It was a dangerous near miss that even after the fact neither ground nor the other aircraft seemed aware of. I contacted ground and told them it was near miss. Airports are starting to get busy again but I feel controllers and pilots are not as current as we were. Someone should have caught this before it happened. Ground is going to have to step up their game if airlines are adding flights to ZZZ. You can't be giving clearances on ground frequency when you are already overloaded. That's crazy.

## Synopsis

Air Carrier flight crew reported a critical ground conflict occurred during taxi out and stated they were not advised by Ground Control of the approaching aircraft.

## Narrative: 1

Aircraft X was inbound to land Runway XXL. When I issued a turn northbound the pilot questioned the heading. The session is muffled during replay due to the requirement of wearing mask. This creates an undue safety issue when each transmission is time dependent. Since all of our positions are separated by more than 6 feet that mask [should] not be required when working position unless it is an associated hand-off.

## Synopsis

TRACON Controller reported a pilot questioned a heading clearance and cited a possible muffled transmission due to wearing a face mask as a factor.

## Narrative: 1

Runway XX at ZZZ is through a valley, runway is not always visible when turning final. I was given an extended downwind by maybe 3 miles because of a small aircraft. I missed the turn from base and continued and turned north of the final. Tower asked me where I was as I was off course. I said I did not have visual on the airport. He gave me instructions for reposition, I was slow to follow course correction as I was low, slow climbing stopped the turn. I then asked for [Runway] YY which had better visibility, but I couldn't find that either from where I was. Weather was clear and unrestricted visibility, but area was covered in snow. (not runways or roads). From not making [Runway] YY I got a visual on [Runway] XX which was main landing runway due to winds (3,200 feet, vs 4,400 for [Runway] YY) asked for that. This caused backup of other traffic and then one aircraft in pattern didn't comply with controller's request for heading information. Controller started yelling at him for non-compliance (after yelling at me several times). Unpleasant situation, stressful, tried to remain calm. He gave an instruction on a heading which I was slow to comply in part because there was an aircraft above me in the direction of the turn. I mentioned it to the Controller and he said it was 1,000 feet above me. After I acquired a visual on [Runway] XX and the Controller positioned me and cleared me to land, I landed without incident. I hadn't flown since November due to winter and the pandemic. I was planning on going to ZZZ1 for the day, but decided against it due to lack of recency and stayed local and went to a local airport just to do some VFR practice approaches. All was OK until I turned base to [Runway] XX. I have MS flight simulator 2020 and recreated and solved the issue. Extended center line on Foreflight I think will solve the problem, I'll go back to ZZZ tomorrow and shoot some low visual approaches to see if there is an altitude and distance in which I can see the airport, runway or the valley better with the Foreflight extended center line which I believe will solve the problem for me. Main factor probably was lack of recency due to winter and pandemic. Normally I try to get up every couple weeks at least, but haven't done so since the pandemic and winter.

## Synopsis

Pilot reported not having flown in a while, having difficulty finding an airport, and having issues with ATC.

## Narrative: 1

This was the first leg of a 3-day trip and my 2nd trip in several months. I had not flown in several months due to COVID scheduling (but I have remained current with a PC simulator). I was having difficulty in clearly hearing ATC and through the interphone in flight. I was the pilot flying at the time of the event. My First Officer has been enduring a highly antagonistic situation in the home life, which may have found its way to the flight deck, creating an unanticipated stressor. My First Officer was distressed over these interactions, resulting in a secondary distraction. On approach, my First Officer (the pilot not flying) believed we were issued a clearance down to 2,400 feet and read back the misunderstood altitude of 2,400 feet. I did not catch the altitude clearance. Descending below 3,400 feet, ATC advised us of a low Altitude Alert and informed us that we were meant to be at 3,400 feet. We apologized and explained it was a misheard clearance. ATC asked us to climb back up to 3,400 feet and advised us we were still cleared for the approach. We complied and continued without incident. We discussed as a crew the intention to submit a report that evening. Being a bit rusty on operating in the physical environment and with the remainder of a 3-day to focus on (including a line check), I inadvertently forgot to write the report. After our first 2 legs, I was scheduled to split from my First Officer to fly with a line check pilot (per my request prior to the trip) out of an abundance of caution, due to being out of the physical environment for so long. It may be because we were no longer operating together that my First Officer and I forgot to submit our reports in a timely fashion (without having each other as a reminder). My job as a Captain is to ensure the aircraft is flown in a safe manner and that we comply with ATC instructions. The responsibility comes down to me to maintain total situational awareness in all phases of flight. I became inadvertently disconnected from the communications loop as pilot flying. This resulted in a breakdown of a good multi-crew concept, as well as an unsafe situation and unintentional deviation from ATC instruction. I must remain more diligent and vigilant as a crew member in all aspects of flight, regardless of assigned duty in order to maintain safe and compliant operation. It is also imperative that I participate in SMS in a timely manner, consistent with company standards. To be an effective team leader, it is also my duty to ensure my crew members take part in SMS. This can only enhance safety for our colleagues and industry as a whole. It was never my intention to neglect to submit a report, but unfortunately it was mistakenly forgotten. I should make reminders for myself to stay on task with necessary reports. In the future I may find it helpful to set reminders in my phone whenever issues like this arise.

## Narrative: 2

On approach to land, as the First Officer and PM for the leg, I responded to ATC's instruction to descend to 2,400 feet. My Captain did verify with me the altitude to descend too, since Captain had not heard it clearly. I advised that the assigned altitude was 2,400 feet. It wasn't until we were descending below 3,400 feet that ATC checked in and advised that we were to level off at 3,400 feet. We did proceed to climb back to 3,400 feet and continued the approach to land. The altitude of 2,400 feet was above the FAF altitude and ATC did not correct me when I replied to ATC with the confirmation to descend to 2,400 feet. It was then that, with the 2,400 foot altitude assignment being a bit lower than expected, even though ATC had not corrected me when I responded with a 2,400 foot altitude assignment, I should have verified the altitude assignment. In the future, as a First Officer and soon to be Captain, I will be more vigilant with all procedures and in the interest of safety and full compliance, verify that all direction and communications are clear, concise and without question. If this is ever in doubt, I will take full responsibility and take all steps necessary to ensure a safe and compliant flight.

## Synopsis

Air Carrier flight crew reported an altitude deviation due to a misunderstanding of ATC instructions. The crew cited lack of flying as a contributing factor.

## Narrative: 1

Cleaners in ZZZ are not following policy for waiting for all passengers to leave aircraft before they board to clean, and not following crew instructions to remain off the aircraft. Cleaners must wait for all passengers to deplane prior to boarding the aircraft. Cleaners in ZZZ are aggressively pushing their way into the forward galley to remove trash from the carts during the deplaning process. This impedes the flow of deplaning passengers and obstructs the ability of flight attendants to manage the flow of passengers and maintain door and safety compliance. Cleaners are insisting that flight attendants leave the galley area so they can work, they say operations has told them to move the crew to accomplish the cleaning task. Allowing cleaners to pull carts and trash while flight attendants and passengers are deplaning creates safety hazards (bumps, trips, and impacts from trash removal) and does not allow for safe social distancing as per company policy. Cleaners also leave bags on the floor posing a trip hazard for crew and passengers deplaning, as I was deplaning a cleaner had left a gray cleaning tote below a jump-seat and I tripped over it falling into the bulkhead.

## Synopsis

Flight Attendant reported the aircraft cleaners are not adhering to the social distancing policy.

## Narrative: 1

Taxiing to Z10 in the Z concourse at ZZZ we entered the ramp area without checking in with Ramp Control due to our confusion with ground clearances instructions. We were waiting on Y Taxiway to taxi to our gate and instructed by Ground Control to "follow an aircraft ahead into West (the ramp area leading to our gate)." Usually these instructions are followed by "contact Ramp Control." However today we did not get those instructions. We followed preceding aircraft into West. I stopped on the north taxi lane without pulling into our gate and instructed my FO to check in with Ramp Control to make sure we were cleared in. They in turn informed us that we needed to get clearance to enter the ramp and "that Company A has been entering the ramp without clearance all week." Hopefully this report will stop a clearly recurring problem. Maybe our confusion with ground controls clearance isn't only unique to us. We operate at many airports with Ramp Control and I can attest that there are standard instructions that we as pilots look for as cues such as being told to "contact ramp control" before entering ramp. Compounding my confusion is the non-standard operations at airports because of COVID where air traffic is down, and Ramp Control has been frequently out of service. I thought I did the right thing by stopping to query my instructions. I admit I'm still getting used to the Z concourse procedures at ZZZ having operated at ZZZ even before all the construction. I should have queried earlier right at the boundary of the ramp and relayed the instructions I was following. Also, we observed another Company A aircraft read back the wrong instructions going into the West Ramp Control. They were told to taxi Y to West. The pilots read back "taxi to the gate." Which is incorrect because they were told to taxi to the ramp area not straight to the gate. Not sure if they were able to follow the instructions correctly. I'm more aware and learned from this experience and will be more vigilant going into ZZZ in the future.

## Synopsis

Air carrier Captain reported entering the ramp without contacting ramp control and cited as contributing a confusing clearance and non-standard operations at airports where ramp control is frequently out of service due to COVID-19.

## Narrative: 1

I was working Sector X combined with Sector Y when I gave Aircraft X a descent clearance to FL300. I saw that Aircraft Y was potential traffic and though I had time to get back to monitoring the separation. I got caught up with other duties. The Controller at Sector Z mentioned that I may want to watch the Aircraft X and Aircraft Y. When I looked back I increased the descent rate on Aircraft X through FL310 and turned Aircraft Y 20 degrees left. I forgot the Aircraft X turned slightly west at ZZZ VOR. I should have given the Aircraft X a crossing restriction at ZZZ1 [VOR] and anticipated the turn to ZZZ [Airport] after ZZZ1 [VOR]. We are working very short in our area and having to keep sectors combined due to COVID-19 eliminating half our crew including our Supervisor. We now must run CIC and control and train. Get controllers vaccine shots so we can work together again and be back on a regular schedule so we can get used to busy sessions again.

## Synopsis

Center Controller reported an airborne conflict and cited staffing issues due to COVID-19 as a contributing factor.

## Narrative: 1

I had been furloughed and haven't worked the last 5 months. I got my first reserve trip as no 4. I worked my first leg, we were full to the capacity. It was hectic. When I was boarding my next leg, I realized I had not done exit row briefing on my first leg. I did

everything I was supposed to, and absolutely have the knowledge of procedure, but having been out of work for 5 months, and working full flight with lots of bags, I think it slipped my mind. I regret forgetting exit row briefing. Had never happened and will never happen again.

## Synopsis

Flight Attendant reported forgetting to brief the exit row and cited not flying for five months as a contributing factor.

## Narrative: 1

We were being vectored to final for the visual to Runway XXR in ZZZ. Descending out of 9,000 feet in the right downwind of the ZZZZZ arrival we were then given a vector "Turn right heading 030, descend and maintain 7,000 feet." It was clear that the Controller was very busy and was working approach for three parallel landing runways with many inbound flights that morning. Our next instructions were, "Turn right heading 090." Shortly after the turn to the east we were assigned, "Turn right heading 150 to join the [Runway] XXR LOC." This last instruction was given a minute too late. It was already apparent that we were going to fly through the final approach course with parallel traffic joining up for [Runway] XXL. The Captain had been saying prior to this, "Controller needs to give us the turn... Controller needs to turn us already... we are going to fly through final." Sure enough the turn was way too late and the aircraft automation was too slow to make the tight turn. The Captain immediately informed ATC that the vector was issued too late and that we would be flying through the final approach course and correcting west bound to rejoin. I disengaged the autopilot as the automation was not reacting fast enough to recapture the final approach course. ATC then issued us a 190 heading to rejoin the localizer and a traffic advisory to the aircraft that was flying the parallel, saying we were at their 3 o'clock same altitude and correcting west to rejoin [Runway] XXR LOC. Just seconds after the heading to rejoin was issued (We were already in the turn at this time) a TCAS Traffic Advisory went off due to the proximity of the aircraft on the [Runway] XXL parallel visual. Nothing further happened from this event. We were able to rejoin the [Runway] XXR LOC maintain 7000 feet until descent for landing was necessary and we completed a stabilized approach to landing. The cause of this event was due to task saturation for the Air Traffic Controller. Controller was working one approach frequency with dozens of aircraft needing vectors to final for the triple parallel visuals landing south at ZZZ. The automation lag didn't help when trying to join the LOC with the last second instructions however that was mostly mitigated by disconnecting the autopilot and hand flying a more abrupt turn to re-intercept and avoid further deviation. As a pilot (and never having been in to see a behind the scenes look at an ATC approach facility) I cannot tell you exactly what was going on or any, if at all, distractions may have existed behind the microphone at ZZZ Approach that morning. However, I can tell you based on my perception that the controller was talking non-stop with zero breaks between Controller and aircraft transmission and that Controller may have been overloaded during this event.

## Synopsis

Air carrier First Officer reported the ATC Approach Controller seemed overloaded with arriving aircraft and gave the heading change for localizer intercept too late.

## Narrative: 1

This was me and the First Officer's first flight together. He hadn't had a landing for approximately a month and hadn't been flying a lot recently. It was a beautiful day in ZZZ and we were cleared for the visual to XXL at about 7,000 MSL. We were established on the localizer as a backup and had the runway in sight holding around 210 knots. Approach control handed us off to tower and I checked in. We were cleared to land and told that there would be fighters departing out of ZZZ1, but they would stay below us. The First Officer started too slow and I extended flaps to 2. I started searching for the fighters and saw 2 of them takeoff. I keep my eyes on them to make sure we were clear. First Officer called for the gear and I extended it. I noticed we were still at flaps 2 and we were too fast for flaps 3. We were inside the FAF by this point and it was going to be close for a stabilized approach. The first officer had previously selected the approach mode and we were on course about 300 feet high on the glide path and fast so not correcting. I noticed the power on the engine instruments was not at idle which was strange because we had the approach selected in managed speed and the speed tape showed the target speed well below our current speed. I pointed the power setting out to the first officer and it was also confusing to him why the power was still up. We got to flaps 3 around 1,000 AGL and were still high on the glide path. We leveled off a little to get the flaps to full and then started to correct to glidepath. When we got to 500 feet we were still a good 200 feet high and 15-20 knots above our target speed. The First Officer asked me if I wanted him to go around. There was no traffic and the runway is 2 miles long so I said to continue. We ended up touching down at target speed well within the touchdown zone and cleared the runway. After getting to the gate and shutting down the engines we debriefed the approach. The First Officer said that all along he thought he was setting himself up nicely for the approach and thought it would work. I agreed and then I took myself out of the SA loop when I started searching for the fighters and didn't pay close enough attention to our energy status. When I finally did get back into it I wasn't forceful enough to help. When I pointed out the engines not being at idle I assumed he would disconnect the auto thrust and put the throttles at idle. When he didn't I should have told him too and that alone would have probably made us stable as there was still some time. At any rate I didn't and we were clearly unstable and we both knew it. The only correct option was to execute a go-around. Fuel was not an issue as we ended up landing with 6,500 pounds. I told him that I should have told him to go-around but he should have just executed a go-around without asking. That is the procedure. You don't need permission from the other pilot and permission not to go-around is still wrong anyway. We agreed that the biggest factor that got us going down this path in the first place was his recency of experience and that in order to fix that he should in the immediate future at least, slow down and configure earlier than he thinks he needs to. Going back to our departure briefing I should have taken the first leg anyway since I knew he hadn't flown in a while. This way he could have eased back into it.

## Synopsis

Air carrier Captain reported landing after an unstable approach when they should have gone around.

## Narrative: 1

This is a General Safety concern. No faults were committed by myself or the Captain. HOU ATC is constantly running 1 frequency to work Tower and Ground Control. This is causing an unsafe level of radio congestion. We could not get a push call in without blocking other aircraft or being blocked ourselves. Finally, once pushed, we had difficulty obtaining a taxi clearance. We finally were told to taxi and hold short of 13L. As we were holding short, we noted several aircraft attempting to push, taxi to and from runways, and obtain landing clearances. We noticed one corporate aircraft that could not obtain a landing clearance until short final, despite multiple attempts on their part, with no answer from Tower. HOU is a complex airport with multiple crossing runways, multiple taxi routes utilized, while also crossing runways. HOU ATC has been utilizing a single Controller for Ground and Tower Ops for most of the last 12 months, since the start of the slow down in air traffic. While this may have worked in the early days of this pandemic, it has turned into its own form of danger as air traffic has steadily increased, especially with the onset of Spring Break travel. I believe I am not alone in my concern that this could cause a serious incident at HOU, as there is no way a single Controller can safely manage traffic on the ground and in the air. I have been to far less complex, and less busy airports that utilize designated Ground and Tower Controllers. Please see to it, that this is not allowed to continue any longer. It poses a danger to our aircraft and our customers.

## Synopsis

Air carrier First Officer reported not being able to communicate with ATC due to Controller working Tower and Ground Control combined at HOU airport.

## Narrative: 1

We setup pre-flight like normal for Runway XX. No takeoff data for Runway YY. After push off the gate we were assigned Runway YY for departure. Before starting we got the data from ACARS for Runway YY. We took our time and entered it in the box. Then briefed the engine out for Runway YY. Since not flying much in the last year I tried to be helpful by entering data on the performance page since I was PF. I took extra caution to confirm the flap setting going to flaps 2 for Runway YY from flaps 1 for Runway XX which was setup in pre-flight and briefed. After starting engines we did flight controls prior to moving since it was a short taxi. Then we completed the before takeoff checklist to the line. Upon reaching Runway YY we were running the before takeoff checklist below the line when I saw we still had Runway XX selected. After noticing that the tower cleared us for takeoff. The First officer changed the runway and we finished the checklist. After taking the runway when I selected flex there was a pause then an ECAM for thrust not being in the detent. I looked down trying to adjust thinking it was set and only just slightly out of the detent. Upon realizing something wasn't right by not getting set power went TOGA as FO also called TOGA and continued as per training and AOM. Not flying much during the pandemic. Even taking our time when things got out of sequence trapping one error not realizing there was more to do. I have been through the training on this exact scenario and thought how could this happen. Well it was incredibly humbling getting lead down the path and once you realize it it's already happened. We literally caught the error during the before takeoff checklist and thinking since we trapped the error during the checklist and completed it that we were ready. Flying more. Any interrupt in the checklist EVEN if you literally trap the error during the checklist start over. Once you trap one error stop and take a minute to regroup then rerun the checklist. Don't think since you fixed it while running the checklist you are done.

## Narrative: 2

We entered Runway XX into the FMS since we had no takeoff data information about Runway YY. Upon push back, ATC suggested Runway YY was preferred for the winds. I

sent a request for data through ACARS. As a crew we entered the new data into the performance page and reviewed the engine out departure for Runway YY. The Captain decided to start both engines and preform the before takeoff checklist to the line prior to taxi so that I would not be task saturated on the short taxi out. As we proceeded to taxi and complete the checklist below the line, the Captain saw that the correct runway was not in the FMS. I corrected the runway and we continued to finish the checklist. When cleared for takeoff the Captain set the thrust levers in the flex detent, we received an ECAM stating the thrust was not in the detent. The Captain, as well as I thought that possibly the levers were not properly placed in the detent. When I realized something was not quite right I called for TOGA and the Captain immediately pushed the thrust to TOGA. After being off for almost a year myself and the Captain not flying much on reserve as well as taking leaves was a large factor. Though we caught one error with the checklist we did not follow through and catch the other. I have had this very scenario in my first simulator about 2 years ago and still fell down the path. We should have restarted the checklist from the top once we saw that there was any incorrect information in the FMS. Follow our training! Try to stay current as best as possible. We worked as a crew and had a good outcome, it would've been an even better one had we just redone the checklist.

## Synopsis

Air Carrier flight crew reported they did not follow SOP's for an existing aircraft condition and continued the takeoff.

## Narrative: 1

Cleared for takeoff on Runway XXR at ZZZ. XX passengers. Aircraft GW about 125,000 lbs. Aircraft accelerated normally using auto-throttles. At about 80 knots, the Right Bleed Trip Off light illuminated. I immediately began the rejected take off procedure. The airspeed may have gotten as high as 90 knots before spoilers and brakes began to decelerate. The aircraft slowed to taxi speed, we turned off at the first taxiway, and returned to the gate. No secondary indications or warning lights. No indication of hot brakes. Recency may have been a minor factor. I had only flown once in the last 30 days. Maybe I could have begun the rejected take off even sooner if I had flown more recently and more often. Still, I think my reaction was pretty good. I believe my decision to abort was a good one. Recency could have been an issue. As soon as I saw the light, I checked the airspeed at 80 and decided to abort. Maybe if I had been flying more regularly, I could have caught the light and reacted even sooner. At any rate, the aircraft GW was 125,000, the deceleration was controlled, and another aircraft was immediately available.

## Narrative: 2

Cleared for takeoff. Everything normal and as I said the 80 knots call we got an amber light. Captain asked what have we got, I responded with amber bleed trip light. He elected to reject at approximately 85-95 knots. Cleared runway at A taxiway . Technically speaking, we were just above 80 knots and should have continued but the Captain elected to reject the takeoff. We both discussed it at the gate and both agree that a lack of recent consistent flying may have caused "quick trigger." We could have done another quick reject/departure brief holding short to emphasize what reject procedures are.

## Synopsis

Air Carrier flight crew reported the Right Bleed Trip Off light illuminated during takeoff roll resulting in a rejected takeoff.

## Narrative: 1

During brief, maintenance write up for "Cargo Door" caution had been reported with no prior pressurization issues and MEL issued. This was an additional threat to monitor for. Upon departure, we received a "cargo door" caution message, and noted the pressurization was indicating decreasing cabin pressure. The QRH procedure was called for and ran. Due to fluctuating pressurization indications, it was decided to divert to ZZZ1 for further investigation into the issue. In my opinion, this event was caused in part due to lack of recent currency as both pilots had been on COVID leave. More important though was lack of threat and error management which led to rushing the QRH procedure. This was a time threat and there was ample opportunity to slow down and evaluate the condition. During the departure phase, there was some task saturation with multiple contacts with ATC and normal checklists procedures. In the future, I need to be more aware of my fellow crew member's task saturation condition level and be pro-active to verbalize when we need to make time and slow things down to avoid rushing through abnormal procedures. Knowing the history of the maintenance issue, we should have completed the departure phase of the flight, requested to level off at 10,000 feet to reduce the workload, and run the QRH at that time. Then, evaluate the condition and determine the best course of action.

## Narrative: 2

During the departure briefing I mentioned to the First Officer that we needed to have the Cargo Door checked by ground personnel prior to departure per deferral and failed to do so. I have had this same deferral several times before and was overconfident with the knowledge that nothing has happened since the initial write up. I have been out on COVID leave since December. This was my 1st flight back online. I did not sleep well the night before, I ate something that did not agree well with me for a late lunch the previous day. I was borderline wanting to call in fatigued but thought how bad it would look after 30 hours at the hotel. Don't eat tainted food. Get better rest. Have some sort of reminder to make sure the deferral requirements are met before departure.

## Synopsis

Air carrier flight crew reported not checking a cargo door that had a MEL on it due to a distraction before departing resulting in a divert.

## Narrative: 1

We momentarily exceeded the max altitude of 13,000 feet at ZZZZ [Intersection]. Upon realizing this, we quickly returned to 13,000 feet as per the departure. The Captain was hand flying the departure, which was new to both of us. In hindsight, because we were both unfamiliar with the departure, it should have been on autopilot for reduced workload. He had also been off for several months, and I had just returned from a week of vacation.

We could have verbalized the new departure as at least a minor risk factor and made an initial decision to engage the autopilot sooner after takeoff.

## Synopsis

Air carrier First Officer reported exceeding the maximum altitude at an intersection during climbout.

## Assessments

Contributing Factors / Situations : Environment - Non Weather Related  
Contributing Factors / Situations : Human Factors  
Contributing Factors / Situations : Staffing  
Primary Problem : Staffing

## Narrative: 1

The staffing has been really poor. We have taken a few hits because of people being out with coronavirus or close contact. I just wanna say on Day X that I worked a X AM to Y PM shift and that was the beginning of my week. It was tough to get caught up from the fatigue of that for a shift in the very first part of my week. Also, I have worked X weeks in a row with only a single day off. I took a handoff Aircraft X IFR from ZZZ [Center] (X SECTOR) at 4,000 destined ZZZ [Airport]. Airspace configuration was north based on ZZZ1 [Airport] international traffic. This required me to vector Aircraft X around the ZZZ1 [Airport] Final Box. I did so. Because of the staffing we were told or encouraged to not work VFR overflights or VFR practice approaches that day. I don't know if that word was past two adjacent facilities, But I was trying to eliminate as much of the VFR traffic as I could by terminating them whenever they checked on from other facilities or by denying services. ZZZ [Center] (Y SECTOR) handed off Aircraft Y, VFR at 4,500, but the pilot never checked in. I had to call ZZZ [Center] (Y SECTOR) and ask for communications. I had no intention of working Aircraft Y. I wanted to be able to communicate with the pilot to terminate Flight Following in order to concentrate on other tasks. I had the Flight Data controller remove Aircraft Y from the NAS. While I'm doing this, a couple of things happened at or about the same time. Aircraft Z checked on the frequency and was in the ZZZ1 [Airport] Final Box under the Class Bravo Airspace. Aircraft Z requested clearance

into the Class Bravo airspace and to navigate VFR to a hospital that I hadn't heard of and was not mapped. I was trying to determine where exactly the hospital was. At or about that same time I had an aircraft (Aircraft A) check on my frequency (the wrong frequency), wanting clearance into the Class Charlie airspace at ZZZ2 [Airport] for closed traffic. Aircraft A should have made the request on ZZZ1 [TRACON] frequency XYZ.Y. I looked over to my left and the ZZZ1 [TRACON] Controller looked and sounded busy so I decided to accommodate Aircraft A and then point out Aircraft A to the ZZZ1 [TRACON] Controller. I issued all of the instructions for Aircraft A. I also accomplished all of the coordination for the Aircraft Z with the Final Controller. When I finally get Aircraft Y on frequency I told him I was too busy to accommodate VFR flight following, told him squawk VFR and radar service terminated. At some point I drop the track on the wrong aircraft. I drop the track on Aircraft X IFR to ZZZ [Airport]. I'm shocked that I did not realize that I dropped the track on the wrong flight, but for whatever reason I did not. I'm pretty sure I was pretty tired by this point. My previous session in the day ran almost 2 hours, during which I took an absolute pounding. I am further shocked that at no time in the session did I realize and correct my mistake. Later in the session I took the hand off on Aircraft B from ZZZ1 [TRACON] Y Sector. Aircraft B was requesting 6,000. Departure 3 & 4 were being worked by one controller, who was probably the busiest controller in the room. I decided to give Aircraft B, 4,000 as a final altitude. Aircraft B was now IFR at 4,000 southwest bound and on a converging course with Aircraft X. I don't remember the destination for Aircraft B. Aircraft X is tracking pretty much direct ZZZ [Airport] I don't remember if I had given them direct or not. I noticed Aircraft B was converging with limited target at 4,000, which was Aircraft X. I called the traffic to Aircraft X. Seeing the conflict I decided to climb Aircraft B to 5,000. I don't recall if Aircraft B ever called the traffic in sight, but I know, after watching the replay that I never had more than 500 feet separation between the two flights. Still not realizing my mistake, Aircraft X calls ZZZ [Airport] in sight. I ask who he is and where he came from. Not one of my better moments. At some point, I began to remember Aircraft X and I start the track on the flight, make the appropriate entries in the scratch pad, coordinate with the ZZZ1 [TRACON] Y Sector Controller for landing ZZZ [Airport], inbound the flight to the Tower, and cleared Aircraft X for the visual approach to ZZZ [Airport]. I know this recommendation will be laughed out of the office, however it would be terrific if the terminal world had a version of EDST [En-route Decision Support Tool] along with a monitor/terminal to view and amend flight data at your position. This technological implementation is frankly overdue and it is a genuine travesty that we don't have it.

## Synopsis

TRACON Controller reported numerous issues while working traffic and problems associated with the workload and staffing.

## Narrative: 1

During ZZZZZX arrival into ZZZ descended to 12,000 at ZZZZZ. Prematurely started descending to ZZZZZ1 (11,000) before reaching ZZZZZ2. ATC deleted speeds, was a little preoccupied checking speed, making sure I did not have a speed deviation. First flight in almost three months. I need better situational awareness.

## Narrative: 2

ZZZZZX Arrival; After we leveled off at 12,000 feet at ZZZZZ, the FO set next altitude of 11,000 feet for ZZZZZ1 with confirmation. Approach Control notified us of a new ATIS. During our level off at 12,000 feet I copied the new ATIS. I looked up at the PFD and noticed we had vacated 12,000 feet prior to ZZZZZ2, and shortly after crossed ZZZZZ2. [Suggest a] digital ATIS.

## Synopsis

Air carrier flight crew reported not making a crossing restriction during arrival.

## Narrative: 1

We recently received a mandate to wear masks on position and I have been complying with that, however the masks cause my glasses to fog up. This is a problem with all the FAA issued masks, and the disposable masks. There are no masks that don't cause my glasses to fog up. I have tried the tape tricks and all the bending and positioning tricks that I can think of and my glasses still fog up. Since the FAA has mandated this, it has been a problem. Essentially, the FAA is asking me to void my medical every time I am on position. If I do not wear my glasses, my medical is invalid. Having fogged up glasses is like not wearing them at all, as far as vision goes. Allow us to take our masks off on position. That would fix the problem.

## Synopsis

TRACON Controller reported wearing an FAA mandated face mask is fogging up the Controller's glasses. Reporter cannot remove glasses due to FAA Physical requirements.

## Narrative: 1

I had to repeat control instructions because the pilot didn't understand what I said because I'm wearing a mask while controlling aircraft. Wearing masks while working traffic is not safe. I thought we were for safety first. The positions are socially distanced so requiring us to wear masks in addition is not safe, nor is it necessary for the health of others. This mandate is not following the science and is unsafe for the control of air traffic.

## Synopsis

TRACON Controller reported having to repeat transmissions to pilots because they could not understand the instructions, due to reporter wearing a face mask.

ACN: 1791338

## Narrative: 1

Upon door closure Flight Attendant Y came up to me and informed me she was having problems with a passenger who is refusing to put his mask on. I told her I would go to the back while she checked the doors for me. I went to handle the passenger and she did

closed doors and made the announcement. We both said cabin secure. I noticed the flight deck door was closed and had assumed she had done cabin secure for me seeing as I was tending to this passenger and she had done door closure for me. I continued on with the safety briefing. Approximately one minute into the safety briefing the Captain opened the flight deck door to inform me that no one informed him of cabin secure. Me and Flight Attendant X both became aware that we had assumed the other person had secured the cabin door and quickly re-secured the cabin. We continued on with our briefing. I believe we both made the mistake because of the destructive passenger. I had assumed that while I was tending to this passenger she had took over all of my duties and she assumed that I was going to finish my duties once I got back up into the gallery. I also believe the pilots close the door on their own to keep warm which is why we had gotten confused on the door being close.

## Synopsis

Flight Attendant reported being distracted by a disruptive passenger and forgetting to advise the flight crew the cabin was secure and they were ready to depart.

## Narrative: 1

I listened to the ATIS and prepared to taxi out for the short flight from ZZZ to ZZZ1 in the new to me aircraft. We had come in a few hours earlier and had no adverse radio issues at all. Reviewing the NOTAMs earlier I had filed away that the Tower was on part time status, most likely due to COVID, and would be closing in the afternoon. After startup we called Ground and did not hear a reply. On our arrival they had told us to stay on the Tower frequency, so we tried that one. Still no response and we tried each a few more times. We listened to the ATIS again and noted that it talked about the Tower closing and that it was many hours old. The passenger in the right seat was also a very experienced ATP rated pilot and CFI and he told me "The Tower is closed". I remembered that possibility from my NOTAM search earlier in the day and asked him how he knew. He said it was on our Foreflight app and he heard XA30 on the ATIS. That seemed plausible to me, so we reverted to CTAF procedures, announced our taxi on the Tower frequency, and proceeded to Runway XX. I did glance up at the Tower, just in case, and saw no light gun signals but the Tower was soon out of view. Part way to the runway we were intercepted by an airport vehicle and the driver pointed to his radio. I switched our radio to the second nav/com and was able to establish communications with the ATC facility. In retrospect, this was a good example of a display of expectation bias. We fit the facts we were experiencing into the theory we had developed for what was going on and we were mistaken. I knew that when a Tower closes they say so on the ATIS broadcast, but being so old I thought maybe they had just forgotten to do so. We both had XA30 in our minds as the closing time and discussed that it was now XB30, but we missed the fact that on the ATIS and the NOTAM XA30 was the opening time and it was UTC, not local time. The radios worked fine on the way in, they must be working fine now, etc. In reality we were wrong on all accounts and it is a good thing that we were able to establish ATC contact before taking off which would have only complicated things for all.

## Synopsis

GA pilot reported thinking the Tower was closed, started to taxi to the runway and was stopped by an airport vehicle who pointed to the radios. The pilot contacted the Tower before takeoff.

## Narrative: 1

Tower arranged for VFR flight following with ZZZ Departure, transponder code XXXX and a climb to 5,500 feet. I set my altitude alert selector to 5,500 feet. Airborne, I establish contact with ZZZ Departure of my departing altitude and climbing altitude of 5,500 feet. ZZZ cleared me on course to my destination and acknowledge and confirmed my climbing altitude. Shortly thereafter he handed me off to ZZZ1. It was extremely busy and congested, I had to wait several moments before I could establish contact with ATC. My initial contact I stated my departing altitude and climbing to 4,500 feet and not 5,500 feet, ATC did not inform me to notify them of any altitude changes. (realizing my previous transmission with ZZZ Departure I indicated that my cruising altitude would be 5,500 feet which they acknowledged). I stated an incorrect (previously stated to ZZZ Departure climbing to 5,500 feet) altitude that I was climbing to. I immediately tried to correct my climbing altitude with ATC while slowing my climb at approximately 4,800 feet. However, due to radio congestion this took several moments to advise ATC that I was climbing to 5,500 and not 4,500 feet. Due to radio congestion ATC did not receive my correction. ATC was also a little distorted in their communications, later on Controller advised all that could've been possibly due to wearing a COVID mask and [being] shorthanded. ATC informed me of traffic at 5,000 feet on my right side. ATC gave that IFR traffic a turn to the right and shortly thereafter give me a turn to the left. I did not see the traffic visually however I had them on my traffic avoidance system. Once clear of traffic I was given clearance to destinations.

## Synopsis

GA pilot reported the ATC Controller was busy, rushed and hard to understand possibly due to speaking through a face mask and the facility being short staffed.

## Narrative: 1

Upon doing the cabin sweep, I notice [Passenger in] X1 talking on the phone and asked her to turn it off. I only knew she was on the phone because her phone was facing up in

her palm and I could see the active phone call with the phone screen. She seemed to act like she was complying, but she was still talking. Her mic for the phone was inside of her mask, so I would never have been able to say she was on the phone had I not seen the phone. I told the forward she was still on the phone. People hide their cell phone microphones in the masks all the time. It is hard to tell when they are actively talking or just singing along to a tune. If it is so hard for me to discern an active phone call is taking place with a passengers face covered, I have to wonder what else people can hide inside a mask that could cause me, fellow passengers, crew or the plane harm. 3D printers can make all kinds of gadgets - including sharp objects - that could hide in a mask, not to mention the possibility of any kind of explosive that could be detonated between the teeth. COVID masks - supposedly are for crew and passenger safety, but these federal masks on airplanes create more safety concerns. I know the masks appear to keep us safe from the dreaded COVID, but the reality is the masks pose a much greater safety risk than COVID. I can't see what people are actually doing (talking on the phone or not). I can't identify a human trafficking victim from any other masked passenger. I can't identify a bad actor hiding in a mask from an innocent one in a mask. I can't smell alcohol, smoke, or even jet fuel when wearing a mask, which is required of me at all times - especially in my jump seat. The ability to do my job as a safety professional on an aircraft is greatly reduced thanks to these mask mandates. I am really surprised that the FAA and airlines care more about the optics of safety than the actual safety on board a plane these days.

## Synopsis

Flight Attendant reported concern regarding the face mask policy as it covers a **passenger's identity and creates a possible way to hide unwanted items under the mask.**

## Narrative: 1

When arriving at new aircraft, the ground power was connected. The temperature in the back of the plane was stifling - it had to be 95 degrees Fahrenheit in the plane. I told my forward Flight Attendant (FA) and we reported to Captain. Passengers were allowed to board and they immediately began taking off as many clothing layers as possible. FAA and company regulations still require everyone to wear masks, despite CDC warnings that masks should be removed when overheated. As the AFT FA, I am responsible for making announcements in a mask, which is laborious and requires many more breathing pauses than usual. Saying the announcements with a mask, in ridiculous heat is more, exhausting, distracting, and physically concerning. My only focus was being able to breathe and the health of my passengers. I walked to the front of aircraft to get some air, but also to get water for the poor passengers. Thankfully, the plane did cool off in the air, but it was still extremely uncomfortable. Extreme heat conditions on the airplane combined with mandatory mask compliance for passengers and crew caused this event. Crews can be terminated/lose benefits if removing masks on board the aircraft in front of passengers. Until recently, FA's were not required to wear masks while making announcements. Passengers can be fined/lose flight privileges for removing masks. The threat of the FAA fines and penalties under the new federal mask mandate appears to supersede common sense safety practices and concern and care for crews and passengers. Masks, may help prevent viral spread (there is much data to refute those claims), but prevents the passengers and crew to breathe much needed fresh oxygen. The effects of not getting enough oxygen and the potential for hypoxia were ingrained into me during FA training. I am greatly concerned that airlines and the FAA are continuing to put the safety of passengers and crew at risk with mandatory mandates that restrict fresh oxygen, which can cloud judgement and critical thinking abilities. Heat exhaustion and the need for fresh oxygen when wearing masks was acknowledged by the CDC. Of course, the CDC recommended spacing of self 6 feet away, but plane passengers and crew do not have the luxury of a 6 foot distance. Mandatory mask mandates on planes should also come with the ability to tell passengers and crew to remove masks when feeling anxious or stressed or when breathing is compromised. If one feels sick or faint because of heat and a mask, the ability to lower a mask on a plane should be allowed. FAs should be empowered to use their common sense when enforcing masks in extreme heat conditions. The "appearance of safety" seems to be aviation's new standard of practice rather than "actual safety" of anyone on board an aircraft. This is a very serious shift in thought for the FAA and airlines. The unintended consequences of these "appearance of safety" standards are frightening.

## Synopsis

Flight Attendant reported concern for passenger health regarding the face mask policy when the aircraft is on the ground with little or no air circulation and the cabin is hot.

## Narrative: 1

FO to be pilot flying. After cleared to line up and wait I stopped the aircraft and stated "Your aircraft, parking brake set" FO advance thrust levers to TOGA without releasing parking brake. I stated, "My aircraft, reject" and rejected the takeoff. There was no indicated airspeed. After following all reject procedures, we taxied clear. Followed up with Volume X and QRH. Re- accomplished Before takeoff checklist and proceeded to ZZZ1. The FO stated he did not hear me state "parking brake set" He also briefed me previously that he hadn't flown in a while so that may have [been] a contributing factor. This may have been a communications failure. I think it should be emphasized that the park brake be set anytime the aircraft is not in motion. This is the safest procedure to ensure unwanted aircraft movement.

## Synopsis

Air carrier Captain reported the First Officer advanced thrust levers to TOGA without releasing the parking brake.

## Narrative: 1

I was the pilot monitoring and my First Officer was the pilot flying from ZZZ to ZZZ1. The First Officer briefed and the flight computer was programmed for the ILS XXR. We were flying to ZZZZZ waypoint on ZZZZZ4 RNAV STAR. When the Approach Controller assigned us the ILS XXC approach, the First Officer incorrectly executed the secondary flight plan. He asked for my confirmation, but he had already executed the secondary plan before I had a chance to tell him not to do so. And, he misinterpreted the FMA on his PFD, which led him to make an incorrect turn using the heading mode selector. This caused a course deviation. He was confused. So, I reprogrammed the flight computer to rejoin the arrival route. Soon after, ATC gave us a heading to intercept the localizer for XXC. The flight was completed safely and normally. After the flight, I briefed him on the importance of confirming with the crew before executing the flight computer program, not to be in a hurry, to take time to correctly interpret FMA, and to know how to correct your own mistake when you make one. During this COVID pandemic period, he has moved from this fleet to XXX fleet then back again to this fleet. That might help explain his getting confused on this flight computer system. He took the post flight briefing professionally, and I believe it will help him in the future. However, I must say that we cannot keep using the pandemic as an excuse for errors and mistakes made on the job. Professionals should, regardless of the root cause, be able to recognize his or her own deficiencies, and continue to put effort into doing a better job every time.

## Narrative: 2

I was probably off course temporarily while on the ZZZZZ arrival while we were attempting to reload the arrival and changed runway.

## Synopsis

Air Carrier flight crew reported a track deviation due to the First Officer's confusion with the FMC. Reportedly, the First Officer has changed aircraft during the pandemic several times which may have contributed to the event.

## Narrative: 1

The clearance on takeoff was "Cleared for takeoff, fly heading 100 and climb to 4,000 feet. When handed off to Departure Control, I checked in and reported, erroneously, that we were "climbing via the ZZZZ 3 RNAV except maintain 4,000 feet. The Captain/Pilot Flying did not actually deviate from the clearance, I just reported it wrong. ATC then asked for clarification, if we were flying the SID. I replied "correction, we are on a 100 heading, climb to 4,000 feet. We were then given an additional turn to 070 heading, as well as an additional climb to 16,000 feet. This was my first leg of OE after nearly eight months without flying due to the COVID schedule reductions.

## Narrative: 2

Doing an OE with Requalification First Officer. First leg of trip. Everything was SOP up until the point of check-in with ZZZ Departure. I was the PF and the OE pilot was the PM. Original clearance was the ZZZZ1, we had a CDR on taxi out which changed us to the ZZZZ 3. Tower assigned a 100 Heading and to maintain 4,000 feet. We set 100 HDG and deselected LNAV. I flew the 100 HDG and maintained four thousand. Upon check-in with departure, the PM stated altitude and we were climbing via the ZZZZ 3. ATC then cleared us to 6,000 feet, which we set per SOP. We deleted the 5,000 below restriction and climbed to six in VNAV. Shortly after, ATC quired if we were on the ZZZZ as we were almost on a direct line to ZZZZ4 and to climb and maintain 16,000 feet. The FO read

back we were on a heading of 100, not the ZZZZZ. ATC stated to turn left to 070. I had FO verify we were still cleared to 16,000. We continued climb on a 070 HDG until cleared to ZZZZZ5 on course.

## Synopsis

Air carrier flight crew reported the First Officer (PM) read back the wrong clearance to ATC during departure causing confusion. The First Officer cited lack of flying contributed to the event.

## Narrative: 1

I observed a Controller remove their glasses stating that they were fogging up from wearing their mask. This was during a moderately busy IFR, RVRs in effect, simultaneous instrument approach configuration. This configuration was more complex than normal caused by unusual winds and compression on final. Controllers were required to wear masks at this time due to positions not being distanced by six feet. On several other occasions, date and times not recorded, I've observed: -A Controller remove their mask stating they could not breathe and their glasses wear fogging up on a busy satellite push. - Controller's, including myself, headsets falling off from applying or removing mask. -Hear

back, read back errors from masks garbling communication. -Distractions during a moderately busy arrival radar final session, a Controller hastily confronting another Controller for the manner in which they were wearing their mask. -Controllers stating they cannot take a deep breath. - A higher rate of non-compliance from surrounding sectors due to being unusually combined. For example: two weeks in a row, aircraft being issued **wrong arrival and being four thousand feet lower than expected, in another controller's** airspace and without a point out. There seems to be a conflict between personal safety and professional safety in the NAS. For personal protection, controllers are wearing masks which seems to be creating a potential impact to safety in the NAS. Hear back, read back is always a hot ticket item and at the top of our safety goals as an Agency. With the observations stated above, it seems to be the least of our potential safety concerns. As a facility, mitigations have been set in motion to separate each scope by the minimum requirement of six feet which will extremely help the glasses, mask, breathing, distraction issues stated above. I am deeply concerned for all of our personal safety relating to the health aspects of prolonged mask wearing, reduced access to pure oxygen and the daily exposure to the chemicals used in the virus prevention. But that's personal. Most concerning, and the reason I chose to finally file a report, is the potential risk to safety we are introducing to the NAS by ignoring these comments and actions that are happening daily just in this one facility. As a profession, we are highly sensitive to changes in the workplace, stress mitigation, distractions, compliance and safety; all of which are at risk when a controller cannot see or breathe.

## Synopsis

TRACON Controller reported safety related issues with having to wear face masks while on position.

## Narrative: 1

This was at the very end of the swing shift, where I sent down the other two controllers for COVID clean-up protocol. There were four arrivals - 2 pairs - so I paused on cleaning to work them down and to their ramps. Aircraft X landed Runway XY Right, with an aircraft

rolling out on Runway XY Left, with another aircraft on Taxiway T. It looked like Aircraft X would exit T as well. I gave the Runway XY Left arrival turn left on D join A to the ramp this frequency. I then gave the first aircraft at Taxiway T cross Runway XY Left, turn left to D while crossing and join A to the Ramp this frequency. I gave them both A because they were parking at the D Ramp. Then I gave Aircraft X cross Runway 28 Left, turn left on D, then left on B, taxi to the Ramp via B, H, A, this frequency until switching over to Ramp Control. I gave Aircraft X, B due to parking at the B Ramp, and to not get stuck behind the other aircraft should they not have marshallers to enter the ramp. Once this was all communicated, I resumed cleaning and the first mid shifter came upstairs. I noticed at this time that Aircraft X had joined Taxiway A behind the other aircraft and watched to make sure the other aircraft were able to get into their ramp space. They were and I was satisfied to file a report. The mid-shifter plugged in and I began the briefing with mid shift closures, and then followed the check lists to cover CIC, Local, Ground, and Clearance Delivery. As I was covering the Ground traffic, I noticed Aircraft X was now on B between G and H as they should have been originally. I am not sure why they corrected when the other two aircraft were out of their way. I completed the briefing and left. I have no recommendations for this event. I would however, like to hypothesize why I believe this occurred. I think that the preceding 2 aircraft crossing T to D to A, created an expectation bias with Aircraft X to follow them without having been told to. I believe they were finishing up their after landing checklist and confirmed between them that they were to have been on B, and joined B at F1 hoping that the diagonal versus 90 degree turns would be subtle enough that ATC would not notice. I further believe that we are all running around 10% acuity with the pandemic and all of the circus atmosphere of the recent political debacles. This would explain the simple mistake and due to the reduced traffic there was no harm to the operation. Finally, there is a chance that with nighttime and possible lack of familiarity, the crew was confused by the taxiway lights at the junction of Taxiway's A/B/D.

## Synopsis

Tower Controller reported a taxiway incursion due to the aircraft flight crew not following clearance instructions.

Narrative: 1

I was working the south side sectors of the ZZZ1 area while training on finals. There was minimal final traffic and the vast majority of the traffic was within the sectors I am certified on. Aircraft X was a non-radar ID SFRA aircraft inbound to ZZZ2. I forgot that ZZZ3 airspace was open at the time and did not call the traffic to ZZZ3 approach as I should have. There was no conflicting traffic. I should have used an additional memory aid to remind me that their approach control was open. It also has been challenging keeping up with busier traffic on VFR days on scopes I'm not very current on given standard COVID/winter traffic levels/others training on that position. I wish we had a better memory aid system in place for ZZZ3 being open as I think this a common mistake people often make. Maybe we can make the airspace yellow when it is open similarly to how we do with the RXXXX restricted areas?

## Synopsis

TRACON Controller reported an airspace violation and cited not being sure if another sector was open or not open as a contributing factor.

## Narrative: 1

ZZZ ATIS advertising ILS Runway XY, winds 24008 favoring [Runway] ZA but it is normal for ZZZ to use 12 until winds are 10 KTS or greater due to terrain and approach undesirability of Runway ZA. Aircraft checked on with correct ATIS descending from Center and asked for RNAV ZA. I only heard RNAV. The common request from airline is for the RNAV Z Runway XY when we are advertising ILS's because it saves flying miles/time. I should mention that the cleaning/disinfecting person was starting my station so I had to move out of the way and move items away for her cleaning process. This is a nightly routine and is highly distracting. I cleared Aircraft X for the RNAV Z Runway XY approach. To which they read back "Cleared RNAV" (pause) "Zulu, Runway XY" (the XY was dropped and due to the cleaning I only heard Y which I assumed was part of X-Y) [Note: there is NO Runway YA at ZZZ]. I observed the aircraft making a right turn at ZZZZZ intersection instead of the left turn for Runway XY this alerted me the aircraft was following the Runway ZA approach path. I immediately canceled the approach clearance, assigned an appropriate altitude and heading and informed the pilot it appeared he was on the wrong approach and I was now vectoring for the correct approach. The pilot was still above all MVA's so there was no immediate danger. There was a short discussion with the pilot and he set up for the correct approach which was completed with no issue. 1st, Cleaning/Disinfection of control position and its immediate vicinity by contract staff should be done only when the position is not being worked at that station. Our facility closes the TRACON at XA:00 and has a 5hr XX min window this could be done in with no distractions and eliminate the danger to the NAS is currently poses. 2nd, this was a clear hearback/readback issue with expectation bias on both the controllers and pilots part. A- Because of distraction, I failed to hear the initial request for Runway ZA and followed up by issuing a standard clearance for the RNAV Z Runway XY with no other warning to the pilot such as "Unable Runway ZA" as I would normally do with an opposite direction request I was unable to approve. B- The pilot readback a completely wrong clearance in many ways, The RNP approach he wanted to Runway ZA is called "RNAV Runway ZA". It does not have a Z and is to ZA not YA. By reading back "Cleared Rnav Z Runway YA" it greatly increased the chances of my hearing it as I expected. C- In listening to the recording the pilot obviously was unsure of the clearance he got as there was a long pause between RNAV and Zulu, which leads me to believe the pilot had a flag going off in his head that he neglected to properly follow up on. Had I not been involved with dancing around the cleaning person to be able to see my scope I probably would have picked up on this better. As it was I must have had a flag of some kind in my own mind because I did give extra vigilance to ensure the correct turn at ZZZZZ so there must have been something warning the back of my mind as well. In the end the system did work as it ultimately should and the error was caught and corrected with no risk. I know a last minute correction like this can cause stress on a flight crew and this crew handled it with high professionalism and safety was insured by both them and myself.

## Narrative: 1

Within the first few minutes Aircraft X asked for a transmission to be made again due to the required mask wearing. After 3 times of having to repeat a transmission, I removed my mask to provide a better voice quality. I was not asked by any pilots to say again after that. Then the OM came walking down the isle and told me to put my mask on. [The OM] walked by again and told me to put my mask on. He then stood behind me and told me a third time, distracting me from the scope and forcing me to engage in conversation with him regarding the pilots having difficulty understanding me. He then told me a 4th time to put my mask on and I complied. During this distraction I missed at least one pilot transmission. The very next transmission I made, the pilot asked me to say again. I recommend that if a Controller deems it necessary to work traffic without a mask, to

better provide a clear and concise transmission, then it should be left up to the discretion of the Controller with how to provide the safest way to communicate. Regardless of the policy for mask wearing, Aircraft safety should remain at the top of the list for FAA priorities. It's a shame that it takes controllers complaining of pilots not being able to hear them through masks and then having to file reports to bring this to light. I sincerely hope an aircraft mishap doesn't have to happen before someone of higher authority takes action.

## Narrative: 1

Recently we were told we had to wear masks while on sector. Following the rules I was wearing a mask, and multiple aircraft could not understand what I was saying. Multiple times I was told to "Say again" until I pulled the mask down to give the aircraft the transmission. After I pulled the mask down they said they could understand me better. This is a safety issue. If the aircraft can't understand what we are saying and takes the wrong altitude this could be disastrous. Since Coronavirus started we were told we only had to wear masks when we couldn't be socially distanced. What has changed? Why do we have to wear masks all the time even if we are socially distanced?

## Synopsis

Center Controller reported communication issues with pilots while wearing a face mask.

## Narrative: 1

Aircraft X arrived from the south east at 110 where ZZZ has a MVA (Minimum Vectoring Altitude) at the highest point of 115. I do not know if ZZZ1 has the same or lower MVA in that area. Per the LOA with ZZZ1 any arrivals in this area 130 or lower, must be on an airway and verbally coordinated. There was no coordination from ZZZ1. OJTI was being conducted at the Approach position, I was the OS in the TRACON. Due to COVID social distancing requirements the OJTI was working from the "B" scope, the trainee was working from the "A" scope and I was at the OS desk. There is no radar scope or secondary monitor available at the OS desk to observe traffic, so I was unable to see the altitude of the aircraft. A regional jet that was about to be switched to the Tower told approach that an aircraft was trying to call approach and at that point I was able to observe Aircraft X at the altitude below the MVA. Aircraft X eventually was able to reach approach on radio and landed without incident. -Review ZZZ1-ZZZ LOA -Add a non-certified radar display at the ZZZ TRACON OS desk -Check the MVAs to the south east of ZZZ to see if there are any discrepancies between ZZZ1 and ZZZ MVAs.

## Narrative: 2

I am training the trainee on approach control. Three arrivals scheduled with close arrival times. Trainee accepted all three handoffs back to back well outside of our airspace boundary, further away than normal. He was not aware that Aircraft X was flying a wrong altitude for direction of flight as well as 500 feet below the MVA we have depicted on our maps until after accepting the handoff. Neither of these two issues were coordinated between either facility. Aircraft landed without issue. We need to have matching MVA

maps with ZZZ1. This could be a real issue in the future. That aircraft was 500 feet below our MVA and could not reach us on radio due to the terrain.

### Narrative: 3

I was training on approach with 3 aircraft inbound ZZZ [airport]. I had accepted a handoff from ZZZ Center on 2 Aircraft whose tags were over the top of each other. Both aircraft were about 19 miles from the edge of my airspace with stacked data blocks and targets. They were not a factor for each other. Once there was a bit more separation between the tags, we noticed that Aircraft X was only at 110 in bound from center. At this altitude the aircraft was below my MVA for the area and wrong altitude for direction of flight. ZZZ Center had not coordinated anything in relation to his altitude. The aircraft being so low over mountains also made it hard for them to reach me over the radios. I wasn't able to communicate with Aircraft X until they had gotten about 5 or so miles into my airspace and were above the next MVA. I think we need to make sure that ZZZ MVAs and ZZZ Centers MVAs are up to date or matching each other. I have a hard time believing that ZZZ Center's MVA in that area is lower than mine. Coordination just needed to happen in relation to that aircraft Altitude on both sides.

### Synopsis

Controllers reported an aircraft that they were not talking to was on an IFR flight plan, below the MVA and NORDO.

## Narrative: 1

Aircraft X checked in for Runway XXC was told descend and maintain 040 and good rate down, leveled off at 050 while being vectored to final and told to parallel final on heading 350 and expedite down to 30, shortly after looking 1,000 feet at 2.7 miles he saw the field and was cleared. There was approximately 10 read back errors during this push due to the new mask mandate, control instructions had to be repeated to this pilot 2 times. With the new mandate and tower restrictions forces us to land Runway XXC and XXR in IFR weather this operation is unsafe with the new altitude restrictions implemented by our supervisors. For the past 2 weeks management has told the arrival wall to not go below 4,000 feet until north of ZZZZZ (the dual fix) regardless of where the aircraft's flight path will be, this makes IFR operations very difficult to accomplish at ZZZ and is a very poor knee jerk reaction to a Controller making a simple mistake. These type of rule changes mean that every single transmission on that wall need to be 100% clear and any read back error will cause an aircraft incident, we cannot continue with frivolous rule changes and a mask mandate unless we would like a major incident or accident at ZZZ. Allow us to use judgment and common sense on where to turn our own airplane. These unnecessary rule changes will cause more incidents than they will prevent.

## Synopsis

TRACON Controller reported communication issues with pilots due to having to wear a mask which is exacerbated when new procedural changes are introduced.

## Narrative: 1

When reviewing my logbook on Date 6, I discovered that what I thought was a BFR completed on Date 2, was an IPC only. I did however complete a BFR on Date 1, eight months before the IPC. I made two flights after Date 3; one on Date 4 and the other on Date 5. I believed at the time that I made these flights that my last BFR was completed on Date 2, and thus that my next BFR was not due until Date 8. However, since I only completed an IPC on Date 2 (and not a BFR), even allowing for an extension provided by the SFAR in response to the COVID-19 health emergency, it appears that I made two flights after my previous BFR (the Date 1 BFR) expired. Upon discovering this inadvertent error, I immediately contacted my flight instructor and scheduled an appointment to complete a BFR with him today, literally one day after discovering my mistake. In order to prevent this from happening again, I have calendared the due date for my next BFR on an electronic calendar, with an automatic reminder set 30 days before my current BFR expires.

## Narrative: 1

Boarding a nearly full flight began at XA: 30 AM. We had power (i.e. lights) but, we did not have any airflow (air conditioning). We were beginning to sweat profusely. I (FA)

contacted the terminal Supervisor who patched me through to Agent, in the tower. I told him of our plight and passenger complaints and concerns. He said he would send someone immediately to turn on the air. This was approximately 20 minutes later. About 15-20 minutes later we still had no air. Passengers were getting very upset and many took their masks off. We made announcements stating that without airflow, it was even more important to keep their mask on since they could not social distance. I contacted the Supervisor again and insisted the passengers be let off the aircraft if we were not going to get airflow and we still didn't know anything about when the pilots would arrive. Approximately 10 minutes later the pilots boarded and stated we should never have begun boarding under those conditions. They got air up and we departed 15 minutes later. 1 hour and 10 minutes after boarding. I felt very, very unsafe in those conditions as did many passengers. We should never board without air conditioning during COVID. If the pilots are running late, a mechanic should be brought down to turn on the air. A few minutes would be acceptable but when the tower is contacted, something should be done in a timely manner. Flight attendants should be allowed to let passengers deplane under such extreme conditions where everyone's safety and health are put at risk.

## Synopsis

Flight Attendant reported passengers were boarded before the pilots arrived at the aircraft. No air conditioning was available and passengers began removing their face masks.

## Narrative: 1

In flying return flight from ZZZ1 to ZZZ2 at 3,000 feet, we were anticipating B clearance into the ZZZ 1,500 feet shelf northeast of ZZZ VOR. This expectation was due to the fact that clearance was received shortly before going the same route but opposite direction, and that ZZZ was landing Runway XX, so arrivals would not be a factor in receiving clearance. We were receiving VFR flight following from ZZZ1 followed by ZZZ1 [TRACON]. Upon hand off to ZZZ Approach frequency from ZZZ1 [TRACON], the frequency was extremely congested. We established two-way communication and made initial Bravo request with ZZZ around ZZZ [VOR], but only received "radar contact" in return with no further clearance. I queried the Controller at least two more times for clarification, but communication was blocked and the frequency was extremely congested. We initiated descent near ZZZZZ [Intersection] to avoid the 1,500 feet class B shelf, but may have penetrated the B airspace in the descent down to 1,400 feet MSL. We remained below the floor of the Bravo and received no further communication from ZZZ until handoff to ZZZ2 Approach near ZZZZZ1 [Intersection]. Contributing factors leading to this possible deviation are that the PF was the senior pilot on the flight and is very experienced in the area but may have been somewhat out of practice as COVID has significantly decreased flying. Also, the Controller seemed to be slightly overwhelmed, possibly working multiple frequencies; we weren't anticipating the business of the frequency although we should have known better. Additionally, the strong tailwind increased ground speed; although the descent was rapid, the ground covered during descent was greater than normal. Finally, as we just flew the same route the opposite direction, we were (falsely) anticipating the B clearance. While these factors are no excuse for possibly entering the airspace without clearance, the notion that business is picking up again means we all need to be more diligent in our planning and flight execution. As Captain, I should have anticipated not receiving the B clearance, and planned descent accordingly.

## Synopsis

Pilot reported a Class B airspace violation and cited ATC communication issues and the co-pilot's lack of recent flying as contributing factors.

## Narrative: 1

The aircraft had several maintenance scheduled items that needed to be addressed before we could fly the aircraft. It was supposed to be the first revenue flight after long term storage. There was one maintenance schedule item X which needed to be accomplished before the aircraft can be used for revenue flight with passengers. The item was signed off

on the completed items sheet and the aircraft was released for flight. When we were taxiing, Dispatch notified us to hold. We called them and they said there was a maintenance schedule write off not signed off properly. So, we returned to the gate to have to addressed. The reason for this report is that you cannot leave the gate with passengers unless maintenance schedule item X had been signed off. Our paperwork showed it was signed of yet the electronic AML [Aircraft Maintenance Logbook] said it was not. We returned to gate. We found out later that it was a clerical data entry error made by someone in maintenance and the maintenance schedule item sign off was entered incorrectly. The cause is easy to figure out. The only way to fix it is to have a computerized completed items sheet that only shows items cleared and then the computer copy and paper completed items sheet would always match! After items are cleared in computer, print out new completed items sheet for AML so paper and computer always match.

## Synopsis

Air carrier First Officer reported a return to gate after Dispatch told them they had an improperly signed maintenance item. The aircraft had several maintenance items that needed to be addressed before the flight due to it just coming out of long term storage.

## Narrative: 1

Climbing out of ZZZ on the ZZZZZ TWO on our flight plan. After a short delay ATC cleared us direct to the ZZZZZ1 Intersection followed by the ZZZZZ2 and ZZZZZ3 intersections which are on the ZZZZZ2 THREE departure. During the departure briefing both the FO identified our lack of recency experience as a threat. When the clearance was sent to the FMC with the new routing the FO was not aware of the LOAD FMC prompt so the new routing was never loaded. When I reviewed the print out of the PDC clearance I remember being confused by the clearance. I should of voiced my concern to the FO when I did not understand the clearance. Unfortunately, I got distracted and never resolved the discrepancy. There's no substitute for diligence when it comes to the route check.

## Synopsis

Air carrier Captain reported a track heading deviation. Captain stated when the clearance was sent to the FMC with the new routing the FO was not aware of the LOAD FMC prompt so the new routing was never loaded.

## Narrative: 1

Dispatch notified us that the release was not signed at cruise. I immediately realized he was correct. I added 2000 pounds operational fuel on the way to the airport and discussed this with the crew. I planned on signing the release and talking with the Dispatch in Operations (Ops), because this is one of the last places internationally that we still go to Ops. The van takes us through security then to Ops then to the bottom of the jetbridge. All 3 of us had done this recently and knew of no change and in fact the 10-7 page states that we are not allowed to go through the terminal. However, upon reaching the airport the driver brings us to the terminal, stating that this is the new procedure. We verified on our iPads and even called Ops to verify this change. Indeed, due to COVID, we go through the terminal. The security was extensive, overly extensive and time consuming. The walk to the gate is long and although we hustled, we still arrived at the jet later than desired. I called Dispatch for the brief once arriving to the cockpit and received a standard brief which included a new release, release 2 due to ZFW increase. I agree that was okay, but after the call, we realized the 2000 pounds I had added via app was not added, so I called the Dispatch back. The Fueller arrived during this call and he agreed to add the extra 2000 pounds for us and I told Dispatch it was done so no new paperwork was needed. I wondered why the Dispatcher had not included the 2000 pounds. In retrospect I should have realized something was amiss, for example, the release not being signed. We then had discussions with Ops regarding the extra 2000 pounds, but it was all resolved. During this time, the FO saw the dispatch release, stated it was #2, but neither of us noticed it said "not signed" at the top, only noted that it was release 2 and that we were all fit for duty. We had the Oceanic checklist out and looked through it, but missed the dispatch release on it. I have been signing the release lately enroute from the hotel to the airport since we never go to Ops anymore due to COVID, except today, since this is one of the few places that we do go to Ops. However, apparently, we don't. A note in the 10-7, an Ops alert, or something stating this would have been helpful.

## Synopsis

Air Carrier Captain reported a change in airport procedures, due to COVID-19, caused the flight crew to miss the required signing of the Flight Release.

## Narrative: 1

On the morning of an international departure that was scheduled to depart later that evening, the Captain emailed and informed both FOs of how the flight would be conducted in regard to face masks. During the pre-flight phase, the #2 FO challenged the decision and said he was walking off the trip unless the Captain agreed to wear a mask whenever he was on the Flight Deck. In an effort to maximize safety and also to address the #2 FO's concerns, the Captain offered the solution that he would wear a mask during cruise, whenever the #2 was performing his relief duties, but, with safety concerns about glasses fogging and hindered communications during critical phases of flight, said that #2 could sit in the cabin rest seat during those phases if it would make him more comfortable (since masks would not be worn). The Captain believed this was "legal," since an #2 actually wasn't required by the FARs on the planned 6 hour and XX minutes flight and was also the safest option since, if the #2 dropped the trip, the flight would likely be sent un-augmented with zero inflight rest periods then available to the "flying" pilots. The #2 agreed with this solution and the flight departed. Prior to the later descent, the #2 stated that he believed that an FAR's had been violated by him not being in the cockpit for takeoff. He said that he would be in the cockpit for descent and Captain said he was welcome to be there but reiterated that masks would not be worn during critical phases of

flight. The #2 did then come up for the descent and landing. After the aircraft was parked and debrief conducted, #2 said he would be submitting a report over his belief that an FAR was violated by him not being in the cockpit for takeoff and departure. The Captain and #1 FO are not aware of any "violations" of FAR's in this instance but decided to report the incident in case there's something they are not aware of.

#### Narrative: 2

During takeoff, the #2 FO stayed in overhead flight crew rest area instead of on the Flight Deck. Erroneously thinking his presence was not required on Flight Deck on takeoff. Captain and #2 chose that course of action, as #2 wasn't comfortable with staying on Flight Deck with the Captain who had a cough. Captain was unable to wear a mask due to fogging of glasses.

#### Narrative: 3

Prior to the scheduled departure I received an email from the Captain about meeting in Flight Ops and face mask conduct during the flight. Upon arrival at Ops I meet the captain and asked about the email he sent because I had not received an email talking about face mask usage, because it was the standard SOP on mask use. While in Ops I noticed the Captain had a cough and inquired about his coughing. The Captain stated he had [tested negative for COVID-19 and was cleared to work]. After the conversation I was satisfied about flying the flight. Unfortunately, the #2 FO wasn't and stated he was UNCOMFORTABLE with no mask during takeoff and landing, this was 15 minutes before departure the Captain and #2 FO came up with a solution and I agreed. Unfortunately, later in the flight the #2 believed we violated FAR's because he wasn't in the cockpit for takeoff and landing. Not being sure if the FAR's were violated I'm submitting this report.

#### Synopsis

Air Carrier flight crew reported they had an agreement between themselves regarding face mask policy on the flight deck and may have violated FAR/SOP policy.

## Narrative: 1

While on final approach the PF was having difficulty slowing the aircraft and continuing the descent. The headwind we had been fighting quickly turned to a crosswind. The PF elected to re-bug and use flaps 40 well above 1,000 feet. As the PF I selected the new flap setting in the FMC and verbally called out the Vref and target speeds. As we were slowing past our previous target speed the PF called for flaps 40. We had no amber band visible for flaps 40 placard speed, so I verified the placard, 162 knots, and selected the flaps seeing 158 knots and slowing on my tape. As I verified the speed brake was armed he again called for 40. The flaps were still at 30. At this point we were now below 1,000 feet but above 500 feet. We discussed the non-movement and load alleviation. As the PM, I suggested, pitch up and slow, the flaps moved to 40 as we suspected they would. The checklist was completed and we were able to be stable by 500 feet AGL, so we continued the landing. We did not observe any limitations being exceeded on the flaps or in procedure as the PM was able to manage the approach prior to the 500 foot gate. In discussing this event during our debrief we believe that we did meet our approach gate criteria. We were in our first "heavy" approach in many months as the flight was full. The weight may have contributed. The wind was also a contributing factor as it shifted down the final enough that by the time we departed the traffic flow had reversed. Neither of us were averse to going around but it did not seem necessary in the moment as it seemed we met our criteria to continue. Having said that I'm certain eyes further from the instrument panel may have captured data we missed but I believe we trapped and corrected the situation.

## Narrative: 2

While on final approach I, PF, called for final landing flap (flaps 40) and flaps did not move to commanded position (they were at 30), despite being slower than max speed for flaps 40. Since we were within a few knots of max flaps 40 speed, I slowed further and flaps extended to commanded position. I believe the flap extension occurred right around 500 feet. The final approach speed was within stabilized approach criteria and the outcome of the approach and landing were not in doubt. Landing was uneventful. We have been flying mostly empty airplanes for almost a year and this flight was almost completely full. I believe the higher landing weight coupled with a significant loss of headwind on final contributed to the airplane taking a while to slow down to an acceptable speed for final flaps. When I called for final flaps, we were 3-4 knots below the max flaps speed and I believe the aircraft's safety system was restricting flap movement until I was a little slower. As we return to Pre-COVID passenger loads, I will have to adjust lead time for decelerating the jet. Today was a good reminder.

## Synopsis

Air Carrier flight crew reported the aircraft was carrying a pre-COVID passenger load and they were not prepared for the higher flap speeds required for a stable approach.

## Narrative: 1

I believe this aircraft had been parked due to COVID. Apparently, when pulled out of parking, the FMS database was not updated. During pre-flight we noticed that revision "W" and "X" were available, but revision "Y" was now current. I don't know how long this plane has flown without "Y" database, but it is deferred now.

## Synopsis

Air Carrier Captain reported the aircraft database was a few revisions "out of date" and suspects the aircraft was "parked" during the pandemic for an extended period of time.

## Narrative: 1

I received the second dose of my Pfizer vaccine for COVID-19 yesterday at XA:00 AM. I was not feeling any immediate effects of the dose and had a flight lesson scheduled XE:00 AM and felt fine. It wasn't until this morning I was chatting with a mentor of mine and they had mentioned there being a 48 hour period of restriction for any flying for those that did receive the vaccine. I did some research of my own and found that this was indeed true. I did not feel like I was putting myself or my instructor in any immediate danger and could still perform my duties as a student pilot. Upon discovering the restriction, I scheduled my other lesson for after the 48 hours have passed.

## Synopsis

Student pilot reported taking a flight lesson prior to the 48 hour waiting period after receiving a COVID-19 vaccine.

Narrative: 1

Once the aircraft door was opened and only a few passengers from first class deplaned, the cleaners were trying to come on. We asked them to wait just a bit, as we had 4 wheelchairs, and our first-class cabin was still getting off. The cleaners told us they are instructed to get on right away. The Captain said No, they needed to wait till most of the aircraft had deplaned. A few of the cleaners were still trying to argue with us, even after the Captain had said they had to wait. There are no quick turns, as our cleaning procedures during this pandemic are totally opposite of the term quick turn. This also is dangerous for the passengers and crew. There is no room for cleaners in the galleys or in the aisle as we safety try to deplaned using the company's policy of social distance, and deplaning a few rows at a time. In addition, the cleaners are getting in the way of the flight crew full filling our FARs responsibilities and safety obligations, post cabin sweeps. This is a safety hazard and needs to be addressed immediately.

## Synopsis

Flight Attendant reported, after gate arrival, the oncoming cleaning crew was interfering with passenger deplaning and social distance policy.

Narrative: 1

Pushed away from gate. Started taxiing in ZZZ alley when I got a call from #1 Flight Attendant, (FA), that there were First Class, FC, passengers that were not wearing face coverings after being told to wear them by the FAs. Stopped the aircraft and made a very "To the point" PA that any non-compliance with Flight Attendant instructions, particularly pertaining to facial coverings, would have "un-favorable" consequences. I had already made it clear that facial coverings were required while on-board during my "welcome aboard" PA. Conferred with FAs that my second PA was successful, and we continued taxi and takeoff. Once established in cruise, the FAs informed me that they were having problems with FC passengers willfully being non-compliant regarding wearing a facial covering after being advised as such multiple times by at least 2 different FAs. My FAs had even switched working positions in order to try to de-escalate the situation and convince the passengers to comply. I commenced communication with Dispatch and relayed the situation with advisement to contact customer representatives. Shortly thereafter, due not only to non-mask wearing, but also, disruptive behavior by passengers requested to be re-seated in Main Cabin. I further relayed this information to Dispatch. It was at this point the FAs gave the notification of passenger misconduct warning. Shortly thereafter passenger started harassing my FAs with constant cornering them in the FC galley and demanding trivial items. At this point, even after a tremendous amount of patience, de-escalation attempts and warnings by the FAs, and with building harassment and aggressiveness being demonstrated by passengers, I notified Dispatch that we would be diverting to ZZZ1. We landed at ZZZ1 non-eventfully, without being overweight and without declaring an emergency. Passengers were removed from the aircraft. We departed ZZZ1 and arrived in ZZZZ uneventfully. Please allow me to acknowledge my FAs for their display of "Consummate Professionalism" during this flight. They were tireless in their attempts to de-escalate the situation in hopes of precluding a diversion. I would also like to acknowledge the support of Dispatch and company as reflective of the number of communications that were made prior to our diversion. And last, but certainly not least, I would like to acknowledge the expert airmanship demonstrated by my First Officer during our extremely busy diversion as well as throughout the rest of a very long day. Should you need additional information from me regarding this diversion, please don't hesitate to contact me.

## Synopsis

Air carrier Captain reported passengers were unruly and not complying with face mask policy despite multiple warnings by the crew resulting in a diversion, and removal of the passengers.

## Narrative: 1

After departing [Runway] XXR from ZZZ [airport] on the ZZZZZX SID, began to accelerate through 9,000 feet MSL using speed mode. This caused the aircraft to level off around 9,300 feet MSL as it was speeding up from 250 KIAS. Captain was talking with ATC regarding our climb clearance when the acceleration began. ATC did not acknowledge the increased speed. After finishing the clearance readback the Captain noticed the increasing speed and changed to vertical speed mode to reduce airspeed. As pilot flying I reduced the thrust as well. Upon reaching 10,000 MSL we resumed normal profile climb. Limited experience taking off with wing and cowl anti-ice on. Normally upon reaching ZZZZZ1 intersection we have reached 10,000 MSL and can begin to accelerate. Because of the reduction in climb performance using the anti-ice system we were 1,000 feet lower than normal. The use of cowl and wing and anti-ice also caused the aircraft to use a lower angle of attack to reach entered airspeed resulting in a reduced climb performance. Because of reduced loads from COVID-19 we have normally not encountered a problem reaching 10,000 MSL before the west bound turn resulting in a habit of increasing speed at ZZZZZ1 or west/east bound turn.

## Synopsis

Air carrier First Officer reported exceeding 250 knots below 10,000 feet due to a reduced passenger load on climbout.

## Narrative: 1

Cleared to descend via the ZZZZZ2 arrival except maintain 10,000 feet. Initially high, changed descent mode from managed to open and selected 300 knots to get to path with speed protection. However, due to distractions, failed to manage descent appropriately. A few miles from ZZZZZ with a constraint of 12,000 feet from FL190 I noticed we were approaching 12,000 feet rapidly. I asked the FO to request descent to 10,000 feet. We leveled off, but not in time and crossed ZZZZZ several hundred feet below 12,000 feet. ATC did not say anything however this was not safe and not professional airmanship. Distracted with conversation related to COVID and job security instead of flying the aircraft more attentively. Switched descent modes without alerting the PM. Failed to recheck altitude constraint early enough to discover error. Discontinue involved conversations prior to phase of flight changes.

## Synopsis

Air Carrier Captain reported an altitude deviation during descent and cited being distracted due having a conversation about COVID-19 and job security.

## Narrative: 1

When we arrived and the door was opened we started to deplane the aircraft, a full flight, just as the first three first class passengers were deplaning, the cleaning crew started to enter asking if they could board to clean first class to start. The first class wasn't even deplaned. Only three people had deplaned while others were trying to get their bag down and deplane. I said no not at this point, which in turn the first cleaner gave me serious attitude. The Gate Agent came down, no mask on, with an attitude about us not letting the cleaners enter to clean. They had 12 people to clean, usually they have a shortage of cleaners. But we hadn't even had first class passengers cleared and they started coming on. I asked not yet, let the passengers deplane and this flight is a full flight. This is becoming a serious issue at times and passengers getting upset they can't deplane and usually the cleaners keep cleaning and not moving in so they can deplane. Understand at this time with COVID the importance of cleaning but passengers complain at me about cleaners not clearing so they could deplane. It's stressful enough with all we are dealing with no food drinks and upset passengers about what they can't have. Our passengers were moving quick and not stalling getting off. When they were off we couldn't get our bags and personal items together. The flight deck wasn't able to exit. I understand there is time a limit and all but this rushing is going to seriously cause problems with safety of crew and passengers. I was wrong possibly and maybe for which I will follow these memo's I forgot about from now on. Just trying to give our paying passengers a pleasant and safe flight including safe deplaning.

## Synopsis

Flight Attendant reported there was no social distancing by the aircraft cleaners during deplaning and also stated the Gate Agent was not wearing a face mask.

## Narrative: 1

On the ZZZZZ6 we were told to level at 7,000 feet for traffic. This was my 3rd trip on IOE and was practicing hand flying the departure. It was turbulent and we were in and out of IMC. Since we were extremely light due to light loads we were climbing at an extremely fast vertical speed. Passing through 6,000 I announced that I was going to use TCS to reduce the rate of climb to about 1,000 since there was traffic above and I wanted to avoid a RA. I corrected the VS to about 1,000 ft/min. I was not quick enough to override and reduce the autothrottles to avoid increasing airspeed. The airspeed quickly and momentarily increased to 270 knots as we were leveling at 7,000 feet. I reduced the autothrottles too late and while reducing them altitude deviated by 140 feet high. Both deviations were short and immediately corrected. Nothing was mentioned by ATC. We were later given higher once the traffic passed. The combination of hand flying in turbulent conditions in IMC and leveling at a low altitude with light loads was a recipe for distraction and error to occur. I could have eliminated some of these variables by engaging autopilot earlier or reducing autothrottles quicker. The CA and I debriefed and talked through what led to the event and how to prevent it in the future. I learned that when possible reduce extra variables that could lead to an error. I am new to flying with the company and new procedures, was hand flying in turbulent conditions and IMC, light loads with good performance, and was given a low level off. That is a lot of variables at once and the ones that I could control are the earlier use of automation to help alleviate some of the task saturation. Hand flying in turbulent conditions and maintaining altitude can be difficult and the autopilot can alleviate and sometimes do a better job to avoid deviations. Additionally I learned not to lag on overriding the autothrottles when using in FLCH mode. From this experience I feel that I can better identify and evaluate a handful of risks in a certain situation and will take prompt action to reduce these risks in a timely manner. The CA and I had a productive debrief and agreed on what variables led to the deviation and how to prevent in the future.

## Narrative: 2

Upon departure we exceeded the 250 knot speed limit in class B while leveling off. We sped to 265 knots for about 15 seconds while leveling off at 7000 feet. Aircraft was very light and a great deal of convective weather in our vicinity. This was a training flight with a new first officer who was hand flying the departure. The rapid climb rate and early level off instructions caught the First Officer off guard. The First Officer recognized the issue and overrode the auto throttles to get the aircraft slowed to 250 knots.

## Synopsis

Air Carrier flight crew reported an airspeed and altitude deviation due to weather, hand flying and having an aircraft with a light passenger load.

## Narrative: 1

Based on unfamiliarity with the FAA's COVID relief policy regarding medical duration's, I acted as PIC between ZZZ and ZZZ1 on date in a type aircraft with an unknowingly expired 2nd class medical (issued date). The unfamiliarity came from reading headlines in several industry publication emails about the FAA extending medical certificate duration's during COVID. I failed to follow up on these headlines to determine the extent of the extensions and therefore performed this flight under the assumption that medicals were extended indefinitely until COVID was over. I discovered my mistake after my coworker (in ground school) asked me about medical duration's in preparation for his private pilot written exam. I proceeded to search for his answer, and in the meantime recalled the COVID medical certification extension news. Upon finding and reading FAA orders describing the extension details, I discovered my certificate was subject to a two-month extension and expired date. Immediately I visited the FAA's AME directory and called several AME's because my AME has since closed their practice. I found several AME's (including my previous AME) to be no longer practicing FAA exams (some for several years), however they were still listed in the FAA directory. I finally found someone still in business and am in the process of scheduling an appointment with them at the earliest convenience. I have a flight today to/from ZZZ2 where I will sit the in the right seat only to provide an extra set of trained eyes and ears for the safety of the flight while not acting as PIC or SIC until my medical is renewed.

## Synopsis

Corporate pilot reported flying without a current medical.

## Narrative: 1

I had been delayed 1 day while performing a conditional inspection due to weather at the departure airport. Once in the air, I transited through the congested ZZZ1 airspace to return to my home airport. I contacted the ZZZ Control Tower once I exited the ZZZ1 airspace and read back instructions to make a downwind entry. I monitored the radio for other traffic in the airspace and flew the pattern. Once on the ground, I realized I might not have read back a landing clearance. Due to Coronavirus, I have been making limited flights, basically only to maintain currency. Because of this, I pay more attention to flying the airplane, while radio work is handled habitually, and I wasn't letting each radio transaction sink in, nor ensuring I make all the necessary calls. This leads to diminished piloting skills, and more practice is necessary to operate in congested airspace.

## Synopsis

Pilot reported a possible landing without a clearance and cited lack of flying as a contributing factor.

## Narrative: 1

Departed ZZZ1 and was given XXY.A departure frequency and after the fact it was XXY.B. I maintained VFR the whole time and was told I may have violated the Class Bravo airspace. Tower was closed at ZZZ1 due to COVID-19. A lot of confusion on the ground and with traffic in the air. I was VFR the whole time and contacted ATC when I landed in ZZZ2. Talked with Controller and explained my situation and filled out this report. No evasive action was taken.

## Synopsis

## Narrative: 1

I received the second dose of vaccine against SARS-CoV-2 (virus that causes COVID). The vaccine is highly safe and effective, but clinical data show that many people have minor side effects like fatigue, muscle pains, headache, and flu-like symptoms. The FAA requires a 48 hour waiting period after administration of this vaccine for that reason. I had not reviewed the FAA circular. I concluded that it would take longer than the flight I had planned for any potential side effects to develop, so I launched on a 4 hour flight. Towards the end of this flight, I made an unscheduled fuel stop and started to develop a mild headache. Recognizing that these might be symptoms related to the vaccination, I grounded myself. Later that evening, I developed symptoms that were severe enough that they would have presented a safety issue, had I been operating an airplane. I neglected to review the FAA circular in advance of this flight. A 48 hour delay after vaccination would have prevented the possibility of experiencing symptoms that could present a danger during flight.

## Synopsis

GA pilot reported receiving the COVID-19 vaccine and flying before the 48 hour wait period requirement. Pilot did not read the FAA circular regarding the vaccine and developed a headache during the flight.

## Narrative: 1

On final [Runway] XXL ZZZ we were paired up with traffic on another runway in visual conditions. I thought the FO had selected TA on the transponder. After debriefing on the ground he told me that he was telling me to set TA on the transponder, but what I heard was transponder is set to TA. Inside ZZZZ [Intersection] at about 1,200 feet we got an RA Climb. I verbalized "We got to go." I surmised that the TCAS RA would be followed by a go-around. My communication was unclear. The traffic was in sight throughout the approach. The FO continued the approach and landed uneventfully. We should have gone around, but after debriefing I understood that the FO thought it might be unsafe to climb and go-around with the other traffic so close.

## Narrative: 2

With the A.P. and A.T. off, I was P.F. on the visual approach to Runway XX. ATC calls out traffic at our 2 o'clock that will be close to us for another runway. We call the Aircraft Y

traffic in sight and proceed inbound. Both the Captain and I are wearing masks (COVID), which I believe muffled my request to "Set to TA only." The Captain later said he thought I said "We're set to TA only." The approach continued normally with us going to managed speed, gear down, as we started down the glide slope inside the FAF. Just after I called for flaps 3 around 1,400 feet AGL, I noted the Aircraft Y a little above us and the appropriate distance to the right joining up with us. I was still slowing the aircraft at that moment, and the RA went off "Climb, Climb." I asked the Captain "We are not in TA only?" He responded "Well we are going to have to go." I momentarily considered going around, but thought continuing the approach was actually the safest course of action when the RA immediately stopped. We continued the approach and landed uneventfully. The RA happened the moment the Aircraft Y was joining the other localizer course. What I should have done is gone around. Following the RA is the right thing to do unless it is unsafe to do so.

## Synopsis

Air Carrier flight crew reported a communication misunderstanding between the pilots resulted in conflict during approach. The Captain stated they were both wearing face masks and that it may have contributed to the miscommunication as their voices were muffled.

## Narrative: 1

While departing ZZZ1 for a direct flight to ZZZ2, I inadvertently climbed into ZZZ Class C airspace while heading 280. My plan called for climbing to 3,500 feet for the short flight. I completely forgot about the Class C airspace floor. Contributing Factors include: - Not being VFR current due to winter weather, Coronavirus limitations. - The autopilot on the plane was placarded "INOP". I typically set the altitude on the autopilot to 2,000 feet (100 feet below the floor) as a reminder for the airspace floor. - Air temperature was -X degrees C, which makes for great airplane climb performance. The last time I had flown was October, and the weather was much warmer. I was distracted by the great visibility and great climb rate. - This plane is part of a local flying club. Planes are at X different local airports, only one of which is under the Class C veil. It's sometimes hard to remember all the different nuances when you are flying different planes from different airports, and don't do it regularly. - I sometimes fly IFR. This provides additional protection from this type of excursion because you are talking to ATC continuously. I just have to be more focused about airspace limitations when flying VFR from this airport.

## Narrative: 1

I was providing instruction on new avionics for a client in Aircraft X. An IFR flight plan was filed by my client on his certificate. I briefed prior to engine start that he was PIC and that I was there to provide insight on the use of his new GTN 750. He had flown previously with this equipment, based on what he had told me. This was our first flight together in his aircraft. Prior to taxi, I reviewed with him how to load and activate approaches in his new GTN 750. He seemed familiar with its use and only asked a couple questions prior to departure. His knowledge of the features was adequate when I queried him on the unit. After takeoff from ZZZ Runway XXR, we were given a left turn to a heading of 070 and a climb to 3,000 feet. He engaged the autopilot at about 1,000 feet AGL. My client requested from ZZZ Approach the RNAV Y XXR but asked for a non-standard transition. He stated that he wanted the RNAV Y XXR to ZZZ "via the ZZZZZ transition." This is not a published transition and not what we briefed prior to departure. We had briefed previously that he would ask for vectors for the approach and he would repeat that same approach three times to increase familiarity with the equipment and its use in the approach environment. A short time later, we were given the instruction to climb to 3,000 feet and after that, to "turn left direct ZZZZZ." The autopilot began turning the aircraft to the right, presumably because he had switched from HDG mode to NAV mode without my knowledge. ATC queried and he once again read back the left turn. By the time I caught the erroneous turn direction and autopilot setting, the aircraft was well into the right turn. ATC then requested that we continue the right turn "since we were already turning right and I have to keep you away from other traffic." My client did as instructed and I queried ATC to confirm that we would overfly the ZZZZZ waypoint, then proceed outbound for the full approach. I apologized for the error on that same radio call. ATC responded in the affirmative, then cleared us for the approach. No further communication about the incorrect turn direction was made and the rest of the flight proceeded without incident. My client and I debriefed this issue and shared the lessons we learned. We both looked at this with an eye toward learning and future improvement. First, I reminded him of the importance of flying what we brief and that we will commit to always do so in the future. Second, as his flight instructor, it was my responsibility to catch the turn error and take control -- an effort I began but could not finish before ATC requested that he continue the right turn. Third, reliance on the autopilot worked against us and I suspect he switched from HDG to NAV mode without my noticing, initiating the right turn direct to ZZZZZ. Finally, business has been slow due to COVID and I have not been instructing as much as I normally would. I feel this last point is perhaps the most important one. As the pandemic has continued for nearly a year now, its effect on skills as pilots and flight instructors is being felt industry-wide.

## Synopsis

Instructor pilot reported a track heading deviation during a training flight with a student.

## Narrative: 1

As I was pre-flighting the aircraft before the passengers were boarding, I noticed that ALL of the cleaners onboard the aircraft did not have a mask on around their nose and mouth. Most of the cleaners had their mask only around their chin, some didn't have any mask on. This is a federal mandate, and a company requirement to wear a mask, yet the rule is not being followed. There's no enforcement. Plus, there was no air connected to the aircraft, so there was stagnant air. This was an unsafe environment. I see this on just about every flight, which is 1-4 legs/day. I'm also seeing at least 20% of the passengers in the boarding area or walking in the concourse not wearing any mask, and some are just wearing the mask around their mouth only. There is no enforcement. I'm seeing this at every airport I've been to in the domestic system. This Federal Mask Mandate is a complete joke. Airports are not safe if 20%+ of the passengers are not wearing masks. These people are not drinking or eating, so there's no reason why they are not wearing a mask.

## Synopsis

Air carrier Captain reported observing a cleaning crew onboard an aircraft not wearing face masks correctly. Pilot also reported people in terminal not wearing face masks correctly.

## Narrative: 1

The FO was on the very first leg of OE. The flight proceeded perfectly until arriving in the ZZZ1 [airport] terminal area. ZZZ Center descended us and never handed us over to the local [ZZZ] TRACON. Instead, we were told to expect holding instructions. It was clear the Center Controller was very busy (he was doing an exceptionally good job). Instead of issuing holding instructions we were asked where we wanted to hold. We told him we wanted to hold at ZZZZZ [Intersection], the initial approach fix for the ILS Runway XX to ZZZ [airport]. He issued instructions to hold south. We asked if we could hold north inbound, right hand turns. He issued instructions 'cleared as requested' with no EFC. He asked how much fuel we had onboard and we replied 2 hours. I didn't push the EFC because it was clear he was saturated and we were holding at 11,000 feet above a lower layer in VFR conditions. ATC explained to other aircraft that ZZZ [TRACON] was ATC Zero and he was the only Controller handling all aircraft going into and out of 4 controlled fields. It was difficult to simply get a break on the frequency so I decided to just be patient. We had been sending ACARS messages to the company enroute and didn't get any responses, this is not that unusual, usually Dispatch will reply with 'OK' but not always. When we were issued holding instructions we sent Dispatch an ACARS message "Holding at OM for Runway YY ZZZ, no reason given" and once again, we did not receive a reply. Incidentally, I instruct all my OE pilots, as I did in this instance, to look for the "VHF IN PROGRESS" display after selecting SEND on an ACARS message to be certain the unit actually sent the message. In all cases it did. The airport pages indicated that ZZZ2 [airport] was just XX miles away and we knew they were not affected by this situation. The weather at ZZZ2 was also good. Our FMC fuel reserve was 4.0 since we had no alternate. At first I wanted to use 7.0 as a decision point on fuel. My thought it would probably take 20 minutes to get to ZZZ2 if needed and I wanted a cushion so I added 3.0 to the FMC fuel reserve to make my decision. If we hit 7.0 on the fuel it would be time to contact Dispatch and go to ZZZ2. While we were doing all this ATC was relying on us to contact aircraft going into and out of the airports below to issue instructions. Needless to say we were a bit busy. We were told to descend first to 8,000 feet in the hold, then to 6,000 feet. On several occasions VFR aircraft popped up on our TCAS (no alerts were issued) as we were holding in Class E airspace above the ZZZ Class D and the ZZZ1 Class C. We were keeping a keen eye outside. At one point ATC issued instructions to climb to 8,000 feet in the hold for traffic. Again, the Center Controller was doing an exceptionally good job. We were told on several occasions what our sequence was going into ZZZ, third,

then second, then next. Our intent, of course, was to get into ZZZ safely. ATC was issuing phone numbers for aircraft to call when on the ground. I was a bit confused as to why, I thought the towers were open, but paid it no mind. We heard the Controller mention COVID as the reason to another aircraft. Unfortunately, the aircraft landing ZZZ in front of us, Aircraft Y failed to call the phone number. This haunted ALL landings into all 4 airports. The Controller explained to another aircraft that his procedures precluded him from clearing any other aircraft for approaches into any of the four fields until had had a cancellation from the Aircraft Y. In fact, ATC had us attempt to call him on the frequency. I considered whether we could get in VFR but we could not get down into the class D with ZZZ Center and there was a layer between us and the field (I've forgotten where it was but probably about 3,000 feet). I then considered our fuel considerations, rather than using the 4.0 FMC fuel reserve I decided to use the actual FAR fuel reserve of roughly 3.6. The FO stayed on top of duties not only contacting other aircraft but complying with my requests as the flying pilot very well. Finally, when we reached 6,600 pounds of fuel remaining I asked the FO to contact Dispatch via ARINC phone patch. We had already looked at the ARINC Services page in the Jepps early on and determined that ARINC had a surface on ground frequency of XYX.XZ at ZZZ1, and we would be able to get a hold of them down low. I asked FO to come up with a diversion plan. FO worked with Dispatch who recommended ZZZ2 (of course) and said the fuel required would be 1,100 pounds at 10,000 feet. This seemed too low, I didn't see how we could climb to 10,000 feet, fly XY miles, and shoot an approach and landing on 1,100 pounds (and change) of fuel, so we declared minimum fuel and requested an immediate direct vector to ZZZ2. At no point did we use the words 'Mayday' or 'Emergency'. We were instructed to fly a heading (I believe it was 045 degrees) and issued climb instructions to 10,000 feet. We immediately complied and began to set up for an approach into ZZZ2. The FO did a great job juggling responsibilities, getting ATIS and setting up for the approach, contacting ZZZ1 local, etc. At one point ATC queried our fuel status and the FO initially used the word Emergency but then quickly corrected and said we had declared Minimum Fuel. We landed on ZZZ2 Runway XXL with 3.7 on the fuel. We pulled off the runway and asked ATC for a position where we could sit and call the company. We called Dispatch on the cell phone and were instructed to go to the 'Maintenance Ramp.'" We complied and were met with a follow me car where we parked, right next to an aircraft with a full load of passengers (obviously there for the same reason, we were later joined by another aircraft). We were immediately met with a set of stairs and a representative who asked what we needed. Dispatch immediately gave us a field load and we ordered thirteen thousand pounds of fuel. We arranged for the proper fuel load. It took some time for the fuel truck to arrive. We then had to coordinate getting paperwork to the aircraft. While Dispatch and the team did a great job of getting that all set up, the young lady driving back and forth had to go quite a ways to get our paperwork which took a great deal of time. Once we had our paperwork we were able to depart for the short flight to ZZZ. We completed the legs without further incident. I am uncertain what drove ZZZ TRACON to close, whether it was a scheduled cleaning due to COVID or some type of emergency. We reviewed the ATC and FIR NOTAMS and did not have anything mentioning the closure. Clearly this was the beginning of the delay. Then, it was further exacerbated by the crew of Aircraft Y jet failing to call the phone number after landing. Had they called we were next to be cleared to land and we would not have diverted. Several suggestions: We need clear and concise ACARs policies in the FOM. Each and every time Dispatch receives a message from a crew inflight they should ALWAYS reply. Perhaps this is a policy with Dispatch, but since it is not in the FOM and once in a while we do not hear from them we have no idea and I was not concerned about not getting replies, until we mentioned holding to them and I got no reply. That's when we hopped on the ACARS Services chart and noted that ZZZ1 had a ground based frequency and we could reach them from our holding position (incidentally, many of our pilots don't even know that table exists). Second, It is not unusual for ACARs not to work.

This needs to be cleaned up. We are constantly writing up aircraft for 'NO COMM' and ACARS failures and they don't work. Honestly, I'd say ACARS works correctly about 2/3 of the time, certainly not the spirit of FAR 121.99. Granted we have ARINC, but crews will rely on ACARS just to find out after the fact that dispatch never got anything from us. Next, if this was a scheduled COVID cleaning we should have known they were going ATC Zero before we arrived in the terminal area. Dispatch was even caught off guard about it. ATC must develop a means of communicating this so we don't find out so late in the game. They should also consider issuing a TFR. Perhaps the FAA should consider a new type of TFR for COVID. Frankly, I am a small aircraft owner and use it frequently. I don't want to be told I can't fly over class D airspace while in Class E airspace simply because they are cleaning TRACON. On a beautiful sunny day there are going to be aircraft all over. If I were flying GA in the area and knew the TRACON was down I'd probably stay away just because I don't want to get run over by a transport. Finally, the company should consider what paperwork we REALLY need at the aircraft. For instance, we can already get performance via ACARS. We can pull up our NOTAMS on our tablet. That would leave signing fit for duty and the release. Perhaps we could give Dispatch all the pertinent info (they already had the ZFW weight and balance) so all they needed was fuel onboard and they could simply give us the necessary numbers for departure. Next, send us an ACARS message for signatures - we could print 2 of them and leave one with the rep on the ramp. Had we been able to do that we would have been out about an hour earlier and would NOT have taken another delay. Incidentally, we obtained our PDC via ACARS in ZZZ2 correctly and it worked properly all the way back, including the summary page.

## Synopsis

Air Carrier Captain reported the unannounced closure of a TRACON that was possibly due to an "ATC Zero" event caused a divert for fuel. Captain reported there was only one ATC Controller working multiple positions.

## Narrative: 1

While on an OE Refresher flight, I was the PM and my FO student was on his first PF leg in about 9 months due to being non-qualified during the COVID crisis. We were on a right down wind with a clearance to descend 2,000 feet. We were told to stop our descent and we leveled off at 2,600 feet. ATC alerted us to a helicopter crossing our path at 2,000 feet. We reported him in sight and ATC turned us for a right base. When we were clear of the traffic we were cleared to 2,000 feet and then for a visual approach with the airport in sight. The FO called for gear down just outside the marker and managed the speed at the marker. We were at 170 knots at the time. We had planned for a flaps 3 landing. With our encounter/**interruption with the close traffic we didn't take into account that the** marker was 3.4 miles from the runway and at 1,200 AGL. With the glide slope captured and a planned flaps 3 landing the airplane was having a hard time slowing down. I pulled the speed brakes to assist the aircraft and the FO was slowing the airplane down. I pulled them just inside the marker and stowed them a few seconds later when the airspeed was near Vref. What I didn't realize was I had left them extended below 1,000 feet. I think part of the issue is the approach seems a little nonstandard (standard: 5 NM, 1,500 feet AGL) and sneaks up on you with the marker at 3.4 NM from the runway at 1,200 feet.

## Synopsis

Air Carrier Captain reported an unstable approach.

## Narrative: 1

Due to COVID-19 and family issues there has been a considerable limited amount of flying. I am flying practice flights to regain proficiency in all aspects. Did not call in to Approach until 16 miles from ZZZ instead of the required 20 miles. It was a miss communication caused by time away and now getting back into the system after the layoff. This is why I am practicing in VFR conditions with various phases of flight.

## Narrative: 1

Due to COVID-19 and family issues there has been a considerable limited amount of flying. Flying practice flights to regain proficiency in all aspects. Assigned a heading and altitude of 2,500 feet on departure from ZZZ. If given a change to ATC I missed the call, but do not remember hearing it. I climbed to 4,500 feet which was my flight altitude. I was told by Tower to go to Departure. Departure stated I climbed to an unauthorized altitude as there was possible traffic. Was not allowed above 2,500 feet. Miss-communication and getting back into the system after the layoff. This is why I am practicing in VFR conditions with various phases of flight.

## Narrative: 1

Due to the nature of wearing a mask due to COVID-19, it contributes to a couple safety concerns. It is a matter of time before there is a serious injury or damage due to the policy of wearing a mask the entire time while on airport property. I have been involved in a couple of close calls and have seen issues with my coworkers as well. First off, the communication issues. We already have issues with radio communication and I know there have been reports filed in the past for this. However, now there is another issue involving the wearing of masks and trying to understand what the person is trying to say. The voice is usually muffled or broken up and hard to understand. Most of the time requiring the person receiving the transmission to ask the other person to either repeat or in some cases just misunderstands the call. Throw in the inherent environmental noises from jet engines or air conditioning packs and other loud noise, communication becomes very difficult at times. As you can imagine, this can easily become a safety issue especially in times of urgency or clearing of flight control movement or other tests and engine runs. Second, visual impairment. The wearing of masks impairs your line of sight looking down. In order to actually see the ground in front of your feet, you need to actually bend your neck down to move your head to see and while you are looking down with your head down, then that is when you end up walking into something. You are unable to just look down. The obstruction has caused many trips due to the obstacles of power cords, tow bars, tools, steps on ladders, walking in cargo pits, and weather related issues, such as ice and snow. These are just a few of the most common items, but the list is endless. Also, when wearing safety glasses or prescription glasses or sunglasses, there is the issue of

them constantly fogging up. Especially in colder weather. This just compounds the issue with not being able to see what is in front of your feet. The easiest and fastest way to fix this is to not require the wearing of masks. Maybe only wear a mask while stationary and unable to social distance as long as it doesn't affect your job. TSA does give an option to not have to wear a mask if it is a safety concern as stated in the TSA website for the Executive Order. So my suggestion is to make the determination that due to a safety risk, the safety guidelines need [to] be changed to make masks optional on the individuals choice, depending on the job he or she is involved in due to the reasons stated above.

## Synopsis

Maintenance Technician reported safety concerns related to the having to wear a face mask while performing job duties on airport property and suggested the requirement guidelines should be revisited.

## Narrative: 1

During Climb we Leveled at 17,000 departure switched us to ZZZ Center on XYZ.AA. Upon check in with ZZZ Center we were given the clearance to climb and maintain flight level 290 and 270 knots. The Captain who was the pilot Monitor at the time read back those instructions and I set the altitude preset to FL290. During the climb coming through approximately 220/230 we were given traffic at our 2 to 3 o'clock which wasn't a factor. Then while climbing through FL250 ATC called us asking what our altitude was, he then told us that we were assigned FL190. He then cleared us to FL300. Flight continued without further issue. As pilots we take responsibility for any deviation of this nature and if there's questions it is our duty to ask and ask again to repeat if needed. I have however, noticed that since we've started flying more frequently since COVID that there are many more miscommunications on the radio than normal. I think we need to recognize that with what's been happening with COVID over the last year we as a group have lost a little proficiency especially with regards to radio calls and procedures. A lot of us have been out on the leaves that includes both pilots and controllers. The only way I can think of to mitigate this is that we're gonna have to slow it down, make sure that we have it right before we do anything. Maintain a vigilant watch, both on the aircraft and the radios.

## Narrative: 2

after copilot (pf) leveled at 17000', dfw departure control handed us off to ft worth center (ftwc) on 127.000. upon checking in with "aa461 level 17000'", i (ca-pm) heard ftwc say for us to climb to fl290 and maintain 270kts. I read back climb to fl290 and maintain 270kts. with the added narrative of 290 on the "altitude" and 270 on the "speed" to avoid any confusion between the two. the cp (pf) set 29000 in the altitude window and we both pointed at it confirming what we both heard. ftwc then additionally called traffic at our 2 o'clock, (do not recall distance and alt.), I replied, negative contact, looking. minutes later at 1917z and Passing through fl250, ftwc asked us to say alt, I replied FL250, climbing FL290. Fort Worth Center said, "Say again?" and I repeated. Fort Worth Center then said, "I assigned you FL190 for traffic". I replied, "roger". Fort Worth Center then told us to climb and maintain FL300 (our final altitude) and contact center on the next frequency. following the read-back, I asked if there was any loss of separation from the previously called traffic. Fort Worth Center, replied, "No, thank God." we never received any TCAS alert nor did we ever see any traffic displayed on the nav display (ND). I read back the

altitude and speed in two different ways. Maybe state "FL290", "twenty-nine on the altitude", in the future?

## Synopsis

Air carrier First Officer reported an altitude overshoot and cited loss of pilot/ATC communication proficiency due to lack of flying as a contributing factor.

## Narrative: 1

I had been concerned with the aircraft even making it into ZZZ due to runway conditions and crosswinds at the time of landing. My focus then turned to being able to depart from

ZZZ and making sure we had the fuel necessary for deice, and that braking conditions did not continue to deteriorate, as there were some reports of braking action being poor. The first alert I can find referencing a ZZZ Center closure was at XA:20L. There were several emails that followed, however due to the weather and runway conditions I was dealing with in ZZZ, and the multitude of messages coming through, it did not register that my flight would be affected by the ZZZ [Center] closure. Had we departed on time, and not been delayed for deicing, we would have entered the airspace in time to continue as normally scheduled. Our departure time was XA:50Z. The first fix into ZZZ [Center] airspace was ZZZZZ [Intersection], which is roughly 5 NM from the airspace border. To reach ZZZZZ [Intersection] based on my filed flight time took 1hr and 25 minutes, which would have put us into ZZZ [Center] at XC:15Z, with a 1 hour and 15 minutes buffer. At XB:54Z, I ACARSeD the flight as they were close to their 1 hour Top of Descent Point, and I wanted to check in. At this time I was going through my email inbox, and we were receiving a lot, when I realized my flight would be affected by the closure. Once I realized this, I immediately called my coordinator, who verified that the NOTAM for the airspace closure did not allow us to even drop down once entering the airspace, and was only published for overflights, and at XC:00Z I ACARSeD to return to gate, since even if they departed immediately, which they had just started the deice process, they would be pushing it to make it into the airspace in time (they were already filed fast). The flight returned to gate and was delayed several hours in order to allow for arrival to ZZZ [Center] after it opened at XF:30Z. I missed the original emails stating the closure which would have given myself, the crew, and the coordinator a heads up to be careful of our times deicing. It is hard to check every email. For ATC-0 events, I believe there should be other forms of notification to dispatchers to prevent this from happening. I do not believe ATC-0 NOTAMs attached for pilot paperwork, as the Captain said he did not see it, and reviewing the paperwork, I did not either.

## Synopsis

Dispatcher reported receiving an ATC Zero event notice too late, the flight was already taxiing for takeoff, and then having to notify the crew to return to the gate for a several hour ATC delay.

## Narrative: 1

At the gate we received a message that we needed to push early, or on time, due to ZZZ Center closure for COVID cleaning. We pushed back and taxied west route to Runway XL. Halfway down the taxi, by [Taxiway] 1F on [Taxiway] 1, we received a takeoff clearance for [Runway] XL. As I pulled out onto the runway, the FO advised me I entered the runway at [Taxiway] 1D and not [Taxiway] 1C full length. I started a back-taxi for full length and we received a clearance from Tower at [Taxiway] 1D for cleared for takeoff, and we had traffic on four-mile final. When we took off we were between [Taxiway] 1C and behind [Taxiway] 1D. Additive conditions were being off for three weeks. Takeoff at night on unfamiliar runway direction usually is [Runway] XXR. Getting takeoff clearance almost one minute prior to takeoff during taxi. ATC zero hour for destination COVID cleaning was a distraction trying to get off in time before ATC closure.

## Narrative: 2

While taxiing to [Runway] XL for a nighttime departure, we were cleared by the Tower to line up and wait well ahead of the runway end, roughly [Taxiway] 1F. As we had just completed the Before Takeoff Checklist after a single engine taxi and engine start, I was a bit behind in setting the Departure frequency. I went into the EFB to find the frequency, and when I looked up I realized we were turning onto the runway at [Taxiway] 1D. I alerted the Captain that we weren't at the end. At the same time, Tower advised us we were at [Taxiway] 1D, but cleared us for takeoff with traffic on four-mile final. The Captain had already started a bit of a back-taxi, and upon hearing the traffic report we

discontinued the back-taxi, lined up and departed. We were not at the very end, rather somewhere between [Taxiway] 1C and [Taxiway] 1D, but behind [Taxiway] 1D. Upon reflection, we decided that our takeoff data may not have been valid since we were not sure of our start point. Additive conditions were an ATC zero hour at destination and the Captain admits his three weeks off prior to our day put him a little behind. I also didn't advise that my head would be down while taxiing out. Better verification of runway departure point and better awareness of taxi diagram.

## Synopsis

Air Carrier flight crew reported a taxiway/runway incursion and cited being rushed to beat an ATC Zero time contributed to the event.

## Narrative: 1

There are several concerns regarding the long term wearing of face coverings on an airplane. There is a reduced oxygen environment while in-flight. It is difficult to breathe normally with more layers and there are many studies that I am concerned that our company and the CDC do not take into account. The time of useful consciousness at 41,000 feet does not allow enough time for customers to get on supplemental oxygen and take off their face coverings at the same time. Time of useful consciousness is roughly 9-12 seconds. If a face shield is worn in addition to a face covering it takes even longer for non-trained customers to don O2 masks. In addition, the face covering takes away senses of smell to properly detect issues on board the airplane in the event of a biological mishap **or a potential fire. Security concerns remain regarding covering a passenger's face** along with flight attendants for cockpit entry and exit procedures to properly verify identities. Wearing a mask during critical phases of flight continue to be concerns when it comes to quickly communicating.

## Synopsis

Flight Attendant reported concerns regarding face mask policy and how passengers would react in the event of a rapid depressurization.

## Narrative: 1

After departure from ZZZZ [Airport], while enroute, ZZZ Center announced a closure from XA:Y0z-XC:Y0z. The NOTAM announcing the closure did provide routing through ZZZ

Center during the closure. Flight AB approached the northern border of ZZZ Center at XB:Y0z and was placed into holding to allow 10 nm of separation between aircraft in a non-radar environment. Flight AB was informed to expect further clearance at XA:X0Z. Because the closure was not known at the time Dispatch prepared the release, the additional fuel needed was not planned. Flight AB was released with 17 min RPF fuel and no contingency fuel. The Captain called Dispatch on SATCOM at XB:Y5z and briefed the enroute delay. Captain was not comfortable delaying until XA:X0Z and diverted into ZZZ [Airport]. ATC Center COVID cleanings come with relatively short notice i.e., no more than 6 hours. For lengthy flights such as this one, additional contingency fuel even with excellent destination weather would have provided more options.

## Synopsis

Dispatcher reported the information regarding an ATC Zero event was not received in time to change the aircraft's fuel load and prevent a diversion.

## Narrative: 1

ZZZ1 ARTCC went ATC zero from XA-XB: X0p local. Sector X was required to get ZZZ [Airport] arrivals down to 9,000 feet at ZZZZZ [Intersection], near ZZZ [VOR]. The reason for such an early descent was to get them below departures which were supposed to be at

10,000 feet southbound filed over ZZZ [VOR], which kept them out of ZZZ [ARTCC] XY airspace that was ATC zero. The arrivals were given certain routing which had them go through ZZZ1 [ARTCC] XY ATC zero airspace. We couldn't turn the arrivals to stay out of that airspace because the departures were sometimes coming out at altitudes other than 10,000 feet, and we couldn't see limited [Data Blocks] because radar coverage stopped.

**Plus, this was the coordinated routing so we weren't sure that we should take them off** of it anyways. The paper that we were given that served as our 'briefing' on the event, had information to give the aircraft from Sector X to ZZZ Approach. This would have been fine, except ZZZ1 Approach was open and their airspace is between Sector X and ZZZ2 Approach. There needs to be better communication for the safety of the airplanes and controllers. Why were we allowed to fly through a portion of ZZZ1 [ARTCC] with the arrivals, but the departures had to wait. And, if we were supposed to turn the arrivals; or if we were allowed to climb the departure on contact, that needed to be better communicated to the Controller. also, when these route or procedures are being created, they need to have all facilities involved, so that the information we receive is actually pertinent and usable.

## Synopsis

Center Controller reported an airspace deviation and cited confusion due to another Center going ATC Zero contributed to the event.

Narrative: 1

Problem with slide bustle and slide, no action or inspection by maintenance. Possible contact with COVID-19 passenger in which no actions were taken by company to protect passenger and crew from possible virus contact. Suggestion - New overhaul of employee management actions. Ill passenger sat on the slide bustle in front galley for more than 5 minutes. I asked if a mechanic could look at the slide and bustle to make sure that they were intact but was ignored. It was more important to get the flight out.

## Synopsis

Flight Attendant reported possible exposure to COVID-19 and cited no action on the part of the company. Flight Attendant also stated a reported slide bustle maintenance issue was also ignored.

## Narrative: 1

At approximately XA:45, I realized it seemed to have been sometime since I had heard from the Controller. This is not entirely unusual. Due to the pandemic, there are times of much less radio chatter. In fact, several times a week, there are periods where nothing is said by anyone on frequency for lengths of time as long as 20-40 minutes save the occasional "You still there?" It seemed to have been a bit longer than normal, so we called on our last assigned frequency. We heard nothing so I tried Guard and heard nothing. Unbeknownst to me the volume of the radio receiving Guard was accidentally turned down. As I was trying Guard my copilot found a frequency on the chart, made radio contact and was given the proper frequency we should be on. We re-established communication with ZZZ Center. All seemed fine, until the hand-off came with a phone number for possible pilot deviation. Upon arrival at our destination I called the number I had been given. The Controller I spoke with asked if I knew why I was given the number to call. I told him I believed it was due to lost radio contact. He said it was. We then discussed how this might have happened and things to do to re-establish radio contact. He then said it seemed to him we had never been given a hand-off. He also said that sector was very busy at the time the incident occurred. I have no doubt they were. I suspect they were even a bit understaffed due to the pandemic. we concluded our conversation and thanked each other. My copilot and I spent considerable time discussing how this might have happened and how to prevent it in the future. But it must be noted there is no recourse for pilots that find themselves in this situation. There is also no sure way of completely preventing this type of situation. Pilots have no way of knowing when a hand-off should occur or when they have reached a specific time limit. Sometimes we check on, only to be immediately handed off with "short stay, contact center on XYX.AB". Other times we listen for long periods time listening to a completely silent radio. Those long periods of silence do not help at all. They only make the silence seem normal. Maybe controllers should be required to inform us, at check-on, how long or how many miles we

can expect to be with them. They always seem to have an idea how long we will be in contact with them.

## Narrative: 2

At approximately XA: 45 local, at FL360, in cruise, we noticed that we hadn't heard from Center in quite some time. During these times of COVID, it has become commonplace to go for long periods of time without hearing anything from Center or other traffic, especially in remote portions of the US. With the frequent occurrence that the only radio traffic heard is a pilot asking "Still on?" just to make sure someone is still out there, it is impossible for a pilot to determine at what time/distance interval, he should be expecting contact, a hand-off, or any other instruction from ATC. This was the case on date. During a long cross-country flight, we went for what seemed a long time without hearing anything from Center. We acknowledged the fact and I keyed the mic to interrogate Center. There was no response. I tried again and even switched to the previous frequency, just in case. Still no joy. Pulled up the sectional to find the nearest Center and discovered ZZZ Center, Area X on frequency. Called out to this Controller who brusquely inquired who we were, where we were, and informed us that we were on the wrong frequency, providing us with the correct one. We immediately switched to the appropriate frequency, received a response and continued on our way. Shortly thereafter, we received a call from Center that we had a possible pilot deviation and they had a number for us. Number was copied, remainder of the flight continued without incident. Upon landing, we reached out to the Center phone number, who informed us that, after reviewing the recordings, we had not been handed off to the next sector, and it was no fault of ours. Easy enough. Controller called back a few minutes later, stating that the previous sector had filed a report on the incident, and needed pilot license number, etc., for the reports. This brings me to the point where I ask, what can be done in this situation? There is clearly no exact location where an aircraft is handed off to another sector/center/controller. There is no exact amount of time flying through a sector before a switch is made. What can we, as pilots, do to help with this situation? Obviously, I cannot do my job as a pilot AND do the job of the controllers on the ground, so where is the happy medium? Is there a guideline of the appropriate amount of time to go without hearing from ATC before inquiring? Should we set a timer after each hand-off, or create a GPS way-point a certain distance down the line? It can be argued that "I have a number for you to call, advise when ready to copy" are the most stressful **13 words heard in a pilot's day. It generates fear, concern, trepidation and second** guessing of the skills and abilities that we spend years honing and decades perfecting. When we make mistakes, that is a definite way to bring attention to the problems and help find a solution. What recourse do we have when a controller makes the mistake? We spent the remainder of the flight and, arguably, the next 24 plus hours, stressing over what we should have done, when we should have checked in, how were we supposed to know, etc.

## Synopsis

Air Taxi flight crew reported not hearing ATC for a while during cruise. Reportedly, they had not been properly handed off to the next Center.

## Narrative: 1

We were doing approaches on an IFR flight plan because ATC currently won't allow practice approaches due to, we were told, coronavirus staffing levels. Being on an actual IFR flight plan increased the complexity of what should have been simple currency training in visual conditions to get instrument currency. The aircraft, an Aircraft X type, was newly purchased and had been flown VFR by my student (I trained him and signed him off for an instrument rating; he passed on the first attempt almost a year ago), but he had yet to take it IFR. It is nicely equipped with two Dynon combination PFD/MFD's and a Garmin GPS NAV/COM. I have 1000-2000 hours on Garmin products, both GPS and G1000 systems, but only about a dozen hours on an Aircraft Y type with similar Dynon systems and no prior hours on an Aircraft X type. We took off from ZZZ1 and shot two approaches into ZZZ2 (about 15 NM away) and were being vectored for a last approach into ZZZ1 to a full stop. I was simultaneously looking for traffic, explaining a point about GPS approach procedure, listening to another pilot on the radio report his position, and looking out for a scattered layer that was getting lower as the flight progressed and that we were just about to go into. The autopilot was on and I noticed the aircraft climbing through 2,800 feet. I thought I remembered that ZZZ approach had given us an altitude of 2,000 but I wasn't quite sure (my student was handling the radios), so I jumped on the radio and made an inquiry. Approach confirmed we had been given an altitude of 2,000. I immediately had my student hold the altitude we were at while I waited to jump in on the frequency as it was congested. I reported that we were inadvertently at 2,800 and asked what altitude they wanted us at. They replied 2,000. I said we would descend to 2,000 which we did immediately. ATC did not ask us to call a number when we got on the ground or make any other mention of it. The autopilot should have stopped the plane climbing at 2000. Neither of us could determine why it didn't as it worked fine leveling off at altitudes both before and after. I can only guess it was user input error on the part of my student. When he changed it to descend to 2,000 and hold that altitude it worked just fine. I believe the reason why I didn't notice the altitude deviation sooner than reaching 800 feet over our assigned altitude was a combination of sensory overload of having to teach, look for traffic, listen to radio chatter, look out for entering clouds (which should have been less of a consideration since we were on an actual IFR plan), combined with a lack of experience on the Dynon systems which limited my rapid acquisition of altitude information. I shall endeavor in the future to practice with the Dynon systems more in VFR conditions before venturing into IFR.

## Synopsis

Flight Instructor reported an altitude overshoot due to unfamiliarity with aircraft equipment.

## Narrative: 1

Taking off in ZZZ an incident occurred where we blew through altitude and we [were] slow to follow our heading assignment. I was PM on this flight, and it was the second flight of the day on this trip. Pre-flight was normal and we loaded up our passengers ahead of schedule with no pressure to rush. Upon receiving our takeoff clearance for Runway XX in ZZZ we were assigned a heading of 230 and an altitude of 2,000 feet. I performed the before takeoff checks and the PF armed the AT and the lateral mode (roll mode.) (SOP from manufacturer for takeoff with a heading assignment is either to activate heading mode and then spin the heading to the assigned heading at 400 feet, alternatively you can input the heading but leave it in roll mode until 400 feet upon which you can activate heading mode. Neither of which is particularly helpful during a high workload environment). Takeoff procedure was initially normal, we lined up on the runway and proceeded with a rolling start. The PF set takeoff thrust, and I made my first call at 40 kts. Sometime between 40 kts and 80 kts the AT Disconnect sounded. PF elected to continue. We rotated normally and after the call for "Gear Up" and the "400 feet" call the pilot asked for me to engage the AT again. I hit the AT button, and continued with my climb sequence checklist. (Speed 180, FLC, Flaps to 0 and After Takeoff Checklist.) Around the time I hit FLC Tower called us to switch to departure. At approximately the same time the AT again disconnected (without an aural alert). I called AT disconnect and reminded the PF that he had to manually control the throttles for speed. As I swapped frequencies the PF attempted to rearm the AT's and blew through our initial altitude. The AT's again disconnected immediately after hitting the button and I called ATC informing them that we had blown through our ALT by 200 feet and were descending back to intercept as well and the late initial turn to a heading of 230. ATC acknowledged and asked us to IDENT and to turn to a heading of 260. At this point the PF had manual speed control, I finally armed the correct lateral mode. (Heading set to 230) PF and I had a quick discussion and decided now that the workload was lower we could troubleshoot. We armed the AT one last time however this time it did not disconnect, and we proceeded with the flight normally. There were a few contributing factors that caused this error. Firstly, we are both new on this equipment and are still learning the correct procedures and cadence of the flight. Secondly, due to COVID we have not been flying as much as we normally do further extend the period of settling into the new aircraft. Third, we believe manufacturer's procedure for setting the lateral mode during a very high workload stage of flight 400 feet

during the climb sequence further exasperated the situation. The AP/FD should be programmed so that when you are in T/O mode that it will hold roll to 400 feet then will initiate the turn to a heading and revert to LNAV to HDG mode. Finally, the most critical error I believe was the PF's throttle technique. He would arm the AT and then bring the throttled straight to the stops whereas manufacturer procedure is to bring the throttle levers to around 40% TLA and then let the AT's set takeoff thrust. I hadn't noticed it in previous flight, but I noticed it on this takeoff because the throttle levers moved much to quickly to takeoff power. I believe that this movement overrode the AT logic and if he accidentally moved the throttles past the detent even momentarily it may have caused the AT's to disconnect. Then for the rest of the T/O roll the throttles were possibly still slightly past the detent not allowing engagement until they were finally moved to a lower power setting whereupon we could finally engage the AT's. We discussed this discrepancy during the cruise portion of the flight and the PF will use the correct throttle technique going forward.

## Synopsis

Embraer Legacy First Officer reported altitude and heading discrepancies and cited distraction from an AT disconnect as a contributing factor.

Narrative: 1

During deplaning at ZZZ airport, a passenger advised the lead flight attendant that either she may have been or was exposed to COVID-19. The affected passenger advised she was transferring to an international destination. This passenger would have had to disclose at check-in if she was possibly exposed, but passengers lie because they want to get home or travel to their destination. Also, on this flight I observed at least 10 passengers walk off the plane without any mask on and about 20 passengers walk off the plane with their mask only around their mouth. I see this type of activity on EVERY flight EVERY week. This is even with numerous PA's telling the passengers they must wear the mask around their mouth and nose. Many customers just don't care. I've had passengers completely remove this mask right in front of me. I've even experienced passengers telling me, "[profanity] the mask" right in my face as they walk off the plane mask less. This is the type of activity I see on every flight.

## Synopsis

Captain reported being advised that a passenger told the Flight Attendant they may have been exposed to COVID-19.

## Narrative: 1

I was First Officer and pilot monitoring for a reposition flight from ZZZ to ZZZ1. When I arrived to the airplane, the Captain was already there with multiple maintenance technicians working through a dual inoperative GPS situation. The consensus was to defer both GPS units, along with the associated MEL items. After processing our 9 MELs during our pre-flight discussion we waited approximately two hours for a flight plan to be filed due to the issue with ADS-B being inoperative. During the after-start checklist, the CONT CAB ZONE TEMP fault appeared on Master Caution recall. We complied with the QRH and MEL and contacted Maintenance Control for deferral under the "flight crew placard" option. The Captain and I discussed the phrase in the QRH, "if the light extinguishes when Master Caution System is reset, no further action is required" - and he noted that this does not alleviate us from the need to defer the item per the MEL XX-XXY. Along the same time, the Captain noted that the "dispatch alert" box was unchecked, so after the deferral was complete we resumed normal operations. After takeoff we experienced two additional master recall lights - "Anti-Skid Inop" and the "Reverser" on the overhead panel. Shortly after we leveled off at cruise altitude the dispatcher asked if we had added a new deferred item after pushback. We responded that we had, that it was XX-XXY. He advised us to fill out a report, despite the "dispatch alert" box not being checked. The reposition flights after long-term storage lend themselves to multiple maintenance related issues and could be planned ahead to be operated by Functional Check Flight pilots. The filing of our flight plan took nearly two hours. Not knowing the exact cause of the issue, it would be helpful for future flights to review the process for filing flights with inoperative GPS and ADS-B to minimize future delays.

## Narrative: 2

Aircraft X was a reposition flight for aircraft (tail) in storage several months. The aircraft was dispatched with multiple MELs. We waited over two hours for Dispatch to be able to get ATC to accept a flight plan into the system for a clearance. A Control Cab "Zone Temp" light illuminated during Master Caution recall during the after-start checklist. QRH procedures were followed and Maintenance control was contacted for a crew MEL (XX-XXY) before departure despite the misleading "No further action required" guidance in the QRH. Two more master caution lights were encountered after takeoff (Master caution "anti-skid and reverser.") Dispatch sent an ACARs message after level off advising us to submit a report for not getting an amended release for XX-XXY before departure. We responded that a Dispatch alert is not required for XX-XXY. Dispatch responded "They give us a heads up anyway." We did not believe we violated any maintenance/dispatch procedures but

were led to believe we had. Reposition flights from long term storage are a severely irregular operation and should be conducted by the Functional Check Flight department.

## Synopsis

Pilots reported equipment issues on a flight due to the aircraft having been in storage for several months.

## Narrative: 1

Today was a very busy day and on top of that our area was short staffed. At the time of the event, all 5 people staffed for the day were working, we needed to have 6 sectors open but couldn't due to staffing issues. We were told that TMU (Traffic Management Unit) was to slow traffic to help alleviate some of the pressure on our area, and we were also told that they could not call for overtime because of the COVID situation at hand. Today was a completely unsafe and unhealthy situation to have been in without any support from management and TMU. What is more important to the NAS, safety or COVID? At the time of the event, I had been on position for just over an hour and it was after two other sessions that I had been working for well over 2 hours with a 20-30 minute break in between. I was definitely mentally fatigued at this time. Aircraft Y was a departure from ZZZ flying west bound direct to ZZZZZ slow climbing from FL260 to FL340. Aircraft X was a southbound ZZZ1 arrival initially on a heading to avoid other traffic and descending from FL350 to FL270. I had turned the Aircraft X back on course to ZZZZZ1 thinking they were clear of all other potential traffic. When Aircraft X established to ZZZZZ1 they "flashed" with the Aircraft Y aircraft heading west bound near ZZZZZ1. I had already switched the Aircraft Y to [the adjacent ARTCC]. So I turned Aircraft X and called traffic. The turn helped but still didn't fix the situation. Ended with 4.5 miles and 300 feet. We need to have the support from not only our local management but also national level management. Volume needed to be slowed due to staffing. Regardless of what the airlines are pushing for or wanting from us. We have to be safe first.

## Synopsis

Center Controller reported an understaffed shift and multiple sessions on position resulted in mental fatigue leading to an airborne conflict.

## Narrative: 1

The issue is [the] extreme limit of CPC (Certified Professional Controllers). We were working with 3 CPC's on a shift that a year ago any less than 9 CPC's on a shift would have been unacceptable. The facility is combining 2 and 3 positions to one controller during very busy and complex traffic. All because a lack of CPC controllers due to COVID issues and minimum staffing due to the agency not hiring any more controllers for our facility. This whole COVID issue has caused all the rules and agreements to go out the window. It is unacceptable for the safety of the NAS! We are just treated like robots like we always have been. There is no empathy for the stresses in our lives outside of work. This year has created A LOT of stress due to all the COVID uncertainty and constantly changing ideas about how to deal with it. Also all the political stress that has gone on all year. As much as we try to push out personal issues and feelings when we work, we are still human. We are

not robots. And some days all the crap going on in society added to an unacceptable over taxed work load just gets to a person. We need more controllers at ZZZ TOWER! Also the positions need to be de-combined when traffic is busy. Combining 3 positions to one controller puts that controller at risk of missing something. And that is not fair to that controller or the flying public. The flying public deserves better than this.

## Synopsis

Tower Controller reported low staffing levels during periods of complex traffic combined with undue outside pressures have created an unsafe situation.

## Narrative: 1

I work the #X position regularly on the aircraft. Personal observation of the close proximity in which #Z and #X [Flight Attendants] sit, facing each other, is of grave concern to me, due to COVID-19. While occupying the jump seats at XX, true social distancing isn't possible. Depending on height it can be a challenge to sit without our knees touching or without adjusting our feet under the jump seat. All a non-issue, pre-pandemic. The #X flight attendant does not have a door arming or disarming

responsibility. There's no reason for the #X's preflight, inflight, or boarding duties to change. I'm suggesting for safety and health reasons the #X Flight Attendant is temporarily relocated to an unoccupied jump seat at door Y for takeoff and landing.

## Synopsis

Flight Attendant reported concerns with the close proximity of occupied jump seats during takeoff and landing.

## Narrative: 1

I checked in with the gate agent prior to my flight to ZZZZ. I don't recall if any passengers were boarded but there were no passengers that I remember waiting to check in because it was still pretty early. As I walked down the jet bridge I noticed a Flight Attendant walking the opposite direction. I had not met her prior as I had not been to the aircraft

yet. She told me she was trying to get better cellular reception so she could complete her COVID-19 form which is required for entry into ZZZZ. When I boarded the aircraft, I met the other two FAs. At no time did I notice any passengers boarding or on our aircraft. After checking the aircraft maintenance log, flight documents, etc. I briefed the A FA. I only briefed the A FA as passengers were now being boarded. I assumed the other two flight attendants were on board. I was completely unaware that we didn't have minimum crew while boarding. Approximately 10-15 minutes prior to departure, the A1 FA informed me that she was informed that we had boarded without minimum crew. I think the COVID-19 online form (for ZZZZ) was the reason that caused this problem. I fly this trip nearly every week and it's generally always a bit of a scramble at the last minute to get the form completed by all crew members prior to departure. In addition it is a very difficult form to electronically fill out for the first time. I believe the FA was only trying her best to complete the form prior to boarding. Perhaps a reminder to both cockpit and cabin crew that a COVID-19 declaration form is required for entry into ZZZZ. And that the form takes a while to complete as it NOT intuitive and can take a few attempts to complete it and requires sufficient WiFi or cellular signal.

## Synopsis

Air Carrier pilot reported the aircraft was boarded without minimum FA crew because the FAs were late completing COVID-19 declaration form.

## Narrative: 1

Ground personnel are being asked to leave their work area, travel in their own vehicle to a random clinic. We are not opposed to being screened but believe the screener should come to us at our place of work. We feel it is unsafe to be placed in an environment that is filled with people who might have serious medical conditions during a pandemic.

## Narrative: 1

Was working these two sectors combined. It needed a D side or to be split. Sector volume was high and complex. Two CPC's [Certified Professional Controller] had been held over on OT to supplement our 5 CPC count for the night shift. They were relieved to go home as they hit their limits. That left 5 CPC's working 5 sectors. No sector could be combined up to free up a controller to help on a D side. There was extensive military training aircraft working sector X at ZZZ1, ZZZ2, ZZZ3. I told the supervisor they needed to tell those aircraft to return to base so X and Y sectors could be recombined to free up a CPC. He got that process started and eventually sectors Z and A were able to combine as well. We have been working short staffed on our 5 day rotations for too long. I am beyond frustrated working combined R/D positions with busy traffic. I have lost my patience and work angry. These sessions are unsafe and on the cusp of causing a safety incident to occur (loss of separation, etc). Our traffic levels are, in my opinion, back to pre-COVID levels. We need to transition back to normal schedules. If not, management needs to place traffic restrictions on the military training flights that routinely come out of ZZZ4, ZZZ5, ZZZ6, ZZZ7, ZZZ8, and etc. I'd say no more than 3 total aircraft allowed to work practice approaches at the ZZZ1 area and no more than 1 at a time at the ZZZ9 area until we can get back to normal schedules and staffing levels.

## Synopsis

Center Controller reported an understaffed shift with high traffic volume and offered recommendations to remedy the situation.

## Narrative: 1

While enroute at FL280, I noticed the radio frequency was very quiet. Since COVID has impacted US aviation, frequency congestion has decreased significantly, which makes longer periods of radio silence a new sense of normalcy. My last handoff to ZZZ Center was eight minutes prior at which I made positive radio contact on frequency XYZ.AB. I was using COM 1 as primary radio and monitoring XYX.B on COM 2 with the proper audio panel selections to hear both radios simultaneously. After time passed by and I realized I was not hearing anyone, I transmitted my N number on COM 1 to ZZZ Center and did not receive a response. I selected microphone to COM 2 and reached out to ZZZ Center on XYX.B, no response. I switched the microphone back to COM 1 and tried XYZ.AB again, no response. I switched the microphone back to COM 2 and announced, "All stations on guard, radio check." After the second attempt, ZZZ1 Center answered and gave me a new frequency, XXC.DY. A Controller replied "Aircraft X, possible pilot deviation, I have a number for you, advise when ready to copy." I was extremely shocked at the situation as I was unaware the radio issue had escalated to that extent. I continued my flight to ZZZZ and called as soon as practical after landing. I spoke with a Controller. Controller said NORDO is a common issue but mine was excessive. I have no deviations on my record and strive to maintain a clean record. Going forward, I will be more diligent in recognizing radio silence and will reach out more frequently if I assume the silent period is excessive.

## Synopsis

GA pilot reported becoming NORDO enroute and thinking because of the COVID-19 pandemic the radio just had less communication traffic.

## Narrative: 1

During climbout from ZZZ, above approximately 2,000 feet AFL, an amber GPS-L enunciated. I continued to hand fly the jet as we climbed into IMC conditions in the pre-dawn darkness. The GPS-L caution distracted me from calling "flaps-up" at the appropriate speed. The Captain called my attention to this as we approached 240 knots IAS. I called for flaps up and the captain retracted them normally. I engaged the autopilot after flap retraction. At no time did we exceed the 250 knot flap placard limit. Maximum speed I remember seeing was 244 knots IAS with flaps not up. The rest of the flight to ZZZ1 was uneventful. I believe my recency of experience was a factor; this being my first unsupervised flight since re-qualification. Also, night, IMC in low marine layer clouds while hand flying the initial portion of the RNAV departure. The GPS-L caution was a nuisance warning that served as the distraction. I was focused on hand flying smoothly and lost situational awareness of aircraft configuration. Earlier use of automation may have helped with my situational awareness during the nuisance GPS distraction. My habit is to hand fly the aircraft until clean.

## Synopsis

B737-800 First Officer reported a GPS-L annunciation on departure which distracted flight crew from calling flaps up at the appropriate speed.

## Narrative: 1

We were met at the hotel by the van to be transported to ZZZZ [airport]. The driver wasn't wearing a mask when he loaded the bags. He finished loading and sat down in his seat without a mask. I said something to the effect of, "You aren't wearing a mask?" He didn't really say anything. After a few seconds, I said, "Since you aren't wearing a mask, we will need fresh air." I assumed that after seeing the 4 pilots with masks on and me saying something, he would put his mask on. He never did. Instead, he started fumbling with the AC controls. I told him that without a mask, we would need the front windows opened in order to ensure ventilation in the van. He eventually complied. We then drove 30 minutes to ZZZZ with the windows open with the OAT ~ 34 degrees. We were freezing cold. We were all upset, cold, and potentially distracted for our flight. This is a safety of flight issue. We used our CRM skills to identify this threat and deal with it. But, the bottom line is that we shouldn't have had to deal with this easily avoidable threat in the first place.

## Synopsis

Air Carrier Captain reported the van driver from the hotel to the airport would not wear a face mask.

## Narrative: 1

The Lead Flight Attendant had apparently talked to the Captain or First Officer about masks. They said something to me about it after my break along the lines that she was upset and combative. I was surprised, as I wore my mask (a KN95 on the ground and a solid multi-layer cloth one in the air) all times outside of the flight deck and in the flight deck if a Flight Attendant was present. Additionally, the other First Officer did as well. The Captain wears glasses that fog easily with a mask on. He wore a mask on the ground, he did not airborne because it would greatly interfere with his duties both because he wouldn't be able to see and could not communicate. This was our 4th leg together and we had no issues with masks among ourselves or other flight attendants. Additionally, both the Captain and other First Officer already had COVID which they had gotten from people they knew at home, not in the workplace. Before our next rest room break I got out a new unused N95 mask for the Flight Attendant that would be in the flight deck while I was in the bathroom. When I called back and ask for the break she ordered me that the pilot remaining in the flight deck should wear the crew oxygen mask. I said that was not something that we did anymore-the practice stopped months ago because of COVID. I offered her the N95 for extra protection because the Captain can't wear a mask and do his job. She refused it. Instead continuing to wear what appeared to be a single layer stretchy black cloth mask. Additionally the flight attendant blocking the cart was wearing a KN95 but the Lead FA did not send her into the flight deck. I found the flight attendant to not be willing to exercise self-help and any wearing of an N95 and apparent multiple complaints to be a distraction from my flight duties. This was not good for crew CRM. While the single pilot on the flight deck, I was distracted from monitoring the airplane by her distress and complaints.

## Synopsis

Air Carrier First Officer reported poor CRM with the Lead FA regarding the company face mask policy on the Flight Deck.

## Narrative: 1

I was deadheading on Aircraft X. I identified myself to the A Flight Attendant (FA) (as I always do) as a safety and security asset. The flight was nearly full. During boarding a man who I later learned was Mr. X approached my seat. He was wearing a camo gaiter around his neck which was partially covering his mouth but was not covering his nose. As he approached, I identified myself as a crew member and politely asked him to pull his mask up over his nose. He complied but said that I should pinch my mask tight over my nose. I didn't quite hear what he said so I queried him. He said, "You should pinch down on your nose to close the gap at the top of your mask." My mask was an NP95 which had no gaps anywhere around my face. It was my sense that the man was being sarcastic and antagonistic. I said nothing further to him. I advised the FA A what happened before we pushed back. She told me that the man had boarded without his face covered and was told to cover his face. Thus he had pulled his face covering off his face between the time he boarded (when he was told to put it on) and the time he approached me, which was no more than thirty seconds. He clearly had no intention of complying with the mask policy. FA A asked me to brief the Captain about the incident and asked if I would talk to the CSR agent whom she wanted to speak with Mr. X. I agreed. Before departure I walked into the jet bridge and spoke with FA A and the CSR. I briefly explained what I observed and what he said to me then I went back onto the airplane and took my seat. A short time later I observed Mr. X walk back down the aisle past me. Sometime during the flight FA A advised me that Mr. X had been [violating other regulations]. She advised me that Mr. X demanded to know the crews names (including mine) but that she did not give him any names. She was clearly concerned about this and I could see how his actions were distracting to the flight crew and were thus interfering with their duties. She told me that she was going to have CS meet the aircraft and asked me to stay as a witness. FA A as well as the rest of the inflight crew were nothing but polite and professional the entire flight, when I observed her dealing with Mr. X or otherwise. After leaving the aircraft I was standing in the jet bridge and spoke with a CS Supervisor. Mr. X walked by me and said in an aggressive and hostile tone, "I want your name." I told him that I could not give it to him and that I could not speak with him about this matter. He again demanded my name and moved closer to me. I backed up. He then raised his camera and said, "I'm taking your picture." I stated, "Do not take my picture." He said, "I'm taking your picture." I quickly turned around and walked around the jet bridge corner toward the aircraft door. I do not know if he took my photograph or not but felt that his forcing his camera in my face was one of belligerence, hostility, and aggression. I felt threatened. All of this simply because he was asked to properly wear his mask. After the CSR Supervisor and Mr. X walked into the terminal, I remained in the jet bridge as I did not want to encounter Mr. X again. When the CSR Supervisor walked back onto the jet bridge, I explained to her that I could not have my photograph taken and suggested that if he loitered around the terminal waiting for me that she please call law enforcement. I asked her if she felt he was being hostile and or belligerent. She agreed that he was. After some time, Mr. X left the area, and I departed the terminal. Based on his behavior and actions I would strongly urge that Mr. X is not allowed to fly on our airline in the future.

## Synopsis

Air carrier Captain deadheading on a company flight reported a passenger would not conform to the face mask policy and was hostile, aggressive, belligerent towards the flight attendants.

## Narrative: 1

As I was leaving the flight deck approximately 6.5 hours into the flight for my break the Captain informed me the Purser had spoken to him about mask usage on the flight deck. Upon returning from my break I was informed there was further conversation with the flight attendants. Not much detail was discussed as we began the preparation for descent into ZZZ. I never spoke to any FAs about the issue nor did they speak to me about it. I am aware the Captain chose not to wear a mask for safety of flight reasons concerning his glasses while on the flight deck.

## Synopsis

Air carrier First Officer reported the Captain chose not to wear a mask for safety of flight concerns while wearing glasses.

## Narrative: 1

I was working the entire area combined. The evening west departure push was going on along with other aircraft throughout the airspace. I was pretty busy on a small scale and multiple frequencies. I descended Aircraft X to 16,000 and verified he had the weather at ZZZ [airport] and what approach he wanted. I cleared him for the LOC/DME [Runway] XX at ZZZ [airport]. I started to hand the aircraft off to ZZZ [Approach] and took it back thinking ZZZ [Approach] had gone home for the evening and we had the airspace. Another Controller had sat down to help but didn't yet get a briefing. ZZZ [Approach] called to give up the airspace and I just went "Crap." Apparently Aircraft X had gone over to Approach on his own and the controller had been watching him. I made a mistake thinking it was later than it was and that ZZZ Approach had gone home for the night. Since the COVID started everything has been off. We are combine sectors too much and too early. The scale and number of frequencies we are required to work is not helpful. We get a lot of EA [Excused Absence] and are just not as proficient as we use to be. I would like to see sectors de combined more often or not combined as early. There are a few that push to combine and we just accept it and work through it. It is really not safe or comfortable to work. Mistakes are being made.

## Synopsis

Center Controller reported thinking it was later then it was and did not transfer communication to underlying TRACON, assuming the Center already had their airspace.

## Narrative: 1

I returned to work after a 3 month absence. I am still qualified on the module. I was assigned as the trainer to Mechanic Y. I was training him on the stator case assembly. I

demonstrated how to tighten each vane segment foot bolts. The procedure that I was taught, and which had been in use as long as I can remember, was to slide the case and vane assembly, so that approximately one third of it overhung the table surface. Then the bolts were tightened from below with a ratchet with a socket and long extension, repositioning the case and vane assembly as necessary until all bolts were tightened. At the time of the incident, I was not in the work area, having gone to the restroom. Support the case with a hoist and sling before tightening the bolts. This should be added to the job card.

## Narrative: 2

One week after return from 3 months off and being the first time working on this unit as a trainee. On Graveyard shift I was working on the module and order # XXXX. I was tightening the bolts of the vanes. The bolts are tighten from the bottom while the case sits on the table. To access the bolts part of the case is moved slightly beyond the edge of the table. I was sitting in a chair with rollers while I was tightening the bolts. The chair moved, the wrench and its extension did come off the bolt head causing the case to slide off the table and fall to the floor approximately 30 inches. There was no visible damage to the case because it fell directly on my arm and that cushioned the fall. Inspection will be called to inspect the unit. I would add to the job card to support the case with a hoist before tightening the bolts. Or developing a fixture that would allow to reach the bolts from the bottom without having to move part of the case off the edge of the table.

## Synopsis

Maintenance Instructor and Trainee reported a training mistake during a training session and both cited being off for an extended time contributed to the event.

## Narrative: 1

Aircraft X was assigned to the hangar midnight crew for the "A" check. The first contact that technicians had with the aircraft occurred at approximately XA00 local time. Avionics technicians, including myself, began the night with completing operational checks within

the aircraft in preparation for the rest of the crew to perform their assigned tasks. Later technicians began to migrate in and out of the flight deck, cabin, galleys, lavs, etc., to their assigned tasks. All technicians were in compliance with the mask policy. Approximately 4 hours later, the Lead Technician and Supervisor alerted everyone on board that the aircraft had not gone through its disinfecting process which usually occurs at the gate upon arrival. The aircraft was cleared and the Lead performed the disinfecting procedures. Concerns were raised from this event. The potential of an infected passenger being on board and the potential of technicians being exposed to COVID. The protocol for traveling to ZZZ is to have a COVID test within an XX hour period of departure time. However, once you are tested there are no guarantees that the individual will quarantine or shelter in place prior to boarding the aircraft for departure. The cleaners finally arrived for the disinfecting process at midnight. I asked the supervisor what the protocol is for an event such as this and he was unaware of one in place. This aircraft originated from ZZZ1.

## Synopsis

Technician reported the maintenance crew was advised the aircraft had not been disinfected after the inspection and repairs were already in progress.

## Narrative: 1

Operating flight from ZZZ to ZZZ1. After landing on Runway XX, exited on Taxiway A and turned left on Taxiway C, and believing that Tower had actually cleared us to taxi to the gate, we started to slowly taxi, when Tower called us and asked that we call Ground. We called Ground and he stated "You started to taxi without calling us, and crossed Runway XX, which is an active runway". We had barely started to taxi on C. We had read the NOTAMs, and in fact, Runway XX was "NOTAMed CLOSED", so it could not be an "Active" at all. Regardless, we asked Ground for taxi clearance to the gate, and received clearance to the gate via "C." We did not want to argue with the Ground Controller, but we do know that Runway XX is Closed at ZZZ1, so it's not Active in any way. We asked the Ground Controller if we should "expect any paperwork", and he said "no". I do not believe we did anything wrong, but it's better to be safe and proactive, and learn from our possible mistakes. We had flown into ZZZ1 previously (a few days before) and due to controller shortages or consolidation of ATC positions (During COVID-19 times), the Tower normally gives us the taxi instruction after we cleared the landing runway. This time, we cleared the runway and thought we had heard the Tower tell us to "taxi to the gate" (as they have been doing recently). We started to slowly taxi on Taxiway C and that's when Tower asked us to "call ground for taxi," something they had not done in the past 3-6 times we had landed there recently. So, probably I was expecting the same ATC procedures to happen, but regardless, in the future, will come to a stop on the taxiway and not move until further taxi clearance is received. I would suggest to avoid being complacent, and instead of expecting the same type of ATC handling from small airports as we may be getting every day during COVID-19 (combined controller positions, where there is perhaps combined Tower and Ground, or even Approach/Tower/Ground Controller), and instead treat it just like a busy airport.

## Synopsis

Air Carrier Captain reported a taxiway/runway incursion and cited ATC staffing, local ATC procedure change and confusion over a NOTAM contributed to the deviation.

## Narrative: 1

TCAS RA on arrival into ZZZ [airport]. Assigned descent to 7,000 feet and vectors to final by ZZZ Approach. We reached 7,000 feet and noted approach was extremely busy where the Controller was being stepped on seemingly more than half of her transmissions. While level at 7,000 feet the TCAS noted a proximate target converging from 1 o'clock, 400 feet below. We attempted to contact Approach but there was zero opportunity to get a word in due to the sheer amount of communication on frequency. I advised the Captain PF to "get ready" while we attempted to locate the aircraft visually. A few seconds later the TCAS noted traffic and ordered a very shallow climb. I announced to ZZZ Approach that we were responding to an RA, but I believe I was blocked, the frequency still jammed with constant communication. A very short time later the controller issued traffic to us and I again advised "Climbing on RA." Controller replied "Roger" I believe and the event was over shortly after. We returned to 7,000 feet and were vectored for the visual, but the controller still had to vector us around multiple VFR targets on our way to the runway. Most significantly we were cleared for the visual approach, but were restricted to flying and intercepting between 5 and 7 NM from the airport due to area traffic. This caused a perceived limitation that pilots are not used to. The CA/PF then overflew the Localizer slightly attempting to maintain these limitations. The aircraft was clearly stable by 1000 feet and we continued in to land, but this was following an incident due to the same cause. Cause was due to the intense level of traffic in ZZZ Approach's airspace. I spoke with a contact at ZZZ [Approach] later who noted the Controller had 15 active aircraft not including the VFR targets attempting to get clearance from the closed airspace, Practice IFR traffic, and VFR flight following requests. The Controller was doing an excellent job and maintained a very professional demeanor throughout. There was just no reasonable way for Controller to maintain communications with the volume of aircraft. I am not sure, but this could have been a result of reduced staffing due to COVID. Maybe there was an East and West ZZZ [Approach] sector available, but no staffing to accommodate. My suggestions would be to either split ZZZ Approach or to draw a new arrival for ZZZ airport to reduce the amount of communications and possible routes needed for the controllers.

## Synopsis

Air Carrier First Officer reported an RA event and blocked ATC communications due to possible COVID-19 ATC staffing issues.

## Narrative: 1

With about 4 hours to go before landing, I had just emerged from the crew rest bunk when Lead Flight Attendant asked me if I could have the flight deck crew wear a face mask when a Flight Attendant was in the cockpit in flight. I told her no for the safety of flight reasons. I did not add anything further. I personally was not going to wear a face mask in the cockpit since I would be in the cockpit for the rest of the flight. I am required by the FAA on my medical "Must wear corrective lenses, possess glasses for near/intermediate vision." Since my glasses fog up every time I wear any type of face mask I know that

wearing a mask at my flight deck seat is a safety of flight issue. About two hours later when the Lead came to in to give us a restroom break we, First Officer and I, offered her an N95 mask to wear for her safety and set it on the pedestal for her. She did not put it on and chose to wear what appeared to be a non-N95 certified black cloth mask.

## Synopsis

Air Carrier Captain reported telling the Lead Flight Attendant that he would not be wearing a face mask in the flight deck due to safety of flight reason as his glasses fog up when wearing a face mask.

## Narrative: 1

Over last few days, there is indication that certain aviation companies are looking into making the COVID vaccine mandatory for their employees. I strongly believe that this is a potential security risk, due to the fact that if an individual is forced to do something against their will, they might fight back. In the aviation industry, as history has shown so well, there is a strong possibility that airplane safety might be compromised, especially by individuals that have direct access to the unsecured aircraft, such as gate agents, operations personnel, mechanics, and ground handlers. Due to the significant safety concerns, I strongly urge the FAA to prohibit mandatory vaccinations.

## Synopsis

Air Carrier Captain reported concerns with airlines possibly making it mandatory for employees to get the COVID-19 vaccine.

### Narrative: 1

I believe complacency played a role in this error. I am always checking and double checking my work but unfortunately I missed an important piece of information on the Center of Gravity (CG) and Passenger Count (PC) data. Next time I will slow down and thoroughly check my work without rushing and recognize my complacency. We arrived to our aircraft in the morning to perform our duties for the first leg out of two for the day. Boarding was complete and I received the cargo sheet and CG/PC Data from the gate agent. As I plugged the numbers in for departure I noticed the passenger count seemed low. Thinking that it was due to the slow season and COVID I continued to run the numbers for our takeoff data. With the low passenger count I figured we were going to also need a ZFW reset from the dispatcher. I confirmed with the Captain and went ahead and contacted Dispatch with our new ZFW and confirmation of our CG. New numbers were sent back and we took off uneventfully. While in cruise the Captain requested a lavatory break. Upon his returned, he voiced his concern with the passenger count from what he saw in the cabin while checking our CG/PC. That is when we realized that the incorrect CG/PC was given to us. As we were starting our decent, the Captain transferred the controls to me while he referenced the COM and tables to calculate our correct weight along with the landing data and Vapp. As a precaution we also added few knots to the Vapp. The Captain completed the tasks and I confirmed that all the information was correct and within safe parameters for a safe landing. We had sufficient runway and the field was VMC at the time of landing. The landing was uneventfully and we continued to the gate.

### Synopsis

Air Carrier First Officer reported the pilot crew realized, in cruise, the weight and balance data were incorrect. The pilots did not question the small passenger load, which is common during the COVID-19 pandemic, before takeoff.

## Narrative: 1

It was toward [the] end of the rush, I was working the low side and had all of my aircraft slowing to 170 kts. Controller Y plugged in for a relief briefing after working as the main arrival coordinator. As I was going through the position relief checklist Controller Y noticed something was off. At first I thought Controller Y was looking at the spacing on final, which was perfect. But then I saw Aircraft X on a 180 heading racing towards the Runway XL final. My first reaction was to turn Aircraft X right to a 330 heading but then Controller Y suggested a left turn to continue eastbound away from final. I issued a left turn 090 and then a climb to 050 to get above the traffic on final approach. It was clear that Aircraft X took the left turn to 180. Aircraft Y had turn to a 180 heading at his appropriate time. If it wasn't for the fast acting from Controller Y the issue could have worsen. In this new world of "COVID Traffic" pilots need to do a better job of listening to control instructions especially when the volume is high.

## Synopsis

TRACON Controller reported clearance communication issues with an aircraft resulted in a conflict which was saved by another attentive Controller who offered a different heading to avoid further separation issues.

## Narrative: 1

During this incident I was on a checkride and we ran a partial panel VOR Runway X approach with a circle to Runway XY. This is normally a Class D airspace but the Tower at ZZZ is currently closed due to COVID and this has presented some challenges to the arriving and departing process given we share the airport with airline operations. We made it to the left downwind for XY and there was a carrier aircraft holding short of XY getting ready to take the runway and they requested over CTAF for us to extend our downwind so they could takeoff. We extended our downwind about a mile or so and decided to turn base. About the time we were turning base there was another carrier that called a 10 mile final for XY. With the position report given, we were under the impression we had the appropriate spacing for us to get on the ground and off the runway before they reached the field. We continued and turned in for final and the carrier taking off was on the roll. I made position reports and heard nothing back that would indicate an issue. When we were on short final carrier made a 6 mile final call. I then made a position call for short final and

we were within a half mile of landing. About the time I was roughly 100 feet over the runway threshold, the carrier aircraft called and stated, "Aircraft on short final, we are going around and will be flying above you." We landed safely and had to extend our ground roll down the runway to exit because another carrier aircraft was taxiing to Runway XY via Taxiway A and we had to taxi beyond where they were. That concludes the incident. I do not know how accurate the position reports were from carrier or their speed but there didn't appear to be an issue on spacing and if they knew they were catching us that fast they could have let us know and I would have executed a go-around. This was not a near-miss event and we never saw the aircraft near us on ADS-B radar or receive any traffic notification. It seems to be more lack of communication in a non-towered environment with busy airspace as a root cause. I think they were well aware of our location in front of them and didn't speak up to let us know how quick they were catching us. I feel like there should be some additional measures in place when a tower is closed at an airport like this with heavier volume and many different types and sizes of aircraft operating. Sharing an airport between GA and airline ops in a non-towered environment is setting the stage for incidents like this to happen and truly presents some added challenges and hazards.

## Synopsis

GA pilot reported CTAF communication challenges at an airport that normally would have a working Tower facility, but was closed due to COVID-19.

## Narrative: 1

We had departed ZZZ1 to the south, when Tower was shut down due to COVID-19, VFR to pick up IFR clearance over ZZZ2. After passing under the [ZZZ] Class B to clear it, we contacted ATC. After giving us the clearance, the Controller gave the Captain a phone number to call (which he did later after landing), and advised of a report, that we had strayed into [ZZZ] Class B airspace.

## Narrative: 2

ZZZ airport Tower was closed for to Coronavirus. [ZZZ is] a busy airport with mixed high speed and low speed aircraft. I departed VFR to pick up IFR clearance over ZZZ2 for arrival into ZZZ3. ATC, as always was very busy in that congested area and it took several attempts to make contact with ZZZ Approach. Very busy in cockpit looking for traffic, etc. May have clipped Class B airspace. ZZZ Approach advised, I may have entered Class B airspace and to copy phone a phone number. I replied: thank you, what altitude and heading would you like? The Controlled replied: "continue, there is no traffic and then handed us off to ZZZ Center. I followed up with a phone call and thanked them for the wonderful service and protection they provide. I have been flying there for years. I have

thousands of hours in general aviation and XX years flying airliners. The controllers do an unbelievable job working with an airspace system that does not work. The way it is designed doesn't work for the controllers or the pilots. At times the controllers are at max effort to keep up with the congested radio traffic. I am sure just they have their distractions with the maximum workload and have their own mistakes to sort out. That airspace configuration needs a good look at for something that works better for high speed **aircraft. Get them out up and out of the way as fast as possible. It's a poor system to** have jet aircraft level off at 1600 feet right after takeoff for normal operation under IFR conditions. In the cockpit of a jet aircraft you are very busy during this time. There needs to be change even if it slows down the current operations.

## Synopsis

Flight crew reported a Class Bravo airspace violation due to the Tower being closed for COVID-19 issues.

## Narrative: 1

The above pairing or trip is built with a tag after an all-night flight and I feel it is not safe for the employees and passengers. We check in at XA:X5 for an all-night flight from ZZZ to ZZZ1. After arriving in ZZZ1 exhausted from working all night the crew has to sit 3 hours at a hub where it would be easy to crew the next flight from ZZZ1 to ZZZ2 with a fresh crew that has slept. Instead a crew that has been up all night has to board and work a 2 hour flight. This I feel is not safe or healthy for the employees and lowers our

immunity making us more apt to catch COVID, or some other sickness also not safe for passengers traveling with a crew that is exhausted.

## Synopsis

Flight Attendant reported after flying an all-nighter, they had to wait 3 hours in the crew lounge to make an additional two hour flight.

## Narrative: 1

Bleeds off TO. After starting engines, I turned off APU switch - IAW Normal after start flow. I should have left APU switch on IAW OM XXX.6 (Bleeds off/APU on TO). We did, however, carefully configure bleeds/packs IAW OM XXX.6. We did not subsequently catch that APU switch was off before takeoff. After departure, First Officer reconfigured

bleeds/packs IAW with XXX.6 and continued normal flight to ZZZ. This was the 4th line trip I've flown at airline since April 2020. A lack of recency flying into ZZZZ1 and a reliance on the muscle memory/normal after start flows contributed to my error in turning the APU off prematurely. Both the First Officer and I were very aware of the bleeds/packs configuration as we had previously emphasized this TO briefing item at the gate prior to departure. Ultimately, by accurately following the pre-briefed OM 120.6 to reintroduce bleeds/packs after TO we trapped my error and the threat was mitigated. We received ACARS msg and SELCAL warning bleeds/packs off on climbout as First Officer was restoring the bleeds/packs per OM XXX.6. The SELCAL was a helpful reminder/backup to the crew.

## Synopsis

Air carrier Captain reported a lack of recency flying and a reliance on the muscle memory/normal after start flows contributed to an error in turning the APU off prematurely.

## Narrative: 1

After I briefed the A Flight Attendant, she asked if I would be wearing a mask whenever they came in the cockpit for a lavatory break. I informed her as per our protocol I am not required and for operational safety reasons I do not wear my mask in the cockpit. She then informed me that they would not enter to give us a break unless I wore a mask. I

then initiated calls to Dispatch and Operations to inform them of this problem. I understand their concerns and respect their decision. Yet, I do not understand why they would take issue with cockpit members facing forward and unmasked when they are continuously exposed to passengers in the cabin who have their mask off while eating or drinking as well as children who are not required to have a mask. On a recent flight my First Officer and I had a hard time understanding the ATC Controller due to the muffled sound because they were wearing a mask. It is also difficult understanding a First Officer who is wearing a mask in the loud cockpit environment. Safety of flight is my priority followed by mission and passengers. I regret the inconvenience this brought to passengers and company alike but this difference in protocol needs to be resolved without imposing non safety operational constraints on the cockpit. I realize this is a novel disease and the information from the CDC and NIH [National Institutes of Health] is at times confusing and conflicting but believe that we should not take information to extremes and compromise operational safety. Lack of cohesive policy between Cockpit and Flight Attendant protocols that plays between personal concerns over operational safety. I also feel misinformation or agenda also play a role on differences regarding relative issues. Keep the current Pilot protocol which works well and imposes minimal restrictions regarding operational safety. Clarify Flight Attendant protocols so they do not conflict with the cockpit. To each individual this pandemic is relative and emotional. Any preconceived or personal perception cannot be satisfied by one fits all protocols, so I believe individuals overly concerned should be required to get the vaccine. I will at the earliest opportunity get vaccinated for myself, family and coworkers.

## Synopsis

Air carrier Captain reported a Flight Attendant stated they would not enter the cockpit for pilot break unless pilots were wearing a face mask. Captain described some the communication issues related to wearing a face mask.

Narrative: 1

Arrival process and COVID screening under new ZZZZ guidelines contribute to extreme fatigue, physiological and psychological concerns. The entire process takes more than several hours. The arrival screeners are unprepared for each flight adding time to the process. The crew is sequestered within the airport during the process without access to toilet, food, or water. Cell phone contact with the company or union is prohibited during the testing phase. The threat of a possible positive test result and subsequent 14 day quarantine in an unknown government facility causes great psychological stress to the crew member.

## Synopsis

Air carrier Captain reported COVID-19 screening in foreign country contributes to fatigue, physiological, and psychological concerns.

## Narrative: 1

At the gate we had a passenger board without permission from gate agent, then we had a non-compliant passenger not wearing a mask. That was mitigated when gate agent came and explained to the elderly passenger that masks must be worn. On taxi out Captain and First Officer were discussing mitigation strategies if that event were to re-occurrence on taxi and failed to run pre-takeoff checklist. Cause - Distraction by pre-flight events with gate agent and non-compliance of the passenger. Remain focused on task at hand. Not replay scenarios until the debrief phase of flight.

## Synopsis

Air carrier Captain reported forgetting to do the pre-takeoff checklist due to being distracted by a passenger being boarded without permission and another passenger not complying with face mask policy.

## Narrative: 1

On climb out of ZZZ [airport] we received an ACARS message from Dispatch saying that the TRACON was closing and that we should ask ATC if we could do Tower enroute to get **into ZZZ1 [airport]. It also said if we couldn't return to ZZZ. We were still climbing on** the SID out of ZZZ and I was still running the after Takeoff checklist. I finished the checklist up and consulted the FO. We were both confused by this message. I went ahead and asked ZZZ Departure if they knew anything about it. They did not know anything then handed us off to ZZZ Center. I checked in with ZZZ [Center]. I responded to Dispatch asking which facility it was that was closing. They replied with ZZZ1 TRACON and that it was to be closed from XA: 30 to XB: 30z. After getting this response. I asked ZZZ Center if they had any information on it. They checked with their managers and didn't know anything about TRACON in ZZZ1 shutting down. I messaged Dispatch saying that we wanted to continue and see how things progress since ZZZ [Center] said they didn't know anything. The reply we received was a strong negative. Dispatch wanted us to turn back to ZZZ [airport] right away. At this point in the flight, we were half way to ZZZ1 [airport]. We were estimated to arrive in the ZZZ1 [airport] area around XB:00z and had enough fuel onboard the aircraft to hold for a while before having to go to an alternate that we would have added. ZZZ2 [airport] was close and had good weather. Dispatch didn't give us any time to explore other alternatives, so we complied with their demand to return to ZZZ [airport]. The entire time, my FO and I were trying to figure out why we were returning to the airport. The workload was high on the return. The risk for making mistakes was pretty high on both our parts. Thankfully, ZZZ [airport] wasn't busy and was able to cut down a lot of our workload by giving us a descent and direct a fix on the approach. Once on the ground I was able to call Dispatch and talk. They closed the TRACON for COVID cleaning and only gave about 20 minute notice. It sounded like the dispatcher knee jerk reacted to it and wanted us on the ground as soon as possible. That's why she didn't want us to continue. I complied because it was a safe course of action to return and because I couldn't get Dispatch to agree to continue. So this was the safest course of action that was mutually agreeable. Suggest going over delay options inflight with dispatch and to not make the decisions for the flight crew. Dispatch should seek the advice of other dispatchers and most importantly of the crew to come up with many options and narrow it down the best one in a non-time critical situation as this. Freaking out and demanding an air return is not a normal way to run an operation. Dispatch should be made aware that there are many options available to crews to stay in the air longer while saving fuel. We could have easily slowed down and held until TRACON opened again or we could have diverted to ZZZ2 [airport] and picked up some more fuel if we needed to. Both would have been faster options of keeping the operations going while being safe.

## Narrative: 2

After departing ZZZ we received an ACARS message from Dispatch informing us that ZZZ1 TRACON would be closed upon our arrival. Shortly after we received another message instructing us to return to ZZZ. We received an ACARS message from Dispatch. The flight return to ZZZ per Dispatch request due to ZZZ1 TRACON closed prior to us landing. We returned to ZZZ and the Captain contacted Dispatch after returning to the gate. Suggestion - If possible, comply with Dispatch instructions. Coordinate with Dispatch for clarification via ACARS or after returning to the gate.

## Synopsis

Air carrier flight crew reported receiving a message from Dispatch during climbout that destination TRACON was closing before arrival. Dispatch told crew to return to departure airport.

## Narrative: 1

A person came to work and his wife had COVID. He was among several of coworkers in a Kiosk. I went with co-worker Y to Manager's office and explained the situation because we were in the Kiosk with him. We asked if the Kiosk could be cleaned right away before anyone else entered. She said she sent the Supervisor to wipe things down and that the cleaning service would clean/spray it tonight. Co-worker Y said the Supervisor did not wipe it down. This is a potential risk of spreading COVID to many people at work and their families. I gave co-worker Y my own personal can of LYSOL spray to use in the KIOSK.

## Synopsis

Customer service representative reported that a kiosk was used by an employee whose wife had COVID. Reporter was advised the kiosk was cleaned, but another employee stated the kiosk was never cleaned.

## Narrative: 1

The problem arose when I went to log the flight and found out that I was not current. Contributing factors (beside my inattention) could be that with COVID, both in general and having had it, I have not flown the amount that I normally would. However, I should have been more alert to my "currency." I file IFR for every trip whether VMC or IFR and so I filed IFR, again without checking for currency. For corrective actions I have set dates in my calendar quarterly to make sure I am on track for currency. Concerning my medical currency, I have two years "under my belt" with Basic Med. I went in for my annual physical and gave the forms to my doctor. However, when it was discovered that I was not under Basic Med, I called the Doctor's office and his response was that he remembers the conversation but not filling out any forms. He had done my last Basic Med so I left it in his hands to complete. I understand that it was/is my responsibility to follow up on this, but I did not. Again, I have placed a reminder in my calendar both to renew my Basic Med in two years and then a week later to follow up with my doctor.

## Synopsis

GA pilot reported inadvertently flying without a current medical.

## Narrative: 1

A passenger wore a mask that looked like it had holes in it, he was irate when I told him it was not allowed onboard. He had a kid with him and to make things easier I grabbed him a mask from the galley. When I got to his seat he had another face covering but I still offered him the mask. He took it but and threw in the seat back pocket. He told his kid he didn't wanna make a fuss, it wasn't necessarily a non-compliance but it is definitely worth reporting my point of view.

## Synopsis

Flight Attendant reported a passenger boarded the aircraft with a mask that had holes.

## Narrative: 1

Tower was very busy with a single Controller working Ground and Tower. On initial climbout we wanted to confirm our initial altitude but had a difficult time getting in contact with ATC. While this was occurring, I missed PIC call for autothrottles, and he did not recognize that I had failed to engage them. We momentarily exceeded 250 knots below 1,000 feet, accelerating to ~290 knots. After clarifying with ATC we both noticed the speed; PIC noticed speed and made adjustments to pitch and power and then I engaged autotrottles. Flight continued normally. Recency of experience due to COVID-19, early morning fatigue may have played a role.

## Synopsis

Corporate Captain reported a speed deviation during climbout. Captain referenced distraction while trying to communicate with a busy ATC and lack of flying contributed to the event.

## Narrative: 1

Coming to ZZZ on the ILS [Runway] XXR, we were continually slowed by ATC for spacing of traffic ahead and behind. At about 1,200 MSL on glide path still IMC Tower told us to go-around. I was PF and hit GA button and advanced power levers. We went through missed approach procedure, but as flight guidance was attempting to be set the aircraft was also capturing the level off of 2,000 MSL so took a little longer to complete. Meanwhile we were a little late on turning to 195 heading. ATC queried us as we were in the turn. We had also climbed to 2,180 feet before stopping and returning back to 2,000 immediately. After we got settled ATC vectored us back to ILS with no further issues. ATC told us they had to send us around because aircraft on final for parallel Runway XXL behind us had gotten .99 miles from us. Spacing needed to stay a min of 1 mile. I should have paid more attention to altitude and started turn to 195 even if flight guidance wasn't quite set yet. Also pulled back power sooner or not add as much to avoid going through altitude.

## Narrative: 2

During our arrival into ZZZ, when told to run base (heading approximately toward ZZZZ [Intersection]), we were slowed to 170 KIAS. We were maintaining 4,000 feet throughout base turn and intercept turn onto final. Once established on final (approximately 20 NM from ZZZZ1 [Intersection]) we were slowed further to 160 KIAS, with traffic approximately 4 NM in front of us. Once we intercepted the glideslope, we maintained approximately 1,000 feet above the preceding traffic, but gained to within 3 NM distance. Meanwhile, ATC vectored a airline flight onto final for [Runway] XXL close behind us. I told the First Officer (PF) to potentially fly a half-dot high on the glide slope to avoid any potential wake from the preceding aircraft. Once we reached approximately 10 NM from ZZZZ1 [Intersection] we were slowed further to 150 KIAS. As we continued down the approach, the TCAS showed us to be approximately 2.5 NM from the preceding traffic, with the traffic behind us close in trail (unable to tell the specific distance). At approximately 600 AGL, ZZZ Tower issued a Go-Around, with nonstandard missed approach instructions (Right turn heading 195, climb and maintain 2,000). The First Officer initiated the Go-Around and the Captain (PM) proceeded to re-program the Flight

Guidance. Due to the light passenger load, the subsequent climb rate caused the Flight Guidance to immediately switch from a Climb indication to an Altitude Capturing indication, which caught the Captain off-guard, and he tried to re-configure the Flight Guidance back to a Climb indication. The Flight Guidance again sequenced to an Altitude Capture indication. At this point, the Captain (PM) noticed the aircraft was off course to the left approximately 35 degrees and was rapidly approaching 2,000 feet. The Captain brought this to the attention of the First Officer while also simultaneously acknowledging ATC stating "Turn right heading 195." The Captain also prompted the First Officer to reduce the power setting, as the airspeed was approaching maximum flap speeds. The missed approach up to leveling off at 2,000 feet was all hand-flown (i.e. not with the autopilot). Once the aircraft was established on the appropriate heading, altitude, and configuration, ZZZ Approach vectored the flight around for a second attempt at the ILS 16R, which occurred without further incident. In researching the First Officer's seniority, he has been here less than X years (Date). After debriefing the flight, he stated that that was his first Missed Approach / Go-Around in the actual aircraft EVER. Since we had been slowed down significantly early during the approach, we knew we could expect to be sandwiched in between other aircraft. However, we did not know that ATC needed only 1 mile separation between aircraft on parallel ILS approaches (told to us by ATC during our second attempt). There was no mention of spacing requirements on our first approach. Due to "COVID loads," the aircraft type climb rates are very good, requiring steeper than normal attitudes so as to not exceed flap speeds. This factor, combined with the First Officer's relative inexperience with missed approaches, caused a momentary loss of situational awareness by the First Officer. This required the CA to not only re-configure the flight guidance for a missed approach, but also ensure the First Officer did not over speed the flaps, communicate with ATC, and ensure the aircraft was following appropriate flight guidance (which was a non-standard missed approach). Also contributing to the loss in situational awareness was the altitude at which ATC issued the Go-Around: 600 AGL. This caused a significant startle factor in both the Captain and First Officer. Had ATC mentioned anything about a potential missed approach, we would have been much more prepared. Last-minute ATC-issued Go Around instructions (below 1,000 AFE), caused by inadequate spacing with simultaneous parallel approach aircraft. RECOMMENDATIONS: 1. ATC NEEDS to let crews know "be ready for a missed approach" if there is potential for a spacing issue. We were given our Go-Around instructions at 600 AGL. This is a very high-risk area to issue a Go-Around, when spacing throughout the entire approach was tight. Some sort of notification to us would have primed for a potential Missed Approach and therefore could have avoided any loss of situational awareness and subsequent heading / altitude deviation. 2. STOP ISSUING NON-STANDARD MISSED APPROACH INSTRUCTIONS. The ILS [Runway] XXR's Standard Missed Approach instructions are to fly runway heading to 900 feet, then climb on heading 195 to intercept the ZZZ 210 degree radial, maintain 2,000 feet. This is VERY similar to what we were assigned (heading 195, climb to 2,000 feet). However, when we're given nonstandard missed approach instructions, not only do we have to interpret what it is ATC actually told us, but also program that into the Flight Guidance. This programming is CONTRADICTORY to what our normal Flight Guidance programming procedures are. Had ATC simply said "fly the published missed approach," that could've aided in our appropriate handling of the aircraft. LESSONS LEARNED: Don't trust ZZZ ATC to not screw up. If spacing looks tight, brief a missed approach, even if it's done on the Final Approach Course. Also, do not trust your fellow crew member to fly a perfect Missed Approach. Watch them like a hawk for course, airspeed, and altitude management, and IMMEDIATELY speak up if there is even a minor deviation.

## Synopsis

Air carrier flight crew reported executing a go-around due to ATC spacing with another aircraft on final. The flight crew overshot their altitude during the go-around and cited the aircraft light weight as a contributing factor.

## Narrative: 1

Please reference ZZZ [airport], ZZZZZ 4 RNAV SID. We were assigned the ZZZZZ 4 RNAV SID and departed Runway XXR at ZZZ. After checking in with Departure Control the FO (pilot flying) called for the After TO Checklist. This is when several things happened at once. Before finishing the checklist the Departure Controller told us to climb to 10,000 feet and said we were clear ZZZZZ1 [Intersection] then ZZZZZ2 [Intersection]. At the same time we received an ECAM alert for a #1 Pressure Regulator Fault. By the time I set the altitude in the FCP, read back the clearance, re-visited and completed the after TO checklist and trying to diagnose what the ECAM was telling me we were over ZZZZZ1 [Intersection] and the aircraft was starting to turn to the next point on the SID which was ZZZZZ3 [Intersection]. The FO put turned the auto pilot on and placed the aircraft in heading mode and started a turn to ZZZZZ2 [Intersection]. We got the aircraft navigating to ZZZZZ2 [Intersection] but apparently it was not quick enough for the controller. He chimed in and gave us a heading for ZZZZZ2 [Intersection]. We told him we were in the turn and navigating to ZZZZZ2 [Intersection] at that time. Probably not a big deal. No conflict with other aircraft or terrain. No airspeed or altitude violations. Just a lot of things happening at once during a busy phase of flight. The result was we were a few seconds late to make our turn when our departure instructions were changed from what was given to us on the PDC. We complied with the ATC instructions as soon as we could. It was a busy phase of flight and we were task saturated at the time. Getting an ECAM message for a pressurization fault was an added distraction. I have been off work for almost a month due to COVID leave and this was my second trip since returning. I was a little slow to respond but I've been off work almost X weeks and I'm still shaking off the cobwebs. Not pointing fingers, but a change to our SID would have been nice to know BEFORE we took off so we could expect, brief, and build the change into the FMS. When taking off on [Runway] XXR via the ZZZZZ 4 RNAV SID you are over the first point, ZZZZZ1 [Intersection], seconds after TO. Having a change to the SID when approaching ZZZZZ1 [Intersection] only gave us a few seconds to react. Trying to read back and amend the departure clearance in the FMS, clean up the airplane, finish the after takeoff checklist, and diagnose an ECAM caution made for a lot of balls to juggle.

## Synopsis

Air carrier Captain reported a track heading deviation during departure. Captain cited distraction dealing with an ECAM alert and lack of flying contributed to the event.

## Narrative: 1

This flight started the night prior when my normal First Officer had flown someone a few days earlier who contracted COVID-19. That night, I was left trying to find a new First Officer for the next morning's flight at XA:00am. I found an FO who has not flown in a while. Our flight to ZZZ was uneventful. On climbout from ZZZ the Tower Controller had issued a speed of 230 kts and a climb to and maintain 10,000 feet. I asked the FO to run the climb checklist. While doing so, the Controller issued us instructions. My FO was caught off guard and looked at me as if to say, "I didn't hear that." I thought I heard and understood the instructions to be "**Normal speed and climb 12,000 feet**" and I read back "Normal speed, climb 12,000 Aircraft X". I then began to climb. This put me into conflict with Aircraft Y that was in the downwind for ZZZ, I never got a TCAS or TA/RA alert from my TCAS system. I know that after the instruction to proceed with normal speed, there was another instruction after that statement. I just cannot remember what it was. The crew change and heavy workload contributed to the misunderstanding. I do not know what could have been done differently to avoid this in the future. I do wonder why ATC would have pilots turn left towards another aircraft even if they were planning to keep the aircraft separated by 2,000 feet. I have flown this departure from ZZZ many times in the past and the point where we were issued normal speed was completely normal from past experience. I really wish that ATC would issue a climb straight ahead until the departing aircraft is no longer in a position to potentially interfere with other aircraft.

## Synopsis

Corporate Captain reported an incorrect read back for altitude which caused their aircraft to climb an additional 2,000 feet resulting in an airborne conflict with another aircraft.

## Narrative: 1

I had the idea in my head from somewhere in my training about what medicals were due for what type of operation. And if you are not confronted with it you don't really look into it. You feel you know the answer. In the course of running my business I got a database to track currencies, compliance, inspections and flight and engine times. While I was loading the database and setting up alerts and warnings I noticed that I may have, in the past, been flying commercially on a third class for a couple of short periods. I am not sure since I do not have all my old medicals to check. And by the past I am talking about 4 to 5 years ago. Remembering exactly what happened is difficult. Because of this incident I am super vigilant now about medicals, although because of COVID, I had to use an extension on my last medical. My database now warns me when I am getting close to my medical due date. I have gotten the idea out of my head that I can let a second class turn into a third class.

## Synopsis

Reporter reported possibly flying commercially with a third class physical several years ago.

## Narrative: 1

On flight XX, ZZZ to ZZZZ FO pre- loaded FMC with arrival ZZZZZ XA with Runway XXR. Before descent checklist (6 hours) later briefed STAR and arrival into ZZZZ for both XXL and XXR. ZZZZ ATIS stated both XXL and XXR were in use. Obtained landing data for both runways. Approaching ZZZZZ we got vectors to ZZZZZ1 with expect XXL. On descent ATIS was calling for gusty winds on final from moderate to severe broken clouds at 2,500 feet. We talked about the winds and before we got to ZZZZ1 we got vectors and a decent to XXL we talked about the winds and forgot to change the FMC to XXL. On vectors to XXL with the approach mode armed we intercepted the LOC to XXR. We still were not aware of the error until the controller told us we were lined up for XXR and wanted to give us a heading of 160. We knew traffic was very light so asked if we could continue to XXR and was cleared to continue and land XXR. Landed without incident.

## Narrative: 2

Upon returning to the flight deck from break, I was briefed on the ZZZZZ XA arrival and ILS XXL approach. ZZZZ ATIS broadcast that both XXL and XXR were in use. Runway data for both XXL and XXR were had been obtained earlier. Prior to descent we completed the descent checklist. At the FMC's, radios; item on the descent checklist, I intended to check the FMC to verify the approach and checked the item complete, but was interrupted by a radio call and never completed it. I did not catch the error that the FMC had ILS XXR

programmed instead of ILS XXL, which had been briefed and anticipated. On the descent we were cleared the ZZZZZ XA Arrival to ILS XXL. Having briefed the ILS XXL, and believing we had ILS XXL programmed, no changes were made to the FMC. We did not catch the error until receiving radar vectors to the final approach. We were given a base leg and shortly after a vector to intercept. The turn to final seemed late and the aircraft but captured and lined up on the centerline. At that point, ATC gave us a "right turn to 160" and then stated we were lined up for XXR and that we had been cleared for ILS XXL. He said there was no traffic for XXR and asked if we wanted to continue. We were at least 4 miles from the FAF so we accepted the approach clearance. We were able to review the approach noting the LOC identifier, changing the minimums and reviewed the Missed Approach procedure prior to descent on the GS. A stable approach was flown from the FAF to the runway for landing and was uneventful, as was the rollout and taxi-in. On the ATIS, gusty winds were noted and moderate, possibly greater, turbulence mentioned. This was a topic of discussion during the briefing and after. We briefed the cabin crew to have the cabin secured early and to take their seats as soon as possible after the chimes for the sterile cockpit notification. The aircraft was slowed early and we had begun configuring early as well so as to be stable early. The discussion was possibly an additional distraction during the briefing and Descent checklist. While we were able to comfortably get set up for the approach that was incorrectly loaded in and able to fly a stable approach, we should have asked for vectors to a new approach in order to properly brief prior to the initiation of the approach phase. We were lucky there was no traffic conflicts as there was little if any traffic due to time of day and the current state of airline traffic due to COVID.

## Synopsis

Air carrier flight crew reported loading the wrong approach in the FMC and received clearance to land on the selected runway because of light traffic due to COVID.

## Narrative: 1

I was the least involved crew member. Passenger X was assigned to seat XX2 but upgraded herself to YY6, an exit row seat next to her friend. The A [FA] gave her a mask when she boarded because she only had a scarf. Passenger X had food in front of her for much of the flight so that she wouldn't have to wear a mask. I picked up her food trash about 1 1/2 hours into flight and advised Passenger X that she needed to wear a mask. Fellow FAs had told her that she needed to wear a mask previously while not eating. She stated, "I won't" very clearly. Suggestion - Have a National Policy on mask wearing and ban passengers that fail to comply. This passenger told my coworkers that she didn't intend to fly our airline again. A coordinated policy might have more teeth, and since these passengers are failing to comply with crew member instructions, consider a permanent ban.

## Synopsis

Flight Attendant reported a passenger was not compliant with face mask policy.

Narrative: 1

At the start of our flight there were thru passengers, one of which was a family of 4. Their small child was not wearing her mask correctly, so I ask that they use the child mask that the previous crew left for them. They were compliant and not a problem. During boarding, another family of 4 boarded with a child that had his own seat and was clearly not under 2. He had no mask at all, I told the Mom that he needed to have a mask on before boarding the plane. She said she told the Gate Agent that he was under 2. I let her board and called down the agent who said that even though he had a purchased seat there was no way other than to take her word for it. During the flight his sister came up and spoke to us about her vacation and told us that she had a baby brother who is 3. This being the same kid that was questioned. My problem with us not having a policy to check for birth dates is that it essentially creates a problem with compliance. How can I be expected to enforce the mask policy to the family that was honest about their child's age while the family that lies does not have to comply. If this was done when the ticket was purchased, then it makes it fair for everyone.

## Synopsis

Flight Attendant reported a child was not wearing a face mask on the flight and questioned how flight attendants could enforce a child to wear a mask.

## Narrative: 1

Aircraft X, ZZZ1-ZZZ did a block-turn-back for maintenance and transload. Due to delay, flight ended up arriving in ZZZ when Tower was closed. I knew ZZZ Tower was closing due to staffing/COVID cleaning and because of the block-turn-back, I simply forgot to add Non-Tower Ops worksheet. Airport towers are constantly closing early due to COVID cleaning or staffing and just need to pay attention to them. Suggest going ahead and sending crew via email Non-Tower Ops Worksheet just in case of delay.

## Synopsis

Dispatcher forgot to include Non-Tower Operations worksheet with the aircraft paperwork.

## Narrative: 1

Landing [Runway] XXL on final, aircraft in front of us reported a 10 knot loss. The FO was pilot flying at the time and over corrected for the wind, causing us to descend below glideslope very quickly on short final. As soon as I was calling go-around the GS aural warning came on. The FO executed a go-around. Because of the difficult wind conditions and seeing we were already at 2,100-2,200 LBS, I decided that I would land the second attempt as I did not want to get into a fuel situation. We were in agreement with this. On short final for the second attempt, with me as pilot flying, at about 150 feet, we had the wind-shear caution alert and proceeded to execute our second go-around. ATC gave us instructions to set up for [Runway] XXR but due to fuel concerns I said "Unable" and declared min fuel. Also, I added that if we did have to take any delays we would be declaring emergency fuel. ATC set us up immediately for a close pattern for [Runway] XXL. On this attempt, I stayed slightly high as the wind shear seem to be the worse right at the tree line at about 150 feet. On this third attempt, we landed successfully and taxied back to the gate. Unstable approach recognized by me and a wind shear caution message for the second attempt. Inexperienced FO who had only flown once since May 2020 and challenging weather conditions with wind shear. Two go-arounds and declared min-fuel. Have pilots who have been out a while receive more recurrent training. It was evident due to lack of recency the FO was struggling with the conditions that day. Also, be vigilant on [Runway] XXL as I have had issues on windy days before where the tree line ends and the field begins. With the second attempt we had a 15 knot increase with the wind shear caution message.

## Narrative: 2

I was the Pilot Flying. The Wind shear changes in combination with the amount of time since I've been flying in the airplane were contributing factors. There were changes of +/- 15kts and on short approach I went slightly below glide slope and then the Wind shear happened which caused the Glideslope aural warning to sound. The Captain called for a Go-Around which we executed. Once we were at a safe altitude and being vectored back for another approach the we exchanged controls and the Captain became the Pilot Flying. As we were coming in on short approach the Wind shear Aural Caution message sounded so we executed a second go-around. ATC told us that they were going to vector us around

for Runway XXR, but were now low on fuel and declared min fuel. They instead kept us close pattern for Runway XXL and we landed safely. Upon landing we had 1,450 LBS of fuel. We taxied to the gate with no issues. Glideslope Aural Warning System on first attempt and Wind shear warning system on second attempt. Wind shear affecting experience level. Go-Around executed twice. Keep crews more recent on flying or more time in simulator if it's been a while.

## Synopsis

Air carrier Captain reported experiencing wind shear on final resulting in a go-around. Captain made reference to the First Officer's lack of flying as a contributing factor.

## Narrative: 1

As we turned on to the lead in line at gate X, we noticed self-park guidance indicated STOP in red letters. We stopped. We noticed two ramp service agents on both wing tips and a marshaller under the unit. We decided that we were expected to taxi down the lead in line with marshaller hand signal guidance and ignore the self-park guidance STOP signal. We parked without incident. On debriefing we (me and the FO) both agreed that taxiing down the lead in line with a marshaller issuing hand signals in the face of a self-park guidance STOP indication is a normalization of deviance that has crept into the culture at ZZZ and should not be accepted at company. During the debriefing the FO encouraged me to consider setting the parking brake, shutting down the engines and politely and professionally request a tow in. It should not come to that. It is lazy and sloppy. It is, of or pertaining to, an organization that because of COVID, layoffs, displacements, cash burn, disappointments, you name it, has taken their eye off the ball. It goes against the pilot culture of never accepting RED. e.g. flight deck indications, Runway Status lights, VASI/PAPI, Runway Stop Bars, REIL, PWS, yet on this occasion, I'm just expected, in the course of normal operations, to taxi to [gate] X at ZZZ with a self-park guidance red STOP indication. This is the second report on such an occurrence at ZZZ.

## Synopsis

Air carrier Captain reported taxiing into a gate with the use of a Marshall, while the self-parking guidance system was indicating STOP.

## Narrative: 1

I was the Captain on Aircraft X (ZZZ-ZZZZ) on date. I just wanted to give some details regarding ZZZZ's refusal to allow us to enter the country without a negative COVID test, and to give a well-deserved kudos to those who helped us. Upon arrival in ZZZZ, we were walking towards the customs area when we were approached by a man from the "health department." He asked us for our COVID-19 test results, which (according to our information) were not required for crews in ZZZZ. When we told him that we didn't have a test result, he said we could not proceed further, as a negative COVID test was a requirement for entry into Country. Two airline employees arrived to assist us - the Station Manager X and another employee Person Y. Both were outstanding and went above and beyond to try to help us. They spent considerable time attempting to explain to the health department official that crews were exempt from the COVID requirement. This did not matter to the official, who insisted that "All passengers must have a negative COVID test prior to entry." Manager X explained that we were crew, not passengers, and therefore were subject to the crew exemption. He stated that he understood that there was an exemption, but he refused to change his position and stated that we couldn't proceed. Several calls were made by Manager X, attempting to get someone to explain to the health department official that we were exempt. Someone then called the official on his cell phone, resulting in a somewhat spirited conversation. After the call, the official decided that if we'd had a COVID test in the last 14 days we would be allowed to enter. When we said we hadn't, he said if we'd had the vaccine, he would let us in, but of course we hadn't had that either. Manager X pulled us aside and said that this official was simply trying to make a name for himself, and she again apologized, even though it was clearly not her fault. It occurred to us later that perhaps he was fishing for a bribe, but while that's very common in small GA airplanes, I've never had that happen as part of an airline crew. Unfortunately, I was not able to get the name of the health official. By this point, we had the Flight Operations Manager involved, and he was working on getting us seats on the plane back to ZZZ as it was clear we weren't going to be allowed into ZZZZ. Manager X and Person Y were both doing an outstanding job of keeping us informed since neither the F/O nor I spoke [the foreign language]. We proceeded back to the gate while Flight Operations Manager got our seats worked out and worked with dispatch to make sure the outbound crew didn't leave without us. As we were leaving, the health department official made one last offer - we could proceed, but he would "Send a doctor to your hotel room to give you a COVID 19 quick test." A quick discussion with my FO, confirmed my thoughts that this was a bad idea. Needless to say, we declined his offer. When we arrived at the airplane, FO was physically standing at the bottom of the stairs to make sure that they wouldn't close the door before we arrived. While it was a frustrating endeavor, we couldn't have navigated this successfully without Flight Operations Manager, Station Manager X, Person Y, Dispatch and the outbound crew of Aircraft Y. The crew desk was on the ball as well as I received a couple of pairing change alerts as we walked to the gate. My FO, did an outstanding job, especially considering it was his first trip after OE.

## Synopsis

Air carrier Captain reported they were not allowed into a foreign country due to not having proof of negative COVID-19 test results, nor proof of having been vaccinated.

## Narrative: 1

Aircraft X had to return to ZZZ for an electrical problem. On the ground after landing, I learned from the flight attendants that there had been a problem with a passenger. They

initially described it as a medical issue, saying prior to departure the CSR had struggled to evaluate if he was fit to fly and eventually decided he was. I was told he was the last passenger to board. There were issues with him not wearing his mask properly and several crew members had asked him to cover his nose. He was seated in the wrong seat prior to departure. At one point he was coughing/hacking severely to the point where other passengers began to react with concern. On the return back to ZZZ, two flight attendants said he was unresponsive when they asked him to put his seat and tray table upright. They said they had to resort to physically shaking him before he responded, They asked him if he knew his name and where he was going and he either would not or could not provide this information, but eventually just said he was "going home." When he was pointed out to me in the terminal prior to the "second" flight, on a new aircraft, and his mask was down below his nose. The flight attendants were very concerned and did not want him on our flight because he would not obey crew member instructions. I agreed the situation would likely not improve once airborne and did not want to risk yet another diversion if that it indeed turned out to be the case and therefore told Customer Service not to board the passenger. I told one CSR he would not be allowed on the flight. As we prepared the new aircraft for departure I was confronted by yet another CSR Supervisor who again tried to talk me into taking him. "We're out of options. There are no more flights out. He's crying. He's very nice. He just wants to go home." I was moved, but the unruly passengers are always nice to the agents when they're on the ground trying to make up for bad behavior and I had to remember that every Flight Attendant in the back, to a person, had an issue with this passenger and did not feel comfortable taking him. I stood my ground. The FAA adopted a Zero Tolerance policy earlier this month. I am disappointed in our lack of training and or communication of FAA regulations to pertinent front-line employees.

## Synopsis

Air carrier Captain reported a passenger was not compliant with face mask policy.

## Narrative: 1

It has been hard to fly during the pandemic, and the aircraft had been in for annual inspection, so I had not flown for two months. I went out for practice. I chose the back-course approach at ZZZ, as it can be challenging. Also, during recurrent training in Month, we had noticed some odd autopilot behavior when flying this approach. My aircraft has Garmin avionics but these are mated to an older analogue autopilot. By the time I was told to switch to ZZZ1 Approach, I was still at 12,000 feet and quite close to ZZZZZ intersection on the approach. When I gave my request for the approach, the controller gave me vectors to circle back to rejoin the course while descending to 4000 feet. She then cleared me for the approach. I believed she said "Maintain 4000 until established...", but in our later discussion she said her instruction was "Maintain 4000 to ZZZZZ." I believe I read back the former. In any case, when back on extended approach course, but a short distance before ZZZZZ, I began to descend further. The chart showed 3000 feet for the segment between ZZZZZ and ZZZZZ1, which is the FAF and 5.8NM from ZZZZZ. My GPS displayed an altitude of 3100 at ZZZZZ, which I believe is its indication of a safe altitude. So, I had set altitude capture for 3100 feet and was descending. The controller alerted me that she had expected 4000 feet to ZZZZZ. While we were discussing this, the autopilot failed to capture and the descent continued to 2900 feet. The controller told me to switch to tower. On my first attempt to call tower at ZZZ, I had not hit the switch correctly and was still with ZZZ1 approach. At the same time, I noticed the autopilot taking me off course for the approach and interrupted it while calling the tower. We were in the descent within the FAF by this time. The tower controller told me I was low for the course and left of course, and he asked if I was flying the approach visually instead of using the Back Course. Due to the autopilot issue, I was by that time flying visually. It was a clear VFR day, and at no time was I in close proximity to terrain or other aircraft. The problem arose for several reasons. The pilot (me) was rusty and needed practice. It was a mistake to do the more challenging BC approach as the first one. (After this event, I did the missed approach as planned at ZZZ and did two fine approaches at ZZZ1 and ZZZ2.) Also, I believe there anomalies with my avionics set-up and back-course approaches, and I should not have been trying to troubleshoot that as a single pilot, especially being a bit out

of practice. Another contributor was my misunderstanding of the controller's instruction, along with using the 3000 foot altitude indicated on the chart for that segment ZZZZZ to ZZZZZ1) and the 3100 foot altitude indicated as the target for ZZZZZ on my GPS for the altitude I was trying to attain. All of these issues increased workload, which is better handled by an in-practice pilot (which is why I had gone out to practice). A final recommendation from this experience is that I will avoid flying BC approaches with my autopilot until I can do a flight with a competent pilot and avionics technician aboard. The BC approaches are quite rare, and almost all have GPS overlays nowadays. So, they are not really a high priority; I actually chosen this one to be challenging and give me practice monitoring the autopilot and taking over if it acted strangely. But given the altitude misunderstanding, resulting discussion, and then the strange autopilot behavior, it was a bit choppy. I flew the airplane in a safe manner throughout (there was no terrain issue along my path), but my adherence to published instructed and published altitudes on the approach was poor.

## Synopsis

Private Pilot reported the cause of the deviation was not flying for 2 months during the pandemic and was rusty and needed practice.

## Narrative: 1

Flying IFR at 2,000 feet I incorrectly entered the approach information for the RNAV GPS Runway X approach to ZZZ and consequently the aircraft deviated from that depicted on the approach plate for the GPS approach. My flying time has been greatly reduced since the COVID-19 pandemic and I entered incorrect information in the GPS by mistake. I have since taken a course for "Rusty Pilots" on the internet in an attempt to stay adequate and I have also scheduled my "Flight Review" with an instructor. I think the reason for the mistake in entering the GPS information was due to greatly reduced flying time experience since COVID-19.

## Synopsis

GA pilot reported a track heading deviation after entering incorrect information in the GPS and cited lack of flying as a contributing factor.

## Narrative: 1

Passenger interfered and disrupted Flight Attendant crew duties. The passenger was noncompliance with policy and procedures put in place by the company, CDC , FAA governing face coverings for flying. The passengers lack of compliance placed crew and fellow passengers at risk of contracting the COVID virus. This is a policy and safety issue that needs to be enforced from the top down.

## Synopsis

Flight Attendant reported a passenger was non-compliant with face mask policy and interfered with FA crew duties.

## Narrative: 1

This report is due to the COVID-19. I'm an X Flight Attendant. My jumpseat now is X4 due to the COVID-19. These are more than XX empty seats from the main cabin but our system allows customer upgrade themselves to X6, which is next to me without 6 feet between us. On the current flight, with turbulence, I have been seating next to a customer

for more than 1 hour and 45 minutes. I think this unsafe for me to be there. I can feel the breathing from the customer as he is right next to me. Please fix the system until we all have vaccine.

## Synopsis

Flight Attendant reported concerns regarding the assigned jump-seat and its location near passenger seats.

Narrative: 1

Passenger was sold last seat in first class cabin at X6 this morning. He had a large service animal. X4 is still reserved for the X Flight Attendant (FA). While I was in the back doing service the gentleman in X6 put his items all over my seat and was asleep when I returned. During the flight we had continuous moderate turbulence for the last two and a half hours. I ended up sitting in the forward jump seat. The few minutes that we were able to get up to prepare the cabin for arrival, the cabin quickly became moderately turbulent again and I returned to take my seat, only to find that he had placed his backpack on X4, my seat. I again had to take the jump seat. When the passenger was finally able to stow his luggage, I took the seat at X4 for landing and the passenger started talking my ear off. I tried to quietly tell him I had to concentrate but to no avail. Could you please tell me why I had a passenger with a large emotional service animal next to what had been assigned to me as my seat, in the X position, when there were only XX passengers in the back? Is this considered to be a "social distance" block? 1. Current assigned seat for the X Flight Attendant does not allow for safe distancing between passenger and Flight Attendant. 2. Current assigned seat for the Flight Attendant was not available during the flight when moderate/severe turbulence hit. Took seat next to Y Flight Attendant - this did not allow for safe distance between both the Y and X flight attendants. 3. Having passenger in X6 is distracting when trying to silently review safely evacuating the plane. I learned that I cannot safely socially distance when someone is sitting next to me. I also do not have an assigned seat when turbulence hits unexpectedly, unless I quickly push all of the **passenger's belongings to the floor. It has also put me in an awkward position upon landing when I am supposed to be concentrating on my drills and safely evacuating the cabin when I have the distraction of a talkative passenger.**

## Synopsis

Flight Attendant reported a passenger was seated in the company social distancing blocked seat.

## Narrative: 1

Passenger X came to the back gallery requesting water. Mentioning that he gets a little tickle in his throat here and there. He mentioned that him and his wife both had COVID in 2020. His wife had it first. I believe he said he had tested positive that month and then tested negative the next month. His wife was sitting in seat XX3. And he went to sit up in Seat YY3. They were a party of X. He talked to the guest in YY4 for quite a bit during the flight. I just wanted to document this because all the flight attendants had contact with their party of X. And the rest of the party could be carrying and asymptomatic. And what if

his negative COVID test was a false negative? I believe they were headed to a resort. I did my demo right next to them. It's a safety issue if this guest and/or his party of X happened to be contagious with COVID. Maybe asked him if he was traveling with others and if they all had tested negative?

## Synopsis

Flight Attendant reported concern after a passenger stated he and his wife had recently recovered from COVID-19.

## Narrative: 1

On our flight from ZZZ to ZZZ1 this morning .... seats X3 and Y4 were open, yet the Gate Agent booked a passenger in X6 right next to me. A large man. It was my understanding that X6 was a LAST resort! With COVID cases escalated, as well as full flights...exactly how is this protecting our health? This is not right. The passenger was in X3 and at the last minute got changed to X6! He was last passenger on the plane. Stop seating X6!

## Narrative: 2

Everything was good to go on my flight out to ZZZ this am. Until the last passenger boarded and demanded I move to clear the way to his seat in X6. As I was the A (FA), I knew that he was blocked in at X3 and showed him his seat. He told me that he didn't want that seat, he wanted what was changed for him at the gate. The Gate Agent was at the boarding door within moments and I asked her why he was moved into a social distance block seat. She told me that he wanted the seat. That isn't enough of an argument for me. The X FA, upset and arguably so came up and asked why this passenger wasn't in his previously assigned seat and the agent got very cold and told us he is technically allowed and wanted this seat, so rather than argue she gave it to him. (He's a premium passenger, go figure.) We pushed back as crew and told her that that isn't protecting the crew and that we still have over 10 minutes to have his seat changed, but I was met with a cold agent who refused to back down and shrugged off our frustrations and concerns with a nonchalant, "It was a problem yesterday too but it's a short flight." I was asked if we could close and that was that. About half way through the flight, I was cornered in my galley by the passenger in X6 and asked why the X FA was so unfriendly. In an attempt to cover for the Company I engaged in damage control apologizing for any discomfort and explained that the reason he was originally in X3 was due to a social distance block on his seat due to the health and safety of our flight attendants. I explained that if any crew member made him feel anything less than welcome, we did not intend to and that it was operational confusion between the agents and the crew. He told me then again that that was the seat he wanted and attempted to tell me that he understood where we were coming from but he just preferred that seat which is why he didn't want to move to any of the open seats on the flight that weren't right next to the flight attendant's jumpseats. He told me he knows a lot of people that fly for our Company and that he was thrown off that the X FA wouldn't engage in conversation during taxi and takeoff. I told him at this point that we are here for safety first and comfort second and that as flight attendants, we are observe a sterile galley allowing minimal distractions as we silently review safety procedures in the unlikely event of an emergency. He seemed pacified enough and moved to a point I could get around him and recirculate myself back to the

isle. I am appalled by this incident on so many levels: 1. Blatant disregard for FA health and safety from an agent that didn't follow protocol around the social distance block. 2. FA should not be expected to sit next to a passenger who may or may not follow mandated COVID protocols. 3. The market we were flying into requires an online form filled out acknowledging the high COVID rates and need to quarantine due to ICU capacities and here you have the FAs sitting among the noise?! Nah. 4. It put both the X FA and the A FA in a compromising spot with the passenger and their perception of our service and this made us both highly uncomfortable when it wasn't at all called for or necessary to do so. 5. Having passengers trying to talk our ears off and be chatty is not only UNSAFE because it is encouraging the virus to spread, 6. It's also unsafe because it is causing distractions during the times we as FAs need to be focused the most. 7. For the Gate Agent to tell me that this was a problem yesterday too, it means that they have no clear understanding of the social distance block and no regard for their team mates who have to endure the flight with a sniffing, sneezing passenger for 2+ hours. 8. A passenger preference for a window is not reason enough to forgo social distance block procedure. This put me in a compromising situation with a dissatisfied passenger. I was cornered in my galley without warning and it startled me. Also, to have to back pedal over a topic that I felt the X FA was in the right and had every reason to be upset about was unnecessary and upsetting BETTER CRM. More education around social distance block for agents who don't know what it's like to be on the front lines and trapped with a plane full of passengers and no place to go without being bombarded with passenger questions as we fight for space over an arm rest.

## Synopsis

Flight Attendants reported a passenger was moved to a seat, against company policy, near their jump seat by the Gate Agent.

## Narrative: 1

As the X Flight Attendant I felt very uncomfortable sitting next to a passenger that during the times I was next to him, he constantly removed his mask to either eat or drink. And I

mean during taxi, takeoff and landing. I stayed away for as long as I could. I only sat down when it was required of me. Not once during cruising altitude did I sit next to him. At some point during flight he was sitting in my assigned seat and fell asleep in it. The A FA asked him to move back to his seat. I hope we can either make sure the X FA on this aircraft sit alone or next to another FA. At least a FA would respect the fact that she/he should not remove his/her mask next to me in such close proximity.

## Synopsis

Flight Attendant reported being assigned to a passenger seat next to a customer that continually removed their face mask.

Narrative: 1

Saw Passenger X sitting in the gate house wearing a mesh mask. I pointed it out to the gate agent and he stated it's approved, because it covers her nose and mouth. But I stated, no, because it's see through and mesh. Masks have to be made of solid material. So thinking the gate agent would say something to her about the mask Passenger X boards the plane and takes her seat wearing her mesh mask. FWD Flight Attendant (FA) sees this and questions it and then calls me for a reference. I stated to her, I don't think it's an approved mask for flying, let me find it in the manual before going to Passenger X. While I'm trying to find it, FWD FA sends a message to the gate agent about Passenger X wearing this mesh mask. FWD FA also informs the Captain as well. After searching under COVID section, I find it and inform FWD FA and the Captain that it's not approved and that I'll inform her that her mask is not compliant. I approach Passenger X about her mesh mask and also show her in manual that it's not compliant. Passenger X makes a statement that she's been allowed to wear it on her flights. I then read the mask compliance portion in the manual verbatim. She makes a little fuss about it and then states "Fine, hand me a mask." I tell her "Thank you." I head back up to the FWD part of the cabin, galley area to inform FWD FA and Captain we're good. Passenger X switched out her mask for one of our mask. Also show them both in the manual where it's located if there's ever any other issues that arise in the future. They can both reference. Also state to the gate agent that Passenger X mask is not approved.

## Synopsis

Flight Attendant reported a passenger was required to remove a mesh face mask, while the Gate Agent did not agree, and use a company supplied mask before departure.

## Narrative: 1

During the initial descent to land, I was eating my crew meal in the galley. The seatbelt sign came on. I automatically went to check seatbelts and collect trash. I did not intentionally disregard the company's face mask policy, but I walked out from the galley and into the aisle and went 3 rows before I realized that I did not have my face mask on. I

had it clipped on to my wings, I immediately place it on my nose and mouth and continued in the aisle checking seatbelts and collecting trash.

## Narrative: 1

I do not feel safe flying in an environment with passengers who do not wear their masks over their noses and mouths. The Company's policy is not effective. People should not be allowed to wear gaiters and bandannas. Flights should not be booked full. Flight attendants are not protected. Look at the numbers of infected flight attendants since the loads have gone up. Our Company is not notifying flight attendants in a timely manner

when exposed. This is outrageous. I am absolutely 100% disappointed with the Company's lack of care for their frontline workers.

## Narrative: 1

During the late afternoon departure bank at ZZZ I noticed several passengers in the X and Y concourse and gate areas who were not actively eating/drinking and were non-compliant with the State X, Worker Union, and Company Face Covering Policy. I did not hear any announcements in the gate areas nor did I witness any of the companies Ground Personnel (Customer Service) reminding the passengers to comply with the policy. I had discussions with airport police, Homeland Security, and CBP [Customs and Border Protection] who all stated they do not enforce the state face covering policy. I spoke with ZZZ inflight senior base manager about the non-compliance issue and she stated that the concourse is not owned by the company and therefore cannot enforce the policy in the terminal. I am advocating for Flight Attendants who are evidently the only ones required

to remind passenger's to comply with the face mask policy which sets us up for failure and contributes to the hundreds of reports of passengers non-compliance.

## Synopsis

Flight Attendant reported concerns with many passengers not wearing face masks in the gate area at airport.

## Narrative: 1

Due to numerous changes with airspace closures/restrictions due COVID cleaning at ARTCC's, I was so concerned with keeping this flight out of ETOPs areas while still avoiding airspace closures, that I totally missed the requirement for HF communication when the flight dipped into ZZZ (oceanic) airspace. May be [good to] have an alert reminding us to check for HF requirement when routing thru specific FIRs.

## Synopsis

Dispatcher reported being distracted by ATC Zero events, airspace closures due to COVID and forgetting to inform a flight crew that HF radio communication would be necessary.

## Narrative: 1

While operating our flight from ZZZ to ZZZ1 I was the Pilot Monitoring. At the time of the event, I was eating my catering and the Pilot Flying and I both found it easier for the PF to respond to ATC and manipulate the FMS. At some point at cruise altitude, ATC cleared us to fly direct from present position to "ZZZZZ." The PF responded to ATC and erroneously typed "ZZZZZ1" into the FMS scratchpad and entered the waypoint as the direct-to navigation fix after both pilots checked the resulting dashed "proposed course line" on the PF's ND screen. After several minutes, ATC inquired if we were proceeding direct to "ZZZZZ" as he showed us drifting right of the intended course. This alerted us to double-check our navigation and to discover that we were navigating to the wrong fix, the misspelled "ZZZZZ1." The PF corrected the spelling of the assigned waypoint in the FMS, proceeded direct to "ZZZZZ" and explained our error to ATC. I can identify three things that might have prevented this event: 1) The normal procedure and best course of action would have been for the Pilot Monitoring to stop eating, respond to ATC and manipulate the FMS. I do not, however, think this was much of a contributing factor. The PF is a "strong" and extremely competent pilot highly experienced on the aircraft. I don't think the PF's assumption of those duties was particularly taxing/burdensome to the PF as we were in cruise at a very quiet and low-threat portion of the flight. It is not unusual for a PF to respond to ATC and manipulate the radios and FMS while a PM is eating. I have always personally tried to not touch anything other than my food while eating in the aircraft and think this is an especially important practice during the current health pandemic. While I could have sanitized my hands once I completed the radio calls and navigation tasks, it

was more convenient to allow the PF to perform those duties for me. 2) The best course of action would have been for the PF to scroll the flight plan and chosen the assigned Direct-To waypoint "ZZZZZ" from the flight plan. However, the aircraft's FMS is slow to respond, making scrolling through a long flight plan somewhat laborious, tempting one to effect the change via the scratch pad method. The PF alternatively could have checked the paper copy of the flight plan for the correct spelling of the waypoint before typing it into the scratch pad. 3) I had the "PROG" page selected on my FMC and did notice that the course to the incorrect "ZZZZZ" was almost 25 degrees to the right of the bearing of ZZZ1 and thought it odd to be navigating that far off the bearing to destination. This matched my curiosity about the dashed "proposed course line" displayed on the PF's ND when the erroneous fix was entered into the scratch pad. However, knowing that the destination was more than 1200 miles away at the time, I assumed there was a significant "bend" in the original flight plan. Had I mentioned my observation to the PF, it might have cued the PF to check the spelling of the waypoint as the PF made the entry from an assumed spelling. When checking off frequency with the controller who made the direct-to assignment, the PF apologized for the error and asked if we should contact anyone for further discussion/explanation. The Controller indicated that he did not believe that would be necessary. My time-in-type, time-in-position and total-time are not readily available and I don't want to delay submission of this report in order to track down those numbers. I therefore entered a generic "1" in each of those blocks in the report. Each of the numbers actually totals in the thousands. Fatigue was somewhat of a factor in the event. It was the last duty day of a pairing that had us flying a mix of long and short legs, including international legs to and from an international country, and crossing the country and multiple time zones. We shifted between flying and non-flying duty periods several times and scheduled rest varied from long to short periods. Obtaining "quality" rest was a challenge and I most definitely accumulated a sleep deficit by the day/time of the event. I estimate that I slept a total of 5.5 hours during the rest period prior to the duty period of the event, one sleep period of 4 hours and another nap of 1.5 hours, waking approximately 3 hours prior to reporting for the event duty period.

## Narrative: 2

First, I can't confirm all the information requested above. I don't remember exactly which Center we were talking to or pinpoint where we were relative to a fix. I think we were with ZZZ but it might have been ZZZ1, and we were south of ZZZ1 and west of ZZZ2 at the time, going direct to ZZZZ. I was the FO and the Pilot Flying. We were cleared direct to ZZZZZ. The Captain/PM was eating his catering so I was also answering the radio. When we received the clearance to ZZZZZ it was easier for me to enter the fix in the FMC than it would have been for him, so I typed that in. About 10-15 minutes later the Controller said that he showed us about 45 degrees off course and asked whether we were going direct to ZZZZZ as cleared. We double-checked for NAV selected to the fix, looked at the course deviation, and checked the FMC, and they all confirmed direct ZZZZZ. On closer examination, though, we realized that we were actually going to a fix called ZZZZZ1, and that I had misspelled the correct fix when I typed it in. I didn't select it from the fixes listed on the flight plan, and should have done that instead of typing it in. That would have obviated the error. The aircraft made a fairly significant turn to the right when I executed the direct-to command and I thought at the time that if I'd known it was such a big difference in the track I'd have requested direct sooner. The Captain later said that he'd thought it was strange that the bearing/distance on the FMC didn't match what the airplane had turned to when we made the turn, and wished that he had said something at the time so that we could resolve the discrepancy. I should have caught the misspelling at the time, but I also should have selected the fix from the list instead of typing it in. I indicated that fatigue was a factor with this event because I think I would have caught the error or not made it in the first place. We overfly ZZZZZ often and I've noticed the variant

spelling before. It was the last night of the trip, though, and I'd not had more than 4 consecutive hours of sleep (or more than 5.5 total) on any of the previous days.

## Synopsis

Air Carrier flight crew reported a heading deviation caused by not following SOP's and a change to the crew's normal procedures due to the pandemic.

## Narrative: 1

We were on a quick turned from a late inbound flight and it verified in ACARS that we were going to keep the aircraft for the final leg of the day. We had flown 3 legs in and out of ZZZ under winter conditions, active snow and de-icing every leg. My attention had been high on the aircraft MEL items, airport NOTAMs and the changing weather conditions. We pushed back for gate de-ice in ZZZ, we had received a SELCAL/ACARS message (MSG) regarding a change and we were still good to go. However, the ACARS remained on this page and prior to de-ice I noticed there was still a SELCAL message posted. My FO and I checked the MSGs and it came to our knowledge that our Flight Attendant (FA) was being removed from our trip due to COVID Exposure. This ACARS message was received after push-back as we were getting de-iced. We then double checked the release and we realized there were 2 amendments. One was for the TAIL SWAP which we were aware of. However, due to the immediate boarding at our gate and activation of ACARS and upon finding that we were keeping the current airplane we did not see AMD # 2 with the FA change. We completed de-icing and that is when I called my Dispatcher and acknowledged the change. I advised him that we would be returning back to the gate, however due to extenuating circumstances, this should have been a notification that should have been sent earlier in particular VIA phone call to myself, the PIC, regarding this change. Prior to push, I had no knowledge of the situation or the change, the change I knew of was of the plane swap because I noticed the tail number in ACARS. Due to the quick turn, the FA had her phone off as we were boarding and was not aware either of the change and of the COVID exposure. However, since there was no acknowledgement there should have been an attempt to notify the FA through my FO or myself. I believe that the quick turn and the focus on the inclement weather distracted me from the information being received. I also believe there was breakdown in CRM from the PIC/Dispatcher point of view. This was a last minute change to our paperwork, and this change should have required a phone call to me, the PIC or an ACARS MSG PRIOR to push to acknowledge the change. At times there is lack of support from the Flight Ops/ Dispatcher level in being proactive to provide the most up to date information forcing the PIC to take attention away from other tasks, potentially like in this scenario and missing information. There needs to be a way to notify the flight crews of amendments made on the release. There are multiple reasons a release

can be amended ranging from, CREW SWAPS, TAIL SWAPS, Weather, Alternate, NOTAMs, MEL, TIMES, etc. These amendments, can be essential to flight and ensuring both PIC and Dispatch is aware of the change is key. On our ACARS we have the ability to respond for numerous items, acknowledge TARMAC delays, acknowledge "UNSTABLE APP AIRPORTS" via ACARS but we do not have a way to acknowledge flight release amendments. I am suggesting that prior to push should an amendment be made, if not acknowledged, it will NOT ALLOW crews to send for T/O DATA until it is ACKNOWLEDGED via ACARS or via telephone. After push back, you would have T/O data, but an acknowledge would be required VIA ACARS or Telephone. I believe this would also help with our AIRWORTHINESS Management system in ensuring crews have the correct MEL Listed on the release prior to push or especially after pushback. I strongly believe this would add an additional layer of safety that ALL Pilots could benefit from.

## Narrative: 2

We had to return to the gate because we became aware that we had the wrong Flight Attendant (FA) on board after push-back. There was an amendment to the release that we didn't receive notification for the FA change. Quick, late, and focused on the weather. Lack of system to ensure receipt of amendments. Break down in CRM between Company, Dispatch, and Flight Crew. I suggest better CRM systems between Dispatch and Flight Crew by implementing some type of acknowledgement when there are amendments to the RLS. Flight crews should not have to dig for information when Flight Ops and Dispatchers can also have the ability to provide the information to flight crews. Therefore, reducing workload on flight crews and staying focused on the things that require our full attention.

## Synopsis

Air carrier flight crew reported returning to the gate after receiving notification a Flight Attendant onboard had been exposed to COVID-19.

## Narrative: 1

Descending into ZZZ on a visual approach to Runway XXL, but following the guidance of the ILS. A stable and uneventful approach. Upon landing we had a 6-7 knot tailwind. We landed longer than normal. I wouldn't say that we were outside of the touchdown zone, but it was very close. From my perspective the main wheels touched down prior to the end of the touchdown zone. We had floated a bit and I had to wait for the aircraft to lose that lift and start sinking into the runway before executing my landing flare. Elected not to go around and continue because nothing was unsafe we had a 10,996 foot runway and I elected to use max thrust reversers upon landing to slow us down safely. There was a few contributing factors. The main one being the tailwind on landing. Second was because of less travel due to COVID we sometimes have very light airplanes. Our landing weight was under 36,000 lbs being very light for the aircraft. So the lightweight along with the tailwind wasn't ideal. Lastly, company has recently within the last year or so updated our procedures where we add X knots to our straight in landing speeds regardless of the situation. Not having to add that extra X knots would have helped us carry less momentum into our final approach. We do bleed off the airspeed before touching down, although it's never perfect. The airport should have been landing in the other direction with the wind favoring the other runway, and it would also be more safe because of less terrain that we can't see at night. Also I should have thought about our extra light airplane and possibly requested the other runway. Also, It has been my opinion since it has started that airline go back to the normal landing numbers without adding extra 5 knots. And let the pilots decide when the extra airspeed is necessary depending on environmental factors.

## Synopsis

Air carrier First Officer reported a long landing possibly outside of the landing zone. Reporter attributed discrepancy to possible company policy of adding speed to straight in landings and the aircraft being light in weight.

## Narrative: 1

With a light load (XX passengers), Tower cleared for an expedited takeoff Runway XXL, Runway heading. Takeoff without incident, with a high climb rate due to weight. Configured and continued climb hand flying. Reaching 3,200 feet, at 200 knots, climb rate was 4,000 FPM+, leveled a bit to slow climb and increase speed to 250 knots. Captain was completing after takeoff checklist, and made 1,000 foot call. Reached 250 knots at 4,200 feet, and proceeded to slow and increase climb simultaneously, while ATC was giving further clearance. In my mind I expected a further climb, but we only received direct ZZZZ. Realizing we were not getting cleared higher, and at 4,600 feet with an increasing climb rate currently at 3,500 FPM, I immediately began correcting with pitch and power. Captain said watch your altitude, and I advised correcting. ATC advised maintain 5,000 feet, Captain responded correcting. The stable correction required a top altitude of 5,300 feet. ATC advised no problem, and that there was overhead traffic. There was no disruption to traffic or flight due to this 300 feet deviation. The rest of the flight was conducted without incident. I believe I slowed my deceleration in order to level at 5,000 feet when I heard ATC begin giving further clearance because I just expected higher to be given also. Obviously each clearance is specific, regardless of expectations, so pitch and power accordingly, and a correction won't be necessary. It didn't help that the climb rate was very high due to light load, adding hand flying to it just increased the workload. At light loads, in the busy ZZZ environment, probably best to utilize the automation a bit more to lighten the workload.

## Narrative: 2

During initial climb via the ZZZZ departure as I was completing the after takeoff checklist I noticed we were at a very high rate of climb as we were approaching our top altitude (maybe 4,800 feet) and reminded name (FO) of our 5,000 assigned altitude he immediately started correcting. As a result of the rate of climb we climbed through 5,000 feet to 5,300 feet and then back down to 5,000 feet. This happened during a busy time I was running checklist and communicating with ATC while the FO was hand flying. I feel that I could have paused the checklist from the 1,000 foot horn and call until our altitude was captured to make sure we wouldn't climb through.

## Synopsis

Air carrier flight crew reported an overshoot of altitude on departure and made reference to the aircraft being light in weight.

## Narrative: 1

We blocked out for our XA: 35 scheduled reposition flight to ZZZ1 at XA: 25 at gate X in ZZZ. Shortly after blocking out we received an MDC fault status message so getting a ramp crew to push us right away was not our top priority. I called Maintenance and we were able to MEL the MDC through a pilot deferral. As I finished up the paperwork I asked my FO to call operations to start rounding up a ramp crew for us as we would be ready to leave shortly, I am guessing this was around XA: 45. After a while I saw 2 rampers come out, they disconnected power then seemed to disappear again. I knew we were a reposition flight, so understood if we weren't the highest priority as the weather wasn't the best; so I tried not to push too hard for them to hurry up. At approximately XB:05, I was just about to call ops to ask them the status on our push crew when our main cabin door was opened unexpectedly by a cleaning crew that informed us they needed to do a sweep and clean our airplane. I was baffled that they just came up to our aircraft unannounced and opened our door without making any contact with us first. We had already completed our pushback checklist and everything 100% ready to go and our door just opens up. They completed the security sweep and the COVID cleaning form (why we need COVID cleaning to send a plane into heavy check is beyond me). No one at the airport seemed to have any idea that this aircraft was going to be ferried out. This led to ground personnel not having everything completed that they were supposed to complete prior to departure. The gate agent told me we were good to go as it was a ferry flight, so I was under the assumption that the security sweep and COVID cleaning would not be needed. To prevent this from happening again I think it would be wise to revert our pushback checklist to how it used to be where we would turn the beacon on as a part of the pushback flow. Those cleaners could have potentially found themselves in a dangerous situation very fast and I think the beacon would have stopped them. As a former ramp worker I was always taught never to approach an aircraft with a beacon on. Also, I think some more guidance on FFOD security sweeps and COVID cleaning requirements regarding reposition and charters would be nice. I worked a charter flight recently and thinking back on it we were never given a security sweep on day 2 of our charter. I have done several repositions lately and sometimes we aren't starting at a terminal and cleaners haven't had access to the airplane.

## Synopsis

Air carrier Flight Captain reported being ready to push an aircraft that was planned for a reposition, when the cabin door opened, and a cleaning crew came aboard.

## Narrative: 1

Non-compliant passenger. During our flight I was informed of non-compliant passenger, Passenger X seat XX6, who apparently was continually reminded of face covering policy. Flight Attendant woke passenger to remind them to mask up. I was informed of this during a bathroom break an hour before landing. The passenger followed the Flight Attendant to first class cabin to complain about being woken up. Captain made PA "reminding all passengers of policy." I told the passenger we need to get a commitment for mask and he agreed and then made a complaint about being hurt by Flight Attendant. Flight continued without further incident and Customer Service Supervisor met aircraft.

## Synopsis

Air carrier Captain reported a passenger was not complaint with face mask policy during flight.

## Narrative: 1

Pairing X was modified once a week or two ahead for report times. Trip began with along ZZZZ layover and second day with a XA:50 report to fly XR:03 block to ZZZ. In cruise to ZZZ we were informed by the FA crew that no meals were boarded for us. We asked for what snacks were available given neither of us had eaten since breakfast. We were given snack type food, sugar and nothing of substance. Upon landing in ZZZ we had to clear customs and had no option for food before leaving the airport as after customs we were right at the hotel pick up area. We called the hotel and asked them to send the van and they informed it would be 10-15 mins. 45 mins later (now 11 hrs remaining in our layover) we got the hotel. We asked what food options were available and they said nothing. We both changed and walked around the hotel and found a takeout restaurant still open but with 5 plus people in line to order. By the time we got our food we had less than 10 hrs remaining in our layover and a full meal to eat. I am not use to eating this way and tried my best to get what rest I could prior to our van at XS:05 AM for a XS:40 AM report. My Captain started the crew briefing that morning with "I did not sleep as well and I'm feeling effects of fatigue so keep an eye on me." I slept OK and we both felt OK to fly to ZZZ1 and would evaluate the day as each flight came. Upon reaching ZZZ1, we were both making our standard SOP callouts - but the wrong callouts at the wrong time. For example, "Set missed approach altitude at GS intercept vs at 1,000 feet AFE". We landed and both agreed we were feeling more effects but were still fit to fly our leg to ZZZ2. Roughly half way to ZZZ2 I felt like I "hit a wall" and told the CA that I would be calling fatigue for the ZZZ3 leg. Immediately she said "please do the same for me." We completed our flight to ZZZ3 per SOP and no errors were made on arrival nor en-route aside from a few misplaced callouts. This pairing X had multiple fail points. First, no food was boarded in ZZZZ - not even the COVID adjusted non approved meal. Nothing. Second, upon arrival and clearing customs, the hotel van took over 45 mins to get to us and over an hour to get to the hotel further shortening our layover time. Third, upon arrival at the short layover, the hotel had zero food options available - not even a to go option. I can assure had we not found the restaurant across the street this would have resulted in a call to scheduling that evening. We cannot not be fed on a 6 hour flight we are planned to get both a meal and a snack and have nothing boarded. And then get to our short layover and have no food available and have to spend more time finding food and then eating a full meal to then have to sleep immediately afterwards. The sleep quality was poor at best. This completely set up day 3 - the longest day of our trip for failure. This pairing needs to be looked over and corrected, and/or the company has to provide some failsafe option if food is not boarded. In this instance we not only had food not boarded and available, but at the time we needed a quick option with no other option - the hotel had absolutely nothing. In this case we were set up on day 2 to have a minimal rest night and then move into a 3 leg day spanning 11+ hours with minimal poor sleep the night before.

## Synopsis

Air carrier First Officer reported a flight pairing where they had no proper food available and minimal sleep leaving them fatigued and hungry during flights.

## Narrative: 1

We checked on with ZZZ Approach and requested the RNAV Z XX via ZZZZZ. ATC advised unable due to traffic for Runway YY and told us to expect a visual to either [Runway] XYR or YY. The ATIS was reporting a high OVC and a low scattered layer, I think at 700 feet, we did not think we could accept a visual so we requested the RNAV Z YY. The Controller said we could expect that but we would need to be vectored, I said that was fine and also offered direct ZZZZZ1. We were vectored pretty far to the south east, over the river and past ZZZZZ1. We were finally given a vector to intercept final at or above 3,000 and cleared the approach. The CA tried to activate the approach and we discussed not activating RNP's, we had descended some while on the final course in VMC (I recall about 1,900 feet) and decided to cancel approach. We flew the missed and were vectored for the RNAV Y YY, that approach was uneventful. The CA and I had a full debrief and we learned a few things. The first issue was the Controller seemed unaware that we are unable to accept vectors to final on an RNP. After the go-around he asked the reason why and I told him that we can accept direct to or an intercept on a published leg but not vectors to final. He said thanks and I think he just did not know, but perhaps this should be known by all the controllers that work company aircraft. The second thing I learned is that I need to trust my gut feeling in these situations, once we were vectored past ZZZZZ1 I was anticipating that the Controller was going to vector us on to final, perhaps I could have asked him or requested the RNAV Y. The CA was ready to accept vectors to final and activate the approach, he began descending on the final course and I reminded him that we cannot accept that as it may cause issues with VNAV. The CA is a good pilot and sharp but is a newer captain and hadn't flown in over a month so the rustiness probably contributed. Overall I think we handled the situation as best we could and did not compromise safety in any way, especially with a missed approach not at the MAP which is something we rarely do on the line.

## Synopsis

Air carrier First Officer reported confusion with ATC's clearance resulted in a missed approach.

## Narrative: 1

On Approach into ZZZ [airport] at night on the ZZZZZ arrival requested Runway XX for landing from ZZZ Approach. ZZZ Approach then instructed a 180 heading for the Runway XX. We could see we were getting on descent that was already going to be high to start with and requested a descent from ZZZ Approach. ZZZ let us down to 5,200 feet due to terrain in the area. This was not how we had briefed or planned to enter the visual approach. We had discussed and gone over the pages enroute and decided based on weather and winds and go-around factors that the coded visual to 15 would be the wisest choice. However, we thought that would start from ZZZZZ1. The vector ATC gave us pointed the plane toward the final approach fix for the Coded Visual Approach ZZZZZ2 bypassing the rest of the waypoints on the approach. The FO was flying the approach and used a high rate of descent to get down. Got a descent rate call on the approach but that was also expected due to the 3.2 degree glide slope. At 1,000 feet AGL I was 10 knots fast right at the edge of the stable and decent rate was 1350 ft/min. I thought I had til 500 feet to get stable since it was a visual approach. I should have either gone around, requested Runway Y or maybe executed an S-Turn. The plane landed uneventfully in about 3,500 feet using a Flaps 40 landing. This was my first time flying into ZZZ and the Captain had only flown in there once before in the previous year also has not flown much during the year due to leave. ATC gave us a vector toward the Final Approach Fix on the Coded Visual Approach which was not expected from reading the pages. Also, the Captain and I were under the belief we had until 500 feet to be stable due to the old SOPs. Furthermore, on the descent into ZZZ using the ZZZZZ3 arrival you are on with ZZZ1 Approach and do not get handed off to ZZZ Approach until 6,000 feet so you don't get a runway assignment very far out. Being at night first time into a short field with mountainous terrain was a cause as well. I think on the company pages it would help to paint a better picture if there were notes to not accept a vector to the visual and proceed direct to ZZZZZ for the visual approach to Runway X if that is the runway of choice. If entering on the ZZZZZ3 arrival a note letting the crew know they won't talk to ZZZ Approach til below 10,000 feet. Perhaps at night to not accept a visual approach to Runway X and use the ILS to Runway Z.

## Synopsis

Air carrier First Officer reported an unstable approach and stated they should have executed a go-around.

## Narrative: 1

Today we completed XX moves, which puts us at the upper limit of historical average daily movement totals, a rate that has been ongoing consistently for over a month, at the same

time while dealing with staffing issues largely related to out of service personnel due to the ongoing public health situation. All that being said, this team could be considered as being pushed to near its operational limits. This report serves to document an inconsistency in the midst of this already stressful situation. It needs to be mentioned that I have previously submitted two reports on this issue, and a few of my colleagues have indicated they have as well, yet the situation continues to cause issues. Like so many other problems that this company attempts to address, the issue garners some focus for a while, but is soon forgotten. While assigned to operate super tug X, we were tasked to tow off an aircraft X type from gate X. The Z gates on the X terminal at ZZZ are known entities when moving aircraft X type, because of the minimal clearance between the nose gear and a line of concrete curbing between the building and the gate. I was acting as the observer on this move, and so I prepared the ship to tow while my partner attempted to capture the nose gear with the super tug X. Because of the extreme limited space, it took him approximately twenty minutes of constant maneuvering to capture the gear. Obviously this adds unnecessary strain to us which could affect our focus. Numerous times while he was attempting to connect, the bumper of the super tug X made contact with the curb wall, at one point almost knocking it over. This was not due purely to neglect, but more so because there was simply no other choice, he needed every available inch and more to complete the task. During the course of this, our Supervisor called us to inquire as to our status. I let him know we were having difficulty, without being specific, and his response was that other crews had towed off of that gate many times without a problem. I am not sure having just seen it firsthand how that would be possible. We had significant difficulties which jeopardized aircraft and equipment, although there was no reportable damage in this instance. Later on that day, during the busiest part of the shift, we again took an aircraft off another questionably accessible gate. At this time, though, no other gates were available. After the main flight departure bank had left, we took another aircraft, an aircraft Y type 2, to a gate which it would have been better not towed to. After releasing the aircraft, I checked the time and it took a full five minutes to egress with the super tug X from the area in front of the plane. Ideally it should take about one minute, or perhaps two depending on driver competence. It took five minutes because it is significantly more difficult to access or egress from the X, Z, and Y gates on the X terminal at ZZZ with a super tug X. This is due to space constraints. Tows should not be assigned to these gates unless operationally necessary beyond just a basic need. In the case of the second tow, it was necessary, because there was no other gate available. On the first tow, from my perspective on that gate, I could see that two other more optimal gates were unoccupied. On the last tow, I decided that I would count the available gates on the North side of the terminal, but I did not have to because they were all open, the only aircraft on that side was the one we had just placed. All though it will soon be a moot point, as the aircraft X type will no longer, at least for a time, be routed through ZZZ, I still feel it is necessary to bring it up because of the avoidable oversights which gave rise to the situation, escalating the risk level with little to no need or gain.

## Synopsis

Ground employee reported difficulty moving aircraft off a specific gate due to reduced clearance.

## Narrative: 1

This report is being filed to document current long range HF communication challenges on the X area route system. On Aircraft X, Date, ZZZ1 to ZZZ2, and several others over late December and early January, the ZZZ1 AIRINC HF radio station in use has been overwhelmed at times. The radio operators are doing a good job, but the volume of aircraft trying to use the primary frequency is often excessive. The X area route HF frequency impacted is X (secondary Y). I believe that pre COVID ZZZ1 AIRINC was using two frequency pairs for X area flights to the X Islands (relief by using [frequency] Z and A to avoid saturation). It appears that they have cut back to a single frequency pair for the X area structure. The root problem however is not the AIRINC reduction, but rather the failure of Company Airlines to properly equip the [aircraft X type] fleet for this flying. The [aircraft X type] fleet has delayed installing SATCOM capability for mainland aircraft, and claims by the fleet to equip the [aircraft X type] fleet properly have not materialized. Report filed [month] 2019 documented an excessive delay of 47 minutes in getting critical medical information for an inflight medical emergency. The [aircraft X type] Fleet responded to the report by stating "We are currently evaluating a solution for the [aircraft X type] fleet. It is currently installed on a [aircraft type] and will be in service in approximately 2-3 weeks. The intent is just as the report indicates, to provide better communications on our [Oceanic] routes." Yet here we are today. As a result of the reduction in demand due to COVID, many airline flights operating to the X Islands are using the [aircraft X type]. All of these [aircraft X type] flights are limited to HF communications unlike the Company [aircraft X type] aircraft in [US territory] that have been using SATCOM, CPDLC and ADS for over X years. Operators like Airline Y, Airline Z and even Airline A are a few of the airlines currently using SATCOM and CPDLC. Company [aircraft X type] flights are often getting updated flight safety information relayed from these other aircraft as we do not have timely access to updated weather and turbulence information.

## Synopsis

Air carrier Captain reported problems associated with the HF equipment on specific oceanic flights.

## Narrative: 1

As pilot monitoring, first officer was receiving a Line Check for a requalification, due to a lapse in currency due to COVID-19 pandemic. During the takeoff roll, I checked all airspeed indications on both sides of the cockpit per SOP. At 100 knots entering the high-speed regime, I observed my airspeed indicator (Captain's), was now reading zero airspeed and there was an orange flag. I realized the airspeed indicator had failed and I called out the reject and took positive control of the aircraft. The auto brakes activated in the RTO function and we cleared the runway and followed SOPs. The aircraft [was taken] out of service for further inspections. There were no injuries to either crew or passengers and no damage to the aircraft.

## Narrative: 2

While departing on the takeoff roll, the Captain initiated a rejected takeoff. Once the rejected takeoff was initiated, I radioed Tower, advised of the reject and asked for vehicles due to possible hot brake conditions. I then addressed the passengers and asked them to remain seated. The rejected takeoff was initiated above 85 kts (because the RTO brakes engaged automatically) but prior to the 100 kt callout. The Captain appropriately exited the runway and advised me that he had witnessed a faulty airspeed indicator display which is why he elected to reject the takeoff. Once clear of the runway, and stopped on the taxiway, we initiated the Rejected Takeoff QRH/QRC procedures. Once complete, we made proper notifications to the cabin crew, ATC, dispatch and company. The entire event was handled very professionally and efficiently by all involved. Once at the gate, the passengers were all booked on a later flight to ZZZ1 [airport], the aircraft was removed from service, and the airspeed indicator was replaced. The Captain and I operated the same aircraft back to ZZZ1 the next morning without issue.

## Synopsis

Air carrier Captain reported the airspeed indicator failed on the Captain's side during takeoff roll resulting in a rejected takeoff.

## Narrative: 1

Aircraft X had more than 50 entertainment and power systems become inoperative during our flight from ZZZZ to ZZZ. The flight crew communicates with Dispatch in hopes of **having the team compensate the effected individuals. Unfortunately, the team's** response was to have the flight attendants utilize their handhelds and enter in each customers information. The team said they did not have the ability to address our partial cabin issue. With the current pandemic, it would be prudent to limit flight attendant interaction with customers. Especially, in a situation where the exposure is high for extended periods of time. Maybe we should rethink how the team can help keep our flight attendants safe and provide a quality product to our customers?

## Synopsis

Air carrier Captain reported entertainment and power systems failed during flight and had to use flight attendants to record data so the affected passengers would receive some type of reimbursement.

## Narrative: 1

Since the COVID-19 Pandemic has started, I have yet to see ANY person in a management position or management support position wear a mask in the flight operations crew lounge. As a result, what I've observed from other line pilots is people walk in the lounge, and drop their masks immediately. That's not universal, but it is or was very prevalent. For months, I've simply avoided going in the lounge. On my last trip, I needed to enter again. Nothing's changed. Clearly, from (name)'s message dated X, as well as (name)'s message the same date, I believe the company's clear expectation is we are all supposed to wear masks in any company location. As supposed experts at managing risk, there is a problem. Leadership by example is lacking. Very disappointing.

## Synopsis

Air carrier pilot reported people not wearing a mask while inside the flight operations crew lounge.

## Narrative: 1

Just prior to pushback we were notified of a ZZZ1 Center closure. We delayed push and notified Dispatch. We were filed a new route, which avoided ZZZ1 Center, got more fuel and a new release. Our CPDLC was as filed. We then received a re-route via CPDLC and it was within about 30 NM of our previous route, checked fuel and pushed. As we proceeded south toward ZZZ [VOR] I queried ATC about our re-route. I emphasized that we had filed for a route that avoids ZZZ1 Center and was told they would call "upstairs" and see what was going on. We were told that the X area route was unavailable. When we turned east toward ZZZZZ [Intersection] I queried the next Controller about our routing and, after making a phone call, I was told the area X route was unavailable and they had a plan to get us to ZZZ1 [airport] via our current routing. As we neared ZZZZZ [Intersection], I again queried the Controller about what the "plan" was. He said that ZZZ1 Center was going "Zero" at XA:XOz. So now I thought we would be holding. We were then handed off to ZZZ2 Center and they said they had a plan for us. They gave us a left vector and I asked about holding. ZZZ2 [Center] said that if we could go down to FL220 they could get us in. We said we could do that and were cleared FL220 direct to ZZZZZ [Intersection] and give a ZZZZZ1 [Intersection] estimate, which we did. After turning south over ZZZZZ [Intersection], ZZZ2 Center told us "Radar service terminated" and contact ZZZ3 Center. Somewhere between ZZZZZ [Intersection] and ZZZZZ1 [Intersection] we received a dispatch ACARS that we were not allowed to accept this routing. While the Captain was trying to coordinate with Dispatch I made an unrequired position report to ZZZ3 Center just to see if they could hear us and they acknowledged. The Captain told me that Dispatch wanted us to divert to ZZZ2 [airport] and was getting us numbers. After a failed attempt to reach dispatch on ARINC we discussed the option of diverting to ZZZ2 [airport]. At this point we were about 80nm from ZZZZZ1 [Intersection] and decided that it was more prudent to continue to destination than to try to reverse course in a non-radar environment. We checked in with ZZZ3 Center at ZZZZZ1 [Intersection] and the rest of the flight was uneventful.

## Synopsis

Air carrier First Officer reported that the planned route to avoid ATC Zero airspace became unavailable and ATC provided a new route which resulted in the flight being in a non-radar environment. First Officer stated that they were later informed by company that they were not allowed to accept such a route.

## Narrative: 1

We were delayed out of ZZZ1 [airport] due to ZZZ Center being closed for a "COVID cleanup." Dispatch sent us a new release with a route that took us well west of ZZZ Center's airspace. Following takeoff and soon after leveling off at cruise altitude, ZZZ1 Center asked if we wanted to stay on that route, or get a short cut. They offered: Route Y (Original: Route X). The FO and I discussed the short cut, and I sent a message to Dispatch indicating we were going to accept this new route. Our thought was ZZZ2 and ZZZ3 Centers had divided up ZZZ [Center] airspace and were providing radar coverage for this route, though it appeared that normal radio coverage would be lost north of ZZZZZ [Waypoint]. We were instructed to contact ZZZ3 Center 35 miles north of ZZZZZ. We were indeed asked for an ETA for ZZZZZ, but we were never told radar coverage would be lost. When we checked in with ZZZ3 [Center], we were told we were in radar contact. Dispatch sent a message later in the flight to call upon landing. There was a question as to the legality of flying through "domestic" airspace without radar coverage. (Dispatch used the term "uncontrolled" airspace.) I explained I was unaware we had entered "uncontrolled" airspace since we were in Class A airspace. I explained, I thought the centers had provided coverage through the route, but we had an area where radio contact on regular frequencies was lost. I am writing this in case we inadvertently entered domestic airspace without adequate ATC control and unintentionally violated a company policy.

## Synopsis

Air carrier Captain reported not knowing if they were legal to fly in domestic Class A airspace in an uncontrolled environment after a Center had gone ATC zero.

## Narrative: 1

I am an Air Traffic Controller. It is my job to keep people safe while maintaining an orderly and efficient flow of Traffic. All of that was thrown out the window this night. I was instructed by management who were following orders received from the Command Center to ship numerous aircraft into a black hole (ZZZ1 ATC Zero). These pilots and passengers left the safety of a radar environment with no radio communication, no approved separation, and no one watching over them. The first ZZZ1 went ATC zero for COVID cleaning in the middle of the day and it completely overwhelmed the ZZZ2 [Center] controllers. The sectors became completely unmanageable. Aircraft from ZZZ1 Center entering ZZZ2 [Center] checked in responding to an RA. Training was insufficient and we were not prepared for what was about to happen. The last time I received training on non-radar separation was in 20XX in a classroom in Oklahoma City. I had no real-life experience with it until this week. I arrived at work I received a verbal briefing from my Supervisor. I was handed a sheet covered with tons of airports, routes, altitudes requirement, and minimal phraseology. Not only was this an insufficient amount of time to absorb the information, the instructions on the sheet were incorrect. We were told to get estimates over a fix and make sure he had 10 minutes between aircraft. In actuality we were supposed to assign a time for them to cross the fix. Also, the phraseology we were given when switching the aircraft did not include "radar service terminated." It was only after I got off position I realized that I had not given that critical piece of information to the pilots. I was so busy trying to sort out who needed what route and what was the appropriate altitude that I was unable to print strips and pass estimates. Knowing I was

overwhelmed I called for help on 2 occasions. However, management and the tracker were so busy helping other people that they could not hear my calls for help. The information sheets we were given had so much information on them it was very difficult to know who needed what. At one point my information sheet was being used by another Controller. This made it very difficult to know what I needed to do with the aircraft. It was a very chaotic situation for everyone. As soon as I was relieved from my position I immediately notified my Supervisor that I had not passed any strips or estimates. I left with a sinking feeling in my stomach not knowing if the planes I shipped were actually separated. Concern over whether they made it through the black hole and arrived safely to ZZZ3 [Center] weighed heavily on my mind. Below are a few examples of Aircraft that were placed in dangerous situations as a direct result of the decision to misapply non radar rules and by allowing ZZZ1 [Center] to go ATC zero in the middle of the day during peak traffic times. Aircraft X- Took the clearance and left ZZZ2 [Center] airspace entering ZZZ1 [Center] ATC zero airspace. At some point the pilots realized that they were not allowed to fly non radar. Since they were no longer in communication, they turned their plane around and flew back into ZZZ1 [Center] airspace without a clearance. This jeopardized the flight because they were at FLXXX. This was an altitude we were using to clear aircraft through ZZZ1 [Center] airspace on non-radar routes. No separation was provided for this flight and they may or may not have had a loss. I have no idea if he was head on with another aircraft at the same altitude. This was an extremely dangerous situation. Aircraft Z - Level at XX,000 feet in ZZZ1 [Center] airspace. ZZZ1 [Center] updated his data block to VFR and put him on my frequency. ZZZ1 [Center] did not call and coordinate anything on his flight. The pilot checked in stating he was on an IFR flight plan in IFR conditions and wanted to climb to get out of the clouds. I told him I did not have authorization to change his altitude and if he could climb VFR to get out of clouds it would be OK. In hindsight this actually may have been an emergency. If he was in fact VFR like his data block indicated, he may have been VFR in the clouds. He later reported that he was VFR on top at XY,000 feet. Additionally, ZZZ1 [Center] put this aircraft on my frequency and he never even entered my airspace. At XX,000 he would have entered ZZZ [TRACON Airspace]. At XY,000 he entered the sector adjacent to me. Aircraft Y - Checked in about 15 miles inside ZZZ [TRACON] airspace level at X,000. The pilot said he was on an IFR flight plan, in the clouds and ZZZ1 told him to contact me. This Aircraft also never entered my airspace. I am almost positive that ZZZ1 [Center] violated ZZZ [TRACON's] airspace with this aircraft. Another aircraft had some confusion on his clearance limit. While in ZZZ1 ATC Zero [Center] airspace he entered into holding and was calling for help. After holding for an unknown period of time he became low on fuel. Eventually he was able to get a hold of someone and land at a nearby airport. This incident is deeply concerning. This aircraft was holding and eventually descended to land while we launched numerous aircraft through this area. How many losses of separation might we have had with just this one plane? He was also in distress and had difficulty reaching an Air Traffic Controller for help. This is a prime example of why it is important to maintain communication with aircraft while they are in a non-radar environment. We had two Aircraft at FLXXX with less than 2 miles separation when they reached ZZZ4 Center's airspace. Apparently, there was a major speed overtake and the trailing aircraft caught up to the lead aircraft. I had an aircraft checked in from ZZZ4 Center who informed me that their estimate over the fix was way off. What we did this day was in violation of the 7110.65 non radar rules and Federal Aviation Regulation for pilots. During non-radar, pilots are required to stay in communication with air traffic controllers and report time checks to make sure separation is maintained. These pilots had no radio communication and were never assigned a time to cross the fix. Also, controllers working the aircraft had no way to keep track of who had what time. We were asked to pass the time to the Supervisor, an impossibly task given the circumstances. We also flooded the route with significantly more aircraft than were intended to be on them. The volume was too high and unmanageable. Everyone working

that day knew this was a bad idea. Union, Controllers, supervisors, upper management and our facility chief all knew this was unsafe. We expressed our concerns but were ignored and forced to proceed. I cannot express how deeply concerning and unconscionable this scenario was. We are lucky that we did not have a mid-air or an aircraft in distress that resulted in an accident because they could not receive assistance from ATC. These pilots and passengers were on their own. On this day we were most definitely NOT the safest airspace in the NAS. Without the proper tools and training in place this is an extremely unsafe situation. Interference with Air Traffic Control facility services can lead to loss of life. We need proper training and practice before we are ever asked to do this again. Rules and regulations must be adhered to. Radio communication should be kept between ATC and pilots at all times. We should not overwhelm the controllers. Traffic reduction is a must in situations like these. A tracking sheet should be kept at the scopes to know who was assigned what routes and times over the fix. Extra staffing should be called in to work these extreme situations. After major events there should be study groups put together to come up with better procedures. Air Traffic Controllers and supervisors that worked the traffic should be included in these study groups. When controllers, management and union say this isn't safe or we shouldn't do this then extra precautions should be taken. We are here to work traffic. We know better than anyone what [the] limitations are. Our voices should be heard and when we say something isn't a good idea we are probably right.

## Synopsis

Center Controller reported safety concerns with another Center facility going to ATC Zero during peak traffic times and the confusion/stress this causes the controllers.

## Narrative: 1

Aircraft X checked on and I instructed him to fly a heading and to descend to 070. He read back 060 and I missed it. A few minutes later I observed him at 060 in a 060 MVA about 1/2 nm from a 064 MVA so I issued a low altitude alert and a climb to 065. The pilot entered the 064 MVA climbing from 061. I asked if he had terrain in sight and he did. The pilot pretty clearly said 060 in the readback, but I think the combination of expectation bias and "six" starting with "s" like "seven" was enough for me to miss it. A FLM sitting next to me and monitoring me also missed it. This shift was my quick turn with minimum time between shifts so its possible fatigue had something to do with it, although I felt okay at the time. I'll have to be more vigilant about expectation bias regarding the routine altitudes and associated readbacks I deal with every day. Although I'm not sure that fatigue had anything to do with it, I think 9 hours between shifts is not adequate. On average it seems like 8 hours is the recommended amount of sleep and accounting for the commute to and from work, the time it takes to actually fall asleep in bed, and time to wake up and get ready in the morning, I typically get 6 hours sleep on quick turns. Adding to my fatigue is the fact that we've been on 6 day work weeks since mid-summer. Management's stance is that training 7 days a week is the only way to get out of our staffing crisis, but I 100% believe that the associated overtime is having an impact on our fatigue levels and morale. The national training plan was suspended due to the pandemic but at ZZZ trainees are not allowed to have a staffing day unless they're on overtime, and even then they might still have to train. If we allowed trainees to have one staffing day we'd be able to cut back slightly on overtime, trainees and trainers would be less burnt out, and maybe we'd be able to rest for a full weekend every once in a while. Additionally it would help us to be a bit more protected from the virus - every time we train, people are within 6 feet of each other. The training plan was suspended for this reason, but at ZZZ we exceed the training plan's requirements despite it not being active. Adding to my fatigue is the fact that we've been on 6 day work weeks since mid summer. Management's stance is that training 7 days a week is the only way to get out of our staffing crisis, but I 100% believe that the associated overtime is having an impact on our fatigue levels and morale. ## Narrative: 1

The events described here are recalled to the best of our ability. The situation was very dynamic, and communication was often difficult. On date, on a flight initially planned from ZZZ to ZZZ1 we were flying in a type X aircraft between FL360 and FL400. Everything was proceeding normally until a reroute that would have taken us to toward the west side of State Y and State X, then to ZZZ2 on the east side of State X, then back to ZZZ1 in central State X. This is unusual, but we assumed it was due to weather in central State X. We also thought there was a good chance the route would be changed, so we were not overly concerned. As we were approaching the southern limit of ZZZ Center's airspace, we received another relatively complex re-route taking us to ZZZ3 then northeast back to ZZZ1. At approximately that time we started hearing reports about airports in north and central State X being closed. While we could see some weather on NEXRAD radar, it did not seem to be severe enough to close so many airports. However we had received no

other explanation for the situation. After evaluating the new routing and analyzing the situation with the closed airports we determined it would be unwise to continue on that route to ZZZ1. We initially requested and received clearance to change the destination to ZZZ4. Also, at about that time we received instructions to contact ZZZ1 Center at a point some distance ahead (however the exact location is now forgotten). As we programed in the new destination and continued to hear reports of all or most airports in central and north State X now closed, (most likely not actually closed but unavailable in a non-radar environment already overloaded with traffic) we determined we were approaching minimum fuel and continuing on into an unknown situation would be unwise. We then requested a diversion to ZZZ5 and declared minimum fuel. We were told ZZZ5 was also closed. Our minimum fuel status was never acknowledged, even though we stated "minimum fuel" twice. At about this time we were told to hold at ZZZZZ waypoint. We were not given an EFC time and as we started the hold, we lost contact with ZZZ Center. At this point we were on the verge of declaring an emergency, but an airline flight began relaying messages between us and ZZZ Center. We stated we wished to divert to ZZZ6 and were told that was approved but we needed to do so VFR, even though we were at FL270. Shortly thereafter we were told to contact ZZZ Approach even though we were still in the flight levels. Since we were basically over ZZZ6 we did a rapid descent and contacted approach while doing so. Eventually we were vectored for an approach and landed at ZZZ6. It should be noted that we were never informed that we were no longer in radar coverage, or that we would lose communication with ZZZ center before establishing contact with ZZZ1 Center. We were also never informed that ZZZ2 Center had gone to ATC Zero. We had also been cleared to lower altitudes, significantly increasing our fuel burn. We later learned during a phone call with ZZZ Center that ATC kept the ZZZ2 Center airspace open even though the center had gone ATC Zero. The methodology FAA Air Traffic Control Centers are using to deal with COVID related ATC Zero situations is extremely confusing and dangerous, especially when attempting to route traffic through a non-radar environment. It requires the use of complex routes that include waypoint names that are difficult and time consuming to say and spell. Had we been informed that ZZZ2 Center was ATC Zero we would have diverted before ever reaching ZZZ2 Center airspace, added fuel and waited for the center to re-open. Had we been informed of the lower altitudes we would be required to fly or of the extended routes required we would also have made other plans. As it was, we remained in a reactionary mode for much of the flight. We were unaware of the situation with ZZZ2 Center until after landing. While we never failed to comply with an ATC clearance, we were apparently still expected by ZZZ1 Center in spite of being cleared by ZZZ (as best we can tell) to divert to ZZZ6. We have the highest respect for air traffic controllers. But on date the ATC system itself severely failed. In addition to the primary events of this particular report, at various times during today's flights numerous other ATC irregularities (to be generous) occurred. For example, after receiving an IFR clearance on the ground at ZZZ6 we were cleared for a VFR takeoff and told to contact Approach in the air, that they were expecting us. Upon contacting approach, who did not seem to be expecting us, they instructed us to climb to 3,000 feet. We were then just left there, in some strange limbo state, not knowing if we were VFR or IFR, at night, at 3,000 feet, in a jet at 250 knots. After prodding approach, we eventually received our IFR clearance, the same one we were given before takeoff. We have no explanation for this. Furthermore, when arriving at ZZZ4 we, and several other aircraft, were instructed to hold as published at ZZZZZ1 Intersection while we were stacked up for the RNAV Runway X approach. However, there is no published hold on the RNAV Runway X approach at ZZZZZ1. There is a hold in the same physical location on the ILS X approach, but the name of the fix is ZZZZZ2, not ZZZZZ1. It was not a good day for us or ATC.

Narrative: 2

Our flight began and proceeded normally. Clearance was issued without any indication of flow problems in route. However, approximately halfway into the flight, reroutes were issued encompassing routing to ZZZ7 and ZZZ3. Multiple changes ensued and it is difficult to recall them all at this point. We surmised that we were operating as in a non-radar environment. However, we were never told that was the case. We complied with instructions. In the process of calculating and verifying routing and ETA's, additional instructions were given. Bear in mind some of this rerouting required headings, in some cases, 120 degrees off course. Additionally, we also had 120 plus knot headwind. Both of these factors combined were a bit unusual and prompted me to apply additional focus on to verify ETA's. We were ultimately informed that we would not be able to land at our destination, ZZZ1. Other requested nearby alternates were denied. We requested reroute to our next filed destination, ZZZ4. However, upon quickly re-calculating our fuel we determined we could not safely make that destination. At one point we were instructed to hold at ZZZZZ waypoint. We complied with instructions and held at ZZZZZ. In the hold we requested landing at ZZZ5 and were informed it was closed as well. At this point I remember discussing the possibility of declaring an emergency and landing before getting into a fuel critical situation. We were very close to ZZZ6 and requested landing there. Near this time, we realized that ATC did not hear us. Another airline flight crew relayed a VFR clearance from ATC to descend from FL270 to ZZZ6. In close proximity to ZZZ6, I initiated a relatively rapid descent approximately 4,000 FPM. Upon establishing communication with the local controllers at ZZZ6, the flight proceeded more or less normally until landing. On the ground at ZZZ6 we were informed that ATC would be back to normal at XAXOZ. We took on extra fuel as a precaution, filed and took off for ZZZ4. Upon receiving clearance to ZZZ4, ZZZ6 Tower gave us the unusual clearance of proceeding VFR with the assurance that ATC was "expecting" us. We took off VFR originally cleared to 2,100 feet. We continued to prompt for higher altitude and were cleared to 3,000 feet. For the initial part of the flight we were in limbo regarding when we would receive an IFR clearance. We were also relayed a phone number for ZZZ Center and instructed to call them when we landed in ZZZ4. Due to all the confusion and delays we arrived at ZZZ4 later than normal for us. We arrived at the time the tower was closing with multiple airplanes landing ZZZ4. We received, what seemed to me, a rather nebulous holding instruction for a fix a bit hard to identify given approach outages at ZZZ4. However, it was manageable and after descending in sequence through the holding pattern we landed safely at ZZZ4. I do not know if this situation is normal at the time of cessation of Tower operation at ZZZ4, however, it was very cumbersome. Upon landing at ZZZ4, we contacted ZZZ Center as instructed. It was a cordial conversation on both sides attempting to fully understand what had occurred. I realize COVID-19 has been a challenge to us all, however I would strongly suggest a different approach to the ATC Zero situation we have now. Such a distraction of multiple clearances with little time to verify and stabilize orientation before another one is issued, coupled with calculations for diverting, and lack of communication is a challenge and potentially dangerous for one aircraft. When that is multiplied by tens of aircraft, it seems to me that has to be detrimental to safety. I was as close to declaring an emergency as I have ever been. Again, I realize COVID has been a challenge to us all. I also realize yesterday was an equally frustrating challenge for ATC personnel, and it is certainly not my intention to impugn them in any way. If I can further help or facilitate a better solution for pilots and ATC, I would be more than happy to help. I hope this account from a pilot perspective is useful.

## Synopsis

Corporate flight crew reported communication issues with ATC resulting in a minimum fuel situation due to a Center going ATC Zero.

## Narrative: 1

On Aircraft X from ZZZ to ZZZ1 passenger seated in seat X3 (Passenger X) had his mask down below his nose and touching his top lip. I told the passenger that he had to pull his mask up over his nose and mouth. He looked at me and then he pulled it up. That was his first verbal warning. While doing the compliant check he had his mask pulled back down. I reminded him again with a second verbal warning about his mask. As we were finishing up the demo he pulled his mask back down and noticed that I seen him because he changed his seat to seat X4, so I was able to see him. He turned and looked at me and I pointed to my mask. He knew exactly what I meant and he pulled it up. That was his third warning. Once service began and gave him a snack he took a very long time to finish his snacking and drinking. Once he was finally done he had his mask completely off. He was just sitting back looking on his phone at pictures and messages. I had to remind him for the fourth time. He rolled his eyes at me this time. While cruising inflight many passengers had fallen asleep with their mask on, I began to do a garbage run. Passenger X had his head back with his eyes closed (his eyes were blinking) mask under his nose and just barely touching his top lip. I called out to him but he never responded. I gently tapped him on the arm and told him once again that he had to pull his mask up. He looked at me with a very mean evil look and he pulled the mask up and snapped it over his eyes so he would not have to look at me. He then folded his arms as if he was having a tantrum like a child. Passenger X just wanted to do things his way and refused to comply. As a frequent flyer, I'm sure Passenger X is well aware of airline's policies and rules, he just wanted to break the rules on this flight. Passenger X was given several verbal warnings about his mask.

## Narrative: 2

On Aircraft X from ZZZ to ZZZ1 I was working the AFT position and passenger seated in seat XX2 (Passenger Y) boarded three [the] aircraft with his t-shirt style mask off. I walked up to the passenger once he sat down and told him he had to put his mask on over his nose and mouth. He then pulled it up. This was his first verbal warning. Once I walked away and began doing my announcements he turned around and looked straight at me and he had no mask on once again. This time the mask was tucked into his shirt as if he was wearing a turtleneck. I spoke to him once again about the mask having to stay on and he just replied "Oh yeah and pulled it up." The FWD FA called me on the phone to ask me was the passenger seated in seat XX2 (Passenger Y) wearing his mask because the gate agent wanted to know. That tells me he had an issue at the gate and they wanted to know was he complying with that rules. Once he passed the gate agent he took his mask off because that's the way he boarded the aircraft without a mask. So once I told the FWD FA I had to speak to him twice she said she was going to let that gate agent know. After

hearing all of that I immediately went to the flight deck and alerted the CA and FO about what was going on. I explained to the pilots that I've spoken to him twice and we have not even closed the door and pushed back from the gate. As I turned around to see if the gate agent had come on the plane Passenger Y had his mask completely off once again. I told the CA "He has it off once again." I began walking towards the back to collect garbage and as Passenger Y seen me coming began laughing and pulled the mask up. An agent came on and spoke to Passenger Y (seat XX2) and his friends who sat across (XX3 & XX4) from him. They all boarded the aircraft with their mask off or down way under their noses. They all began to laugh once the agent was talking to them. The agent was not stern about the policy and he was very passive and they took him and what he was saying for a joke. He asked them a question and didn't enforce Airline's policy. Once he left Passenger Y changed his mask to the company issued mask he was given at the gate. While doing the demo Passenger Y had the company issued mask pulled down. He literally took this mask policy for a joke. He was laughing and cracking jokes with his friends. Passenger Y was given several verbal warnings. Once we landed and were taxiing to the gate Passenger Y took off his seat belt and pulled down his mask under his chin to talk on his phone. His friends looked back at me, laughed and whispered something to Passenger Y. Passenger Y then turned back and looked at me with his mask down and turned his head before pulling the mask up. Passenger Y was determined to do as he wanted and not wear the mask.

## Synopsis

Two Flight Attendants reported two separate passengers were not compliant with face mask policy.

## Narrative: 1

After nearly a 12 hour duty day on date and over 8 hrs of actual flight time my crew and I were advised on the way to our layover hotel that one of our crew members tested positive for COVID. Once we arrived at the Hotel the crew member that was positive was sent to another hotel [to] quarantine. The rest of us were told we had to be back downstairs to return to base for a XE: 45am pickup. It was nearly XA:00am by this time. I

told the individual that called us we were not legal and needed our rest. The idea of being exposed to COVID and now no opportunity to sleep was unacceptable. He stated that we had to be on the first flight available to return to base. We were not going to continue to argue, so we did as we were told. He said this was just a deadhead but that wasn't the point, we needed our rest and there was another flight several hours later that potentially we might have been legal for. We were on duty for more than 20 hours with no additional pay or compensation. COVID or not our contract should have been honored under these circumstances most especially. Does COVID negate FAR's and Contractual agreements?

## Synopsis

Flight Attendant reported that after a long flight, they were told one of the crew members had tested positive for COVID-19, yet they were asked to fly the next morning with only 4 hours of rest. Flight Attendant expressed concerns with company's handling of being exposed to COVID-19 and scheduling.

## Narrative: 1

Flight planned through HF required airspace on a non-HF equipped aircraft. This flight was rerouted to avoid ZZZ1 [Center] airspace due ATC 0 for COVID cleaning. XA20z - XE01z. I looked at routing through the gulf and over Country Y but no overfly permit available for this flight number. Contacted Airnav / Overfly to confirm no overfly permit. They said we

no longer apply for the ZZZ-ZZZ1 or ZZZ-ZZZ2 [airport] flights. So I planned the flight to go east of ZZZ1 [Center]. This route took the flight through ZZZ [Center] Oceanic airspace. I failed to recall that that section of ZZZ [Center] Oceanic airspace is HF comm only, no CPDLC or VHF comm. The aircraft assigned to the flight did not have HF voice. The flight was able to continue by relaying position reports through our Aircraft Y on Guard frequency flying the same route/airspace. With the frequent airspace closures due to COVID cleaning we need more routing options to and from the US - Country Z. We need to start applying for Country Y overfly permits for these southbound flights again so that is an option for us. In addition to usable Country Y routes, a canned route that takes us east of ZZZ1 [Center] and ZZZ2 [Center] needs to be added with route remarks stating that dual HF voice is required for that route. It has been some time since we operated in that portion of ZZZ [Center] airspace and I failed to recall the requirement for HF. I assume the majority of dispatchers would make the same mistake who work this sector less frequently.

## Synopsis

Dispatcher reported planning a flight through HF required airspace on a non-HF equipped aircraft.

Narrative: 1

During a restroom break in cruise at FL370, the Captain stepped out of the flight deck and the FA came in. I had my headset on and was communicating with Center about the rides ahead. When I was done with ATC, I moved one of my headset ear cups off of my ear and I said hello to the FA and mentioned to her that we would have turbulence ahead. She said hello and then said "I see you don't have your mask on, could you please put it on?" Well, I was in a bit of shock by the request as that has yet to be asked of me. I then was queried from ATC about our current ride and answered them and then put my mask on for her comfort. But then I became uncomfortable. I have been in a rapid decompression at altitude before and it all started to come back to me about TUC [The Times of Useful Consciousness] and I became concerned about what would happen if I had that happen again in this situation. The Captain came back though in short order and the FA left but I worry that in my appeal to go along with making her comfortable with putting on my mask I would not have been able to perform my required duties if something bad were to happen. Imagine for a moment being in an aircraft at [fight level] 370, having a rapid decompression and putting your oxygen mask on. At that altitude a person has a TUC of approximately 19 seconds. 19 seconds seems like a long time even with the startle factor of what is happening and trying to figure out why. However, most of us in the aircraft type wear full headsets and I would take my headset off before putting the O2 mask on if a rapid decompression were to happen. 19 seconds of TUC minus the startle factor minus the headset and putting on the O2 mask and time is getting pretty tight not to mention if someone has glasses on. Now throw the surgical mask into the equation and I believe we are now out of time. I wonder how much of this has been explored? Do we indeed have time to take off all of this stuff with a TUC of 18-20 seconds and still live to save the day? It's one thing to have the mask on when the door is open or even below 25,000 feet but I believe we are setting ourselves up if we experience a rapid decompression with our headsets, surgical masks and glasses on. It's also fair to say this became a major distraction as the captain and I were discussing how best to deal with this situation in the future. Not so much as missed radio calls or unsafe handling of the aircraft but just a general distraction weighing on our minds and how this can be handled in the future.

## Synopsis

Air carrier First Officer reported concerns with having to wear a face mask in the cockpit especially in a rapid decompression situation.

## Narrative: 1

We were delayed out of ZZZ1 due to ZZZ Center being closed for a COVID. Dispatch sent us a new release with a route that took us well west of ZZZ Center's airspace. After takeoff and soon after leveling off at cruise Altitude, ZZZ1 Center asked if we wanted to stay on route or get a short cut. Our original route was [route 1]. They offered [route 2]. The Captain and I discussed the new route and accepted it. The Captain sent a message to dispatch informing him of our new route. Our discussion and thoughts were that ZZZ2 and ZZZ3 Centers must have divided up ZZZ airspace and radar coverage, and were now allowing routing through this airspace. When ZZZ2 Center was controlling us, they asked us for our ZZZZZ [waypoint] time estimate, and gave us the instruction to contact ZZZ3 Center 35 miles north of ZZZZZ. We were never told radar coverage would be lost. When we checked in with ZZZ3 we were told we were in radar contact. Several other Company flights, as well as other airline traffic, were also flying through this "closed" ZZZ Airspace and under the control of ZZZ2 Center. Dispatch sent us a message later in the flight asking the Captain to call upon landing. There was a question with the Dispatcher as to the legality of flying through domestic airspace without radar coverage. (Dispatch used the term "uncontrolled" airspace.) The Captain mentioned we didn't think we were ever in uncontrolled airspace, as we were in Class A airspace. He explained to Dispatch that we thought the centers had provided coverage throughout the flight. I am writing this in case we inadvertently flew through domestic airspace without adequate ATC control, and therefore unintentionally violated a company policy.

## Synopsis

Air carrier First Officer reported receiving an amended clearance due to a ATC Center going ATC Zero and questioned if they had violated an FAR by flying in uncontrolled airspace.

## Narrative: 1

During preflight we received a notification via CPDLC and Dispatch that ZZZ1 Center would be going "[ATC] Zero" during our flight and that we would require a reroute to get to our destination of ZZZ1. We contacted Dispatch and they worked a route that would take us over ZZZZZ [Intersection] and over the large area of water around ZZZ1 Center Airspace. The clearance we received via CPDLC has us going south via: [Route]. Once airborne southbound heading to ZZZ [VOR], we told Center the route cleared was different than filed and asked if it was going to work or if we needed to go over ZZZZZ and a large body of water route. They said the large body of water route was unavailable and they were working a plan for us. The cleared route took us inland along the large body of water coast and would eventually cut through ZZZ1 Center airspace. After several hand-offs from ZZZ2 [Center] to ZZZ3 [Center] to ZZZ4 [Center] we were given a vector and told that if we descended to FL220 they could get us through ZZZ1 [Center] Airspace. They then asked for our estimate for ZZZZZ1 intersection. By this time we were past ZZZZZ1 and heading south on XXX airway. ZZZ4 Center then terminated radar service and told us to report over ZZZZZ2 with ZZZ5 Center. We communicated this via ACARS to Dispatch and they told us we could not fly out of radar contact and to prepare to divert to ZZZ1 and standby for re-dispatch. We continued southbound on our clearance waiting for divert numbers from Dispatch. About 80 miles north of ZZZZZ2 we received an ACARS message to come up on ARINC. We tried to contact ARINC for the phone patch but another aircraft had a Medical Emergency with MEDLINK and were using the frequency. We decided the safest course of action would be to continue as cleared and contact ZZZ5 Center ASAP. Approaching ZZZZZ2 we contacted ZZZ5 Center and were able to establish contact and eventually got back in radar contact south of ZZZZZ2. Once in radar contact the rest of the flight was uneventful. Flying at FL220 silenced to ACARS Notification Bell. Due to workload, we were delayed in receiving some of the ACARS messages from Dispatch. Also, the ARINC frequency was being congested prevented us from communicating with Dispatch.

## Narrative: 1

Enroute IFR to ZZZ1 from ZZZ2 we were advised by ZZZ Center that there was control issue at ZZZ TRACON and that we would either have to divert to alternate airport or fly VFR to destination. The weather at ZZZ1 was good so we said we could plan to go VFR into ZZZ1 and we were cleared direct destination. At approximately 35 SE of ZZZ1 at 10,000 feet ZZZ Center asked if we were VMC and we advised we would be upon reaching 9,000 feet. At 9,000 feet we advised Center we were VMC and could proceed visually to ZZZ1. At that point we were on the boundary of ZZZ Class B. I specifically asked if Center would provide flight following through Class B enroute to ZZZ1. Center responded by saying something to the effect "Class B airspace is down." I assumed that ATC was saying that Class B airspace was not in effect due to ZZZ TRACON problem. We proceeded to ZZZ1 and landed without issue. I was then advised by ground control to call ZZZ Center. I called and explained what happened to man on duty. I later that day again spoke with the same individual and he advised me there was a COVID cleaning event that created the problem at TRACON. He advised me that the Controller who handled my flight was in error and did not handle the situation properly. In the event this situation ever happens again I need to make sure I work with ATC to obtain a clearance either out of or through Class B airspace. This was an unusual set of circumstances and that's when everyone involved should have a keener awareness of following proper protocol.

## Synopsis

Air taxi Captain reported an airspace violation after having to divert from original route due to a TRACON facility going ATC Zero.

Narrative: 1

On flight ABCD from ZZZ to ZZZ1 while boarding passenger seated in seat XX1 came on that aircraft with his mask below his nose and between his lips. I told that passenger his mask must come over his nose and mouth. He responded "He will try." I then offered him a company approved surgical mask that were provided by the company. He responded "No thanks." That was the first time of me asking him to put his mask on properly. During my compliant check before doing the safety demo, the mask was down again. I told him once again about the mask. That was the second time. During cabin service the mask was down again and I had to remind him once more. Once cabin service was over and passengers were given time to eat and drink, I then went around to collect trash and he was asleep with his mask down. I called out to him and he opened his eyes and I told him for the third time about his mask. Once we got to the final descent his mask was down and I reminded him once again for the fourth time. Once I told him this time he just looked at me and shook his head. This passenger (XX1) and his wife seated in XX2 were both sick. They were both coughing without covering their cough. The couple kept coughing during takeoff, throughout the flight and landing. The coughing drew the attention of other passengers to look. People are very scared and when they hear coughing and other passengers [are] not wearing mask properly they worry. Many verbal warnings were given.

## Synopsis

Flight Attendant reported that a passenger had to be reminded four times to wear a face mask. Flight Attendant stated that the passenger and his wife were coughing without covering their cough.

Narrative: 1

On Aircraft X from ZZZ to ZZZ1 I worked the AFT and passenger seated in seat X4 (Passenger X) boarded the aircraft with her mask down below her nose. Once she got to her seat the passenger seated next to her in seat X3 was calling me over for a seatbelt extender. I then told Passenger X that her mask had to be pulled up over her nose and mouth. She then pulled her mask up and then rested her head on the passenger shoulder sitting next to her. This was the first reminder. While doing [...] I noticed Passenger X had taken her mask down again. Once she noticed that I saw her she turned her head and pretended as if she was looking out the window with her mask still down. Once I handed Passenger X her snack I reminded her again for the second time about keeping her mask up covering her nose and mouth. She then slowly pulled it up. Passenger X was not compliant with mask policy and was determined to keep her mask down. While walking the cabin to check on passenger, once again Passenger X had her mask down again for the third time. This time when she seen me coming she immediately put her head down so I would not see her. She was taking this whole mask wearing as a joke. I reminded her once again. Passenger X and the passenger seated in front of her (Y4) were the only two passenger on the flight who were given several reminders. They both ignored what was being said and did what they wanted to do.

## Synopsis

Flight Attendant reported two passengers were not compliant with face mask policy.

## Narrative: 1

During the boarding process on Aircraft X from ZZZ to ZZZ1, I was working the AFT position. I noticed that the Passenger X seated in seat X4 had his mask down. He waited

until he passed my flying partner to pull it down. He took his seat and was talking to a passenger across from him. Once I was done saying my 5 minute to door closing announcement I began walking to the front of the aircraft. Once I got to row X, [Passenger X] had his mask down under his chin. I told Passenger X he had to place his mask over his nose and mouth. He looked at me rolled his eyes and did a heavy sigh. I walked away and Passenger X began discussing the mask issue with the passenger seated across from him whom I learned was his friend who was original assigned to seat Y1, but decided to change his seat to seat X1 instead. Passenger Y had an oversized laptop in the back seat pocket and I told him that he had to stow it in a bag under the seat in front of him or in an overhead bin. He replied "Yes, ma'am." Once the doors were closed I began doing my compliment check passenger seated in X4, Passenger X had his mask down below his nose this time. I spoke to him once again. He wasn't happy about it so he rolled his eyes again at me and snatched the mask up over his nose and shrugged his shoulders. This was the second time Passenger X had to be reminded about his mask.

## Narrative: 1

Enroute from ZZZ1-ZZZ2 [airport], Aircraft X, [Date]. Approaching ZZZ3 [airport] ATC informed us that ZZZ2 [airport] was not accepting any aircraft. Asked ATC for amplification and was told ZZZ1 Center [had a] COVID issue. Advised ATC of intention to divert to our scheduled alternate of ZZZ4 [airport]. A couple minutes later, ATC informed us ZZZ4 [airport] couldn't accept any more diversions. We were just east of ZZZ3 [airport] so I informed Dispatch that we were diverting to ZZZ [airport]. Dispatch initially told us to go to ZZZ4 [airport], but after I informed him ZZZ4 [airport] couldn't take anymore diversions, ZZZ [airport] was agreed upon. Landed at ZZZ [airport] and shut down on Gate X. I asked ATC about the delay. They told us about an hour. I informed the passenger and asked Dispatch for a new flight plan. It eventually came and I requested fuel. Pulled our clearance and received an EDCT of XA:X1L. Informed the passengers again. As we finished our cockpit prep for departure we are advised of a ground stop to ZZZ2 [airport]. I inform the passengers again. Called ZZZ [airport] operations to dump lavs and provide us with water and food. Lav cart was broken so we asked if we could use a [different airline] lav cart. [Different airline] said no. ZZZ [airport] only had one crew handling 2 diversions and their regular scheduled departures, so it was very difficult to get anything done. No food or water ever arrived. Received another EDCT of XC:Y1L. Aircraft Y gets tow bar hooked to their aircraft. I ask ops why the tow bar is hooked to the [other aircraft] and not us. I was told we had a passenger count issue. No one had left the plane at this point. Never figured out what the problem with the passenger count was. Aircraft Y tries to take our EDCT but we get another ground stop to ZZZ2 [airport]. About XB:Z0L, the agent finally gets back to us and we discuss deplaning. The agent makes the announcement and I follow up with another announcement about the delay, deplaning, and follow up about taking bags and boarding passes. I also inform them that rebooking needed to be done via phone because there was no one that could do it at ZZZ [airport]. 5 passengers deplane and one returns. We get another EDCT of XD:A4L. I inform Dispatch that that will exceed our MOT. Another EDCT is coordinated and we depart ZZZ [airport] at XC:Y1L. Upon landing at ZZZ2 [airport] at XD:B6L aircraft are parked on every taxiway and holding pad. I inform Dispatch that we need to get a gate ASAP. Finally on gate at XE:C6L. Multiple EDCTs with a couple ground stops just kept dragging us along. Initial thoughts were to keep passengers on aircraft because once we got our fuel, flight plan, etc., it was close to the original EDCT. After we received the first ground stop, I started thinking of the passengers. Thus, the request for food, water, and lav service. ZZZ [airport] personnel were overwhelmed and couldn't handle everything that was going on. This was a rare event that caused every plane going to ZZZ2 [airport] to divert. ZZZ [airport] operations was blind-sided and didn't have enough personnel to handle the demand that this caused. From a pilot perspective, there wasn't really anything we could do to prevent it.

## Synopsis

Air carrier Captain reported having to divert due to ATC COVID-19 issues at landing Center facility.

## Narrative: 1

On [date], Aircraft X, Passenger X, became very defensive and rude after I asked him to place his mask over his nose and mouth. His response for having it off was that he was drinking coffee, however, there was no coffee and he never disposed of any during trash pickup. After doing my compliance check, he ask if we had any mask that he could wear and drink at the same time in a condescending tone. I replied no and walked to the boarding door for departure. After door closure, Passenger X began to talk on the phone. After repeatedly asking him to get off, he did not comply. After the Captain made an announcement for all cellular devices to be in airplane mode, he still continued his conversation until he was done talking. His non-compliance and dismissive approached could be a risk in the unlikely event of an emergency in his future of flying.

## Synopsis

Flight Attendant reported a passenger was not compliant with face mask policy and talking on the phone when not allowed.

## Narrative: 1

On or around [date] on Aircraft X, ZZZ-ZZZ1 a Captain wasn't wearing his mask , I asked the Captain to please wear his mask if he wasn't eating or drinking and he complied. Passenger seated in front of the Captain wasn't wearing his mask as well. I asked the passenger and his wife to please wear their masks as well since they were watching a movie and "NOT EATING NOR DRINKING!" The passenger was seated in [seat] X4 and clearly didn't want to comply with the face mask policy. I received a complaint letter from this passenger who didn't want to wear a face mask when I was just doing my job. Other passengers in the cabin was complaining about the passenger in [seat] X4 who clearly wasn't wearing his mask over his nose and mouth. I made 1 announcement explaining our face covering policy. The face mask policy announcement has since been changed to reflect the face mask must be worn except while eating or drinking for a brief moment. In the future I will report on any employee if they are non-compliant since employees set the tone and pace on the flight. When employees don't comply with policy or procedures passengers think they can do the same and not comply. The Airline should not ask employees to follow policy and procedures and when customers send in bad letters make employees accountable.

## Synopsis

Flight attendant reported a deadheading Captain and a passenger were non-compliant with face mask policy.

## Narrative: 1

An hour before our flight, from ZZZ1-ZZZ2 the flight crew and I got a notification that ZZZ1 Center was going to close down for the duration of our flight due to COVID cleaning. The First Officer and I tried to be proactive by talking with Dispatch and ATC about possible re-routes or delays. We were told to expect an alternate route, but could not get a specific route. We received our PDC and it was as filed. Upon pushback, we started to taxi out, ATC gave us an alternate route. We spoke with Dispatch and confirmed we had more than enough fuel to make the flight. Right around the ZZZ4 area, the Center controllers gave us another route which took us even further west than originally planned. We spoke with Dispatch, and again confirmed we had the fuel to make the flight to ZZZ2. The route took us out west over STATE, south, and then due East back towards ZZZ2. Upon reaching our last way point out west, which would then take us due East, ATC then gave us a heading of 240, that took us in the complete opposite direction of where we needed to go. They then switch us to ZZZ Center, there were several other aircraft attempting to fly East but were also unable due to sequencing because of the ZZZ1 Center outage. Our fuel was showing 3700 pounds landing at ZZZ2, more than enough for us to continue the flight as planned. We checked on with the center controllers and it took several tries to establish contact due to the saturation of other flights trying to get in the direction we were going. We were finally able to get acknowledgement from the Controller who told us he was unsure of when we could expect a turn back to the East. The First Officer and I began to make a plan on what to do if we could not get turned back in the right direction in the next couple minutes. We were finally able to get back in contact with the Controller, he told us we were number 7-8 in line to get a turn East. The turn wasn't even confirmation that we would be back on our original route. We monitored our fuel and we decided that at 3000 pounds, due to the uncertainty that we could get our original clearance back on course to ZZZ2 that we would need to divert. We had ZZZ5 on our route to ZZZ2. I looked in our Jeppesen charts and noted that we had sufficient runway and facilities there to meet our needs if we were to divert. I confirmed with the First Officer that we would need to go there, given the circumstances if we could not get turned back on course. We hit our fuel mark of 3000 pounds, I reached out to ATC and told them we needed to divert due to fuel. The controller turned us in the direction of ZZZ5 and we started to prepare everything to land there. In the short amount of time we had, we reached out to Dispatch, let them know our plan. We got a hold of operations on the ground, advised them we would need fuel and a gate to get us refueled. We were able to get direct to the field, we landed with 3500 pounds of fuel. We taxied to the terminal, had a gate waiting for us, as well as a fuel truck. I called Dispatch once we landed to go over what had happened. The Dispatcher had us refilled already, with fuel totals. We spoke to operations at ZZZ5, they got us refueled and on our way within 40 min of landing. We were able to take off from ZZZ5 and make it to ZZZ2 about an hour and thirty minutes after our scheduled arrival time.

## Narrative: 1

Just received a message stating I did not complete [the] COVID assessment for yesterday. I believe I just forgot to send it due to flight deck distraction with maintenance in there. I

arrived at the aircraft and Maintenance was still on it completing their First Flight of the Day (FFOD) check so I had to wait and work around them in the flight deck. I did pre-flight the thermometer and take my temperature and all was OK. But with the mechanic in the flight deck and the FO and Forward FA it was a little busy. I thought I had submitted on the COVID digital assessment, but I must have forgotten and when I got to my seat I continued with my set up believing I had done it. I must have forgotten to submit. For now add it onto the checklist as a FFOD item. Or send us an ACARS message on our first flight. Maybe just have us when we check in on every leg to attest our fitness for duty that that counts as a COVID check. I think there are solutions to this COVID affirmation than just pulling up the COVID assessment. If we are not fit for duty for these reasons we should not be reporting to work anyway. I think scanning the barcode every leg is a much better way for pilots to confirm COVID compliance without adding an extra step which can, by accident, be forgotten to [be] taken.

## Synopsis

Air carrier Captain reported forgetting to complete the COVID-19 assessment before the flight due to a distraction.

## Narrative: 1

Departing ZZZ1 airport after a couple touch and goes I noticed Aircraft Y flying in front of us a mile or so. Before coming to ZZZ1 from ZZZ2 airport, I checked ForeFlight and erroneously gleaned that the airspace surrounding ZZZ1 and ZZZ was an MOA. But upon further inspection saw it was a Military Area. I did not contact ZZZ Approach at all. And am very sorry for my mistake. I recently got back into general aviation a few months back because of a lack of flying at my commercial flying job due to COVID.

## Narrative: 1

Passenger boarded with mask down but pulled [it] up before I could ask him to. He proceeded to pull down his mask and sit down. I asked him at that point to please pull up mask, it's airline's policy to wear mask over nose and mouth. He stared at me but pulled it up. Once in the air, during service, he had his face covering below his nose. I asked him if there was a reason he wasn't following Airline's policy, he replied "Listen I don't know what you're talking about." So I repeated the policy to him and asked him to pull up his mask. He was very defiant but pulled up his face covering.

## Narrative: 2

Passenger X's mask was down when boarding I asked him to pull up, he complied. He got to seat and pulled it down again, I approached and he pulled it up. During snack service it was down again. I asked him why he couldn't keep his mask up, did he understand the Company's Policy? He stated he didn't know what I was talking about. I told him the policy is to wear his mask over his nose and mouth for the duration of the flight, did he understand. Passenger X pulled up his mask with attitude and said lady," You don't want problems with me."

## Synopsis

## Narrative: 1

This occurred during flight. Passenger X is seated at X5. Another passenger flagged me and said that Passenger X was not wearing a mask, and that he was coughing. Passenger X was sleeping and I roused him on the arm and gave him his mask to put on, as he had placed the mask on his armrest. He put on his mask. But sometime shortly before arrival (maybe 30 minutes before), I found him again without a mask and tried to rouse him. But this time he was wearing huge noise cancellation headphones and would not respond to any tapping or rousing, and no response to my calling his name. He had drank some liquor during the flight, but not enough that he could not be roused. I believe he was ignoring me on purpose and pretending to sleep, and had put the headsets on as an excuse to not

hear me. Then the Captain called me that we had to prep the cabin early due to expected turbulence before landing. We then proceeded to do prep for landing. I again attempted to rouse Passenger X as his seat was reclined. And again, no response. I had to physically push his chair upright, as he would not respond to do it himself. Then I tried to rouse him again, tapping him, calling his name, and telling him to put on his mask. He finally slowly came awake. I put his mask in his hand (he again had put it on his armrest) and told him repeatedly to put on his mask. He finally complied. And as he was leaving the airplane, I saw him again take off his mask at the jetbridge. I believe Passenger X was doing everything on purpose, and that he was awake and just pretending to sleep. He would have had to have taken copious amounts of liquor to not have been aware of me rousing him, tapping him, or calling his name. He also had this huge headphones on. I feel strongly concerned about the possibility that he had done this before, and likely gotten away with it too. I am putting this on for the record, so there will be something to refer to in case he does it again.

Narrative: 1

Throughout the nearly two hour flight, customers part of X organization group refused to comply with the mask policy, repeatedly laughing and mocking us when we attempted to enforce the policy. Compliance simply did not occur. FA A and C spoke many times with various members of the group, to no avail. FA A and C also spoke with adult leaders of the group, who did nothing to encourage compliance. We requested leadership meet the flight upon landing, and we recommend the offending customers be denied further transport on our airline. Our request to deny them travel was not granted by leadership in ZZZ. The offending group of customers were allowed to continue on to their next flight.

## Synopsis

Flight Attendant reported a group of passengers did not comply with face mask policy throughout the flight.

## Narrative: 1

Just curious why we are using aircrafts that APU is INOP. We are jeopardizing the safety of our crew members and passengers for not using the HEPA filter when the aircraft is on the ground. Using the air hose isn't a solution either. It's just blowing air around. We should not be using the aircraft that APU is INOP. I just had this incident when we had an aircraft APU in INOP. Sorry for the last response.

## Narrative: 1

I was the pilot monitoring and my First Officer was the pilot flying on Aircraft X from ZZZ1 to ZZZ. We were rather high and fast at 6,000 feet with 250 knots when ATC cleared us for a visual approach for [Runway] XXL (backed up by RNAV XXL). Approach clearance included the altitude restriction to cross ZZZ2 VOR at or above 2,500 feet which is normal when landing south at ZZZ. However, in our effort to lose excess altitude and airspeed quickly we got busy, and that created a distraction in the cockpit. The result was our crossing the VOR at around 2,200 feet (RNAV FAF altitude). During our post flight de-brief, the First Officer told me that he was not aware of the safety alert memo on the chart page, which cautions pilots on being high and fast when landing south. He also told me that he was not sure of the location of ZZZ2 VOR on his navigational display. None of that was communicated while in flight. My being very familiar with operating in and out of ZZZ, and the past experience of working well with this particular First Officer, led me to assume that he was well aware of the uniqueness of the local procedures. I should know better than to make assumptions about my crew's awareness. What I should have done was bring that alert memo to his attention when he did not include that in his briefing. I should have realized that the First Officer's recent flight experience might have been lacking due to COVID pandemic induced schedule reductions. Again, a thorough briefing without my assuming First Officer's knowledge and awareness could have prevented the altitude deviation. I will be careful going forward.

## Narrative: 2

We were vectored off of the ZZZZZ arrival (landing south) for the visual [Runway] XXL. At this point, we were still holding 250 KIAS at 4,000 feet. We were given a heading to intercept and a clearance for the visual approach with the restriction to "cross the VOR above 2,500 feet." Although we had the aircraft stabilized by 1,500 feet AGL, we may have missed the crossing restriction by approximately 300 feet. During my approach briefing, I failed to notice the safety alert box located on the chart page. When we received the crossing restriction in the clearance, I struggled to find the VOR on the approach plate (RNAV XXL). First, I did not know which "VOR" the clearance was referencing. Second, the ZZZ VOR is not charted on the RNAV XXL approach plate. This caused a brief moment of confusion allowing me to get "behind" the aircraft. Instead of arming NAV mode, I engaged APPR mode. The Captain objected and NAV mode engaged. Realizing that we were fast, high and becoming task saturated with automation, I elected to disconnect the aircraft and fly the approach manually. We used gear and flaps to reduce airspeed before I lowered the nose to put the aircraft onto a glide path. We intercepted the glide path from above and managed to establish a stabilized approach by approximately 2,200 feet AGL. However, in my assumption that we were high on the approach anyway, I did not verify that we crossed the VOR at 2,500ft. The Captain made mention of this after the flight ended in the debrief. He believes that we may have actually crossed the VOR at 2,200 feet (300 feet low). I realize that my failure to thoroughly review and brief all necessary approach plates resulted in missing critical information that would have helped us avoid the threat of this unusual crossing restriction.

## Synopsis

Air carrier flight crew reported not making a crossing restriction on a visual approach.

## Narrative: 1

We pushed from Gate X, after a ATC delay and two CPDLC clearances. At (time) I called Ground frequency to request to taxi. We received clearance to taxi to [Runway] XXL via C. I read it back and we began to taxi. Moments later, while on C, Ground called to inquire what we were doing. I informed them we had just been called and given "Taxi to XXL via C" and that I read it back. Ground replied that he didn't believe we did. Ground came back and told us to squawk XXXX. We looked down and we had XXXY in there. Turns out our revised CPDLC contained a new routing as well as a new squawk, which we missed. We changed to the correct new code and were told to continue via same taxi route as given originally. No conflict with another aircraft was ever created. We speculated that our wrong squawk created the issue and confused Ground that the aircraft they saw moving wasn't the one they had given the taxi clearance to moments earlier, which was us all along. Probably overkill but we are filling this report simply over Ground's misunderstanding that we had never called for taxi, which we did.

## Narrative: 2

Pushed from Gate X in ZZZ over one hour late because ZZZ1 Center was shut down due to COVID cleaning. We were on our third Release with fuel and routing changes. I was dealing with numerous Passenger and Ops Agent issues. We started to push for the second time and received notification from Dispatch that we'd received a new Release. I called the jetway back and went to the podium to get the new Release. I asked the FO to check on our clearance. When I got back to the cockpit, we confirmed the new routing, re-briefed the routing and departure, input the new performance data, and ran the Before Push Checklist. We pushed back, started engines and ran the Before Taxi Checklist. The FO asked for taxi and I thought I heard them say for us to taxi to [Runway] XXL via Taxiway Charlie. He read that back, I confirmed the instructions and began to taxi. When we got on Taxiway C, they asked us "What Company aircraft is on Taxiway Charlie?" We responded

with our call sign and shortly thereafter, they asked us to squawk a different code. We'd both missed the fact that our squawk code had changed with the new clearance. We apologized, entered the new code and continue to taxi.

## Narrative: 1

The RE [RADAR East] was working a busy session and Finals was combined to RW [RADAR West]. However, when Finals is combined, usually the two controllers will each work their own finals traffic. The RE had Aircraft X on a base leg to Runway XXR at 2,000 feet. The RW Controller had a VFR Aircraft Y, southbound at 1,800 feet, west of the Runway XXR final approach course. The RE controller was distracted by another aircraft and forgot to turn Aircraft X. He went through the final approach course and conflicted with the VFR Aircraft Y. Both controllers issued traffic and Aircraft Y was able to maintain visual separation from Aircraft X. However, Aircraft X responded to a TCAS RA and climbed. Although separation was not lost, the situation was still concerning. I was working the desk and combined with AD [Arrival Data]. I had numerous duties on AD and wasn't able to provide consistent oversight. However, I observed that it was getting busy on RE and I suggested the controller give his finals traffic to the RW Controller who wasn't as busy. I did not direct the controller to do so, and so he declined my suggestion. At the time of the incident, I was coordinating a release off of a satellite airport, as part of my AD duties. I believe that it's getting too busy for the staffing that we currently have. We only had one Controller on break, so it would have been very difficult to split off another position. I am consistently having to work AD from the desk, and have been encouraged to do so as much as possible to minimize the number of controllers in the operation during COVID-19. The need for the CIC to work AD is also because we have so few controllers on the shift. I think I could have been more direct with the Controller, forcing him to hand off his finals traffic instead of suggesting it, and he could have used better techniques, such as not descending the arrival to the same altitude as the VFR aircraft. It should be noted that [personal reason] was the day before this incident. I'm not sure that that contributed, but I was more tired than normal.

## Synopsis

Front Line ATC Manager reported an airborne conflict and cited staffing levels as a contributing factor.

## Narrative: 1

ZZZ Center closed due to COVID cleaning. We had come into ZZZ [airport] after ZZZ Center closed. We received a new trip to ZZZ1. I was concerned about duty time, but the director of operations determined that it could be done. Also, upper management, had told us to "turn and burn" in ZZZ. The director of operations had filed a flight plan on or near land. The clearance we received was far from shore, due to ZZZ Center being closed. Due to concern over running out of duty time and company time pressure, the modified routing was not reviewed until we were established in cruise flight. I have been furloughed for several months recently, so I haven't given any thought to my company's lack of authorization to operate in Class 2 airspace. I have done so in the past in other employment positions in other organizations. I reverted to previous thinking in those positions and made a decision to continue to ZZZ1. We completed the flight uneventfully and landed in ZZZ1 as planned. No ATC concerns were voiced. I believe this is, of course, primarily due to the effects of the COVID pandemic, as so many life issues have been affected by this unprecedented event. However, all parties involved should have slowed down and thought more about all of the factors involved.

## Synopsis

Air taxi Captain reported not reviewing a modified route until after being airborne, which was too far off shore, and possibly running out of duty time. This was due to an ATC Center closing down for COVID-19 cleaning.

## Narrative: 1

Flight started out of ZZZ1 with an extended duty period that included X days "on the road" (unknown to the crew at the time). I did not verify the aircraft records to see when the next maintenance inspection was due. I usually always look at the aircraft book to see this information. I did "open" the aircraft book to retrieve the aircraft keys but did not check the numbers. We usually have our aircraft books in the office and was my practice to look at all the numbers in the office. During the COVID crisis it became our policy to keep the office locked up with no personnel so the books were now kept in the airplane. Without checking the numbers I flew .4 past the required inspection.

## Synopsis

Pilot reported flying an aircraft without the proper documentation and correct maintenance records.

## Narrative: 1

Flight Attendant was removed from flight due to COVID exposure. Pre-flight complete with review of AML. Airplane swap from a Type 1 to a Type 0, due too no FA replacement. Running behind schedule. Pre-flighted aircraft and apparently did not verify AML which was left behind and in Maintenance hands. Could have sworn both First Officer and I had hands on! Departed to ZZZ1 without AML. Rushed. I always turn around and confirm that AML is on board at the stage of the checklist when it's announced. Obviously a lack of attention on my part. Still can't believe it happened.

## Narrative: 2

During pre-flight the CA and I conducted our respective preflight duties, including the Before Start Checklist. At the line item AML and flight forms, we both verified that the AML was on the aircraft. The CA then placed it in the CA side bin. At XA: 25 I was notified by the Duty Chief that Maintenance reported the AML for aircraft and XXX was left in ZZZ. Unknown, as we do not know how the AML was left behind. In the future I will be more vigilant in checking that the AML is onboard once the flight deck door is closed.

Narrative: 1

After landing in ZZZZ I was advised by the charter rep that no cabin cleaning had been arranged. The flight had come in with passengers onboard. This resulted in the flight attendants cleaning the aircraft and with no ability for proper COVID mitigation. I queried Dispatch but nobody ever got back to me. Meanwhile the charter representative assured me that the cleaning they did was all that any Ground Personnel would do. He also wiped the bathrooms with clorox wipes and then assured me that the aircraft was fit to be boarded. The flight attendants on this crew went above and beyond the call of duty - especially considering that we were already over two hours late on a long duty day due to previous delays from late aircraft and snow storm in ZZZZ1.

## Synopsis

Air carrier Captain reported no ground crew was available to sanitize the aircraft resulting in the crew having to clean the aircraft prior to departure.

## Narrative: 1

Inbound to ZZZZ on ZZZZZ Star. Taken off STAR early and cleared direct to ZZZZ1 VOR. We were instantly 1,800 feet above the path. Proactively used speed brakes and planned to slow and extend flaps when below 20,000 feet, but were then told to keep speed at 250 KTS. Lowered landing gear shortly after passing ZZZZ1 to get back on profile. Was able to regain the VNAV path just prior to ZZZZZ1 and at Vref +10 per procedure. Flaps were at 25. Frequency was very busy and sky hazy. Very late hand off to Tower. Localizer did not correctly ID until just prior to FAF. FO was very busy with frequency changes, configuration changes and checklist. Tower did not clear us to land, but instructed us to continue as an aircraft was in position on our Runway, XXR. Another aircraft was holding short of XXR waiting to cross. At 1,000 feet I was at approach speed and called "stable," but was distracted by no landing clearance and aircraft on runway. Aircraft in position was cleared for immediate takeoff, we were cleared to land, and other aircraft was given clearance to cross XXR. Departing aircraft was slow to accelerate. Passing 500 feet FO made "stable" call. Shortly after we received an aural alert indicating we did not have landing flaps selected. Flaps indicator showed flaps at 25 degrees versus the planned and briefed of 30 degrees. I realized I had not asked for flaps 30 and was now below 400 feet. Elected not to make a configuration change to 30 degrees below 1,000 feet per procedure. Hesitant to go-around per procedure because I wasn't sure if the crossing aircraft had not just departed the inboard parallel Runway XXL, and the late departing XXR aircraft had just rotated. With the very hazy sky I was concerned about a conflict and /or overtaking the other aircraft during the go-around to increase speed to Vref+10 and land with flaps 25. Landing and rollout were normal. Despite adequate and recent experience into ZZZZ, these particular controllers were hard to understand. FO had to ask for clarification a few times in the last 1,500 feet FAF. FO had just returned from 7 months of leave, was called out on reserve, and had only flown once earlier, and 4 times in the last 7 months. I briefed the arrival and approach thoroughly and early, but it was a Max effort with the direct clearance. I believe he got distracted from completing the checklist when the localizer did not ID until just before the FAF. I was distracted from not calling for final flaps with the aircraft on the runway and the hazy conditions, and the late localizer ID. Add to the note of being at Vref +10 by the ZZZZZ1 fix, to be at final landing flaps. This may have helped me if I had a goal to complete that by the fix.

## Synopsis

Air carrier Captain reported an unstable approach and cited it was difficult to understand the controllers at this foreign location.

## Narrative: 1

While in cruise flight (FL370) we were cleared to cross the ZZZZZ intersection at FL330. The FO entered the new altitude and I confirmed it. We agreed to start down at the TOD. ATIS indicated that we could be landing either [Runway] XXC or XXR. I noticed the runway condition was 555 and total runway distance for Runway XXR was 7500 feet, which required a non-standard landing assessment. I started entering the numbers in the landing app, when I decided to look back at our progress. I immediately noticed that we had overflowed the TOD. I alerted the FO and he selected "OPEN DESCENT! I knew this would be insufficient and called out "My aircraft," he acknowledged and I attempted to make the restriction. I quickly realized there was no chance of making the restriction, so as I stabilized the descent, I instructed the FO to inform ATC would be unable to make the restriction (we would be high). After that I called for "autopilot 2 and we transferred control of the aircraft back to the FO. ATC acknowledged the transmission and we proceeded to the destination airport without further incident. I decided not to debrief until we were at the gate, so to avoid any further incidents. In an effort to stay ahead of the, all too often, last minute approach changes and subsequent rushed approach briefings at low altitude; I as the non-flying pilot, elected to proactively run the landing numbers and review the XXR approach plate. The obvious problem with that is, that the check and balance system for aircraft control is compromised when both pilots are not concentrating on the more immediate task at hand. It should be noted that the FO had just come from a training event to restore currency after almost 3 months off. My FO did list that as a threat on our very first flight of the day. As such, I had been trying to complete tasks earlier than usual, not only to avoid the problems associated with operations at ZZZ1 but also so I could more closely monitor him, but in this case it backfired. According to the report home page altitude deviations are the number one reported event, so I don't really know what could effectively prevent this type of event. Possibly, the best we could hope for is to reduce the frequency. For my part in reducing the frequency of which this event occurs, I will not address any other actions until the descent is begun and the altitude clearance is assured.

## Synopsis

Air carrier Captain reported not making a crossing restriction after realizing they had overflowed the top of descent.

## Narrative: 1

The event occurred because ZZZ is working a busy airport with one Controller utilizing all three frequencies. This is a major safety of flight issue as multiple links in the safety chain were broken that day. If the sharpness of the crews from Aircraft Y and Aircraft Z had not utilized full four ear policy and patience it could have been an issue. The actions taken by the ATC operation in ZZZ are uncalled for and unsafe. If this is overlooked there could be fatal consequences in the future. There are a few local airports in the area of ZZZ that are non-towered. If the Tower Controller delayed any further for us to be handed over to Departure, we could have had a collision or RA with an unknown aircraft all due to the unsafe actions of one Controller handling a workload bound for a minimum of two personal. On the morning of date, I was in command of flight Aircraft X, ZZZ to ZZZ1. The ZZZ Tower had one Controller working all three frequencies: clearance, ground, and Tower. This day was a busy morning with Aircraft A bound for ZZZ1, Aircraft Y to ZZZ3, Aircraft Z to ZZZ4, and us to ZZZ1 all departing at roughly the same time. When we called for our clearance on the delivery frequency, we noticed there was some bleed over as the Controller was issuing takeoff clearances. We had to repeat our request for a clearance but were given it with no issues. I released the brakes and we called for push shortly after. Aircraft Y also called for push after us. In the middle of our push back the Controller called on the ground frequency to inform Aircraft A of a delay to ZZZ2 for them. The two began to have a conversation on ground of a game plan to be made. As their conversation occurred our Ramp crew disconnected the tow bar and gave the wave off for an all clear to a taxi. I noticed Aircraft Y had pushed off gate X and we were pushed off of X+1 with our nose in the direction of travel to only exit at [intersection] with a head on collision. First Officer and I finished our "After Start Checklist" and cleared the area to begin our taxi. I switched on our taxi and nose lights to noticed Aircraft Y did the same. With the Controller

and Aircraft A conversation occurring to what was now a clearance being given with a read back to follow there was no way for me or Aircraft Y to have confirmation one was waiting for the other. There was dense fog and low visibility on the ramp that morning. Tower does not control the ramp and a courtesy call is requested. The weather was so bad we had a takeoff alternate of ZZZ5 that morning. It was a frustrating situation as Aircraft Y and I could barely make out the 2nd half of each other's aircraft, so it was a game of chicken. I tried to call over the radio and speak over the clearance being given but it did not work. Ultimately, I turned off my lights to give Aircraft Y the right of way. As we began our taxi to Runway X Aircraft Z called clearance to get their clearance to ZZZ4 and that now was being broadcast over the ground frequency adding to the safety issue that no one moving on the aircraft surface could talk to each other. The Tower issued Aircraft Y their takeoff clearance and told us we were next. After we got our takeoff clearance, we began the takeoff roll with no issues. As we continued our takeoff climb Aircraft Z called the Controller over the ground frequency. All we heard was the Controller responding over the Tower frequency meaning he was working all three frequencies still. This delayed our hand-off to departure and made us uneasy as the Tower radar could not see our path beyond a certain mileage. As we checked in with ZZZ Departure we were given an instruction to contact ZZZ3 Center as our time had been too long and radar services with ZZZ could not be utilized further. This told me the ZZZ airport Controller took too long to hand us off and impeded the Departure Controller from doing their job properly. We did not have sufficient air traffic control separation all due to the unsafe practices of the ZZZ airport and Air Traffic Control operation at the airport of ZZZ. ZZZ needs to hire another Controller! There must be at least one person working Ground and Delivery while another separate Controller works Tower. The operation in ZZZ has been compromised and it is scary to think that the unsafe actions are acceptable to those working in the ATC system.

## Synopsis

Air carrier Captain reported Air Traffic Controller was working Local, Ground, and Clearance Delivery on one frequency resulting in communication issues and a delayed hand-off to Departure Control.

## Narrative: 1

Failed to add an alternate on the flight when required by FOM. All of my other flights inbound to ZZZ1 had ZZZ2 listed as an alternate. It was simply a missed step on this one. This was one of the earlier departures on my desk and I was still dealing with a full outbound as well as a complicated swap between Aircraft X/Aircraft Y. While OJT was not being conducted at my desk, the Recovery Specialist was conducting OJT in the other chair. Overall and simply put, additional focus by myself or the Captain would have solved this issue. There is also an issue of our airline running behind schedule due to COVID-19

and those flights that would normally be airborne are now departing causing additional distraction. I would suggest that management take at least a temporary look at better matching our flights with the scheduled workload.

## Synopsis

Dispatcher reported not adding an alternate to a flight.

## Narrative: 1

On pushback the towbar broke. When I heard the noise I looked down and saw that the brakes were still set. I had failed to verify that they were released. Fortunately, maintenance found no damage on the inspection. The flight continued normally after we received a new release. There were numerous contributing factors that led to this place. This was my first international trip in quite some time. There were many issues related to COVID-19 and catering. Chief of which was no ice being available. I tried to coordinate with the station to get some even asking if the terminal restaurants had some they would spare. No luck. There was also a discussion between myself and the First Officer regarding the rarely used method to obtain the ATC clearance in ZZZZ. The First Officer said he wanted to get home early and I believe he initiated the call to ground for the push before I was ready. I hadn't yet removed my mask. I did not have my audio panel properly configured and my mask was blocking my view of those switches. Ground Control gave us a push clearance then added a last minute query as to which runway we wanted which the First Officer and I discussed and verified. I either missed the pushback crew saying they were ready or they did not initiate the standard sequence so I had to verify that they were ready. Ground then told us to hold our push and that stopped me from releasing the brakes at that point when I normally might have done so. There was also confusion with the pushback location. I could not locate it on the charts. We were also using a gate in a part of the terminal neither myself or the First Officer had been at before. As I was re-configuring my audio panel my watch flashed a [personal message.] Although I did not read it, I noticed it. That took my out of my routine and although I felt my legs relax after I thought I hit the pedals to release the brakes, they were still set. Although I have been with the company many years, I have also not been flying much lately, 4 legs in the last 90 days or so. I also don't know why my watch flashed a message when my phone was off. In the end it was a failure to verify the status of the parking brakes. I will redouble my efforts to ensure a verification that the brakes indicate they are released in the appropriate sequence going forward.

## Synopsis

Air carrier Captain reported not releasing the brakes before pushback resulting in a broken tow bar. The Captain cited multiple distractions and lack of flying as contributing factors.

## Narrative: 1

Early in the boarding process the Purser notified me of a family that was being defiant about wearing masks in compliance with company policy. After speaking with the family, the Purser still felt uneasy about the family. I then asked for a Customer Service Supervisor to meet the airplane. While discussing the issue with the supervisors and FAs, a separate family came forward to note their concern over the behavior of the first family. Two of the second family quickly began tearing up. Additionally, there was a passenger in

the vicinity of the problem family who had health issues. At this point, I decided to have the problem family removed.

## Synopsis

Air carrier Captain reported that during boarding a family was not compliant with face mask policy. After other passengers expressed concern, the Captain had the family removed from the flight.

## Narrative: 1

Working Radar East at ZZZ. I had approximately 14 aircraft. Aircraft X was on an arrival to ZZZ. I had many other over flights and 3 more arrivals into ZZZ. I got caught watching a separation of ZZZ also Traffic near another airport. I had based Aircraft X. I missed the turn to final. I tried to turn the Aircraft X back to ZZZ and was late in seeing Aircraft Y that was being vectored south of ZZZ to a nearby airport. When I saw Aircraft Y, I told Aircraft X to give me a tight turn to heading 020, if unable I'll need to turn to the south. I called traffic and the aircraft were really close. Aircraft X reported Aircraft Y insight and was climbing. They didn't report and RA at the time. Aircraft Y was also called traffic and told to maintain visual separation after they reported Aircraft X insight. Aircraft X was cleared for visual approach shortly afterwards. Due to the COVID staffing my crew continues to work short staffed. I allowed another controller to allow a VFR aircraft to be flying to conflict with my arrivals that drew attention away from the final at the time. I also should have handed off the arrivals to the West Controller that also had the finals at the time. The West Controller was the one that allowed the VFR traffic that I was watching in conflict with the arrival into ZZZ conflict.

## Synopsis

TRACON Controller reported an unsafe operation between an IFR carrier and a VFR aircraft resulting in an airborne conflict.

## Narrative: 1

I left ZZZ VFR to ZZZ1. I requested flight following from the Ground and was informed they are "Not allowed" to do this. (This in itself is part of a BIG problem). So I called [TRACON] Departure and requested the flight following -no problem - standby. After 10 minutes of standing by they come back and say ....oops - you're out of my airspace, ask the next ATC Controller. So I did, and they replied "No services available, ask the next Controller." I am TRYING to get thru the X VFR route which is at 5,500. There is a 5K bravo shelf right before it. I stay at 4,500 until I make two-way contact with the Bravo. It's incredibly busy - can't get a word in....I finally do and I was told "Cleared thru the Bravo, climb to 5,500" - I repeat it back. Then 3 minutes later, I hear my call sign again and was told "State your request" - very confused at this point, I say I want the X route and I'm told...."You better make a left 360 because you're about to enter Bravo and I haven't cleared you." Still very very confused, I make a left 360 - then he states, "Make a right 360 - huh?? Then he says, ok - I see you're already making a left 360, stay with that. Well, all that turning and confusion put me at around 5,200 (I was already climbing because I thought I was cleared). So I'm pretty sure I went into that Bravo space just above 5,000 and I immediately dropped as fast as I could back down to 4,500. 1/2 way thru my turn I was cleared the Bravo and X route. Guys - I'm not a novice pilot - I've done these VFR routes many times. I don't know what's going on with ZZZ Center. Here's what I think happened.....maybe someone was on UHF that I couldn't hear and that is who the Controller cleared through the Bravo - or maybe it was a similar tail number. I asked for clearance, heard it given to me, confirmed it back. I'm super curious as to what exactly happened. We are trained - if you don't know - ask. Well...that's only possible if you CAN ask and get into the frequency - I couldn't. I would never have entered the Bravo but for the Controller telling me "cleared thru the Bravo and climb to 5,500) - or at least I thought that was for me. If you're going to have VFR corridors - make them accessible - otherwise, just close them all down until you can staff them. Had I known up front it wasn't available, I would have just climbed to 10,500 and flown over. As for me - I'm just going to go IFR unless I can get flight following from the Ground. This is very dangerous - it's too busy and you're going to see an accident sometime soon.

## Synopsis

GA pilot reported communication issues with ATC while attempting to receive a Class Bravo clearance.

## Narrative: 1

When arriving at gate for our ZZZ-ZZZ1 flight, the Purser told the CS agent we needed a few minutes so we could do our required Safety duties (FA briefing which is required per safety checklist. Safety checks (which company says can be done during boarding which isn't the safest during COVID time), be at the boarding door after putting our bags away, get customer wipes for customers company's COVID safety protocol. The agent was told by inflight Supervisor X, ZZZ, to begin boarding on top of the flight attendants boarding the plane. When questioning Supervisor X about not giving us time to do our required safety duties Supervisor X's answer was "We can't hold boarding on a quick turn." I understand we all want an on-time operation but that shouldn't come at the cost of safety. Even the Captain was amazed that we were not given time to do our safety duties. I would like to know if flight attendants are required to brief as stated on the safety checklist or not, and if we are required to brief why are we not given the time to brief when we ask for 2 minutes. If we are not required to brief then please alter the safety checklist. What happened to safety is our top priority?

## Synopsis

Flight Attendant reported concerns with completing safety checks while passengers are boarding.

## Narrative: 1

We all have been complying with mask use at ZZZ to "Stop the spread" and for public image. I see the policy becoming more and more restrictive, and gets interpreted differently by people. Yes, we must wear a face covering while in the public. Yes, if we are unable to maintain social distance, we should also be wearing a covering outside of public area. What this does not address is the long term health effects of wearing a face covering every day of the week for hours at a time. Extended mask use can cause and is not limited to: 1.Shortness of Breath and Light headedness 2. Headaches 3. Dermatitis 4. A weakened Immune System ( your body is unable to rid toxic cell normally because they wind up staying in your face covering which causes bacteria to stay in your mouth. Having bacteria stay in your mouth leads to health issues such as dental issues (root canals, infections, etc.) Healthy oral hygiene is a necessity for heart health and overall health. 5.Chronic Respiratory Issues

## Synopsis

Customer Service Representative reported health related concerns with wearing face masks at work for extended periods of time.

## Narrative: 1

After going to the bathroom to clean my teeth, for a split moment, I forgot to put my mask back on. I realized it quickly and put it back. I don't think anybody realized it as most passengers were resting. It was a human mistake and I corrected it right away. It was a moment of forgetfulness.

## Narrative: 1

I was making my final walk through during taxi. I made it to the back of the aircraft. I made my checks and then the B Flight Attendant said there was a passenger being unruly during the safety briefing. I had her point him out. He was making snide remarks about the masks when they were mentioned in the PA's. As I was conducting my walk through back to the front of the aircraft, I noticed this passenger had his mask down. I asked him to return his mask and started to confirm with him his compliance and need to not interject during announcements. During this conversation, we received the cleared for departure ding. The B Flight Attendant was not in a jump seat but was in the galley confirming I had the correct passenger and keeping an eye on me. I was trying to gain compliance from the passenger when the aircraft began to take off. I was in the middle of the cabin dealing with this passenger and had to end the conversation and climb my way into my jump seat. I did not confirm that we were cleared for departure with the pilots, nor did any other crew member.

## Synopsis

Flight Attendant reported standing in the aisle talking with a non-compliant passenger regarding face mask policy when the aircraft began the takeoff roll.

### Narrative: 1

Boarding the flight from ZZZ-ZZZ1 half of the passengers on board either had their mask down or half down from their nose. We asked them several times as well as made all the announcements and I notified the Captain and the Gate Agent. The Captain made several announcements after the Agent brought down the flights designated Supervisor. The Supervisor proceeded to make an announcements to please follow the mask policy. They had to follow the company's mask policy or potentially be removed from the flight. Passengers complied but soon after we made a walk through, all the above passengers had their mask off, completely removed and not even visible. I notified the Captain and he told me to write down seat numbers. Upon arrival he would hand it to the Station Managers. ZZZ1 Supervisors and Gate Agents were informed and said thanks for our great work and professionalism. They will take care of the incident with the Station Manager.

### Synopsis

Flight Attendant reported several passengers would not comply with the face mask policy during boarding.

## Narrative: 1

I did not declare an emergency with ATC. We were already near Top of Descent with no traffic ahead. Getting medical attention was not time critical. The greatest risk was in the deplaning of our other passengers. While enroute to ZZZ, I was notified that "A man in [seat] XX1 had declared that he had a high fever prior to boarding, and that he now felt very ill." I queued an ACARS to Dispatch "call me med" and waited for more information. Once I got this additional information and spelling of the man's name, I sent the message and spoke with Medical and Dispatch in attendance. In the meantime, I got another call indicating the man now said that he just had high blood pressure and would be okay. The load was light and we agreed to move the man to the back row and to move other passengers forward. The Flight Attendant's temperature strip was inconclusive. This information was passed to Medical. We issued the man an N-95 mask, and he wore it. The advice from Medical was to provide Tylenol and continue to ZZZ. Paramedics would meet us at the gate. IMPORTANT, it was then that FA called back to say there was an identity mistake. The actual seat assignment was XX6, not XX1. This meant that the passenger's name was incorrect during the Dispatch/Medical call. The incorrect passenger name is omitted to avoid confusion. I sent the correct name to Dispatch via ACARS. On approach to ZZZ, the man aspirated on the carpet and floor next to the last row and could not wear a mask. FA's notified me of this on taxi-in. Because of the concern for COVID-19, we made the decision that we would have passengers deplane quickly, then allow either the paramedics to the passenger, or allow the man to deplane. Inflight Supervisor and Customer Service Supervisor were at gate and aware of the de-boarding plan. The paramedic overruled the plan and rushed aboard. He proceeded to escort the man passed all the economy passengers and then blocked the jet-way several moments to get him into a wheelchair. I ordered the First Class cabin to deplane after the paramedic passed on his way to the back. I'm glad I did. The aircraft was towed away for disinfection. I checked in with Flight Ops enroute prior to landing and told a call would not be required. Checked in with Chief Pilot on the day after to determine COVID-19 result. There was no answer as of this writing.

## Narrative: 1

Climbing out on the ZZZZZ2 RNAV Departure off [Runway] XX in ZZZ. We did a precautionary takeoff for LLWS reported on the ATIS. It was a light aircraft. We climbed at a high rate and got distracted with doing the Climb Checklist. Also we were accelerating to 250 knots, which masked the level off prompt on the PF FD display. We did not honor the 10,000 foot hold-down at ZZZZZ Intersection. The PF was hand flying and climbed to 10,400 feet before noticing the hold-down symbol on the MFD maps display route. The PF immediately began a descent to 10,000 feet. Upon which ATC queried if we were climbing via the ZZZZZ2 Departure. We acknowledged our mistake and corrected. Enhanced pilot monitoring, higher situational awareness climbing with a light aircraft and notice that things are moving fast and hold off on Climb Checklist until higher altitude with autopilot on [would help prevent this type of event].

## Narrative: 2

Normal departure and climbout. The Pilot Monitoring was slightly task saturated due to altitude approaching 10,000 feet, frequency change and checklist. The Pilot Flying failed to

level off at an intermediate altitude restriction on SID. The Pilot Flying didn't follow proper flight director guidance while hand flying the aircraft and could have used a higher level of automation. The aircraft climbed to 10,400 feet and immediately descended back to 10,000 feet when the Pilot Monitoring inquired and started to intervene. ATC asked to verify our climb clearance and stated the importance of the altitude restriction and said no other traffic was affected by our deviation. Use the highest level of automation to increase your situational awareness.

## Synopsis

Air carrier flight crew reported an altitude overshoot deviation due to the aircraft's light gross weight and high climb rate.

## Narrative: 1

I was notified about a report of a wrong surface landing. I was the Controller on the midnight shift. I cleared Aircraft X for Runway XXC, but the Aircraft landed Runway XXR. Approach switched the aircraft on an extended base for the visual approach [to] Runway XXC. The pilot checked on the frequency for Runway XXC. I cleared the aircraft to land for Runway XXC. After I cleared the plane to land the janitorial guy comes to the Tower cab to vacuum the Tower and empty the trash. I usually go opposite of him so we can keep our space (we had our mask on) for social distancing. When he finished cleaning the Local 3 position I recognized the aircraft was short final to Runway XXR. I knew the runway had no vehicles on it because my strip bay showed no vehicle above Runway XXR bay header. I let the aircraft land Runway XXR due to the critical phase in flight. I taxied the aircraft to the ramp after the aircraft landed safely. In the past Approach would call me on the shout line to remind me that this aircraft is set up on the wrong approach. By me not being at the position walking around the Tower cab I did not recognize the aircraft on approach for the wrong runway. The recommendations I would use to prevent this wrong surface landing is to observe an aircraft turn onto the right approach for the right runway. If that pilot makes a mistake turning on to the wrong approach I can either send the aircraft around or correct the aircraft to land on the proper runway, or I can help the pilot get visual for the runway the pilot is lined up for and clear the plane to land for that runway. The key is catching the aircraft turning on the approach early enough so I can correct the pilot.

## Synopsis

ATC Tower Controller reported an aircraft landed on the wrong runway and cited social distancing distraction during a janitorial service in the Tower as a contributing factor.

## Narrative: 1

I was working the FWD cabin and Flight Attendant (FA) B was working the AFT. During the flight FA B approached the galley and states to me that she was going to give Passenger X a face mask warning, because he was having a hard time complying to keeping the mask over his nose and she asked on numerous occasions before pushback, taxing out to the runway, and during the flight to keep his mask over his nose. I called flight deck to inform the Captain what was about to happen. So FA B gave the written policy to Passenger X and he stated he didn't want to see it. FA B informs me what happened and I call the flight deck. I tell the Captain she gave the warning and Passenger X refuses to hear it. The Captain states we'll just call for supervisors to meet us at the gate. FA B and I both say "okay." I decide to do a walk through in the cabin and notice Passenger X has his mask on covering his nose and mouth. I inform FA B and the Captain. Captain states that's great, but so there's no further issues with Passenger X we'll still have the Supervisor meet us. I say "fine." I guess noticing that FA B and myself are talking to the Captain inflight, Passenger X states to FA B he now wants to read the policy. Once seeing the policy and reading it Passenger X states to FA B that he's sorry. FA B then calls the Captain to let him know Passenger X has a change of heart. Captain still states he'll have the Supervisor meet the aircraft at the gate. We say "okay." Once at the gate, I open the main door and the supervisors are there. They wait for Passenger X to deplane to talk to him. The supervisors also state they will inform his connecting flight.

## Synopsis

Flight Attendant reported a passenger would not comply with face mask policy and was met at the arrival gate by supervisors.

Narrative: 1

I took the insert of the food catered for the pilots up to the flight deck prior to passenger boarding. The Captain asked me to set it on the jump-seat behind him. During boarding, the Captain came out and told us that the First Officer does not wear a mask in the flight deck and asked if either Flight Attendant A or myself would be willing to come up to the flight deck if the Captain needed a lavatory break in flight. We both said that we would not be comfortable with coming up there if the First Officer was not wearing a mask. Upon landing, I realized that the insert of flight deck food remained in the flight deck until after landing. Better CRM between flight deck and flight attendants if this situation comes up. I honestly don't think that anyone even thought about it. Flight Attendant A and I just knew that we were not going to put ourselves into the flight deck if the First Officer wasn't wearing a mask, which we would have had to in order to grab the insert. But it absolutely was not intentionally left on the flight deck for takeoff and landing on our part.

## Synopsis

Flight Attendant reported the FA crew were unwilling to enter the flight deck because the First Officer would not wear a face mask.

## Narrative: 1

Ever since we began wearing masks I am fearful of my job. I am getting headaches and at times migraines. When I get a headache, I am cranky so not always nice to passengers. I cannot communicate properly with my [coworkers], my customers, the agents, etc. In an evacuation, how are we to hear one another? We are in a metal tube with little oxygen already. What our company is spraying on the aircraft can be damaging to the human body. Neurologically speaking and hard to pinpoint.

## Synopsis

Flight Attendant reported experiencing health issues since the wearing of a face mask began and the use of sanitizing spray in the aircraft.

## Narrative: 1

Controller had to have had a mask on as his communications were muffled and thus hard to understand. We read back clearance to FL230 and as we were passing through 22,500 he said we were only cleared to FL220. He said to just continue to FL230 and that is what we did. No conflict was noted.

## Synopsis

Air carrier Captain reported an altitude deviation during climbout and cited communication problems with a Center Controller due to the Controller possibly wearing a face mask.

## Narrative: 1

A little while after reaching cruise altitude, the flight attendants contacted us to let us know that there was a passenger who was not complying with the mask policy. They were handling it per their guidance and keeping us informed. Later in the flight there had been some other problems that they had informed us about. The First Officer and I had completed a bathroom rotation just before starting down into ZZZ when we got a call from the flight attendants informing us they were [having problems with this passenger]. They just wanted to be sure we knew this. I asked them to let us know if there were any problems. Several minutes later, we received a call that this passenger had not taken kindly to the warning and had become "verbally combative." I thanked them for letting us know, and asked if everyone was okay. They replied yes, they were. I asked them to keep us informed if there were any changes or if anything escalated, they said they would. At this point we had begun the descent on the arrival into ZZZ, the First Officer had been flying the whole leg. He had been managing the radios as well while I was talking to the flight attendants. I considered that while the situation currently was Level 1, I felt it was most prudent to get the aircraft on the ground to protect my crew and the other passengers. Additionally, felt it would reduce my workload as well as my First Officer's if we requested priority handling. I told the First Officer what I was considering and why, and asked if he had any considerations. He agreed that was a good choice. I then requested priority handling with ZZZ approach and informed them of SOB and fuel remaining. I had sent an ACARS message to Dispatch informing them of our situation. I called ZZZ ops and informed them of the same. I then checked in with the flight attendants to ensure things were okay, which they were. I informed them we were accepting priority handling and would be on the ground as soon as possible. As we passed through 10,000 feet we kept the speed up around 315 knots to expedite our arrival. We were given radar vectors to a visual Runway X and landed uneventfully. We had to wait a few minutes for our gate as it was occupied. We pulled into the gate. The passenger disembarked and the situation was over. There were no injuries. After the plane was empty the crew got together in the front of the airplane for a debrief of the situation. At the end of the debrief I asked the flight attendants if they were okay and would be comfortable with continuing. They all felt that they were okay to continue. When the First Officer and I debriefed, I asked him the same and he was good. I took a moment to assess myself and determined I was good to continue as well. It is worth noting that the flight attendants did a very good job of keeping us informed as to the status of the situation. This was helpful and good crew CRM. They were clear in their communication, calm and professional. My First Officer also was a model of CRM and performed exceptionally to include his aircraft handling to expedite our arrival.

## Narrative: 2

Passenger wasn't complying with mask usage after being repeatedly requested to by flight attendants. Flight attendants issued warning after which passenger became verbally aggressive.

## Synopsis

Air carrier flight crew reported a passenger misconduct incident during flight that initiated due to non-compliance with face mask policy.

## Narrative: 1

The fatigue call that was made by myself and my First Officer was predicated by a very long day the day before as well as schedule changes on the day of the fatigue call. On [date 1], we flew 9.1 hours from ZZZ to ZZZ1 to ZZZ2 to ZZZ3. We had 30 minute or less turns the whole day, both passenger legs required lav services, and refueling was required at each stop. On approach into ZZZ1 we also had to break off the approach as the aircraft in front of us slowed down more than ATC anticipated. On approach into ZZZ2 we picked

up ice and frost underneath the wing clinging to the bottom of the cold soaked fuel tanks. We attempted to start the process for de-icing, but multiple aircraft had to be moved on the ramp for that to occur per the FBO. By the time the passengers arrived and bags were loaded the majority had melted and I used my hands to remove the rest. The flight down to ZZZ3 was 4.0 hours due to headwinds and we arrived at night time. The next day was only supposed to be one leg from ZZZ3 to ZZZ4 then it grew to include ZZZ4 to ZZZ5 once we got to the hotel. Only about 30 minutes prior to departure from ZZZ3 the next day were we informed that the day had grown to ZZZ3 to ZZZ4 to ZZZ6 to ZZZ7 and then once we arrived in ZZZ4 it had grown again to include a 4th leg back to ZZZ5 from ZZZ7. On our way into ZZZ7 we were informed by ATC that ZZZ Center would be going ATC zero for COVID cleaning and once we landed no clearances could be issued northbound. This would necessitate staying in ZZZ7 for the night and a show at XM:0X am to arrive at ZZZ5 for the passenger leg at XP:00 am. The fatigue from [Date 1] and [Date 2] would have only been amplified by the early show and so we decided it was not safe to continue as scheduled once we arrived in ZZZ7 for the night. The fatigue was further evidenced by the fact that while we were getting our bags out at ZZZ7 we discovered that a passenger [bag] from the ZZZ3 to ZZZ4 leg had been missed and was still in the aircraft.

## Synopsis

Air Taxi Captain reported calling off a flight due to fatigue from a grueling schedule they had for a couple of days.

Narrative: 1

Flight operated normally. After landing in ZZZZ and beginning flight planning for next leg I realized I had not signed the release prior to departure for the previous flight. I had just returned to the line after not flying for almost 7 months due to the pandemic. We were on a delay due to flight attendant staffing. I reviewed the release, saved it to my iPad, briefed my crew and even spoke with the Dispatcher prior to departure about the Flight Attendant issue and our timeline for departure. However I missed signing the release. Contributing factors include, lack of recent experience due to the pandemic, inability to print the dispatch release displayed on the ACARS.

## Synopsis

Air carrier Captain reported not signing the flight release prior to departure.

## Narrative: 1

During cruise flight, the Purser called to advise that the passenger seated in X was not complying with established face mask policy. Per the flight attendants, the passenger was

tearing layers of the mask away. The flight attendants offered a new face mask from onboard PPE provisions but the customer refused. The Purser advised multiple de-escalation attempts were made along with the flight deck making a PA. The Purser advised that non-compliance continued and, ultimately, the operations center was advised. A customer service representative was requested to meet the flight after coordination with the Inflight crew and operations center security. Purser advised that a FA a report would be submitted for this event.

## Synopsis

Air carrier Captain reported passenger was not compliant with face mask policy during flight.

## Narrative: 1

Three flights, three last minute gate changes, full on full off on through flight, weather delays, etc. Busy with pre-COVID like Ops tempo. We got a last minute gate change and when we got to our new aircraft we called for push, same callsign, from our old gate. Surprised Ground, but no conflicts noted. Ground Ops is struggling to keep up with changes and weather issues using COVID Manning and Procedures. Constant gate changes, especially on through flights, doesn't seem to be the best solution. Pilots need to be aware of post COVID procedures irregularities and adapt accordingly. This was a simple mistake but indicative of a larger issue. Called for push from wrong gate.

## Synopsis

Air carrier Captain reported using the wrong gate number when requesting push and cited last minute gate changes, weather delays, and time pressure as contributing factors.

Narrative: 1

Aircraft X was on the ZZZZZ departure climbing out of ZZZ. The [Sector X] Controller climbed the aircraft to FL330 and flashed the aircraft to [Sector Y] who followed the AIT and flashed it on to me working [Sector XY]. I recognized a limited aircraft at FL360 so I waited until there were no longer a factor and I looked over and did not see a [Sector Z] Controller at the other end of the room. I called [Sector X D side] and APPREQed control for climb for Aircraft X. The Controller said approved as requested. I climbed the aircraft to FL390 and violated Sector Z without a point out. I made several mistakes in this situation. I had known that [sector] Z was open since I had shipped multiple aircraft to that sector but when I looked over at the sector I did not see a Controller at [Sector Z]. The view of the [Sector Z Controller was blocked by the Sector X Controller. I did not see the Controller sitting behind the Sector X Controller. Another big contributing factor in this situation is that since Month during the COVID pandemic and the reduced traffic, we almost never opened sector Z. Now that traffic has been picking up and we have been utilizing the sector more often I have made this mistake. During the COVID posture we typically gave sector A control to climb on the ZZZ departures. That could also create a problem once sector XY opens. I needed to pay more attention to the current sector configurations.

## Synopsis

Center Controller reported an airspace violation and cited COVID-19 staffing and work environment configurations as contributing factors.

## Narrative: 1

The following is a list of concerns and questions regarding ZZZ Center's decision to go ATC Zero in the middle of the day as well as the process by which it occurred. I'm going to divide the report into three major issues with details below. I'm not sure how many of my colleagues will file individual reports, but this is a combination of many of our concerns as discussed during and after the event. The three major places we believe safety was jeopardized were: 1) The decision to close in the middle of the day on short notice. 2) Confusion between the published contingency plan and the COVID contingency plan. 3) The decision to not transition into ATC Zero procedures until only 30 minutes prior to the event. 1) Why close in the middle of the day? ZZZ Center has had multiple COVID positives since the beginning of the pandemic, and cleaning was always delayed until the mid-shift, when traffic is greatly reduced. In fact, in early Month 1, we had a Controller from the X Area report to work and leave in the middle of the shift because he was feeling sick. He took a test on his way home from work and reported back to the facility that he

was indeed COVID positive. His crew finished their shift, the night crew worked their entire shift, and then cleaning occurred on the mid. This is after a confirmed COVID was in the building, working traffic that very day. Yesterday, management became aware of the COVID positive the day before and the person hadn't been in the building since Month 1. However, the decision was made that cleaning had to be done immediately. Why the urgency this time? Closing airspace on a very busy travel day on short notice introduced innumerable safety risks to the system, not to mention greatly impacted the efficiency of the NAS nationwide. 2) Confusion regarding contingency plan. ZZZ Center has a published contingency plan, which we review at least annually. Procedures and routes have been developed to allow traffic to continue through the facility should it need to close unexpectedly. Apparently, a separate COVID contingency plan was developed outside of these procedures. There was quite a bit of confusion among the workforce regarding this discrepancy - including a NOTAM being published with the frequency from the existing contingency plan, which was actually not going to be used in this COVID plan. Additional issues from the Controller standpoint included a lack of understanding about what was actually happening to ZZZ Center airspace at XA:X0 local [time] when ATC Zero was declared. The contingency plan seems to indicate that ZZZ Center airspace is to be assumed by ZZZ1 Center and ZZZ2 Center, however ZZZ1 Center was under the assumption that ZZZ Center airspace was to be non-radar. To this end, approximately 25 minutes before ATC zero, an aircraft from ZZZ entered [Sector Y] airspace without a hand off. I called [Sector Z] to call radar on the aircraft, assuming that they were busy changing flight plans and forgot to initiate a hand off. The Controller told me on the line they had "terminated" the aircraft and they were monitoring ZZZ2 frequency. ZZZ1 Center was in contact with ZZZ2 Center and passing ZZZZZ [Intersection] estimates to the controllers there. I told ZZZ1 we were still open until XA:X0 and Controller told me they were informed we were closed 30 minutes before XA:X0 local. Finally, the COVID route into ZZZ2 ended at ZZZZZ1 at which point we were supposed to issue "rest of route unchanged." First of all, most of these aircraft did not have ZZZZZ1 on their route, so rest of route clearance doesn't make sense. Second, any aircraft headed to a northeast airport that got tied back into their route with a direct after ZZZZZ1 went right back into ZZZ Center east area airspace. Once again, the question of who owns that airspace, is it radar on non-radar communications into play. We asked for clarification, which didn't come so **we started to issue ZZZZZ1â€¦ZZZâ€¦next fix to go further north and around ZZZ Center.** We were never adequately briefed on this new COVID contingency, neither when it was developed, nor on the day it was to be implemented. It seemed every time someone came down from TMU (Traffic Management Unit) or the watch desk, we were being told something different. There was a general feeling among the workforce that this was being made up on the fly. 3) Too short of a time frame for implementing contingency plan. When airspace is blocked for special operations, routes are put out hours in advance. There are "all aircraft must be out of the area by xxxxZ" notes sent to surrounding facilities and published in NOTAMs. These special operations have become fairly routine at ZZZ Center and we still get procedures started early. ATC Zero in the middle of the day is a much more complicated issue affecting a much larger piece of airspace and many more routes. Regardless, the decision was made to operate essentially as normal until the ATC limited at 30 minutes before XA:X0 local. Beginning with the fact that it takes significantly more than 30 minutes to traverse ZZZ airspace, this was not nearly enough time to sterilize the airspace and ensure all remaining aircraft were established on the only acceptable routes through ZZZ when ATC Zero (COVID procedure) has been declared. Below is a small list of the issues this created: - As late as 50 minutes prior to XA:X0, aircraft were still departing ZZZ3 and airborne from airports with "bad routes." This created increased workload for sectors ZZ and YY as they tried to get aircraft established on good routing prior to the XA:X0 local ATC Zero. - Sector YY needed a D-side and had (estimated) 15+ tracks as late as 35 minutes prior to XA:X0 local ATC Zero. At a time when we should be well into the

transition into ATC Zero procedures, we were still working hard to separate aircraft and resolve conflicts. - Sector YX/ZX took hand offs on two slower moving aircraft near ZZZ4 at approximately 15 minutes prior to filed to ZZZ4 and ZZZ5. There was absolutely no way these aircraft could have been established on the legal contingency routes by XA:X0. We wound up negotiating with ZZZ1 Center [named] sector to take radar on these aircraft after we issued routes southeast towards their airspace. When we were forced to leave by management at XA:X0 (due to 10 hour shift limitations), these aircraft were switched to ZZZ1 Center, but well into ZZZ Center airspace and not on the established COVID routes. While it is still unclear if ZZZ Center was officially non-radar airspace or not, these aircraft were not on legal non-radar routes. Several controllers were very uncomfortable leaving the airspace in the configuration it was at XA:X0 (myself included). We felt there was more to be done before each of the aircraft we were responsible for was in a safe and legal place. There was a feeling that getting us out before we hit 10 hours was more important than having the procedures fully running properly. Of course, both could have easily occurred if the transition to ATC Zero procedures started earlier. 1) Closing in the middle of the day. In the future, short notice ATC Zero procedures should be reserved for immediate, dire emergencies and not be used for cleaning especially days after a positive person was in the building. The decision to go ATC Zero should not be taken lightly and the risks should be carefully measured before the decision is made. 2) Confusion regarding contingency plan. A complete, thorough contingency plan needs to be developed and properly briefed to all involved - from OM down to controllers. There should be no confusion about what is going to happen and what each individual facility and sector's responsibilities are to be. 3) Too short of a timeframe for ATC Zero implementation. When it is absolutely necessary to go to ATC Zero, the procedures must be implemented earlier. At a minimum, aircraft forecast to be in the affected airspace need to be given routing off of the ground. ATC Zero cannot be declared until each and every single aircraft in the affected airspace is accounted for and on an established contingency route.

#### Narrative: 2

ZZZ Center went ATC Zero for a mid-day for COVID cleaning. This had not been conducted before during the day shift at ZZZ Center, only on the mid shift. The COVID cleaners were slightly delayed for their cleaning resulting in the airspace being closed longer than Command Center and Management had anticipated. The Operation Manager and all of the Front Line Managers were told that the cleaning was completed in the control room. They all came into the building to see and smell how the environment was inside the control room. Within minutes most of management came back outside dry heaving and coughing severely and said that the areas (Control Room) needed more time for the chemical to settle. After approximately 15 minutes, Management told us to come back into the building. We all initially thought the smell was bad. It was truly hard to breath. After a short amount of time, I was experiencing confusion, headache, sore throat, shortness of breath, nausea and could taste the chemical with my mask on. The taste of the chemical today has still not gone away. It smells and tastes like insecticide. My throat is still a bit sore. Several controllers went home on sick leave because they could not breathe and were coughing. The Operations Manager and all of the Front Line Managers left the control room multiple times because the fumes were so bad. They needed fresh air. There was not enough time between when the COVID cleaning taking place and when we were told to come back into the building. I want to know what chemical I was breathing in for over 5 hours. I believe this harmed me. Tech Operations stated that everything was saturated in the control room. What we were breathing in was not safe.

#### Narrative: 3

This was a workplace safety event that arose after a COVID-19 cleaning. When we walked back into the building we saw supervisors and other controllers coughing and becoming light headed from the fumes of the chemicals used in the cleaning. I personally was light headed for around 30 minutes after coming back into the building and then it went away. When I would walk out of the TMU (Traffic Management Unit) area to use the restroom I would become light headed and get a small headache as the fumes and residual smell was stronger out in the hallway areas. I noticed my coworkers were light headed and having slurred speech from the fumes/chemicals as well. I could hear the controllers coughing out on the floor working the planes and saw and heard upper level management even saying they had to go back outside to get fresh air and was dry heaving from the residual fumes. Someone needs to check the chemicals used to make sure they are safe (for the controllers that are coming in to work during a pandemic) and to make sure we are safe in our work environment. There should be more time or a better way to air out the building so that we are not inundated with fumes and potentially harmful chemicals when we reenter the building.

#### Narrative: 4

ZZZ Center went ATC Zero during the middle of the day during one of the busier times of the year. I'm at Sector X and prior to sitting down on position, we briefly get briefed on what the procedures were and how to handle them. All aircraft heading northbound needed to be re-routed via one single routing. We would get an estimated time an aircraft would be over a certain fix (ZZZZZ1) and then terminate radar services and have them contact ZZZ2 Center at another fix (ZZZZZ2). We would then notate the termination time and give it to the Supervisor. I was working the sector by myself. So, I was basically shouting at the D-Side at the adjacent sector, to write down all the pertinent information on the flight strip to pass on to the Supervisor. It was a gigantic mess since the [Sector Y] controller was also getting the information from his aircraft and passing it on to the D-side. There were lots of airplanes and the entire process was chaotic. I don't believe the ATC Zero event should have occurred at the time that it did. It was dangerous because we are not non-radar controllers (unlike other areas whom are proficient daily) and were tasked with becoming ones in a real life setting. I would recommend that ATC Zero for ZZZ Center should not have happened in the middle of the day when it's one of the busiest travel times of the year. We should have also had time to get acclimated with the procedures prior to being thrown into the mix. I believe that there should have been more in-trail coming out of the terminal airspace to help alleviate the spacing that was required. Almost every altitude was being used since that was all we could do via non-radar.

#### Narrative: 5

I worked the R-side for these two positions during a short notice ZZZ Center ATC Zero event for a few hours occurred during a typically busy time of day. I was a firsthand witness to multiple instances of confusion among controllers and between controllers and pilots. Atypical and complex traffic patterns were planned for controllers to use but they proved to be incomplete or unclear to many. Having to review and implement the procedure specifically developed for this event within the same few hours showed that controllers were not on the same page. This added and unusual workload left the airspace vulnerable to unsafe situations. Follow the standard ATC Zero contingency plans outlined in the building, and allow for refresher training on implementing them.

#### Narrative: 6

Operated Aircraft X, ZZZ6 to ZZZ7. After reaching cruising altitude our dispatcher mentioned that ZZZ Center was going ATC Zero but that it shouldn't affect us. Unfortunately, later on ZZZ8 Center mentioned that in about 200 miles from our current

position at the time we were going to have to cruise at 10,000 feet the rest of the way to ZZZ7. We immediately told our Dispatcher the information following ATC Zero procedures from our iPads. We asked them to coordinate alternates for us, we told them our options were ZZZ9, ZZZ10 or ZZZ4. We ran numbers for all of them by cruising at 10,000 feet and ZZZ4 was our best choice, we told this to Dispatcher but never got a suggestion of alternate from them. At this point ZZZ8 Center was insisting that we needed to tell them our plan because they had to start us down to 10,000 feet in a few minutes. Eventually we told ATC we were proceeding to ZZZ4, and communicated this decision to our dispatcher via ACARS. Soon after this, our dispatcher sent us an ACARS changing our destination to ZZZ4. We eventually landed in ZZZ4 to obtain extra fuel, and then proceeded for a safe arrival into ZZZ7. ATC explaining the reason for our early descent to 10,000 feet due to ZZZ Center closure. ZZZ Center going ATC Zero due to cleaning facilities, which cause ATC to tell us that they would have to descend us 10,000 feet and fly that way all the way into ZZZ7 from present position at the time. We ran our fuel numbers and unfortunately we were going to be unable to do that all the way into ZZZ7 with a comfortable amount of extra fuel remaining. Followed ATC instructions, ATC Zero procedures in our manuals, and notified Dispatcher of the need of a possible diversion due to unplanned early descent to 10,000 feet. Suggestion would be to follow ATC Zero procedures from the iPad as listed, especially with unplanned closure of centers due to cleaning. We followed the steps of ATC Zero in the iPad. Unfortunately, we didn't get expedited response from Dispatch at the time regarding suitable alternates. We communicated our fuel on board, tried to coordinate suitable alternates with comfortable extra fuel remaining, but we didn't receive a list of coordinated alternates according to the iPad. At the same time ATC kept insisting they needed a new plan due to the ZZZ Center closure in a few minutes. Therefore, the FO (First Officer) and I determined that the best choice would be ZZZ4 which gave us plenty of extra fuel remaining by cruising at 10,000 feet. We eventually told our dispatcher that we were proceeding to ZZZ4 to grab extra fuel since ATC couldn't wait any longer for them to respond about the decision of going to ZZZ4. Eventually we received an ACARS with an amended release of new destination ZZZ4, and a coordinated arrival with Ops (Airport Operations) at ZZZ4.

## Narrative: 7

What needs to be looked at here is the motivation to clearly flight plan a trip without regard to the FOM or FAR requirements. You can be out of radar environment and make position reports, but if the agency controlling has been shut down, who would you be making the reports to? This would have put the aircraft in an overwater non-radar, non-communication environment for over 200 miles. Another less experienced crew may have accepted dispatches confirmation that, yes we can do that. This also may have been influenced by pressure from scheduling that, if we don't get that airplane off the ground the crew will time out. All these things need review and corrective actions need to be implemented to never put flight crews in a precarious position again. During the afternoon of [Date] ZZZ Center was to be shut down due to virus decontamination. We were able to leave ZZZ11 for ZZZ6 before this happened. Upon arrival in ZZZ6 we were told of a delay due to this closing. This delay would cause us to exceed our FDP (Flight Duty Period) of 13:00 hours. Both the FO (First Officer) and I declined extending our FDP. I then received our flight release with the following notes. "Only non-surveillance separation will be provided between ZZZZZ3 and ZZZZZ4". "No ATC com will be available between ZZZZZ3 and 50nm N of ZZZZZ5." I contacted Dispatch with the legality of this release and was told "Yes we are allowed to do this." My next call was to the on duty Chief Pilot. My concern was I could not recall any relief from continuous com between the aircraft and ATC. The Chief Pilot made some calls and confirmed my thoughts that we could not operate under this condition. Luckily ZZZ Center re-opened sooner than expected and we were able to complete the day within our FDP.

## Synopsis

Five Center controllers and two air carrier captains (different flights) reported safety concerns relating to the closure of an ATC Center during the middle of the day for COVID-19 cleaning.

## Narrative: 1

Throughout all stages of the flight Passenger X and Passenger Y, kept removing their face masks to talk to each other and their daughter. Passenger X kept her mask below her chin throughout boarding and when I passed by her I told her she needed to keep her mask on. She initially complied but for the rest of the flight she kept pulling her mask down and placing her fingers in her mouth and on her nose. During final compliance checks before

landing her mask was down again and she was touching her nose. I told her to pull her mask up again. She refused and said she needed to blow her nose because of an ear issue. I told her she can pull her mask up over her nose and mouth and then pinch her nose over the mask and blow to relieve the pressure. She refused. I told her again that regardless her mask needs to cover her nose and mouth and continued my compliance checks. She ignored me and kept her mask down for landing. The couple did not take the mask policy seriously and ignored my warnings as if they were merely suggestions. They were blatantly non-compliant and they did not require their daughter to wear her mask at any time either. I believe that the couple should be placed on the mask noncompliance list because of their blatant non-compliant behavior and the way they ignored my instructions. There was not time during the flight to issue the warning or to call the pilots to arrange for [customer service] to meet the flight because we were in final descent during sterile cockpit.

## Synopsis

Flight Attendant reported a family was non-compliant with face mask policy throughout the flight.

## Narrative: 1

This aircraft came in late, we were on the jet bridge while the cleaners cleaned and rushed during this pandemic on a full flight sanitizing the aircraft properly is what we are promising our passengers. We did not see the cleaners with X sprayer on aircraft that is announced to our passengers. They are trusting us to provide a safe and clean cabin during this pandemic and a quick turn makes that challenging. Furthermore, passengers were boarded right behind crew, our bags were not put away we hadn't done safety checks yet and with people boarding made it challenging to complete during boarding

process. No social distancing was done during boarding, customer service manager wrote in group chat to try to close on time. Meanwhile aisles are full, safety checks had not been completed and passengers were back into the jet bridge to terminal. As we all would love things to be normal we are not currently in that situation with a global pandemic. I was forced to have passengers standing directly in front of me with no room to turn because again, no social distancing took place. Not to mention I was told by company I was exposed on [Date], by COVID positive crew member, so I was really trying my best to not be directly in anyone's faces and wore 2 masks just in case until I [am] able to be tested. We have to do all we can to keep everyone safe and rushing quick turns and not properly inspecting is not part of our values. I was able to complete my checks right before the door closed. And was able to brief UM after the door closed.

## Synopsis

Flight Attendant reported quick turnarounds on full flights make it difficult to social distance, complete safety checks, and for cleaning crews to properly sanitize the aircraft.

## Narrative: 1

Customer boarded with face covering mouth only, immediately advised covering must cover nose also. While stowing bags nose [was] still not covered. I politely asked would she like a different mask. Customer immediately put her face inches from mine asking was

this ok? I felt very uncomfortable having customer do this. Customer sat down as husband tried to explain how she was not wearing mask correctly. He apologized for her. She yelled across aisle not to apologize as she did nothing wrong. They had 2 children not wearing masks either. I personally felt threatened by this lady. And if she had COVID by yelling in my face I feel very paranoid and upset about this happening. Gate agent came on board told her again about not wearing mask correctly and advised if [there were] issues in flight [the] Captain would divert. She was compliant in flight. Children were not.

## Narrative: 1

I asked the Flight Attendant A to please wear her mask properly when sitting together on the jumpseat and when talking with me. If she would keep a safe distance, that would be acceptable for the later. Just not without distancing. She informed me that her asthma makes it hard for her to breath. She also informed me that it keeps slipping down. I told her that I need her to please wear it properly and she said that she would try. It was clear that the mask was not going to cover her nose so, I called for a Supervisor to mediate the situation. They witnessed her mask below her nose and asked her to change the mask to a mask that would not keep falling down. After a lengthy discussion, she complied. During the safety demo and flight, I asked a passenger to please wear his mask over both his nose and mouth. He told me that having his mask under his nostrils is acceptable. I informed him that our policy states that it has to be worn over his nose and mouth. I offered to show him the policy and he declined. He said that the policy was stupid and that he was going to write airline about it. He asked for my name and I gave it to him.

## Narrative: 1

After a lengthy delay of 4 hours in ZZZ1 due to weather and COVID in ZZZ we departed and the flight was normal and uneventful until descent on the ZZZZZ STAR into ZZZ. I was PM, so I was on the radio and ZZZ Center gave us cross ZZZZZ1 [Intersection] at 11,000 and 250 knots. I repeated the clearance then verified it with my Captain who began putting it into the MCDU and set 11,000 in the altitude selector. I glanced down and confirmed and then returned to looking for ice buildup. Within a half mile of ZZZZZ1 ATC called and re-cleared us to descend and maintain 11,000 and maintain 250 knots. I repeated the new clearance and then my Captain and I noticed that our initial clearance for ZZZZZ1 was inadvertently selected on the next fix ZZZZZ2 which is 7 miles from ZZZZZ1 and has 11,000 feet restriction on the STAR. While there was an error I do not believe an FAR was violated because ATC was diligent and noticed we were not going to make the assigned restriction and re-cleared us before the restriction. Furthermore when I apologized to ATC they said no worries have a good night and they shipped us to the next Controller. I believe this could have been avoided if my Captain and I spent an extra second looking at the MCDU before ZZZZZ3 it. I believe factors that played into this were two long legs with a 4 hour delay in ZZZ1. To reiterate I do not believe an FAR or clearance was violated, but it was close so my Captain and I decided to write a report.

## Synopsis

Air carrier First Officer reported not making a crossing restriction during descent.

## Narrative: 1

A passenger in seat X was displaying COVID-19 like symptoms. He stated that it was asthma. We contacted the company and the ground security. The ground security coordinator contacted medlink and med link advised the ground security coordinator to remove the passenger from the flight. I made an announcement in regards to what happened. I explained to the remaining passengers that if they wanted to disembark the aircraft because of the situation they were allowed to. Only one person left the aircraft. When we got to ZZZ1 we found out that indeed it was only asthma.

## Synopsis

Air carrier Captain reported a passenger was removed from flight after exhibiting COVID-19 like symptoms. Post flight, the crew found out the passenger did have asthma.

## Narrative: 1

Slow Pressure Leak at FLXXX. This trip started as a 3 day ZZZ1 airport. Flight X was the second segment on day 1 from ZZZ2 to ZZZ3. My First Officer, was the flying pilot for this leg. Loading and boarding were normal, and the flight was full. At push time a passenger stood up and ran to the lav, so we waited and pushed off gate X at XA:XXz. We taxied to Runway XL for takeoff, the weather was beautiful. With [FO] flying we departed XL on the ZZZZZ2 RNAV Departure to ZZZZZ. Our route would take us from ZZZZZ to ZZZ4 ZZZ5 ZZZZZ1 into ZZZ3. It was a beautiful day, we could see the front range clearly with [Mountain Peak] in the distance and nearly unlimited visibility. The departure was uneventful, passing 10,000 feet I turned off the Sterile Cockpit light and gave a double ding, checked the pressure which was operating normally. (A habit ever since my [X type aircraft] days, as they tended to be leaky airplanes, and because I read a story about an airliner that took off with the mode selector in the wrong position and all lives were lost). As such, I try to check it every so often in the climb. Again passing 18,000 we did our flows, I checked the fuel which was feeding evenly and normally and again we were pressurizing normally. I checked fuel and cabin pressure one more time and all was normal. We had a continuous climb to FLXXX without a single level off, which is unusual for ZZZ2. In level flight at FLXXX I checked the fuel passing ZZZZZ Intersection and all was normal 2 minutes ahead. We were both still on headset with our speakers off at this

point. Shortly after ZZZZ when we were just starting to settle in at cruise from ZZZZ to ZZZ4 intersection, the Master Warning Illuminated with a Siren and a Cabin Altitude EICAS. I glanced up and saw the Cabin Altitude light and the Cabin altitude between the 10 and 15 mark. We immediately donned our masks. Upon donning my mask the expansion strap knocked the ear piece out of my left ear, so it was dangling somewhere off the O2 mask. With the Boom/Oxy switch in Oxy, I could not hear myself until I turned up my speaker. Donning the mask was interesting, with earpieces, eye glasses, and not to mention the removal of a COVID mask that [FO] was wearing. It took a few seconds to get the mask on and check in. In any event with both our speakers up we checked in on O2 and I requested priority handling while accessing the QRC. FO immediately started the descent. We initially started down with 14,000 feet in the window which I knew would clear the terrain until I could check the Grid MORA's more thoroughly. Running the QRC, we confirmed O2 on 100% with communications established, Engine Bleed Air switches were on and both Packs were on. The next step; Step 5 says, Choose one: Cabin Altitude is Controllable: or Cabin Altitude is uncontrollable: When I looked up I saw the cabin steady between the 10,000 and 15,000 marks on the gauge and was not climbing, but was obviously higher than a normal cabin. The Auto Inop lights were not illuminated and we were currently in Auto 2, so I decided to select Auto 1. At this point nothing changed, but the outflow valve appeared closed and the cabin seemed to be steady. I chose to continue the checklist with step 6 PASS OXY (If cabin Altitude 14,000 feet) ON. I knew the masks had deployed because I could hear the flight attendants on the PA telling the passengers to put on their masks. Structural integrity was not in doubt, so I confirmed with FO that all the steps in step 8 were accomplished. FO had done a great job and had accomplished all the steps, MCP was set at 14000, FLCH, Thrust was IDLE, Speed Brakes were extended, Speed was set at VMO, so I turned on the seat belt sign, ATC had been notified, so I did not set 7700 on the transponder. I looked back up and at this point the cabin was slowly decreasing. At no point did the cabin ever go out of the 10,000 to 15,000 marks on the cabin pressure. At the most the cabin is estimated to have reached approximately 14,000 or a bit less (Maybe 13,000 or so). Between the 3 of us in the cockpit, that is about the highest any of us saw. You must interpolate because the gauge only has a marks for 10 and 15. At some point during all this the flight attendants called the cockpit and I told the jump seater to take the call which he did. I quickly checked the Grid MORA's and confirmed the 10,000 was safe, so FO requested 10,000 and I set it in the window. At this point and altitude the cabin was stable. We were well into the descent and the cabin had started descending. I continued the checklist with the expanded items in the checklist, altimeters were set. Initially we requested a divert to ZZZ6, as we were both familiar with the field and it was the nearest suitable airport. I took the airplane from FO so he could set up which again he did very quickly. I gave FO back the airplane and called the flight attendants. They informed me that everything in the back was fine and I told them they no longer needed the masks. Now we started a conversation about our divert options. With the passengers, all safe and no issues, we checked our fuel and determined that we had plenty of fuel to safely return to ZZZ2. The cabin altitude was sitting somewhere around 6 to 7 thousand feet. I sent a quick note to dispatch to call me, so they sent me a frequency. We were unable to reach them, so they sent me a second frequency which also did not work (Probably because we were at 10,000 feet). I then established communication through the SAT Comm to the Dispatch, because there was no direct connection for sector X. The dispatcher that answered handed me off to the sector X dispatcher, and he agreed that ZZZ2 was a good choice and said he would let everyone know. After clearing with Dispatch, we discussed our plan and then informed ATC we no longer needed priority handling and that we were not an emergency and would like to proceed to ZZZ2. They routed us direct ZZZZZ2...so I called the FAs and informed them of the new details and time. They again informed me that everything was fine in the back and the cabin was secure. I made a brief PA announcement to inform the passengers of

our situation and our return to ZZZ2. In the cockpit, we all started a discussion about the plan and confirmed that we had notified all the parties concerned and accomplished all the appropriate actions. I asked Captain Y if there was anything else he could think of and he said, no you did everything you can do. I requested landing data for [Runway] YL and FO briefed the Visual approach. We accomplished the Descent Checklist and FO flew a beautiful uneventful visual approach to Runway YL. Once on the ground we taxied back to gate X and handed the plane over to maintenance. Two things that are interesting about this situation: First, when donning O2 masks and establishing communications. Because we both turned our speakers all the way up, it made initial communication both inside and outside the aircraft difficult, due to feedback between the 2 speakers. Also, I transmitted once outside the aircraft instead of inside with the rocker switch on the yoke. The second and more interesting point is that whenever you practice a depressurization in the simulator, it is always an explosive rapid decompression. This was not like that at all, this was an airplane that had a high cabin with a gauge reading between the 10,000 and 15,000 marks. A higher than normal altitude but not climbing. At the point on the checklist when it says "Cabin altitude is controllable:" It says "Attempt to reduce cabin altitude by switching to the other auto controller (or manual mode if AUTO INOP is illuminated)." I think it would be better worded to say Cabin altitude is controllable and can be returned to a normal cabin altitude. In our case it was a high cabin, but not one that was continuing to climb. So is that controllable? We decided to continue with the uncontrollable portion of the checklist and drop the masks etc. So, what went well? Our planning and decision making, and workload management went well. We constantly evaluated our situation and adjusted our plan as we gained more info and had the ability to discuss our options. What could have gone better? The communication while on O2 masks. Next time I would make sure my ear piece stays in my ear and or I would turn down my cockpit speaker so that we do not get so much feedback over the speakers. I feel that all in all, this was a well-executed event by all concerned ending with a safe return for passengers and crew.

## Narrative: 2

Aircraft X departed ZZZ2 for ZZZ3 on [Date] with Captain X (pilot monitoring), First Officer Y (pilot flying), and Captain Y (flight deck jumpseater). Takeoff from Runway XL and the ZZZZZ2 departure were uneventful, with no clouds, unlimited visibility, and light winds. Shortly after reaching FLXXX, with the autopilot and autothrottles on, the CABIN ALTITUDE EICAS message was displayed and its associated siren sounded. All flight crew members donned oxygen masks and crew communications were established. I noticed the cabin altitude indicator reading approximately 10,000 feet. Captain X ordered an immediate descent, and advised ZZZ Center that we were descending to 14,000 feet. ZZZ Center cleared us to descend, and advised that there was no conflicting traffic. I initiated the descent by putting 14,000 in the altitude window and pushing FLCH, followed by deploying the speed brakes and selecting a higher indicated airspeed. I continued increasing the airspeed as VMO increased. As I was flying the descent, Captain X ran the CABIN ALTITUDE checklist. Once the checklist was complete, Captain X brought up the Alternates page in the FMC and we discussed possible diversion airports. ZZZ6 was chosen as the nearest suitable airport and ZZZ Center cleared us direct to ZZZ6. Captain X focused on diversion planning and communication while I flew the airplane and talked to ATC, who cleared us to continue our descent to 10,000 feet. Once we were level at 10,000 feet, we reconsidered the decision to land at ZZZ6. Captain X confirmed that the situation in the passenger cabin was under control, the situation was stabilized, and our fuel state was sufficient to continue to ZZZ2. After coordinating with Dispatch, the decision was made to change diversion airports to ZZZ2. The flight to ZZZ2 at 10,000 feet was uneventful. ZZZ6 Approach provided a route to ZZZ2, which was then simplified to radar vectors by ZZZ Center and ZZZ2 Approach to a visual approach to Runway XL. A normal approach and landing were followed by a normal taxi to gate X. Other notes and

observations: When the alarm sounded, I was wearing a surgical mask, glasses, and a headset, and holding my company iPad. I was startled by the warning, and before donning my oxygen mask, I reflexively checked the cabin altitude, and saw that it was approximately 10,000 feet. As I donned my oxygen mask, I knocked my glasses askew and my headset off, and left my surgical mask on. I had to release my oxygen mask to remove the surgical mask, and then get my glasses situated on my face. I abandoned the headset in favor of the speaker. Captain X had some difficulty with his earpiece, as well as with the comm panel (transmitting on the radio rather than the intercom at one point). Additionally, we both experienced feedback when attempting to communicate with each other. This resulted in poor crew communication during the initial stage of the descent, while Captain X was running the checklist. Once the checklist was complete, we were able to troubleshoot our communications and they improved. However, I was lacking situational awareness of the situation in the early stages due to the communication issues. During the descent, Captains X and Y reported a maximum cabin altitude between 14,000 and 15,000 feet. I did not observe the cabin pressurization system during the descent, as my focus was on flying the airplane. Captain X had difficulty coordinating with Dispatch. He sent a "Call Me" request via ACARS and received several VHF frequencies, but all failed, possibly due to our low altitude (10,000 MSL, 5,000 AGL). He reverted to satellite communications, and was again hampered, this time because our dispatch sector did not appear in the SATCOM directory. He was eventually transferred to the correct sector and was able to coordinate our diversion. Captain X did an outstanding job of crew resource management, using me to fly the plane and coordinate with ATC, and using Captain Y as an additional resource for communication with the cabin. Additionally, he asked for and received input from both Captain Y and me, and used that input to guide his decisions about our diversion. All ATC agencies (ZZZ Center, ZZZ6 Approach, ZZZ2 Approach, and ZZZ2 Tower) were extremely helpful and professional, providing all requested assistance without delay. Captain X left the flight deck promptly once the parking checklist was complete to reassure the passengers and flight attendants. Several people commented that they were happy to see him in the cabin during the deplaning process. Debrief Items: What went well? Decision making. Looking back, the decision to divert to ZZZ6 initially was well considered and sound. We knew that Company had service to ZZZ6 and without knowing if there were any sick or injured passengers or flight attendants, a close airport was appropriate. Once the situation was stabilized, other factors could be considered (passenger accommodation, maintenance resources) and the decision to divert to ZZZ2 made the most sense. Workload and automation management also went well. By utilizing me to fly the plane and coordinate with ATC, and having Captain X assist with cabin coordination, Captain X was able to run the checklist, troubleshoot the problem, and stabilize the situation. And by keeping the autopilot and autothrottles engaged, I was able to initiate and manage the descent effectively. Finally, as I stated earlier, Captain X's leadership effectiveness was excellent. He remained calm when things got busy, and he actively sought out advice from all available resources, which led to a successful outcome. What could have gone better? My reaction to the alarm should have been to immediately put on my mask, rather than check the cabin pressure gauge. And I could have donned my oxygen mask more smoothly and quickly, rather than forgetting to remove my surgical mask and knocking my headset off. We could have done a better job establishing effective crew communications, which could have led to better situational awareness and crew coordination. Thankfully, all of these items were dealt with promptly, and none of them stood in the way of a successful outcome.

## Synopsis

Air carrier flight crew reported a pressurization problem during climbout resulting in a return to the departure airport.

## Narrative: 1

The last two times flying through HOU, both Ground Control and Tower Control have been combined into one frequency and consequently one Controller. During both of those flights, upon being cleared for takeoff, the Tower Controller was also coordinating pushback clearances and ground taxi instructions. Predictably, multiple aircraft called for pushback during our takeoff roll, all while "stepping on each other" and blocking the frequency. As we were rotating, other aircraft were [sending unnecessary messages] (Why not get a full route clearance on Tower while we're at it?!). All these distracting radio events: the blocked transmissions, frivolous radio calls and non-runway-pertinent radio chatter, compromised the safe execution of what is arguably the highest risk portion of any flight; the takeoff. In this scenario, ATC was juggling pushbacks, ground taxiing aircraft, and most crucially aircraft taking off while loaded with humans and fuel. Worse yet, aircraft on takeoff were hearing it. Pilots' ears are trained to be listening for certain things at certain stages of the flight. Hearing pushback calls, blocked radios and the like on takeoff is nothing but a potentially dangerous distraction to the pilots.

## Synopsis

Air carrier Captain reported an unsafe environment at HOU with the Ground and Local Control positions being combined into one frequency.

## Narrative: 1

I was working [Sector] X at the time of the incident. Our area was not staffed properly, so I had been on position for about 2:40 when the event occurred, and was working my third different radar scope of the session. I had been moved twice due to partially certified controllers kicking me out of my previous position. I had also just returned from XX days off. The sector next to me (XY) was very busy, and part of my attention was diverted to that scope because there was inadequate staffing to provide them a tracker or D-side. I know this is not something I should do, but the controller at XY seemed over loaded. I took hand offs on Aircraft X and Aircraft Y at about the same time. I saw the traffic immediately, and turned Aircraft X to a 270 heading, and issued Aircraft Y 20 degrees left. I've been certified at ZZZ1 radar for over X years, and have seen this same scenario thousands of times in my career. I continued doing other things, then looked back on the situation and saw for some reason my 20 degree turn was not going to be enough. I am not sure if Aircraft Y actually turned 20 degrees, or maybe wind was a factor. I issued a 10 degree left turn to Aircraft X, confident that this would resolve the issue. Upon checking back a minute or so later, I saw that this was not going to be the case. I issued another 20 degree left turn to Aircraft Y and instructed them to expedite the climb. I stopped Aircraft X at FL190, but did not issue further turn because it would have violated ZZZ2 RAPCON airspace. About this time both aircraft responded to RA's. I waited for both to complete the RA maneuvers and cleared them back on course and up to requested altitude. First, I feel that personally I should have used altitude separation instead of, or in addition to, lateral separation. I should have ensured that the vector was enough before giving up vertical separation. It is something I have told my trainees hundreds of times in my career, and something that I should have done. Also, I recommend that the area be staffed correctly. We have been on COVID-19 schedules since March, and there seems to have been a shift in mentality regarding staffing. As a facility we worked nearly X,X00 tracks yesterday, and my area's night shift only had X CPCs (Last year we would have had 5 or 6 on the shift.) The result of this was that I was on position for nearly 3 hours without a break, during which my LoSS occurred. I understand that we are trying to keep the crews isolated from one another, but we also need to staff appropriately for the traffic. If we cannot staff enough people on a shift, then traffic needs to be slowed down.

## Synopsis

Center Controller reported a loss of separation and attributed it to being overworked, and short staffed at the Center.

## Narrative: 1

ZZZ1 went ATC zero due to a COVID cleaning around Xpm local for several hours. We had one non-radar route going north bound from my area to ZZZ2 Center. My area does not train or use non-radar procedures so we were very unprepared in terms of skill. We were told to get an estimate for the ZZZZZ Intersection from the aircraft and provide 10 minutes in trail between aircraft at similar altitudes. We were initially given 20 miles in trail from approach controls, but this quickly over loaded the sector and it was increased to 30 miles in trail which was insufficient. Things that went wrong: 1) Printer at the XY position broke at the beginning, but was fixed by tech-ops in a somewhat timely manner. 2) The automatic printing was not turned on for the XY position and no one knew how to turn it on. 3) Manual printing the strips took up a lot of time for XY position. 4) We did not have enough strip holders to post all of the strips for the aircraft in our airspace. 5) The ZZZZZ Intersection sounds a lot like the ZZZZZ1 Intersection so we got a lot of incorrect time estimates as pilots got the confused. 6) A lot of aircraft were still climbing before getting to the ZZZZZ Intersection to being the non-radar routing so they gave us incorrect time estimates for ZZZZZ1. Once some of these aircraft leveled off their estimates were changing drastically. 7) Once we got the time estimate from the aircraft our Supervisor had to go and call on the area land-line. So we had no easy way to communicate with ZZZ2 Center. 8) The XZ position was also open and 'merging' aircraft into the north bound routing but did not have a d-side and given the strong westerly winds was getting odd ZZZZZ1 estimates. 9) The combined amount of overflight traffic and departure traffic was greater than the number of available altitudes. We had 9 usable altitudes but often had 11+ aircraft per 10 minute period. I would very strongly recommend that the non-radar **north bound route not be used again unless it's late into the night when there is very little traffic.** If it is necessary for it to be use then only two or three major airports be allowed to depart aircraft and they would only be allowed to depart one aircraft every 10 minutes per airport.

## Synopsis

Center Controller reported a possible loss of separation and having difficulties to attain the required non-RADAR separation due to another Center going ATC zero for COVID-19 cleaning.

## Narrative: 1

Flight originated in ZZZ as a Part 135 scheduled flight to ZZZ1. There were no passengers on board. ZZZ Center advised us that ZZZ4 Center would be going to an "ATC Zero" condition for 1 hour 30 minutes at 15 minutes prior to our scheduled arrival due to a COVID situation in the Center facility. I made the decision to divert to ZZZ3 and accomplished training enroute and landing late afternoon. Weather in ZZZ3 was IFR with a report that fog was believed to be moving into the ZZZ3 area. We refueled and departed for ZZZ1. Training was again accomplished enroute...landing was at night with 2,500 broken, 3,100 overcast and 3 mile in R and BR. This was the end of a long day that started early morning for a departure to ZZZ5 from ZZZ1...scheduled time was 1 hour 50 minutes with a 20 minute turn. Due to waiting for a dead heading crew member we left ZZZ5 one hour late, arriving ZZZ1 at noon. I picked up another FO and departed for ZZZ for a planned 1 hour 40 minute flight. Landing at ZZZ, we then departed for a planned 1 hour 40 minute flight to ZZZ1. As noted previously, we were forced to divert to ZZZ3, due to ATC Zero. I exceeded 8 hours but, felt that, per our FOM and the FARs, I was legal to start and finish because the divert to ZZZ3 was not planned and the scheduled times were within legal limits. Note that I had over 14 hours rest before the flying the following day and was off duty after the days flying was complete and no other flying scheduled for several days. The issue that bothers me is that I was accomplishing training at night and in solid IMC conditions...never again. There was some unspoken pressure to get the training accomplished due to approaching holiday and a lack of aircraft to accomplish the training during daylight hours. I also should not have pressed the flying...the start of the problem was the unplanned ZZZ5 turn due to the scheduled Captain timing out and for whom I was asked to cover. As soon as we knew we would have to divert to ZZZ3, I should have terminated any further training and proceeded to ZZZ1 as soon as ZZZ4 Center re-opened. Several "takeaways"...I will not allow this to happen to me again, even though I believed (and believe) I was legal...fatigue was not an issue. Training should only be accomplished in solid VMC conditions and preferably in daylight.

## Synopsis

Air taxi Captain reported a training flight session extended well beyond the original time planned due to a divert caused by an ATC Zero at an enroute Center.

## Narrative: 1

I may not have closed my IFR flight plan until an hour after landing. I flew in yesterday and the Tower had closed during my flight (I think for COVID). It's a very busy airport with lots of private and commercial jets. After being cleared for the approach by SCT TRACON, airport was far busier than normal and non-controlled. I simply do not remember if I cancelled in the air or not. Regardless, I tried to cancel about 20 minutes after landing when I doubted if I canceled in the air. It took me over 45 minutes to get a human on the phone. I called Weather-brief repeatedly and 1) the new menu isn't friendly without an account. 2) I was on hold forever all times. I also periodically called SCT TRACON and the SNA extension was busy. I finally tried BUR, got a Controller and he walked down the hall and canceled for me. What should I do? Always think about canceling. I was complacent, I never cancel there. I also should set up a WX-brief account. I also realize you can call other ATC numbers than the airport you landed at.

## Synopsis

GA pilot reported the SNA airport Tower was closed possibly due to COVID-19 resulting in difficulty closing the IFR flight plan.

## Narrative: 1

I was using a safety pilot and view limiting device to log instrument approaches to regain IFR currency. I was on climbout/missed approach from a low approach to a practice ILS X at ZZZ. I was told to by the Tower to "proceed on course" after having previously told the Approach Controller I was headed next to ZZZ1 for the next approach. I was switched to ZZZ Approach at about 1,800 feet MSL on climbout and reported 1,900 feet for 3,000 feet direct ZZZ1. I was told "Radar contact" and nothing else specifically. On climbout I was trying to set up my Garmin 430W for the next approach, and get a new program on the iPad (Foreflight vs. Garmim pilot I had previously used) to post the selected approach for ZZZ1 on the map. I had trouble with my glasses fogging up due to wearing a COVID mask in the plane and was experiencing updrafts/turbulence. The time to 3,000 feet was shorter than expected and due to the above distractions, I did not notice I was passing through 3,000 feet until I hit 3,250 feet at which point I reduced power and pushed the nose down. I was back to 3,000 feet within 15 seconds. I heard nothing from ATC regarding this, probably due to being VFR and no altitude restriction issued by ATC. I was able to verify all audio and events/altitudes due to a GoPro running to capture the flight. While I was VFR and there was no traffic nearby, if this was IFR, I would have had the same challenges and it would most likely been an altitude bust. There needs to be the same discipline applied to "practice" instrument work as there is during the real thing in IMC, or the bad habits and distractions you allow during practice will seep into operations in general. I should have left the gizmo programming for level flight and popped the glasses off if the mask induced fogging was a distraction. I should have made the instrument scan primary rather than assuming I had more time than I actually had to program while getting to 3,000 feet.

## Synopsis

GA pilot with a safety pilot reported an altitude deviation during climbout. The pilot cited distraction from goggles fogging up and turbulence was a contributing factor.

## Narrative: 1

Passenger X in [seat] XX1 brought his own alcohol. When I came by his row for drinks his mask was down, he was sleeping and he had an open can of mixed drink-whiskey and coke. I woke him up-asked him to mask up and asked him if he knew he couldn't bring his

own alcohol on board. Mr. X nodded and I apologized but had to confiscate his drink. 3 times he was reminded of his mask and he grudgingly put it back up over his nose each time he was reminded. Upon landing he had his mask completely off and told the D FA that I ruined his trip. Alcohol brought on board and tried to be consumed. Mr. X may need a reminder for his trip back that he needs to comply.

## Synopsis

Flight Attendant reported that a passenger brought and consumed their own alcohol during the flight. Flight Attendant reported that the passenger was not compliant with face mask policy.

## Narrative: 1

Passenger X was reminded to keep mask on several times. Mr. X continued to pull his mask down and have conversations with other passengers around him right after takeoff after being asked to keep his mask over his nose and mouth. Passenger Y rang call light to inform us Passenger X was not wearing mask. Passenger X was traveling with Passenger Z. Both passengers were served several rounds of wine and asked for more and was told that were out of wine. During pilot break the D FA was blocking and signaled for more line. D FA did not move and told her to wait a second. Passenger X rang call light while D FA

was blocking. B FA responded to call light and informed them they were cut off because they would not comply with face mask policy. Passenger Z also came to front galley and asked for more wine after being told we were out. During the pilot break C FA also came up and spoke with Mr. X about mask policy. Passenger X became argumentative and used profanity with C FA. Passenger X was given several warnings and was also issued a [warning] by C FA. Passengers X and Z should be banned from flying on [airline] from this point forward until the mask policy is over. Other passengers should not have to feel unsafe and crew member should not have to jeopardize their health by having to confront these passengers with their mask off.

## Synopsis

Flight Attendant reported that two passengers were non-compliant with face mask policy, despite multiple requests from other flight attendants. Flight Attendant reported one of those passengers became argumentative and used profanity.

## Narrative: 1

Kit was sealed [correctly] but did not have all contents inside. Gloves were only in the pouch with the protective gown and the pocket mask. Only one pocket mask was inside when there should be 2. No gloves inside the kit with the red biohazard bag either. Several

other items were missing. The time it took to retrieve the bag from the front of the aircraft to the back of [the aircraft] and to open the kit and rummage through it to find gloves was too long. Also, the [other kit] had an oximeter with dead batteries. Universal precautions are important. Gloves need to be easily found in a medical emergency as they are to be used in virtually all contact we have with a patient. Not every situation requires a pocket mask or biohazard bag. A suggestion would be to place a supplemental bag at each FA jumpseat containing gloves and a face mask. This suggestion has been made before but sadly ignored. The batteries in the oximeter in the [the other kit] need to be changed regularly. Hope someone reads this report and considers my input to avoid problems with future medical events.

## Synopsis

Flight Attendant reported that although the medical kit was sealed, it did not have all required contents.

## Narrative: 1

Minimum Crew Requirements were not followed during a crew change while through the Passengers were onboard. We had two through Passengers onboard that were continuing on to ZZZ1. I had a great conversation with them while I was tidying the aircraft. Our D Flight Attendant was the first Inbound Crew Member to leave the plane. There was a female Outbound Crew Member that came on to help clean, as well as a COVID-19 Cleaner from the Ramp. A second Outbound Crew Member came onboard as well, he stood in the forward entry area. I heard the Inbound A Flight Attendant ask him if all of the Outbound Crew Members were at the gate, I guess he said yes because she collected her things walked off the plane. The COVID-19 Cleaner and the Outbound Crew Member that helped us clean walked off the plane as well. I also noticed that there was an Above the Wing Supervisor standing in the jet-bridge. I think he was there because we arrived late and it was an aircraft booked FULL out of ZZZ to ZZZ1. The two through passengers had moved from the back of the aircraft to the front of the aircraft and sat in row two. They were seated below the overhead bin where my crew luggage was stowed, and they were asking me if they could use the lavatory. I brought my things down and thanked the male Outbound Crew Member for stepping onto the plane. I think that all of my other Crew Members had already walked off the plane, and that I was the last Inbound Crew Member to step off the plane. This is the part where the COVID-19 Brain Fog comes in. I'm not sure if the B Flight Attendant or myself was the last Inbound Crew Member to leave the plane. I do know that there was only one Outbound Crew Member onboard an aircraft with through passengers onboard. There was a lot going on during the crew change and I didn't think about having two Outbound Crew Members onboard before leaving the aircraft. Three months ago I had an on the job COVID-19 infection, and I was off work for three months recovering. I still have a couple of the COVID-19 "Long-haul" symptoms such as Brain Fog and some occasional fatigue. I should have made sure that two Outbound Crew Members were onboard before I stepped off the plane.

## Synopsis

Air Carrier Flight Attendant reported a possible FAR violation due to an insufficient number of FAs on board while passengers were aboard. The Flight Attendant cited long lasting symptoms from COVID-19 that may have contributed to the event.

## Narrative: 1

I was called in by crew tracking to cover a flight to ZZZ1. When I arrived I was told by the FO that the previous Captain had to call in sick "because his fever had gotten so bad he

could no longer safely fly." It's extremely reckless in this current environment (COVID-19) to send more crew into an environment that is known to be contaminated. I would suggest that the affected area be sanitized after the sick crew member leaves that aircraft. I would also make sure crew is notified.

## Synopsis

Air carrier First Officer reported being called in to fly because the previous Captain had called in sick with a fever. Reporter suggested the aircraft cockpit should be sterilized after a sick crew member leaves the aircraft.

## Narrative: 1

After an unplanned diversion to ZZZ, we did not deplane since it was a short wait for our departure to ZZZ1. ZZZ Center closed from XA:00Z-XB:30Z for COVID cleaning. Because we did not deplane no passengers or bags left the aircraft. When completing the manifest we were unsure of how to get the clearance and passenger count without the station uploading via ACARS. I called Dispatch to help with some of the numbers like cargo weight and passenger zones. With Dispatch I could get weight for cargo but not zones, for passengers we were able to get the zones. I told the ground crew that if they could figure out the cargo bag count then we would be good. They tried to look into it but they were unable. So with Dispatch's help we got our manifest and had good numbers. After we left the station uploaded a new passenger count and later discovered the new passenger count from the station was about 300 pounds less than our original manifest. The main cause was the fact that the station couldn't upload an ACARS passenger count because they did not scan passenger tickets, everyone stayed on board. This caused an unusual hurdle where we had to figure out a way to get the numbers. But after we got it from Dispatch the station's last minute help with an ACARS upload caused a mix up with the passenger count and weight discrepancy. I should have printed the manifest before starting the new flight on the FMS. We need a way to maintain the passenger zones and cargo report since we don't have paper reports anymore. The close out report only has the total adults and children but not their zones, and the cargo only has total weight and not which bags go where.

## Narrative: 2

After an unplanned divert to ZZZ we did not offload because it was a short wait for our departure to ZZZ1. The divert was a result of ZZZ Center going ATC Zero causing us to delay our arrival to our original destination. While completing the manifest we contacted the Dispatcher to get the numbers from our previous flight as they had dropped from our FMS. With Dispatch we were able to get the cargo weights and passenger zones. After we left the station uploaded a new passenger count and we discovered the new passenger count from the station was 300 pounds less than our original manifest. The main cause was the fact that the station couldn't upload an ACARS passenger count because they did not scan passenger tickets, and we no longer have paper PINs in the cockpit from the initial count. We should have printed the manifest before starting the new flight on the FMS.

## Synopsis

Air carrier flight crew reported that a passenger count and weight and balance error occurred at the diversion airport because the count could not be uploaded through ACARS. The crew stated the flight had to divert due to an ATC Zero Center closure.

## Narrative: 1

I wanted to take a few minutes to relate to you my personal experiences during the events that transpired. We were at the tail end of a lengthy four day trip, with the usual holiday related challenges; weather, maintenance, crew-placarding, lengthy sit times, de-icing etc. On the third day of the trip, we were waiting in line for departure on [Runway] XXL at ZZZ, when the tower informed us that the operation was shut down for a "deep-cleaning" at ZZZ1 Center. Having personally experienced the same the same scenario last year when both the ZZZ2 Tower and ground were shut down for a COVID spread throughout their Tower, it didn't take long for us to figure out the reason for the closure. Like everyone one else in our situation, we opened up the FOM and began compliance with the notification processes for the passengers, the Flight Attendants, and ZZZ Ops. My First Officer (FO) and I immediately began working the 14 hour duty day issue, (FO A was my second FO during the course of the trip, and he had a less restrictive duty day constraint than I did). After nearly two hours at the hold short line, we began the process of finding a gate, with the intent to avoid the prospective government fines levied for lengthy delays. It was the usual chaos, with ZZZ Ops being overwhelmed by this unforeseen event. As we approach the two hour FOM deadline for locating a gate, we were assigned DXX via ACARS. While taxiing to the gate, we made multiple attempts to get guidance from Ops, Ramp, Dispatch, etc., to see what the intent was for the passengers, my crew, and the aircraft. We were unable to get any specific guidance. Following our arrival at the gate, an Agent opened the main door, and told us that the flight would be cancelled. As directed by the agent, the passengers disembarked with their bags. Since we had seen no changes to our crew schedule, nor had we received any kind of communication from crew tracking, we assumed that the agent was correct regarding the cancellation, and as such, we began reviewing our required duty time obligations. Absent any further guidance, we subsequently put the aircraft "to bed," and once again we attempted to contact crew tracking, (no luck there). Rather than exit into the terminal, we elected to continue to wait on the aircraft. After 20 minutes or so, a new Agent came down the bridge, and asked me if we were ready to board the aircraft. Needless to say, I was a bit astonished. I asked her what the plan was, and she said that we were going to resume the flight to ZZZ3, ASAP. I reminded her that the airspace was still closed, and that we had not received any contact from either dispatch or tracking, regarding an updated release, and that we would need additional fuel, lavatory/water service, and a resupply of the delay rations that the Flight Attendants had used for the passengers during our time spent waiting on the taxiway. I also told her that both of us, along with two of the Flight Attendants had duty-time issues that we have to calculate and resolve before departure. She promptly replied and asked me, "Captain are you refusing to board the aircraft?" I immediately realized that this was the standard pass-the buck/assign the delay language, that some Agents use in an attempt to intimidate Pilots. I took several deep breaths, before I stated to her in no uncertain terms, that we would need to at least begin to address the aforementioned issues, before we would be comfortable boarding the aircraft again. Her reply was,

"Captain, are you refusing to board the aircraft?" I answered that until we get some of these issues resolved, yes. What was clear to myself, my FO and the number one Flight Attendant, is that this was clearly an attempt at pilot-pushing. [In my opinion], this Agent had one concern, and that was to make sure that these passengers would become someone else's problem, (namely ours). Long story short, and after significant efforts by all involved, we reconstituted the flight and determined that without further lengthy ground delays that we would likely arrive in ZZZ3 within our respective 14 hour duty day window. We then performed our usual checklists, flows, refueling, new clearance etc. After push-back, start and taxi instructions were received, I made my first mistake of the flight, and turned in the direct opposite direction of ground's instructions on the taxi clearance. It was at this point that I realized I was a lot more tired than I thought. My FO and I discussed this, and we agreed that though we were both somewhat tired, it was safe to proceed, and that we should just take extra time and precautions going forward. Mistake number two on my part was that when ATC changed our departure STAR, we briefed it at the gate, had it up on our iPads, but I had failed to enter it in the MCDU. After wheels up, ATC gave us direct-to clearance to a fix that wasn't on the legs page. My FO quickly realized that I hadn't entered the new departure STAR, and he rapidly remedied it on the MCDU. I was mad at myself for making this series of unprecedented and inexplicable mistakes. Those mistakes continued as we descended on the type of complex STAR with a series of "at or above" altitude constraints, that confounds the logic on some of the older "Basic" airplanes. Needless to say, we landed safely in ZZZ3 later that evening. After block-in, I determined that I was within my duty legality, by 20 minutes or so. It had been a very long day. We had departed ZZZ4 that morning before the sun had risen, and we had left the gate at ZZZ for the second time, well after the sun had set. In summary, I had made many embarrassing operational mistakes during the course of the last leg, beginning with my pre-flight, push back, all the way through the descent into ZZZ3. The only explanation for my numerous mistakes was fatigue. In short, I will never, ever, again allow the "system" to push to me beyond my own personal safety limits. I will take my First Officers counsel more seriously when it comes to considering just how tired we are. Additional factors include that when you consider the cumulative effects of four and five day trips on us, along with a 14 hour duty period, it can be well beyond the average pilot's limitations to safely operate. And while I don't blame the agent personally, (like everyone else, she was just doing the job in the manner that she was trained), and like everyone else she's just under time pressure. As time has gone by at our company, it has become clear to me, that the safety culture at the top of this airline, is in many respects, mostly honored and kept in place, by those who of us, who are at the pointy end of the spear. In retrospect, the main causal factor was fatigue due to a lengthy delay. Two suggestions. The first is that [in my opinion], we need to take into account the cumulative effect of a lengthy four and five day trip on pilot fatigue. The other issue is Gate Agent conduct and verbiage regarding flight Ops as it regards to boarding the passengers.

## Synopsis

Air Carrier Captain reported several operational errors occurring after a long ground delay long due to an "ATC Zero" event.

## Narrative: 1

We were on the ZZZZ1 arrival into ZZZ and we had a clearance cross the ZZZ1 VOR at Flight Level 260 and then to descent via the ZZZZ1. We were in a managed descent with 4000 feet set for the bottom of the ZZZZ1 arrival. Nearing ZZZ1 I thought that we were high on the profile. I selected open descent intending to level off at FL260 and then continue on profile but I did not select FL260 in the FCU window. The airplane was very light at 113,000 pounds and descended very quickly right through the assigned FL260. I intervened by leveling off and we continued in a managed descent on profile for the remainder of the arrival. My estimation that we were high on the profile was inaccurate due to the fact that the airplane was light and capable of descending very quickly, I had not taken that into consideration. The pilot monitoring was heads down and I did not tell him I was changing the mode of descent from managed to open and explain why I was doing so. Had I done so, he would have caught it. This was my first day back to work after two months of leave. I had prepared to return by studying flows, call, procedures, etc. and had briefed the other pilot hoping to prevent errors from happening. Suggestions - Keep the other guy in the loop. Tell him when making a change especially if he is heads down. Always check the altitude selected when changing modes. Always focus on the next restriction.

## Narrative: 2

We were south of ZZZ1 arrival validation completed, arrival briefing completed clearance to cross ZZZ1 at FL260. We were then cleared to descend via ZZZZ1 Runway XXL. The Captain set 4,000 feet in the FCU. We both verified the altitude selected and the aircraft was in managed descent. I verified the aircraft was on profile and would cross ZZZ1 at FL260. I then updated the MCDU with the new ATIS, did an in range and verified arrival gate and set ramp frequency in the number 2 standby radio. The Captain then said, "I messed that up", or something like that. I didn't realize the Captain had changed modes to open descent and had descended through the FL260 restriction at ZZZ1. He said he felt the aircraft was not descending quickly enough. We crossed ZZZ1 approximately 1,000 feet low. There was no call from ATC. The Captain then went back to managed descent and we continued to ZZZ without and further incident. Cause - Lack of communication from the Captain letting me know he went to open descent. Captain had been on extended

time off the last 7 months. Suggestions - Communication of mode changes in decent to Pilot monitoring. Resetting FCU to next altitude constraint when operating in open decent.

## Synopsis

Air carrier flight crew reported an altitude deviation due to failed crew communication and the Captain's recent extended time off.

## Narrative: 1

While descending via the ZZZZZ2 STAR into ZZZ, we were given a direct, followed by a heading and a descent to 6,000 feet and a request to fly our best forward speed for spacing. In complying with the instructions, I descended below 10,000 feet at 300 knots. At approximately 9,000 feet, I recognized the error, leveled off and slowed to 250 knots. We continued the flight to an uneventful landing. Although I had gotten a full night's sleep the night before, I was feeling somewhat fatigued by the time we began the flight to ZZZ. I had been flying long days from the previous 4 day trip that started with a very early commute on the morning. Compounding this is the fact that my recency of experience is lacking. I had flown very little during the previous 3 months due to a problem with my international qualifications. I believe that if I had not gotten distracted with the revised clearances from ATC this would not have happened. I had been flying in VNAV, but opened the speed window when a higher airspeed was requested by ATC. My improper monitoring of the automation led me to descend below 10,000 feet at a speed above 250 knots. Unfortunately, my First Officer did not catch the error either.

## Synopsis

Air carrier Captain reported exceeding 250 knots below 10,000 feet during descent. Captain cited fatigue and lack of flying as contributing factors.

Narrative: 1

Hand flying on climbout on the SID I exceeded the 12,000 feet restriction at ZZZZZ by a few hundred feet. There was no communication from ATC regarding the exceedance.  
Cause - Concentration on hand flying the aircraft. With as little flying as we are doing recently it would be better to engage the autopilot sooner and monitor.

## Synopsis

First Officer reported a crossing restriction overshoot during departure.

## Narrative: 1

I am writing this because I'm concerned about the safety of the ZZZ - ZZZZ - Chengdu Airport - ZZZZ - ZZZ pairing. Starting on date, it was changed from a 4 person crew to a 3 person crew. This is NOT SAFE. I understand why [it] changed is because the duty time went from XX:25 to XX:20 and so only 3 pilots are required. I've flown this trip X times and it's challenging with 4 pilots let alone 3 pilots. The primary purpose of this report is to identify this [pairing] as a safety event. My goal is to provide a corrective measure that will mitigate a safety issue, before it becomes a Incident/Accident THREAT: Personal

Fatigue. This trip is on the back side of the body clock with a late night pick up out of ZZZZ. This trip becomes close to a XX hour duty day because of the 1:10 ride from downtown [city] to the airport and back. The flight from ZZZZ is often 2 hours longer than the flight coming back from Chengdu due to the Jet stream. Often, because of this jet stream, there is moderate turbulence along the route, making sleeping in the bunk difficult. The Captain must be in his seat for the take-off and landings for both legs. With a three pilot crew, it is difficult coming up with a plan for breaks, especially on the shorter Chengdu - ZZZZ segment. The relief Pilot will hardly get a break, besides being upset for not getting a break, they will be very tired. The relief pilot is one of the most important people in the crew, and you want them alert. They often see threats before the flying pilots do, and can bring the threat to their attention. THREAT: Environmental. Often there is low visibility in Chengdu and ZZZZ this time of year, increasing the work load. There is a X:10 break in Chengdu which is a very busy time for the pilots. We have to flight plan, pre-flight (with full suit) deal with the Chengdu police and customs. With the boarding of cargo (very noisy and moves the plane around a lot with loading of cargo containers) it is impossible to get any rest while on the ground. THREAT: Technical. Chinese airlines are almost back to normal, leaving Chengdu is a very busy time for ATC. I have flown with new pilots that haven't flown China and between operating in meters and the difficulty with the Chinese ATC language it is impossible, and irresponsible leaving the flight deck out of FL180 to go on break. Because of this, it isn't until reaching cruise altitude until the Captain can start his break. Meters can be challenging and causes a lot of missed ATC calls, or repeats. The 4th pilot is a huge benefit for listening to ATC and providing back up! I've flown this trip X times now, having 2 Captains and 2 FO's was by far the safest. It gave everyone a break and each Captain had a leg which helped mitigate stress, and fatigue. With one Captain and 3 FO's it is not nearly as safe as 2 Captains, but it is bearable because you get more of a break. With one Captain and 2 FO's it is impossible to get a break, of good rest. Another thing the company needs to think about, this is China during COVID times. The company realizes the difficulty of a layover in China for the crews. The duty time with 3 crews is reduced to XX hours. There can only be a X:10 delay in Chengdu before an extension takes place. After doing this trip X times I know for a fact that the likelihood of me extending is nil, due to fatigue. The mitigation is simple. Make it a 4 person crew.

## Synopsis

Air carrier Captain reported that the flight crew count on a trip pairing had been reduced and cited multiple issues associated with the reduction.

## Narrative: 1

Passing FL230 in VNAV Climb FMC airspeed was set at 310 KIAS. As airspeed approached Vmo, power was reduced but the airspeed briefly passed Vmo by about 5 knots and for 3-5 seconds. Pilot flying was new to airplane and neither of us are flying much. Pay closer attention to FMC inputs; fly more!

## Narrative: 2

Entered climb speed in FMS of 310. Previous Econ climb was 257/.81. I failed to enter .81 after 310/. As the aircraft climbed speed approached MMO at FL 230. Adjusted speed in FMS but the aircraft was empty and continued to accelerate. I manually reduced the throttles, but not enough we exceeded about 5 knots before we slowed down. New to the aircraft. I had not flown since OE ended. Fly more. But we all know the environment.

## Synopsis

Air carrier flight crew reported an over speed during departure and cited lack of flying as a contributing factor.

## Narrative: 1

We had no operational issues whatsoever. This debrief is simply an observation. The SNA Tower closed for COVID exposure and SNA has become an uncontrolled field. The flight experience of the GA traffic that saturates that airspace is typically very beginner level and a Control Tower is essential. Uncontrolled field operations were nothing short of chaotic at that airport, and I really do see a potential for an accident to occur. Simply put, the pilots that are operating at that airport don't have the experience they need to merge with airline operations. The radio was saturated, there was confusion of who's going to take the runway next, a twin engine airplane decided to do a 360 to provide spacing while a commercial aircraft was 4 miles behind them on final. A small aircraft almost took the runway with an aircraft on short final. I saw another small aircraft make left traffic for [Runway] 20R when the traffic pattern is only right. In my professional opinion, I suggest that SNA be only an IFR only operation only during non-towered operations. The amount of threats at that field are countless. Every pilot has to start somewhere and I'm sensitive to that, but a new small aircraft pilot practicing landings, turning an early base while an air carrier is on final (hypothetical example, that didn't happen), has no business in such a busy environment without a Tower Controller there to mitigate risk. Again, there was no event. This is an observation. Lack of traffic management is the factor in a potential disaster. If there is to be no tower at SNA, it needs to be commercial or IFR only operations.

## Synopsis

Air carrier First Officer reported flying into an airport with the Tower closed due to COVID-19 and described the associated issues flying in the same environment with inexperienced general aviation pilots.

## Narrative: 1

We blocked in late after completing our flight from ZZZ to ZZZ1 after a diversion to ZZZ from ZZZ2, due to ZZZ ATC [Center] closures during our original flight. With an early report and the late block in, we fear we may have exceeded Flight/Duty time. On our flight from ZZZ2 near ZZZ VOR, we were informed that ZZZ Center was closed and would remain closed for several hours. We coordinated with Dispatch and decided our first alternate choice of ZZZ4, while closer would be unsuitable since we would have no access to customs should we need to deplane. ZZZ was agreed to be the best alternative. We landed and parked with no further incident. Once on the ground, we were advised that ATC would open at XA:00Z and we had a new flight plan for XAZ and an EDT of XA:40Z. We spent the following XX:23 [hours] in constant communication with Dispatch, ZZZ Clearance and Ground, scheduling, and operations. During this time, we were told that if we could get fuel, it was coordinated that we would be priority one for departure and our communications reflected that. The fuel truck took longer than expected due to lightning, arriving at approximately XA:45Z. At that time, we received a warning message for our [departure time]. I contacted dispatch and together with ATC, coordinated a new release which would allow for a [departure time] of XB:34Z. We were informed that we also had only 25 mins to get airborne from block out due to flight time regulations, but if we could do that we would be legal. We were cleared via the filed route and given clearance to depart. With efficient and professional teamwork from all involved, we were able to close, push, taxi, and takeoff in 19 minutes. Just prior to takeoff, we were given a quote "short reroute" by ATC, which we believed would still allow for compliance with the FARs. We made changes and were off at XB:31Z, 3 minutes prior to [departure time]. We confirmed the route with dispatch immediately once time permitted (at approximately 10,000ft) via ACARS. We worked with ZZZ1 Center ATC and were able to receive two shortcuts, which further shaved off time from our arrival, which was still in time from the new numbers we received from dispatch. The flight was very busy due to the high volume of ATC communications, turbulence, avoiding thunderstorms, performing duties, and trying to maintain situational awareness. We also worked to double check our times, to ensure compliance. Once we switched to ZZZ Center, we received multiple delay vectors and made to reduce speed. Once with approach, we were slowed to 190 on the arrival and 170 prior to intercepting final at ZZZZ for the ILS [Runway] XXR, a 20 mile final. On the ground we received a very short taxi of approximately 3 minutes to parked short of our gate. We then waited over 10 minutes for a ramp crew to show up. Official block in was at XD:01Z. Without the delay on the ramp and the excessive vectors and speed reductions, our computer had us in prior to XB:40Z, even with the routing by ZZZ Center. We completed our duties during and after the flight with no further incident. Honestly, I cannot say enough about the teamwork and professionalism of each of the crew members, dispatch, scheduling, and operations personnel involved with this flight. Each member was thorough and efficient in their duties and each was critical to the safety and completion of the flight. My feeling is that, if possible, last minute reroutes should be avoided if possible and ramp personnel ready to welcome aircraft upon arrival.

## Synopsis

Air carrier Captain reported that duty time may have been exceeded due to the flight having to divert when an ATC Center closed.

## Narrative: 1

During boarding [I] was notified by Lead Flight Attendant and Customer Service Agent that passengers in row X123 traveling together were loud, intoxicated, disruptive, not adhering to mask policy and one was vaping in his seat. Customer service agent was in the process of removing them when one of them decided to make a display of his anger in the forward part of the aircraft near first class. I was making a cup of coffee and he directed his anger and profanity towards me. I tried to get him to step into the jetway where the other two companions were and hoped he would follow. He mentioned something about getting his jacket and passport but the companions already had them. All three people continued their verbal tirade and protest while the agent called for law enforcement. Subsequent check of their row found two cans of open alcohol containers which they brought on board.

Remaining customers seated nearby told the flight attendants they were drinking and loud in the boarding area. Another nearby passenger had been "egging" them on and also difficult with the agent at check in but he immediately complied with flight attendant instructions, apologized, and said he would not cause any trouble. I discussed this with the customer service agent and told him it was his call whether this passenger be removed as well. Based on his cooperation and lack of evidence of intoxication, he traveled uneventfully on the flight.

## Synopsis

Air carrier Captain reported that several intoxicated passengers were being disruptive and not complying with face mask policy. The Captain stated that while one passenger was being removed from the aircraft, he became angry at the Captain and used profanity.

## Narrative: 1

We were two hours late due to ATC closure (ZZZ Center). After discussing with Dispatch that we would be very close to Crew day, we launched from ZZZ to ZZZ1. Landed approximately two hours late and took off from ZZZ1 in time to land back at ZZZ within Crew day; however, upon landing (with 20 minutes to spare) there were approximately 10 aircraft waiting for a gate. I sent Dispatch an ACARS telling them that we were going to exceed our 13-hour Crew day. I was told by ZZZ Ops and Dispatch that gates were being issued "first-come, first-serve." We waited approximately 45 minutes before making it to a gate. Total day was approximately 30 minutes over allowed hours.

## Synopsis

Air carrier First Officer reported being two hours late due to ATC COVID Center Closure and going over daily allowed work hours.

## Narrative: 1

First day back after being off for two weeks for COVID-19 quarantine, we don't even have half of our normal staffing which is already low due to COVID. Total number of CPC's for the day is only 6 when normally it would be at least XX. I get put on the LC1 position with no assist or LC2, I was told that there was a CFR [Call For Release] in effect for ZZZ. It ended being super busy and it seemed like there was no flow put in place, we were pretty much operating business as usual. I did not receive much spacing on final and I even had to send an aircraft around because of an overtake and lack of runway separation. Approach also sent in an uncoordinated early turn IFR jet from the north east, I had to adjust his flight path to de conflict him from the [aircraft in the] traffic pattern and from a departure I had rolling on [Runway] XXR. This created another conflict with another arrival they had doing 180 kts that they never slowed down. It was pretty overwhelming to work that volume/complexity of traffic after two weeks off and not being able to ease back into the work flow, especially when we have limited staffing/positions open and with TRACON not following the LOA's and traffic flow directives. We are going to be operating in this limited capacity working 6 days a week 10 hours a day for the next week. There needs to be better communication and an understanding of the unfortunate circumstances that we will be working under for the next week. It is completely unsafe to operate business as usual and I'm hoping there will be better coordination going forward.

## Synopsis

Tower Controller reported an airborne conflict resulting in an aircraft having to execute a go-around. Controller cited staffing and traffic volume as a contributing factors.

### Narrative: 1

The rides were bad and Aircraft X asked to descend. My D-side called and requested control, but neglected to point the aircraft out to the underlying sector. I forgot about the shelf as well so I never double checked my D-side's work and I descended the aircraft. There is really no recommendations. The issues are a lack of competency on everyone's part. The D-side barely works as is, and I myself do not get enough quality time anymore because of the lack of traffic. Combined with a constant changing of sector configurations led to this issue.

### Synopsis

Center Controller reported descending an aircraft into another Controller's airspace, thinking the D-Side had pointed the aircraft out.

## Narrative: 1

This was a second flight of the night shift, and was unusually busy, because the hospital we are associated with is understaffed because of COVID. We got the call to go to ZZZ, and the weather was marginal, but good enough to get in. We accepted the trip, and flew the RNAV approach to Runway XX. Later, I looked at the approach chart, and it said that the approach was not authorized at night. I think that being busy after a long period of hardly flying contributed to the error, and also that it was XA:00 in the morning. Also, due to COVID-induced rules, we had to wear masks flying, and it fogs up my glasses, making it harder to see. I need to make sure that I check all the notes on an approach before accepting a trip.

## Synopsis

Air Taxi Captain reported flying an RNAV Approach which was not authorized at night.

## Narrative: 1

I had heard that the FAA had suspended/extended GA compliance regulation deadlines due to COVID-19. I have operated an aircraft outside of my normal deadline date for medical and BFR requirements. In the last two days I have found that this might not be the case. I purchased an additional aircraft and I don't know if the deadline for registering the plane has also been extended or not. I shouldn't be making assumptions or go by information that I am hearing from the airport/other pilots or online. No additional flights will be made until I verify that I am in compliance with the proper FAA office.

## Synopsis

Pilot reported not being sure of General Aviation Compliance regulation deadlines.

## Narrative: 1

VFR flight from ZZZ1 towards ZZZ2 and return with no specific route. Tablet GPS lost connection with autopilot and I lost situational awareness trying to get the GPS reconnected (using AVARE app). When I finally abandoned the effort and looked at the GPS I realized I was in ZZZ Class B airspace at approximately 3,200 MSL instead of below the 3,000 MSL floor as I usually am. Corrected altitude immediately and left the Class B, went home and landed. I should have had the GPS completely set up before departure and should also have stayed at my usual altitude of 2,500 MSL for local flights. I really don't have an excuse for losing situational awareness. Problem was exacerbated by opening a 2nd app (Naviator) at which point I didn't know which app might have been trying to control the autopilot. I will certainly not make that mistake again! Had not flown at all from 5 months so I am admittedly not as proficient as I would like to be. Will be correcting that situation shortly also!

## Synopsis

GA pilot reported losing GPS connection on tablet resulting in a Class B airspace incursion.

## Narrative: 1

A Flight Attendant in my recurrent class notified the company on [date] that they tested positive for COVID-19. Company notified me [10 days later]. That is 10 days after Company was notified which I find to be completely unacceptable. I had a trip and could have exposed hundreds of passengers plus my crew. I should also add that I exposed my family and I am a caregiver for my XX year old father and YY year old mother. I find this

to be an egregious safety concern in delay of notification since I shared a classroom and training aids to include donning the PBE and POB (Portable Oxygen Bottle) with someone who has since been confirmed positive.

## Narrative: 1

While on a visual approach to [Runway] XXR, I was the PF. I hadn't flown in a month and a half or so, and the weather was conducive to trying to practice skills, so I turned off the AP/AT/FD. While over the ZZZ1 area, we received an RA directing me to level off. After complying with the RA, I began to descend to catch up to the approach, but at the altitude I was at, and the descent rate required to get back on the approach, I would not have been able to do so within stabilized approach criteria, so I conducted a go-around. The go-around was not smooth, and left room for improvement, but all call outs were made, and the checklists were accomplished. After passing through about 1,300 feet or so, we were assigned an altitude of 2,000 feet. The FO selected 2,000 feet and made the comment that we were about 700 feet away. We were climbing at a high rate as we were in TOGA (Still no AP/AT), and I was trying to get the plane slowed down, and arresting the climb rate, the FD began to turn to follow the missed approach for the ILS, as we had loaded it as the backup. We had yet received instruction as to what direction to turn, since we were assigned the visual approach. Between the FD turning and leveling off, it was at this point that I was focused on wanting the aircraft to continue straight on runway heading, and I flew through the 2,000 feet restriction, to my recollection by about 300 feet. The PM attempted to get some sort of instruction from ATC as to what they would like us to do, but struggled to get a word in on the radio. Finally they called and assigned us a vector. They also said since we went past 2,000, to level off at 2,500 feet. At this point, we had a moment, and was able to match up the information on the PFD with what I was wanting, and was able to add back in the AP/AT. This event felt like a culmination of a few problems. The root cause is that I, as the Captain, wasn't as prepared as I should have been. Having flown so little the last few months after upgrade sign off in month, I have been limited to just XX hours of total flying since month, my skill upkeep has been mainly book studying. While this is important, it does not replace being behind the controls of an aircraft.

## Synopsis

Air carrier Captain reported an unstabilized approach leading to a go-around, which then resulted in an altitude deviation. The Captain cited lack of flying as a contributing factor.

## Narrative: 1

Cleared for visual approach to Runway XXL on modified downwind, at 3,000 feet. Maneuvered aircraft to arrive at ZZZZZ at 3,000 to intercept LOC/ Glideslope simultaneously. Thought I was going to be above glideslope at ZZZZZ, asked FO to set 2,000 feet acquired Localizer inside of ZZZZZ, still at flaps 3. Drove into glideslope, selected flaps full. Radio altimeter briefly showed 800 feet due to terrain variation. Broke SOP of being fully configured by 1,000 feet. I accepted a night visual approach after a 12 hour, three leg duty day. Fatigue was a contributor. Hurried visual, should have intercepted final at IAF vs. FAF. My currency was spotty due to reduced flying on reserve. Never accept short visual approaches at end of long duty day.

## Narrative: 2

I was acting as PM. Approaching ZZZ at night from the SW with a high overcast layer above. ATC had us on a downwind leg for [Runway] XXL at 4,000. The autopilot and auto thrust were engaged. Approximately abeam the end of the runway, ATC asked us if we had the field in sight. The CA/PF says he does, so I reported the field in sight. ATC then cleared us for the visual XXL. The PF then set 3,000 in the FCU and I confirmed and referenced the plate showing the FAF ZZZZZ at 3000. I believe the PF went open descent to 3,000 from 4,000. The PF then began his base leg turn. The intercept angle initially looked like it was going to join the final just outside of the FAF. As we approached 3,000 the PF continued the turn in. He asked me to set 2,000 into the FCU and set 1,000 v/s down. I complied as it appeared to me that the PF was trying to intercept the course and I assumed he was going to join inside of ZZZZZ/FAF. He readjusted his intercept to join the final at ZZZZZ or just outside it. By that time I began to realize we were getting low on the profile. I still had visual contact with the runway. At approximately that time, the airplane leveled at 2000 just inside of ZZZZZ and ZZZ tower advised us of a low altitude alert and to check our altitude with the current altimeter setting. I replied with our call sign. We continued at 2,000 until intercepting the glideslope and landed safely. We were approaching the end of a long duty day and it was a non eventful and quiet flight, so fatigue was a possible factor. I am also familiar with operating into ZZZ, so I was a bit complacent, as well as being in VFR conditions and being able to see the runway. Having both pilots confirm and verify any further altitude changes in the FCU after the setting of the lowest charted altitudes for the approach used.

## Synopsis

Air carrier flight crew reported an unstablized approach and cited fatigue, time pressure and reduced flying as contributing factors.

## Narrative: 1

ZZZ1 Center had a positive COVID test from an individual in their building. The decision was made to go ATC-0 in the middle of the afternoon to perform a Level 3 cleaning. I would completely understand the need to do the cleaning immediately, even if it was a high traffic time, if the individual had started not feeling well during that shift, or during

the any shift in the previous 24 hours. This was not the situation here. The positive test came from an individual that had not been in the building in X days! Every Controller that had worked in the previous X days already had worked in a potentially contaminated area. There was zero benefit to go down at that time. The decision makers did nothing that was reasonable and responsible in this situation. Reasonable and responsible would have been to wait for a slower traffic period to get the clean accomplished. I had Aircraft X that had been in the air for 15+20 hours. I was forced to route him over an hour [out] of his way which put him in a minimum fuel situation. We had MedEvac flights, on critical missions that were not allowed to pick up their patients. I would hate to know how many passengers missed their connecting flights. We put our controllers, pilots, and flying public in an unnecessary unsafe situation. When an individual has not been in the building in the past 24 hours DO NOT CLEAN during a high traffic period.

## Synopsis

Center Controller reported an adjacent Center going to ATC Zero due to COVID-19 cleaning and having aircraft that were not allowed on filed routes.

## Narrative: 1

While on the ZZZZX Arrival we were at FL350. We were given a descent to FL330 and to cross ZZZZ at FL240. I set FL24000 in the MCP and the Captain set cruise in the FMC to FL330 and we started down. I looked at the ND display and saw FL240 next to ZZZZ and a Top of Descent point and thought we were set up correctly. In reality the FMC was still loaded with FL240, At or Above, which is the altitude loaded with the ZZZZ1 arrival. We noticed the error and made the changes and started the descent, however we were too high at that point to make the crossing at FL240, I think we were about 2,000 feet high. The Controller did not say anything to us and handed us off to the next Controller. You can say there may be some currency issues in that I have only flown about 9 flights since March, and this was 3rd time at the controls in the last 30 days. However I have been on the aircraft for almost X years and I know what it's supposed to do. I just misread the ND display and didn't see the A (At or Above) next to FL240.

## Synopsis

Air Carrier First Officer reported an altitude deviation during descent and cited lack of recent flight experience as a contributing factor.

## Narrative: 1

Uneventful 3 hour VFR flight from ZZZ1 at 16,500 feet. Just after starting my VFR descent for SRQ was advised by ZJX Center that TPA Approach would not take the hand-off and told to squawk 1200. I switched to TPA Approach for SRQ airport and monitored frequency as I continued VFR descent to 8,500 feet - above the top of Class B. After monitoring approach frequency for 5 minutes as I continued my VFR descent to 4,500 feet - above the top of the SRQ Class C, it was evident that the TPA Approach Controller was saturated so I switched to SRQ Tower. I advised Tower that I would fly west beyond the Class C and descend to 1,100 feet - below the floor, before turning back to SRQ for VFR approach and landing. Tower worked me in perfectly on intersecting Runway 4. Although 121 traffic is down considerably, FAA now needs to assess the current flight activity - which for ZZZ Approach certainly exceeded the ability of 1 Controller to control all sectors, and add back controllers before someone gets hurt.

## Synopsis

Pilot reported the flight was not accepted by TPA Approach Control due to staffing/workload issues. The Captain circumnavigated the area and proceeded VFR.

## Narrative: 1

The hand sanitizer installed on this aircraft is in a dangerous location. Several times I have hit my back center spine and also hit my arm on it. With the addition of the X row of seats on this plane the bulkhead wall is already pushed forward. With the addition of the sanitizer it makes the work space even smaller. Someone is going to get seriously injured

in turbulence or any sudden movement of the aircraft as the bottom part that sticks out, is a thin edge. The catch dish was missing on this aircraft, so any liquid was falling on the floor creating a slip hazard. Whomever is putting the bottles in the holder, they are not securing it in place. The flight attendants have not been shown how to secure the bottle in place. Why are we taking space away from an emergency exit that has already been encroached on by the wall being pushed forward, to add an X row of seats?

## Synopsis

Flight Attendant reported concerns with the placement of the hand sanitizer installed on the aircraft.

## Narrative: 1

Crew stepped off aircraft and was on jetbridge. When I looked at my handheld it said we were boarding. So I replied back we had not been cleaned or sprayed yet so we were not boarding. About 3 to 4 minutes later 2 cleaners came up the airstairs and boarded. One had an electric vacuum in hand the other had [a] trash bag in hand. Shortly after a 3rd

cleaner came on board with a bag of supplies and boarded the aircraft and put [the] bag down by the First Class Lavatory. About 5 minutes later another cleaner (gentleman with nothing in his hands) came up the airstairs and boarded the aircraft. Within 10 to 15 seconds the first 2 cleaners came off the aircraft and right after them the other gentleman came off the aircraft saying "we are good to go." One of my crewmember's asked him was the aircraft sprayed. He repeated "we were good to go" and proceeded to exit the jetbridge door and down the airstairs. I and the other crew member both said I don't think the aircraft was sprayed as neither of us saw the cone being put in place nor did we see the sprayer. At this time the last cleaner with the bag with supplies came off. I asked her has this aircraft been sprayed? She said what did he say, I said he said yes, she proceeded to exit the aircraft. I said can you please show me what you have in that bag, because if there is no sprayer in there, then there is no way our aircraft has been sprayed. She then said "I will tell him to come back." At this time the Gate Agent came down to see if we were ready to board. I explained the situation to the Agent and she said "oh no I am so sorry, that's not right." The Captain was on the jetbridge with us and we were all in agreement that we needed to be sprayed before we could start boarding. The previous gentleman came back up the airstairs with sprayer in hand and sprayed aircraft. When he was done, without further delay, we boarded and departed. The Gate Agent was very apologetic about the incident.

## Synopsis

Flight Attendant reported a cleaning crew had to be reminded to properly sanitize the aircraft prior to passenger boarding.

## Narrative: 1

I was acting as pilot flying on the flight to ZZZ. While flying on our assigned course direct to the ZZZ airport, approximately 100 miles from our destination, while conducting the arrival and approach briefings, ATC Center assigned us to turn left 10 degrees, which I complied with by selecting heading mode on the FCP, and selecting the desired heading with the heading bug. Several minutes later, the Controller, again, assigned us to proceed direct to the ZZZ airport. I selected in the FMS direct to the ZZZ airport, confirmed the selection with my captain, and executed the flight plan modification. However, I had neglected to select NAV mode, which resulted in the aircraft continuing on its previously assigned heading for several minutes while I finished the arrival briefing, resulting in the course to show a full-scale deflection to the left (south). Upon finishing the briefing, I realized the missed step, and immediately turned back toward the course and armed NAV mode. Having recently switched over to ZZZ approach, within several minutes the controller queried us about our position, informing us we were left of course. We notified the controller that we were rejoining the course. The controller then assigned us to proceed direct to the ZZZ airport again, which we selected in the FMS, confirmed, and executed, this time ensuring NAV mode was engaged. The flight continued without issue. This event was caused by lack of recent flight experience, as well as momentary task-saturation. This has not been a reoccurring trend for me during training or during revenue operations. I plan to continue to maintain a high level of situational awareness in the cockpit to trap threats before they become errors. I also plan to ensure I am making appropriate FCP selections when I am making an adjustment to our course.

## Synopsis

Air Carrier First Officer reported a heading deviation and cited lack of recent flight experience and task saturation as contributing factors.

## Narrative: 1

I was the flying pilot, we were kept high the whole time. Then we were given [Runway] XXR GPS Y, as we turned, the turn was inside the approach fix, it was tight. I turned to final and we looked high and I wasn't comfortable, so we asked for a go-around. I initiated TOGA, we were approximately 2,200 feet when we did the go-around, and began the go-around process and around 2,500 feet. ATC asked to maintain 3,000 feet. We got extremely busy and by the time we realized it we were at 3,500 feet. We descended to 3,000 feet and we asked to extend the downwind. I had been out for a year and half, and since I gotten back, I did not fly that much, also was off last month and half of this month due to COVID-19, but also I should have asked for extended downwind in the airport, should not [have] allowed the Controller to rush us and I have learned a lesson. Don't accept any arrival that I am not comfortable with.

## Synopsis

Air carrier First officer reported an unstablized approach and an altitude deviation during a go-around. First Officer cited lack of flying as a contributing factor.

ACN: 1779455

## Narrative: 1

This flight is part of the second trip to be on a landing currency waiver. Landings expired [Date]. Waivers issued for the next two pilot trips. I have stated plainly to the training

desk I want to regain my currency vs flying not current on waivers. One area of safety concern arose prior to this flight due to being non-current. Scheduling called the CA the morning of the flight asking to crew the leg ZZZ to ZZZ1 with just 2 pilots (CA and myself) because they could not find a replacement FO for the trip. CA agreed after checking with union contracts. Safety Issue: CA was unaware I would be arriving for work on a waiver. The CA should be notified well in advance instead of at sign in that a non-qualified pilot would be on their flight. The only way the CA found out I was on a waiver is when I notified him. To be clear: I was never assigned FO in the system. The situation was resolved without ever assigning me as FO. The safety issue is with the PIC being unaware they will have a non-qualified crew member. Issuance of this waiver is only made known to the non-current pilot. Other crew members are un-aware until sign in. This waiver should be rarely used vs the recent expanded use and it needs to be depicted plainly in schedules being visible to all crew.

## Synopsis

Air Carrier First Officer reported having a status as flying on a special waiver that was not reported by the company to the Captain before the flight.

## Narrative: 1

Captain (CA) was PF and First Officer (FO) was PM. We had a crew alert action of AUTOFLT FCU1 failure not far from our initial descent for the STAR. CA was working the crew alert issue and Center called saying what the CA heard was "Flight ABC", Direct ZZZZZ descend via ZZZZZ1" (CA was in the QRH, reading about or looking for the crew alert issue). After talking with the FO on the ground in ZZZ, after the event, the FO thought the read back something like "Flight ABC direct ZZZZZ for the ZZZZZ1." Then, PM made sure PF was inserting the bottom altitude of STAR in the FCU (Meaning PM understood the clearance to descend via the ZZZZZ1). PF did insert the bottom altitude. Then, shortly afterwards, we hit some moderate turbulence and PF decided to start descend early because he could not read the QRH, hoping to get into some clear air. Then we were told we descended and there may have been a flight deviation. I did not think so at the time because of the clearance I understood. I believe there were several causal factors on this event. 1) Pilot Inexperience. The FO was on the Type X aircraft and in March was awarded the Type Y aircraft. But from March through December, all the FO did was go to Type Y training, and IOE. This was the FO's first flight since IOE. The FO was going very slow making sure no mistakes were made. The PF was also going very slow to ensure all FO tasks were completed. 2) Task saturation (crew alert event, pilot inexperience, turbulence and clearance understanding). Combined, this put both pilots in a "caution situation." The PF, was trying for something like this would not happen from the moment the flight started by

making sure he was slow and deliberate on all his thoughts and actions. 3) Turbulence event. We descended early because PF had a hard time reading the QRH. 4) PF flying and completing crew alert actions. In this case, it may have made a difference, but, I do not believe it would have made a difference, because the PM understood the clearance from Center was a clearance to descend Via, and when the turbulence started, the person working the crew alert action would have said descend to get out of the turbulence the QRH could be read. The same outcome would have happened. Suggestions - Verify the clearance, no matter the circumstances...In this particular event, the PF should have verified the clearance knowing the proficiency of the other pilot may not have been 100%. A pilot may be "Current" with regards to the official written documents approved by the FAA, but they may have not been proficient...(I do not know how this can be fixed...)

## Narrative: 2

In preparation for descent, Status Page showed an inoperative system the CA/PF noticed. CA was in the process of investigating the crew alert message that caused it. We had a seasoned CA in the Jump Seat who was assisting in the lookup for the crew alert actions, if any, and the code was sent to Maintenance. In that time, we received a call from Center to proceed "direct to ZZZZZ for the ZZZZZ1." I read the clearance back "direct ZZZZZ for the ZZZZZ1 arrival". I then conveyed to the CA/Pilot Flying "direct to ZZZZZ, we can descend via the ZZZZZ1" and I backed CA up to set direct ZZZZZ in the FMS and dialed in the lowest altitude in the arrival for south landings. We verified the altitude. While inbound to ZZZZZ, we were at FL390 and encountered some occasions of moderate turbulence and continuous light chop. The CA/PF commenced a descent to avoid remaining in the turbulent conditions. I contacted the Center to let them know we were descending out of FL390. They called back to ask what was the reason for the descent. I stated we had encountered moderate to light turbulence and needed to descend to avoid it. They called back asking me to confirm the reason for descent was turbulence. I confirmed. Then, before we were handed off to the next frequency, the controller asked us to contact a number for possible altitude deviation. There was a misunderstanding, on my part, of the vertical clearance in the call with Center with the initial clearance for ZZZZZ1 and I passed that misinterpretation on to the CA/PF. It was my first flight in over a month, preceded only by sim events way back in September and just prior to OE. This was a threat up front. Hadn't flown in this environment in over 18 months. We had multiple distractions due to the crew alert and system loss being addressed, icing conditions and turbulence. The ATC frequency was covering high traffic volume so there was a significant amount of talking on the frequency. We had both been up very early in order to be ready at report time. My expectation bias led me to believe we were cleared to "descend via" when we were cleared only laterally for the approach. We could have briefed the arrival prior to addressing the crew alert and done a transfer of control of the aircraft and radios. I could have had ATC repeat the clearance, once the PF was back with me, so that they could communicate directly what the intended clearance was. I could have stated the clearance exactly as it was read back to eliminate any "single point" of interpretation, or misinterpretation.

## Synopsis

Air carrier flight crew reported an altitude deviation and cited the First Officer's lack of flying as a contributing factor.

## Narrative: 1

On final, Runway XXL, ZZZ, Night, 1000 foot ceiling, Me (Captain) flying, gusty winds, very light load, FO low currency- only 150 hrs in type since hired 1 year ago, and has not been flying much. I was hand flying at 2,000 feet on normal ILS. Called for gear down, flaps 15 at approximately 2,000 feet and flaps 30 landing, check at about 1500 feet. FO ran check list, while I hand flew the approach. The winds were gusty, our target was +15 ref and it was night. I saw flap refs change on airspeed tape, and glanced at gear lights when FO ran checklist, but I did not have full attention to FO duties since it was dark and gusty. We broke out at 1,000 feet, I called clear to land and set missed approach altitude. At 500 feet we simultaneously got the 500 auto call out and Too Low Flaps. I simultaneously, started a Go-Around (finger to toga button) and looked at flap gauge - which was at 25. But I hesitated on the go-around when I saw why we got the GPWS. I commanded flaps set to 30, which the FO immediately did. We were then about 350-400 feet and stable, and I continued to a normal landing. After landing I realized, even though there was adequate time to set the flaps to 30, I should have gone around. We debriefed after parking. The FO said he just missed the flaps in setting and checking on the checklist, most likely due to being low time in aircraft and rusty from time off. I missed his wrong setting, due to the dark and the gusty winds requiring my attention. I said I should have gone around, and that he as well should have told me to. I am confident if I had not immediately recognized why we got the too low flaps and immediately corrected it, I would not have continued.

## Synopsis

Air Carrier Captain reported a TOO LOW FLAPS warning and an Unstabilized Approach.

## Narrative: 1

On RNAV to Runway XX due to GS being inop on the ILS, winds, and airport conditions. Outside FAF, attempted to extend Landing Gear and got only the 3 red UNLOCKED lights. No landing gear operation. Our airspeed was around 165 KIAS. We attempted to recycle the gear and got exact same thing. We executed a missed approach, [advised ATC], and attempted to contact Dispatch on ACARS. We tried several frequencies but could not make voice contact. ZZZ1 airspace was undergoing some sort of COVID cleaning so not sure if that had anything to do with ARINC in that vicinity. We just used the ACARS to communicate as best we could. Dispatch texted that the only thing he was showing was LANDING GEAR NOT DOWN LOCKED (same as us) but had no other system malfunctions that he could see. We followed the ECAM which instructed us to use the gravity extend. We did, it worked, and we landed safely. We texted Dispatch once on the ground that we made it safely, Maintenance came with the tug and towed us to the gate. Passengers and flight attendants were informed in the air and on the ground as to what was happening.

## Narrative: 2

Just after midnight, outside the FAF to Runway XX at ZZZ, I was the PM and was asked to extend the landing gear. The gear failed to extend. Landing gear not down-locked. Recycled landing gear. No joy. Told Tower we needed to go-around to troubleshoot.

Requested priority handling and then transferred controls, I was now PF while the Captain ran the ECAM and coordinated with Dispatch/Maintenance Control/FAs. I requested vectors away from the weather and near the approach so we could quickly join final when complete, requested they roll the trucks, and advised ATC we would need a tow off the runway. The Captain had difficulties talking with Dispatch and Maintenance over ARINC due to our low altitude (3,000) but was able to exchange some messages over ACARS with both. He ran the landing gear gravity extension checklist as directed by the ECAM. Landing gear came down. Captain updated FAs and made a PA to the passengers. We transferred controls and I was then PM for the final approach, visibility was poor due to a weather system. Rough winds and conditions but great landing by the Captain. Full stop on the runway. Crash truck circled and checked the plane out. Tow arrived and we shutdown motors and were towed to the gate.

## Synopsis

Air carrier flight crew reported an unsafe landing gear indication. ATC communications were also reported possibly due to a COVID-19 ATC Zero event.

## Narrative: 1

Passenger in [seat X] refused to wear mask. He was addressed by passengers and flight attendants. He was issued the mask card in regards to not following company's mask policy. The flight attendants did not inform me until after parking about the situation even though it happened during the flight and other passengers were complaining. The station manager at ZZZ was able to find the passenger after deplaning and had a conversation with him in regards to company's policy. During my welcome aboard announcement I did reiterate [the] company's mask policy.

## Synopsis

Air carrier Captain reported that after the flight the Flight Attendant stated that a passenger had been non-compliant with mask policy during the flight and that other passengers had been complaining.

## Narrative: 1

We were delayed yesterday because of ATC issues. By the time we took off it was dark and we had been up for 12 hours. As we flew east off the coast of State X we encountered moderate turbulence and precipitation. The Captain got distracted and as we leveled off at 7,000 feet his speed began to increase. I called out "Speed" and he did not acknowledge so again I said "Watch your speed." By this time we were doing around 275 knots and I don't why but he thought we should continue the climb so he used the autopilot to begin to climb the plane. I immediately told him to maintain 7,000 and reduce his speed. The initiated climb resulted in an altitude gain of 400 feet and the Controller told us to maintain 7,000 feet. We returned to 7,000 with no other issues and slowed. I was told our delay was a result of staffing issues at ZZZ center because of COVID-19. This is by far the longest ATC delay I have experienced and I definitely know fatigue was a factor here. Do I think we were unsafe? No, I do not. That being said I don't think we were the tip of the spear that late in the day. ATC was super busy on the radios and we tried calling several times to request higher to get out of the weather we were in to no avail. Under staffing, busy airspace, delays, fatigue, and weather all combined would be the problem in my opinion. As well as pressure to get the job done.

## Synopsis

First Officer reported a speed and altitude deviation during departure and cited fatigue from a lengthy ATC COVID-19 related delay as contributing factor.

## Narrative: 1

During boarding, the gentleman in [seat] XX1 got my attention to ask if he was in the right seat, so I looked and tapped on each person in the row to confirm for him. That is how I noticed the X Family was a party of 4. The mother was holding the child and I asked if the child was a seat or a lap as I didn't have her as a lap child in my list, but in her own seat. She said she has her own seat. And I asked if she was over 2 years. The mother said yes. I asked if they had a mask for the child reminding them of our policy and also reiterated that the child would need to be in her own seat for takeoff (FAR), landing and whenever the seat belt sign was on. The father stated that she's only two. I said yes, she's

over two that's why she's required to have and be in her own seat. The father also said they were traveling internationally. (I believed they were traveling internationally when we got to ZZZ, but later in this situation the Supervisor who spoke to the family ascertained that they had come in from ZZZZ on Aircraft Y, where apparently the situation was not addressed on that flight). I offered to bring a mask and did. I informed the Purser and cockpit that there was both issues. While I was closing bins I walked past the family and they had made no attempt to rectify the situation. I also had to remind the father twice to fix his own mask. When there was no attempt to address the non masked child by the family I chat text for a Supervisor to address the situation since the door was open. The first Supervisor went to the seat and was there for a few seconds, I was concerned that it didn't appear the situation was addressed by the reaction of the family. The child still didn't have a mask on and no motion to attempt. I approached the Supervisor and asked him about it. He said he told the family. I informed him that I walked by their row and the child wasn't wearing a mask nor was there any attempt to get the child to wear one. The purser also spoke to the family. Another Supervisor came, and spoke to the family. I stayed at the front of the cabin to let them deal with the situation. Supervisor 2, Inflight supervisor came as we were now taking a delay. Supervisor 2 said that they could make an exception to the mask policy. I, as an employee who is required to be masked with verbalized and written termination warning from my company if I do not remained masked at work, is now telling me that exceptions can be made onboard the aircraft for passengers. I have never heard of this and am not aware of documentation of this. The passenger knows the child isn't allowed to be a lap child and they know that anyone over two is required to be masked. While I realize it's difficult for a young child I also acknowledge that Airline chose to pick this age for mask requirement likely to coincide with the FAA mandated age seat requirement. There is ample notification for these policies (during booking and check in), passengers personal responsibility is a choice. As is proactive parenting. After more than two decades of flying there are quite frankly cultural differences/ beliefs of non-compliance and this presents itself as complete lack of acknowledgment of our policies (or FAR's). I completely acknowledge that the flying public is a challenge at times, most follow the rules. This includes me, especially at work. While I'm completely capable of sympathy, compassion and compromise... I'm absolutely not when it comes to safety. I applaud Airline for enforcing the mask policy. I would encourage them to strive for consistency on a multitude of other safety issues that appear at times to go by the wayside in favor of on time departures and convenience. It is this mentality that creates inconsistencies and quite frankly makes my job harder to do.

## Synopsis

Flight Attendant reported issues with a family of four who had a 2 year old who did not want to wear a face mask.

Narrative: 1

As I am greeting passengers and handing out wipes, Passenger X seated in X, boards the aircraft with mask barely covering his nose or mouth, him and his family. I gently ask them to please cover nose and mouth to board, they comply. Keep in mind even kids barely have mask. They all boarded with mask on chin. When they get to their seats they still have it on. Now after pilots inform us that we are departing, Passenger X completely takes off his mask, passengers around him are looking uncomfortably anxious and he is looking to see if I can see him. Although the lights are dim in the cabin I can still see him and he sees me. I do a friendly gesture so he can put it on. He completely ignores me. Then when I get the 10,000 I get up to kindly ask him to place mask over nose and mouth, he complies and then as I walk away he takes it off. I let him know one more time announcements say. He doesn't comply and wife [has] her mask off too, to tell me why don't I leave him alone. At this point I head towards forward to inform pilots and they let me know to let him know one last time. When I informed him I spoke to the pilots and then finally after three gentle reminders, he and wife and kids comply.

## Synopsis

Flight Attendant reported a passenger was not compliant with face mask policy.

Narrative: 1

While preparing the aircraft for departure from ZZZZ to ZZZ I made contact with our Dispatcher to address a minor deferred maintenance item. While I was on the phone I learned we were getting new paperwork due to the ZZZ1 ATC Center shutting down for sterilization. The Dispatcher was still working on the details due to severe weather to the east of ZZZ1 and indicated that it would be sent to me and the normal station location when it was finished. The Load Master came in wanting me to complete the weight and balance so he could leave. I notified him that we needed new flight release paperwork and told him it should be sitting on his printer and to look for revision 1 at the top of the front page. The Load Master came in again later and indicated that he wanted to do the weight and balance paperwork. I told him I wanted to wait till I had the new paperwork in hand and reviewed. Eventually the paperwork showed up and once we reviewed and did a few more items to finalize the preparation I turned around to notify the Load Master that I was ready for the cross check. The person said that they were not doing the cross check at that station due to COVID-19. I was surprised by his answer and said something like "REALLY?" And he repeated his original statement. I told him I had not been notified of this situation and he said it was to reduce exposure on the flight deck. I gave him the paperwork that was completed but did not have the check marks related to the normal cross check process with the Load Master. In hindsight, I am skeptical about the answer I received and decided I should make this report to make sure that this situation is truly their process. If it turns out to be accurate we should possibly notify any crews that will be going into ZZZZ. This flight was already scheduled later than normal due to crew rest requirements and due to the delay in receiving the hard copy of the amended flight release it was running approximately 10 minutes later than the newly scheduled time. It was obvious that they were under pressure to get us moving and I was attempting to keep things standard and attempt to not introduce the opportunity to have errors.

## Synopsis

Air carrier Captain reported a weight and balance change was not cross-checked due to COVID-19 company guidelines as cited by the Load Master.

## Narrative: 1

Reflecting back on this flight today, I fear we may not have obtained verbal landing clearance from Tower before touchdown on Runway X at ZZZ. This was my first flight in over two months, and was assigned with another Captain as my First Officer, with no one else present on the flight deck. I had also been on leave earlier in the year. Before we flew, I briefed that two captains flying together as a two-pilot crew complement is a threat, as it does not happen often, and there is an operational bias for the acting First Officer (co-Captain). During the descent, Air Traffic Control vectored us to a close-in base leg to Runway X. Approach Control asked us if we had the field in sight, and I elected to continue with a visual approach, which I believe now was not the best choice for myself. My acting First Officer momentarily lost sight of the field during my turn from base to final, however I had it acquired visually the entire time. I pointed out the field to assist, and the pilot monitoring re-acquired it. This should have resulted in a go-around to rejoin the approach, as this is a team environment, and a two-pilot airplane. I know I did switch the nose-wheel landing light to "on" during the final approach leg, as that is SOP after being cleared to land, according to FOM. I was focused on flying the plane, slowing down early, and ensuring a stabilized approach. I was not completely in tune with what my co-captain was or was not doing. Stabilized approaches are a topic often discussed in training, so it weighed heavily in my priorities on this day. My co-Captain (pilot monitoring) may not have switched to Tower as it was somewhat a high workload environment and unusual operation, at least to me. I should have recognized the threat of two captains flying together, along with my low state of landing currency, would lead to a chain reaction easily. I should have requested the full ILS to Runway X, or at least a longer final approach leg. I would recommend after a Captain returns to the line after a lengthy vacation, and in my case leave earlier in the year as well, to not pair up with another Captain, but only a highly current First Officer. Although everything was completely my responsibility, this would have eliminated the threat. I recognize that sound aeronautical decision making as it relates to all phases of duty, is the number one factor influencing safety, and it must be practiced even in high-workload environments.

## Synopsis

Air Carrier Captain reported landing without a clearance and attributes the event to lack of flying and complacency while flying with another Captain as the First Officer in this flight.
